Consortium for the Computer Interchange of Museum Information

CIMI SGML DTD V4

(first public release)

October 1996

for information
http://www.cimi.org/cimi
or
info@cimi.org

Introduction

This document contains the human readable form of the CIMI SGML DTD for museum catalogues and texts. The CIMI DTD has a companion document the *Tagging Guide* which contains a tag library and describes the application and use of the DTD.

Both documents are available in a variety of electronic formats from:

<ftp.cimi.org/pub/cimi/cimi_sgml/>

Preceeding the DTD proper is a description of the design principles and key elements of the DTD drawn from the *Tagging Guide*..

CIMI

CIMI (the Consortium for Interchange of Museum Information) is a group of museums and museum bodies which have come together to further the cause of pooling and exchanging museum information. This is an area which has been discussed both locally and internationally for many years, but with few practical results. CIMI aims to make progress at both a theoretical and a practical level.

For more information see <http://www.cimi.org/cimi>

Project CHIO

CIMI's current major demonstration project is Project CHIO (Cultural Heritage Information Online). This project aims to deliver at least 10,000 records of objects and information about Folk Art as a searchable online resource. It includes the full text of exhibition catalogues, wall texts, etc. as well as images and the more traditional museum database records. It can be browsed at <http://www.cimi.org/cimi>.

SGML and the CHIO Full Text DTD

CIMI decided at an early stage in Project CHIO to use the SGML standard (Standard Generalized Markup Language; International Standard ISO 8879:1986) to mark up the textual resources involved in the project (exhibition catalogues and wall texts). In order to do this, it had to adopt or develop a Document Type Definition ("DTD"), a set of rules that defines the allowed structure of SGML documents.

SGML requires that every valid document should have an associated DTD. Although it is possible for every document to have a different, individual, DTD, there are major benefits in adopting a single DTD for a whole project, not least the ability to conduct searches that take account of a document's internal structure. In this sense, a DTD is rather like the Data Definition aspect of a traditional relational database.

Since no DTDs had been developed for museum information of any sort, it was decided that a new DTD was required.

Design Principles

Rendition of the Source Document

One objective that the CHIO project team agreed on, was that the markup should reflect the design of the original printed work from which the SGML version was derived. This would allow each source to be rendered (i.e. displayed on screen or printed) in a format which was compatible with the original book. Thus there should be facilities for marking common features of books such as headings, footnotes, bibliographic references, etc.

It was agreed that this process should stop short of any attempt to produce an exact facsimile of the original work. Nonetheless, we were looking for a DTD that was essentially descriptive, rather than prescriptive, in its approach.

Searching: Access Points

Another principal aim is to provide online access to the relevant parts of documents in response to online enquiries. These enquiries might come from the general museum-going public, or from museum professionals.

In order to do this, any aspects of relevance to potential queries need to be marked up. Also (less obviously) the "scope" of each search term needs to be made clear. If a section within a chapter describes a technique of interest (e.g. rug-hooking), then only that section should be returned to the searcher, not the whole chapter (and certainly not the whole book!).

A distinction was made, when analysing some typical source documents, between the main topic of discourse within a piece of prose, and passing mentions of a topic. For example, a section of one book might be a biographical essay on Grandma Moses, whereas another book might have a passing mention of her name.

Clearly, the biographical essay is likely to be much more valuable to a searcher. We wanted, in our markup, to be able to make a distinction between what we termed "primary" and "secondary" access points.

The need to support specialized "museum" enquiries, as well as general ones, led us to design a framework within which the "museum context" of information could be specified. This framework needed to be very flexible, because we were aiming to describe a wide variety of things: objects, people, techniques, events, ... In the end we produced a modular set of "atomic" "context" terms, which could be combined as required to define a specific context for information.

Linking and Authority Files

Another practical aspect of Project CHIO is that it is meant to be a distributed resource, with contributing documents, object records and image files physically stored anywhere on the Internet. This meant that we needed a method of hyperlinking between e.g. documents and their associated images that was both robust and flexible. Links should not, as far as possible, "hard-wired" to a particular physical location. The location of resources is liable to change over time - in fact this has already happened within the lifetime of the project. Also we wanted to facilitate the possibility of

creating "mirror sites" with hyperlinks to a local copy of images etc.

A related issue is the use of authority files, both as an aid to consistent recording and as a means of expanding queries. We wanted to be able to make reference to any authority files that had been used when marking up documents for CHIO.

Scope of the CHIO Full Text DTD

The CHIO Full Text DTD Version 4.0 is designed to support the SGML markup of "exhibition catalogues" and "wall texts", and any other museum genres which have a similar pattern of information.

It can also support the representation in SGML of "object" and "person records", both typically structured records derived from database sources. (Originally we had a separate DTD for object records, but found that it was possible, and desirable, to add the ability to code object records into the main DTD.)

Use of the TEI Framework

It was agreed that, if possible, an existing DTD design framework should be used as a starting point for the CHIO Full Text DTD. The Text Encoding Initiative ("TEI") scheme was agreed to fulfil Project CHIO's first requirement: the ability to render the main features of each source document. It offers a generic framework for encoding prose (and other source document types that are not relevant to CHIO), with the ability for specific applications to be added as "toppings". This design allowed us to use existing TEI elements for standard textual features as they stood, and still have the freedom to design additional elements to represent items of information that are of particular interest when searching the CHIO databases.

Significantly, the TEI application of SGML also offers museums some well-established techniques for representing multimedia and hyperlinking in a system-independent manner. SGML has a built-in ability to deal with multiple media by means of its "NOTATION" concept. TEI uses this in the <figure> element, which deals with the full range of supporting information that goes with traditional book illustrations. TEI also supports hyperlinking both within and between documents, using an elegant "extended pointer" mechanism which is increasingly being supported by SGML-aware browsers (such as Panorama). This mechanism will also allow pointers to places within non-SGML resources, such as"hot spots" within graphics.

This meant that the underlying DTD supported two-thirds of our requirements, and allowed SGML Working Group to concentrate its efforts on designing a framework for the "museum" aspects of the markup.

TEI Lite

In fact, the CHIO Full Text DTD takes "TEI Lite" as its starting point. This is a base-level implementation of TEI for humanities texts. Our analysis of some typical museum texts showed that the TEI Lite framework was well able to support the tagging of "standard" features of exhibition catalogues, such as sections, subsections, lists, footnotes, illustrations, and bibliographies. It was also found to provide support for a number of concepts that are of direct 'museum' significance for Project CHIO, such as personal names, dates, and place names.

The TEI Lite tagset was modified to meet Project CHIO's information needs by removing unnecessary elements, and adding concepts from the basic TEI framework as required. Museum extensions were then added to the DTD to provide support for Project CHIO's requirements for online access.

The general aim is to have the smallest tagset which will:

* allow exhibition catalogues and wall texts to be sensibly marked up

* support Project CHIO's requirements for online access

Element Naming Conventions

The CHIO DTD attempts to be consistent when naming additional elements, and to follow conventions similar to those used throughout the TEI.

Where an element contains just the name of a concept of interest, it is usually given the suffix "Name", e.g. <awardName>.

Where an element contains a structured set of subelements, with no free text allowed between them and possibly some mandatory sequencing and content, it is given the suffix "Struct", e.g. <objectStruct>.

CHIO access points

As noted above in Searching: Access Points, we accepted in general terms that we needed both "primary" and "secondary access points". However, this general requirement had to be converted to a specific set of access point values that would allow us to answer the sorts of questions which users of the CHIO database were liable to pose.

See the *Tagguing Guide* for a description of how these access points are implemented as SGML markup.

Naming and Linking Strategy

As noted above, a major goal of Project CHIO is to set up a distributed information resource, complete with hyperlinks within and between documents. Achieving this goal involves a considerable amount of care in the design of naming conventions and the use of hyperlinks. This section outlines the approach that has been adopted.

Public Identifiers

In order to achieve a degree of insulation from the changes that occur in the siting and naming of Internet resources, we decided that it is desirable to use PUBLIC identifiers rather than SYSTEM identifiers when referring to external image files, documents, etc. This means that there are no system-specific references inside each document: any changes are restricted to an external "entity catalog".

SGML Open Entity Catalogs

The entity catalogs which we have set up for Project CHIO conform to the format which has been approved by SGML Open, and is increasingly supported by SGML-aware software. This format is already used directly by Panorama Pro.

URLs as System Identifiers

Where it has not proved possible (or convenient) to create Public Identifiers for entity references, URLs have been used as System Identifiers. This at least gives a form of reference which can be resolved directly by Web-aware software.

Where appropriate (for example where referring to an image file), relative rather than absolute URLs are given, again with the intention of improving "portability" of the reference.

Use of TEI Extended Pointers

In order to support links between documents we have adopted the TEI "extended pointer" mechanism. This allows one to specify a target document, and then a precise position within that document. Although the extended pointer syntax offers a wide variety of methods for specifying positions within a document, we have by and large restricted our usage to an implied "IDREF" (i.e. a pointer to an element with a given ID within the target document), on the grounds that this is the most robust form of link.

The CIMI DTD

((#PCDATA | NOTE | AUTHSTMT)*)
-- Place: location: geopolitical, topographic and cultural features.
This has been implemented by the standard TEI tags <placeName> (which
has a number of useful subelements), <geogName> and <address>. Resources:

 not implemented on first pass. May not be needed for exhibition
catalogues. Role: the role played by people, individuals or groups.
This is supported by the ROLE attribute, which is 'global' to members

 of class NAMES. It is also (in V4.0) provided in <topic> and <context>
for primary access points. Style/movement: --

-- subjectDesc: designed to implement the CIDOC Object People Role
Depicted LDG (i.e. 'Subject description' in the brief): Timespan:
use TEI <dateRange> for this. Supports both descriptive and numeric
dates.
  Context element, used to give a (museological) context
to topics. Created by rbl, 26.1.1996. CHIO attribute is for CHIO-approved
contexts (taken primarily from CDWA): VALUE and AUTHORITY can be
used in
  tandem for any other context (2.2.1996). Context is a
member of TEI classes interpret and metadata. --
