

## ebXML Registry profile for ebXML Core Components

### Version 0.1

Working Draft, 28 Avril, 2005

**Document identifier:**

regrep-ccts-profile-01

**Location:**

<http://www.oasis-open.org/committees/regrep/documents/...>

**Editors:**

Name	Affiliation
Ivan Bedini	France Telecom

**Contributors:**

Name	Affiliation
Fabrice Jeanne	France Telecom
Sebastian Wafflart	France Telecom

**Abstract:**

This document define the ebXML Registry profile for ebXML Core Components management. The document specify how to effectively customize and use an ebXML Registry Repository for specific domain. The document includes a standard mapping the Core Component Information Model to the ebXML Registry Information Model.

**Status:**

This document is an OASIS ebXML Registry Technical Committee Working Draft Technical Note.

Committee members should send comments on this specification to the [regrep@lists.oasis-open.org](mailto:regrep@lists.oasis-open.org) list. Others should subscribe to and send comments to the [regrep-comment@lists.oasis-open.org](mailto:regrep-comment@lists.oasis-open.org) list. To subscribe, send an email message to [regrep-comment-request@lists.oasis-open.org](mailto:regrep-comment-request@lists.oasis-open.org) with the word "subscribe" as the body of the message.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the OASIS ebXML Registry TC web page (<http://www.oasis-open.org/committees/regrep/>).

# 83 1 Introduction

## 84 1.1 Scope of this document

85 The aim of this document is to define the ebRIM concepts with respect to ebXML Core Components  
86 technical Specification.

87 The core issue of this mapping is to preserve the CCTS Information Model, structure and content, in the  
88 obtained ebRIM mapped format.

89 At this level to be conform to the [CCTS] means that all information, metadata and relationships aren't  
90 lost into the passage to ebRIM. The defined ebRIM mapping has to be able to store and retrieve all CC  
91 information without lost.

92 The obtained mapping is a set of registry objects that will be the canonical objects for the UN/CEFACT  
93 registry implementation.

94 To implement this canonical objects guarantees the interoperability between registries and permits to  
95 share objects using the registry federation feature.

## 96 1.2 Audience

97 The target audience for this document includes all software developers who will follow this document to  
98 put in place a registry to manage reusable Core Components compliant with UN/CEFACT registry  
99 implementation.

100 The entire comprehensions of this document ask a background acquaintance of the CCTS, ebRIM  
101 specifications and UN/CEFACT UMM methodology by the reader.

## 102 1.3 Overview

103 The ebXML Registry/Repository provides several generic services to manage every type of information,  
104 objects and files. Every stored "file" into the registry is a *RepositoryItem* and every *RepositoryItem* is  
105 accompanied by a registry object that contains all metadata or information.

106 The [ebRIM] provides several canonicals objects to accomplish that, but everyone can personalise the  
107 implementation by adding all needed classifications, object types and association types to the registry.  
108

109 The whole UML class diagram, representing the CC Information Model, defined into the Core  
110 Component Technical Specification can be mapped to the ebXML registry storage format [ebRIM]. For  
111 that both, canonical and specifics objects are defined.

112 This task is done in two steps:

- 113 ● In a first step the rules defined into the ebXML Registry Tutorial are followed. This step provides a  
114 simple way to map a generic information model to the target format.
- 115 ● And in a second step, because the complexity of CC Information Model, an optimization of the  
116 resultant mapping is done.  
117

118 The resultant mapping can constitute one or more XML files for direct submission, by the ebXML  
119 Registry Life Cycle Manager interface, to a ebXML registry.

### 120 1.3.1 UMM Overview

121 The UN/CEFACT Modeling Methodology (UMM) is an incremental business process and information  
122 model construction methodology that provides level of specification granularity that are suitable for  
123 communicating the model to business practitioners, business application integrators and network  
124 application solution providers.

125 This methodology use a limited version of UML class diagrams artefacts to modelling components  
126 structure.

### 127 **1.3.2 ebRIM Overview**

128

---

## 129 2 CCTS UMM Mapping generals rules

130 In this chapter we define all applied rules to UMM profile for mapping CCTS schema to ebRIM model.  
131 Where possible, the generals rules defined in the ebXML tutorial will be applied in this definition.

### 132 1.1 Classes

133 Where applicable the CCTS classes are mapped directly to an existing ebRIM registry object.  
134 If not, a new ebRIM Object Type is defined. Its name is the same of the ccts class using UCC method.  
135 If an UML class is an Abstract class it won't be mapped to an ebRIM object directly, it will represent only  
136 a concept. Its attributes will be created directly in inherited classes.

### 137 2.2 Inheritances

138 Inheritances are defined by the corresponding inheritance relationship among the *ClassificationNode*  
139 under ebRIM Extrinsic Object in the extended Object Type Scheme.

### 140 2.3 Associations

141 Associations can be mapped directly to RIM Associations. Where possible canonical RIM associations  
142 are adopted.  
143 Role will be not considered the type of the ebRIM association.  
144 Undirected one to many associations will take the direction from the « single » class as source and the  
145 multiple class as target.

#### 146 2.3.1 Association Classes

147 The association classes will be mapped directly to the ebRIM Association object.  
148 No new dedicated ebRIM objects will be created to represent this class, but the attributes will be inserted  
149 directly in the ebRIM Association object.

#### 150 2.3.2 Aggregations

151 Mapped to associations.

#### 152 2.3.3 Compositions

153 Rule of tutorial will be applied.

#### 154 2.3.4 Roles

### 155 2.4 Attributes

156 Attributes are mapped to existing canonicals ebRIM attributes or to a new defined ebRIM *Slots*.  
157

---

158 **3 Core Components and Data Types Information**  
159 **Model mapping**

160 The *Unified Modeling Language* class diagram describes all aspects of *Core Components* storage  
161 details and fully describes the types of *Core Components* and their relationships as a requirement of  
162 storage.

163 In the transformation of this diagram each classes corresponds to a sub-node of the [ebRIM] object type  
164 scheme. At the end of this document an optimization will be done. This because for the registry purposes  
165 all we need is the managed artifacts and not every single object (For example the class *RegistryClass* is  
166 never used alone in a business instance).

174 This feature provides us a good mean to personalize our registry objects.  
 175 It will permits us to provides specifics research and discovery (ex: "get all ExtrinsicObject where  
 176 objectType is AggregateCoreComponent") and content management.  
 177

CCTS UML Class (with object type concept structure schema)			EbRIM ObjectTy pe	Comment
Registry Class			RegistryC lass	This class is contains all commons attributes that are inherited by the greater part of CC IM classes. This class is never instantiated directly for business usage.  It is directly a sub-nod of the ebRIM canonical <i>ExtrinsicObject</i>
	Data Type		DataType	Inherit from RegistryClass
	Core Componen t		CoreCom ponent	Inherit from RegistryClass.  This class generalize specifics CC classes as ACC, ASCC, BCC and CCT. No direct business usage is done for this class.
		Aggregate Core Componen t	Aggregat eCoreCo mponent	Inherit from CoreComponent

## 5 Core Components Context Definition Model mapping mapping

### To review...

To better share CCTS classifications from others Registry Classification Scheme, we create 2 Classifications schemes :

- CCTS Context (which is a logical representation of the 8 ccts context)
- CCTS Classification Scheme

The Business Context object (EO) are classified with at least one or more of each type of :

- Business Process Context Value
- Product Context Value
- Industry Context Value
- Geopolitical Context Value
- Official Constraints Context Value
- Business Process Role Context Value
- Supporting Role Context Value
- System Capabilities Context Value

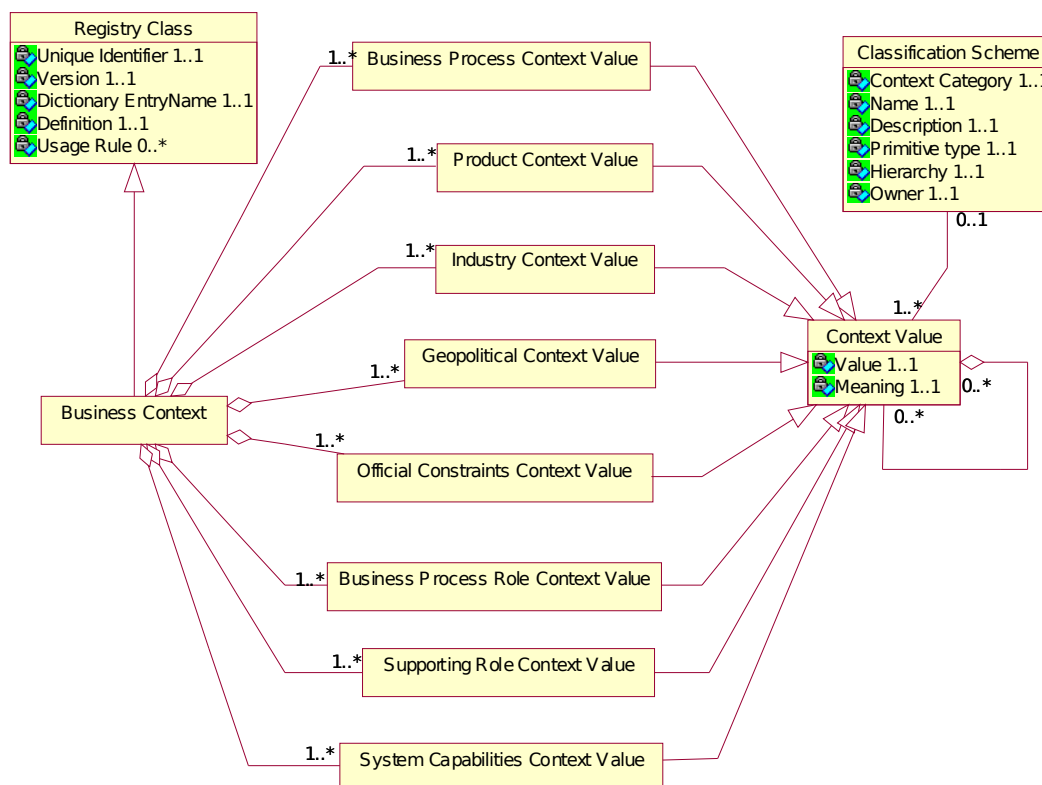

Figure 3 - Core Components Context Definition Model

242

## 243 5.1 Classes

244

Registry Class			RegistryClass	
	Business Context		BC	
Context Value			CCTSContext	
	Business Process Context Value		BusinessProcessContext	
	Product Context Value		ProductContext	
	Industry Context Value		IndustryContext	
	Geopolitical Context Value		GeopoliticalContext	
	Official Constraints Context Value		OfficialConstraintsContext	
	Business Process Role Context Value		BusinessProcessRoleContext	
	Supporting Role Context Value		SupportingRoleContext	
	System Capabilities Context Value		SystemCapabilitiesContext	
Classification Scheme			CCTSClassificationScheme	

245

246 *Here some example and figure....*

## 247 5.2 Inheritances

248

249 ebXML registry has natively the classification system, so every inheritances are mapped to the  
250 classification scheme.

251

## 252 5.3 Associations

253 The association between the Context Value class and Classification Scheme class is already considered  
254 by classification context system.

255

### 256 5.3.1 Aggregations

257

258 The Context Value "self" aggregation is represented by a classification sub-node of context value  
259 classification node.

260 Aggregations between BC class and context values classes are represented by classifications of the  
261 Business Context registry object.

262

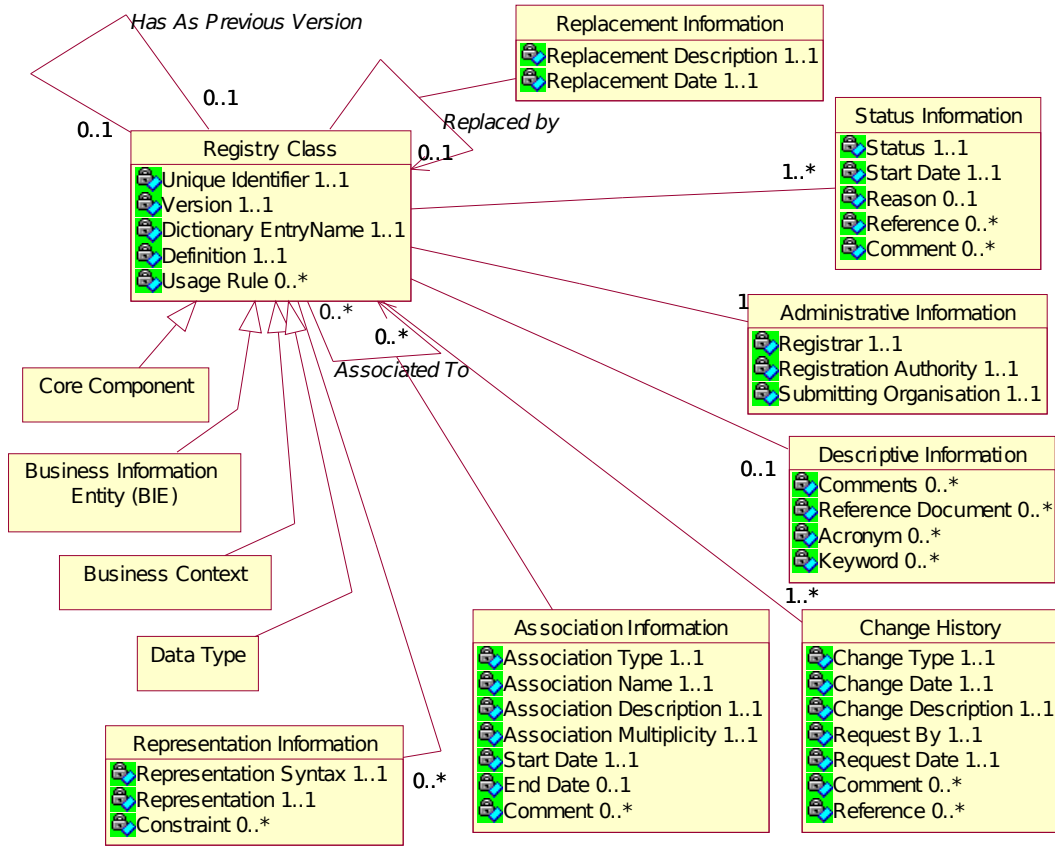

263 *Here an example and a figure....*

264

265 **5.4 Attributes**

266

## 6 Registry Metadata mapping

268

269

270

271 **Figure 4 - Registry Metadata**

### 272 6.1 Classes

273

Registry Class			EO	
Replacement Information			EO	
Status Information			EO	
Administrative Information			EO	An instance of this class will probably link three Registry Person Objects
Descriptive Information			EO	
Change History			EO	
Association Information			Registry Package	
Representation Information			EO	

274

275 **6.2 Associations**

276

Source	Target	Association Type	Name	Comment
Registry Class (new instance)	Registry Class (old instance)	HasAsPreviousVersion		
Registry Class	Registry Class	ReplacedBy	ReplacementInformation	<i>To confirm that we can create an association on the same registry object!!!</i>
Registry Class	Registry Class	ReplacedBy	ReplacementInformation	<i>To confirm that we can create an association on the same registry object!!!</i>
Registry Class	Registry Class	AssociatedTo	AssociationInformation	<i>To confirm that we can create an association on the same registry object!!!</i>
Registry Class	Status Information	Contains		This association is bi-directional, but it is enough to create a one direction association. Only for logical reason we choice as source the Registry Class.
Registry Class	Administrative Information	Contains		This association is bi-directional, but it is enough to create a one direction association. Only for logical reason we choice as source the Registry Class.
Registry Class	Descriptive Information	Contains		This association is bi-directional, but it is enough to create a one direction association. Only for logical reason we choice as source the Registry Class.
Registry Class	Change History	Contains		This association is bi-directional, but it is enough to create a one direction association. Only for logical reason we choice as source the Registry Class.
Registry Class	Representation Information	Contains		This association is bi-directional, but it is enough to create a one direction association. Only for logical reason we choice as source the Registry Class.

280 **7 Defining Content Management Services**

281 **7.1 Defining Content Validation Services**

282 Use of jCAM to validate XML instance docs?

283 **7.2 Defining Content Cataloging Services**

284 The ebXML Registry provides the ability for a user defined content cataloging service to be configured for  
285 each ObjectType defined by the mapping. The purpose of cataloging service is to selectively convert  
286 content into ebRIM compatible metadata when the content is submitted. The generated metadata  
287 enables the selected content to be used as parameter(s) in a domain specific parameterized query.

---

## 288 8 Defining CC Specific Queries

289 The ebXML Registry provides the ability for domain specific queries to be defined as parameterized  
290 stored queries within the Registry as instances of the AdhocQuery class. When mapping a domain  
291 specific model one SHOULD define such domain specific queries.

### 292 8.1 Common Discovery Use Cases

293 The first step in defining these domain specific queries is to identify the common use cases for  
294 discovering domain specific objects in the registry using natural language.

295 For the CC Information model we identify the following sample domain specific discovery use cases as  
296 likely to be commonly needed:

297 Mandatory functions:

- 298 1. Add, update or update Package
- 299 2. Add, delete or update my components. (ex : update ABIE with id ...)
- 300 3. Add, delete or update my RSM
- 301 4. Add, delete or update Documents associated with my component.
- 302 5. Add, delete or update Documents associated with my Package
- 303 6. Add, delete or update component with my package.
- 304 7. Submit a new version.

305 For the CC Information model we identify the following sample specific attributes for discovery use cases  
306 as likely to be commonly needed:

- 307 • Object Class Term
- 308 • PropertyTerm
- 309 • Business Term
- 310 • Definition
- 311 • Business Context value
- 312 • Core ComponentType
- 313 • Keyword
- 314 • Status
- 315 • Version
- 316 • Owner
- 317 • Responsible Organization
- 318

319 Access to 'Consultation' use cases may be restricted. (Ex: users with 'submitter' role can consult their  
320 own components but can't consult others components until they're published (approved))

321 Mandatory functions:

- 322 8. Get a component from its ID: a user can retrieve a component from its identifier whatever the  
323 component type may be. (ACC, ASCC, BCC, CCT, ABIE, ASBIE, BBIE, DataType,  
324 BusinessContext...)
- 325 9. Get documents attached to a Package or component
- 326 10. Get a Package from one of its components (ex: get business specification from an ABIE ...)
- 327 11. Get an Assembly Message from one of its components.
- 328 12. Get all components with the same type (ex: get all ACC, get all CCT, get all Business  
329 Contexts...)
- 330 13. Get all sub-level components from a parent component. (ex : get all BCC from ACC, get all  
331 Supplementary Component from Data Type ...)
- 332 14. Get latest, previous or all versions of a component.

- 333 15. Get components or package by status (ex: get all 'approved' ACC...)
- 334 16. Get all components or package by owner (ex: give me my components ...)
- 335

## 9 Event Notification Feature

The ebXML Registry provides the ability for a user or an automated service to create a subscription to events that match a specified criteria. Whenever an event matching the specified criteria occurs, the registry notifies the subscriber that the event transpired.

A mapping of a domain specific model to ebRIM SHOULD define template Subscriptions for the typical use cases for event notification within that domain.

### 9.1 Use Cases for Event Notification

The following are some common use cases that may benefit from the event notification feature:

- A user may be using an object in the registry and may want to know when it changes. For example, they may be using an XML Schema as the schema for their XML documents. When a new version of that XML Schema is created they may wish to be notified so that they can plan the migration of their business processes to the new version of the XML Schema.
- A user may be interested in a certain type of object that does not yet exist in the registry. They may wish to be notified when such an object is published to the registry. For example, assume that a registry provides a dating service based upon PIM. Let us A person may create a subscription specifying interest in a CC that has a particular Business Context, is classified into Aerospace domain and it is linked, associated to a owned object. Whenever, a CC instance is submitted that matches this criteria, the registry will notify the user.
- An automated service such as a software agent may be interested in certain types of events in the registry. For example, an external workflow engine wishes to be notified of approbation of CC. To receive such notifications, "workflow system" may create a subscription for cc.ApprobationEvents where cc.ApprobationEvents.objectType is "ABIE".

### 9.2 Subscriptions for Events

A user may create a subscription to events of interest by submitting a Subscription object to the registry as defined by ebRIM. The Subscription object MUST specify a selector parameter that identifies a stored query that the registry should use to select events that are of interest to the user for that Subscription.

```
<SubmitObjectsRequest >  
  <rim:RegistryObjectList>  
    ...  
  </rim:RegistryObjectList>  
</SubmitObjectsRequest>
```
