Abstract:

This document explains the SCA EJB session bean binding. It describes how to integrate a previously deployed session bean into an SCA assembly, and how to expose SCA services to clients which use the EJB programming model.

Status:

This document was last revised or approved by the OASIS Service Component Architecture / J (SCA-J) TC on the above date. The level of approval is also listed above. Check the "Latest Version" or "Latest Approved Version" location noted above for possible later revisions of this document.

Technical Committee members should send comments on this specification to the Technical Committee's email list. Others should send comments to the Technical Committee by using the "Send A Comment" button on the Technical Committee's web page at <http://www.oasis-open.org/committees/sca-j/>.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Technical Committee web page (<http://www.oasis-open.org/committees/sca-j/ipr.php>).

1 Introduction

EJB session beans are a common technology used to implement business services. The ability to integrate SCA with session bean based services is useful because it preserves the investment incurred during the creation of those business services, while enabling the enterprise to embrace the newer SCA technology in incremental steps. The simplest form of integration is to simply enable SCA components to invoke session beans as SCA services. There is also a need to expose SCA services such that they are consumable by programmers skilled in the EJB programming model. This enables existing session bean assets to be enhanced to exploit newly deployed SCA services without the EJB programmers having to learn a new programming model.

This document explains the EJB SCA binding. This proposal describes how to integrate a previously deployed session bean into an SCA assembly, and how to expose SCA services to clients which use the EJB programming model.

The EJB programming model supports stateful and stateless session beans. Stateful session beans can implement a conversational interaction with their clients. Stateless session beans are not conversational and instances may receive calls from any number of clients in any order.

The EJB binding supports the stateless session bean model as well as the stateful session bean model.

The EJB Session Bean binding enables:

- SCA developers to treat previously deployed session beans as SCA services, by wiring them into an SCA assembly (SCA reference).
- SCA service deployers to expose a SCA service as a session bean for consumption by Java EE applications.

The use of EJBs and EJB modules as SCA component implementations is beyond the scope of this specification and is described in [the Java EE integration specification \[1\]](#). The following diagram shows the use of the EJB SCA binding on both services and references.

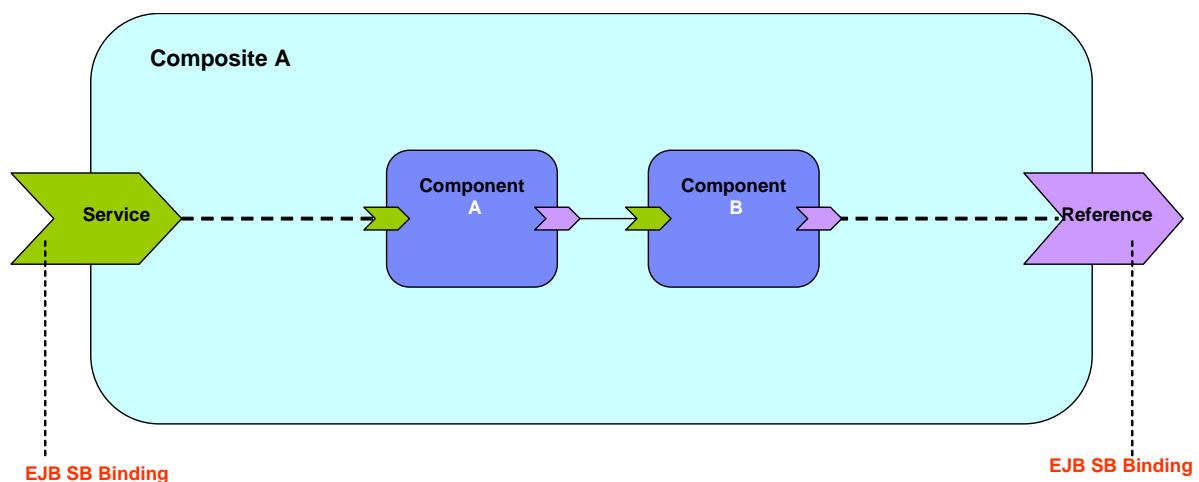

Figure 1: EJB Binding used on Services and References

30 1.1 Terminology

31 The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD
32 NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described
33 in [RFC2119].

52 TBD TBD

2 Session bean binding schema

The EJB session bean binding element is defined by the following pseudo-schema.

```
<binding.ejb
  homeInterface="NCName"?
  ejb-link-name="NCName"?
  session-type="stateful or stateless"?
  ejb-version="EJB2 or EJB3"?
  name="NCName"?
  policySets=" sca:listOfQNames"?
  requires="sca:listOfQNames"?
  uri="anyURI"?
>
  <!-- additional elements here -->
</binding.ejb>
```

- ***/binding.ejb/@homeInterface*** - the `homeInterface` attribute of the EJB binding is the session bean's home interface, and is used when exposing SCA services as EJB 2.x session beans.
- ***/binding.ejb/@ejb-link-name*** - the `ejb-link-name` attribute provides a means for integrating EJB reference resolution with SCA. When used on a binding for a reference, it allows a SCA client to bind to an EJB that is packaged in the same Java EE EAR file as the SCA client. When used on a service binding, it exposes an `<ejb-link/>` target for Java EE clients that want to use Java EE assembly to wire to the SCA service. This attribute is functionally equivalent to using the `<ejb-link/>` subelement of the `<ejb-ref/>` element in an EJB deployment descriptor. The value of this attribute is supplied by an application assembler, and is in the form as specified by the Java EE specification (i.e. `<jar-name>#<ejb-name>`).
- ***/binding.ejb/@session-type*** – the `session-type` attribute is used to indicate the kind of session bean contract to be used when referencing a session bean or when exposing as a session bean. The default is "Stateless". Admissible values are "Stateless" and "Stateful". It is not necessary to specify the attribute, if it can be inferred from the interface of the reference or service. If the latter is conversational, the stateful session bean contract applies, and if it is not conversational, the stateless session bean contract applies. A mismatch of the attribute value and interface provided meta-data will raise an `IllegalStateException` at latest at runtime. See also the section [Interface Mapping](#).
- ***/binding.ejb/@ejb-version*** – the `ejb-version` attribute is used to indicate the EJB client view exposed by the EJB binding when used on an SCA service. This attribute has no meaning when used on a reference. The value 'EJB2' indicates that an EJB client MUST interact with the binding using the EJB 2.x client view. The value 'EJB3' indicates the desire to expose an EJB 3.0 client view.

98

99

100 The base SCA binding schema provides an attribute called **uri**, that is used to denote the URI of
101 an endpoint. In the context of the SCA EJB binding, the **uri** attribute is defined as follows:

102

103 • **/binding.ejb/@uri** – optional attribute that specifies the URI of a session bean endpoint. For EJB
104 2.x, this is the endpoint of the session home. For interoperability the form of the URI is defined by
105 CORBA in the CORBA Services specification [2], and is a standard URI form for referring to
106 remotable CORBA objects. Briefly, the corbaname URI format looks like this:

107 o corbaname:iiop:<hostName>:<port>/<key string>#<path to home>

108

109 Typically, a corbaname URI doesn't include all these components. The following example shows
110 a corbaname URI that uses the default ORB configuration to find an EJB home at ejb/MyHome in
111 the JNDI directory:

112

113 o corbaname:rir:#ejb/MyHome

114

115 Other forms of URI specification are admissible when interoperability is of no concern.

3 Interface Mapping

116
117
118
119
120
121
122
123
124
125
126
127
128
129
130
131
132
133
134
135
136
137
138

144
145
146
147
148
149
150
151

When used with the EJB binding, a service or reference interface must be compatible with a session bean interface, according to the following rules:

- The interface offered by a reference MUST be remotable if the remote session bean interface is being accessed, and MUST be local if the local session bean interface is being accessed.
- The methods on the session bean MUST be a compatible superset of the methods in the interface used by the reference.
- The interface used by a reference MAY NOT contain any methods inherited from EJBObject or EJBLocalObject.
- Compatibility for an individual method is defined by the SCA Assembly Model Specification [4], and can be stated simply as compatibility of the signature. That is, the method name, input types, and output types MUST be identical.
- The order of the input and output types also MUST be identical.
- Except for RemoteExceptions, the set of Faults and Exceptions declared by the SCA reference interface MUST be the same or a superset of those specified by the EJB interface.
- The interface offered by a service or reference with an EJB binding MUST NOT be *conversational* in the case of a stateless session bean and MUST be conversational in the case of a stateful session bean (exposure and consumption).
- The interface offered by a service or reference MAY be an SCA business interface or an EJB 3.0 remote or local interface. The interface is considered non-conversational unless one of the following conditions applies:
 - The interface is marked as conversational using the @Conversational SCA annotation.
 - The binding.ejb element has an attribute session-type with value "Stateful".
- For bindings that consume EJB 3.0 beans, any method marked with the @endsConversation annotation in the interface used by a reference MUST map to a method marked with @Remove in the session bean's implementation class. The interface used by a reference SHOULD contain @endsConversation annotations on all methods that map to @Remove methods in the session bean's implementation class. This assures that the resources associated with the binding are freed when the bean is no longer needed.

152 **3.1 EJBObject and EJBLocalObject Interfaces**

153 The interfaces exposed from EJB 2.X beans inherit from either EJBObject or EJBLocalObject.
154 EJBObject and EJBLocalObject contain methods directed toward the management of bean
155 instances, meaning that the exposed 2.X interfaces mix business and infrastructure methods in a
156 way that makes them poorly suited for use in SCA assemblies. EJB 2.X beans developed using the
157 “Business Interface Pattern” will already have an interface that is suitable for SCA assembly. In
158 other cases, a suitable interface may be quickly derived from the SessionBean interface.
159 However, the session bean interface itself cannot be used as the interface of a reference binding.

160 When SCA Services are exposed as EJB 2.X session beans, the exposed interface will inherit from
161 EJBObject or EJBLocalObject. Section 2.4 describes the behavior associated with each inherited
162 method.

163 **3.2 Stateful Session Bean Home Interface**

164 SCA services have no support for a concept like EJB home interfaces. Existing EJB 2.x stateful
165 session beans may however rely on the use of home interface Create<METHOD> methods for
166 initialization. In order to accommodate the use of the home interface for stateful session beans,
167 the following rules apply:

- 168 • Methods offered by the reference interface that are of the form create<METHOD>(<arg>*)
169 and that do not match any method on the EJB local or remote business interface, according
170 to the rules above, but do match a create<METHOD> method on the bean’s corresponding
171 local or remote home interface are mapped to that matching home interface method. This
172 mapping ignores javax.ejb.CreateExceptions.
- 173 • A call to such a method on a given service reference starts an SCA conversation and creates
174 a new session object for the stateful session bean by forwarding the call to the mapped home
175 interface create<METHOD> method.

176 See also the section [Conversational Service of a Stateful Session Bean](#) for more details on
177 conversations over stateful session beans via the EJB binding.

178 4 Reference Binding

179 When used on a reference, the EJB binding specifies the means for connecting an SCA component
180 to a previously deployed or co-deployed session bean.

181 The reference interface used with the EJB binding can be either a remote or local session bean
182 interface. SCA deployment logic and the binding implementation will introspect the reference
183 interface class to determine whether it is local or remote. If an SCA component needs to access
184 both the local and remote interface of a session bean, then this should be modeled in SCA
185 assembly through two references, one with the local interface and one with the remote interface.

186 The `/binding.ejb/@ejb-link-name` and `/binding.ejb/@uri` attributes are mutually exclusive
187 when used on an SCA reference because they represent alternate ways to provide the same
188 configuration.

189

190 The following example shows a reference binding using a corbaname URI:

191

```
192 <reference name="CandidateCheck">  
193     <interface.java interface="com.app.jobbank.CandidateCheck"/>  
194     <binding.ejb uri="corbaname:rir:#ejb/CandidateCheckHome"/>  
195 </reference >
```

196

197 The specific `uri` would be supplied prior to the completion of deployment.

198 The following example is a reference binding using an ejb-link.

199

```
200 <reference name="CandidateCheck">  
201     <interface.java interface="com.app.jobbank.CandidateChk"/>  
202     <binding.ejb ejb-link-name="candidateEJB.jar#CandidateChk"/>  
203 </reference >
```

204 4.1 Conversational Nature of Stateful Session Beans

205 Stateful session beans fit nicely into the SCA concept of a conversation (see SCA Assembly
206 Specification [4]). This section defines the rules for mapping Stateful Session beans to SCA
207 conversations.

208 **When using an EJB 3 client view, the following rules apply:**

- 209 • If there is no ongoing conversation, any call to a business method of the reference
210 interface creates a new session object (see [2]) for the bean and associates it with the
211 newly created SCA conversation.
- 212 • When the SCA conversation with a stateful session bean ends, for example as a result of a
213 call to `CallableReference.getConversation().end()`, the associated session object will be
214 removed.
- 215 • In order to assure the prompt release of resources associated with the referenced session
216 bean, clients are responsible for signaling the end of the conversation by calling a method
217 that maps to a method marked with the `@Remove` annotation in the session bean's
218 implementation class. Calls to `CallableReference.getConversation().end()` can at most
219 release resources associated with the binding itself, and are not responsible for ending the
220 EJB conversation.

221 **When using the EJB 2.x client view, the following rules apply:**

- 222
- 223
- To start a conversation, the create<METHOD> mapping, as described in [Interface Mapping](#) section, serves as starting point of an SCA conversation.
 - Calling a business method before initializing the conversation will raise an `IllegalStateException`. Similarly, a call to a reference interface method that was matched against an EJB create<METHOD> method during an ongoing conversation will raise an `IllegalStateException`.
 - When the SCA conversation with a stateful session bean ends, for example as a result of a call to `ServiceReference.endSession()`, the associated session object will be removed by calling the EJB Home `remove()` method.
- 224
- 225
- 226
- 227
- 228
- 229
- 230

231 **4.2 Exception Handling**

232 Exception handling for conversations with session beans has been specified in chapter 13 of the
233 EJB 3 specification [2] and in Chapter 18 of the EJB 2.1 specification [2]. The reference binding for
234 session beans can be imagined to consist of two consecutive invocation paths:

- 235
1. SCA business interface to EJB business interface (if different)
 2. EJB Business interface to session bean instance
- 236

237 For the second invocation path, the rules laid out in the EJB specification apply. For the first
238 invocation path, the following rules apply:

- 239
1. any business exception (see [3]) will be re-thrown by the binding implementation while keeping the current conversation ongoing.
 2. any other exception will be wrapped in a `ServiceRuntimeException` which will be thrown by the binding implementation. Any ongoing conversation will be terminated.
- 240
- 241
- 242

243 **5 Packaging**

244 There is no requirement to package the session bean home interface or client stubs with an SCA
245 component that uses the Session bean binding. The Sesseion Bean binding implementation should
246 be able to dynamically lookup, create and invoke the bean without the usual EJB client classes.

247 6 Service Binding

248 When used on an SCA service, the EJB SCA binding causes the service to be exposed as a session
249 bean. This enables a client that is using the EJB programming model to call the SCA service using
250 its native programming model.

251 The `/binding.ejb/@homeInterface` attribute is used to indicate the Session Home interface that
252 an EJB client will use to bootstrap itself with the SCA service, just as it would with any other
253 session bean. The current specification allows for home interfaces that have exactly one
254 `create<METHOD>` with no arguments.

255 The following is an example of a service using the EJB binding.

```
256  
257 <service name="JobBank">  
258     <interface.java interface="com.app.jobbank.JobBankService"/>  
259     <binding.ejb  
260         uri="corbaname:rir:#ejb/JobBankServiceHome"  
261         homeInterface="com.app.jobbank.JobBankServiceHome"  
262         ejb-link-name="jobbankEJB.jar#JobBankComponent"/>  
263 </service>
```

264 A corresponding local home interface `com.app.jobbank.JobBankServiceHome` looks like this:

```
265  
266 package com.app.jobbank;  
267  
268 import javax.ejb.CreateException;  
269 import javax.ejb.EJBLocalHome;  
270  
271 public interface JobBankServiceHome extends EJBLocalHome {  
272     JobBankService create() throws CreateException;  
273 }  
274
```

275 Similarly, the remote home interface can be formulated by extending `javax.ejb.EJBHome` and
276 making sure to declare a `RemoteException`:

```
277  
278 package com.app.jobbank;  
279  
280 import java.rmi.RemoteException;  
281 import javax.ejb.CreateException;  
282 import javax.ejb.EJBHome;  
283  
284 public interface JobBankServiceHome extends EJBHome {  
285     JobBankService create() throws CreateException, RemoteException;  
286 }  
287
```

288 In the `corbaname` used in this example, the first part of the URI (up to the `#`) would logically be
289 supplied by the target deployment environment. See [4] for a discussion of base URIs provided

290 by an SCA domain configuration. The remainder of the name would be provided prior to
291 completion of deployment. The example above shows the URI that a client would use after
292 deployment. Prior to deployment, it should be possible for an assembler or developer to specify
293 only the last portion of the URI (i.e. everything following the #).

294 The service interface used with the EJB binding can be either a remote or local session bean
295 interface. SCA deployment logic and the binding implementation will introspect the interface class
296 to determine whether it is local or remote. If an SCA component needs to be exposed as both a
297 local and remote session bean, then this should be modeled in SCA assembly through two
298 services, one with the local interface and one with the remote interface.

299 When used on a service binding, **ejb-link-name** and **uri** are NOT mutually exclusive. They each
300 provide a means for wiring to the SCA service depending on the locality of the client EJB
301 reference. For example, an SCA service packaged with an JEE EJB application could be exposed for
302 consumption by local EJB clients (using the **ejb-link-name** element) and remote EJB clients (using
303 the **uri**).

304 The service interface used with the EJB binding can be conversational. If so, the SCA service will
305 be exposed by a stateful session bean contract, so that EJB clients will be able to maintain
306 conversations across multiple method invocations, according to the EJB specification.

307 In that case, the creation of a Session Object (see [2]) marks the start of the conversation with
308 the SCA service and the removal of the Session Object marks the end the conversation.

309 If the service interface is not conversational, the SCA service will be exposed by the stateless
310 session bean contract, according to the EJB specification. In particular, there will be no
311 conversational service exposure, but instead, every stateless bean method invocation corresponds
312 to a non-conversational SCA service method invocation.

313 From the perspective of an EJB client (local and remote), SCA services that are exposed as session
314 beans (stateful or stateless) are not distinguishable from ordinary session beans.

315 Specifically, this means that a local client will be able to reference the SCA service as a session
316 bean using **ejb-(local)-ref** declarations in the appropriate locations and by issuing JNDI lookups or
317 relying on dependency injection mechanisms. If the service is exposed as EJB 2.x session bean, by
318 virtue of a home interface specification, the client needs to be aware of the EJB 2.x home interface
319 contract.

320 Similarly remote EJB clients are expected to be able to consume SCA services that are exposed as
321 session beans just as they are able to consume ordinary session beans.

322 6.1 Handling methods from EJBObject and EJBLocalObject

323 This section describes the behavior of the methods that EJB 2.X service bindings inherit from the
324 EJBObject and EJBLocalObject interfaces.

325

Method	Behavior
Remove	For conversational services, this is functionally equivalent to a call to <code>ServiceReference.destroy</code> . Any resources associated with the binding, and the component to which it promotes are released. For non-conversational services, this is a no-op.
getPrimaryKey	Throws an <code>EJBException</code>
isIdentical	Tests whether the service component, to which the binding of the current promotes, is the same instance as the one to which the specified object promotes.
getEJB(Local)Home	Returns an implementation of the interface

	specified as <i>/binding.ejb/@homeInterface</i> . The instance may be used to create or remove bean instances.
--	--

326

327

328

329 A. Use cases

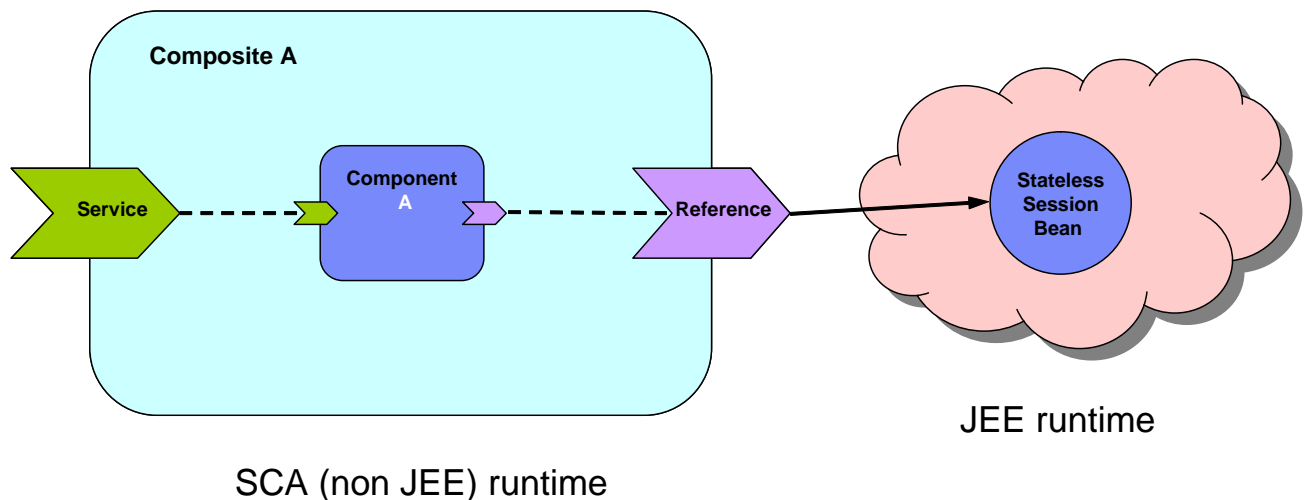

330 The following use cases provide some examples of the usage of the SCA EJBSessionBean binding.

331 A.1 Consuming an Existing EJB SOA Service

332 An SCA service is developed that needs to call a business service which is already deployed and
333 running in a Java EE server. The SCA service will be deployed into an SCA runtime somewhere in
334 the enterprise that is not necessarily a Java EE runtime. The business service was implemented
335 as a session bean. The SCA service defines a reference to the business service, and the deployer
336 attaches an EJB binding to the reference. In this use case, the EJB remote interface is the
337 business interface.

338

339

340

341 *Figure 2: SCA Reference invoking EJB Session Bean*

342

343 The reference in the deployed sca.composite file looks like this:

344

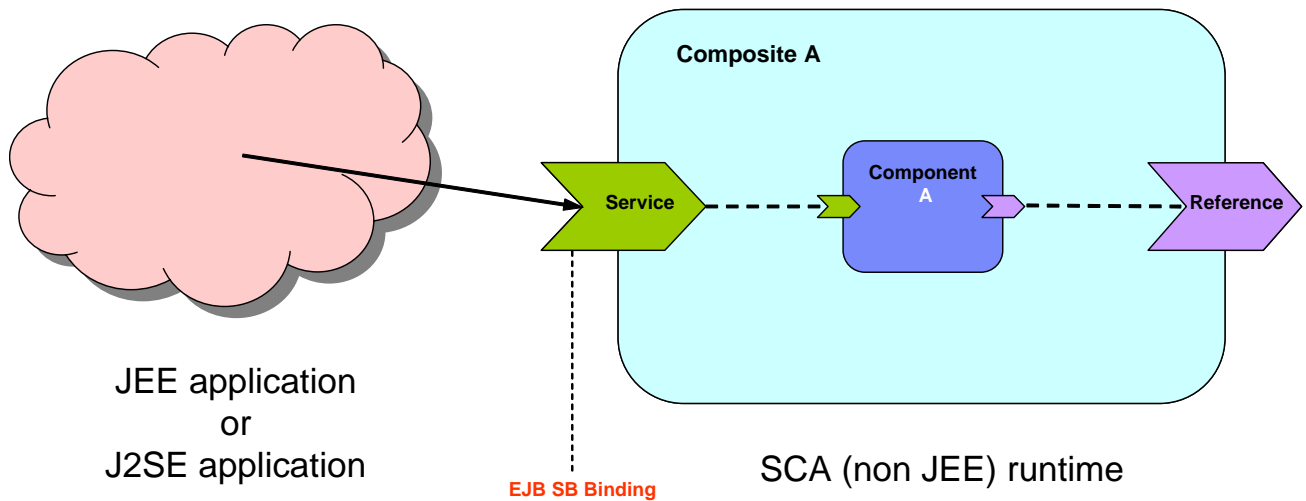

```
345 <reference name="CandidateCheck">  
346   <interface.java interface="com.app.jobbank.CandidateChk"/>  
347   <binding.ejb uri="corbaname:rir:#ejb/CandidateChkHome"/>  
348 </reference >
```

349 A.2 Exposing an SCA Service with an EJB SCA Binding

350 An SCA service is developed that will be called from a Java EE environment. The Java EE
351 programmer doesn't know the SCA programming model and therefore wants to use the Java EE
352 programming model that he knows in order to invoke the SCA service (i.e. new initialContext(),
353 nc.lookup(), etc.). In this case, the SCA service has to be deployed into a runtime that is capable
354 of supporting the EJB binding. Note that deployment of this service can result in the generation
355 and deployment of a session bean, along with its home interface. This aspect is significantly
356 different from the previous use case.

357

358
359

360

361 *Figure 3: SCA Service accessed as an EJB Session Bean*

362

363 Since the client will use the standard Java EE programming model, the client needs to know the
364 home interface of the SCA service. The service in the `sca.composite` file will look like this:

365

```
366 <service name="CompanyInfo">  
367   <interface.java interface="com.app.jobbank.CompanyInfo"/>  
368   <binding.ejb uri="corbaname:rir:#ejb/CompanyInfoHome"  
369     homeInterface="com.app.jobbank.CompanyInfoHome"  
370     ejb-version="EJB2"/>  
371   <reference>CompanyInfoComponent/CompanyInfo</reference>  
372 </service>
```

373

374 The client code as per the standard Java EE programming model looks like this:

375

```
376 Context initialContext = new InitialContext(env);  
377 CompanyInfoHome companyInfoHome= (CompanyInfoHome)  
378     initialContext.lookup("corbaname:rir:#ejb/CompanyInfoHome");  
379  
380 CompanyInfo companyInfo = companyInfoHome.create();  
381 companyInfo.getCompanyInfo("ACME Corp");
```

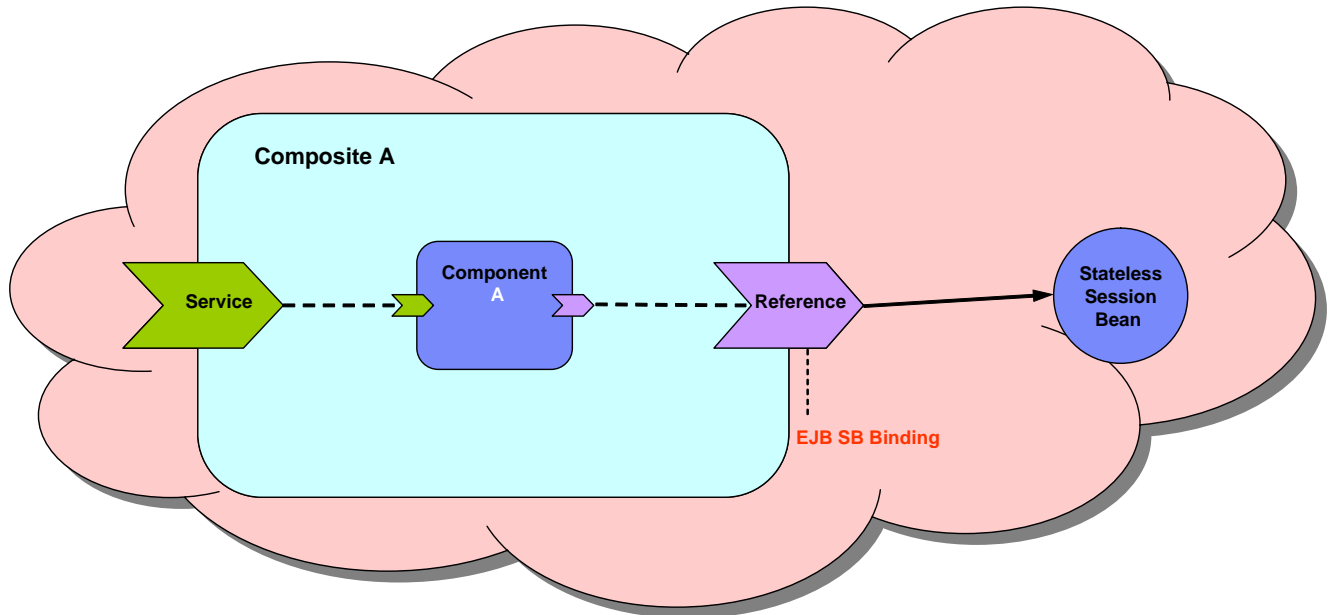

382 **A.3 Consuming Existing Local EJB SOA Services**

383

384 This use case is similar to the use case in section A.1, except that the SCA service is going to be
385 deployed into a Java EE capable JVM, and it is the same JVM as the EJB service. In this use case,
386 the EJB's local interface is used as the business interface.

387
388
389
390
391
392

Note that the SCA client could also use the EJB remote interface. If an SCA component wanted to access both the local and remote interface, then it would declare 2 references (one with the local interface, one with the remote interface).

Hybrid SCA/JEE runtime – all in one JVM

Figure 4: SCA reference consuming a Local EJB service

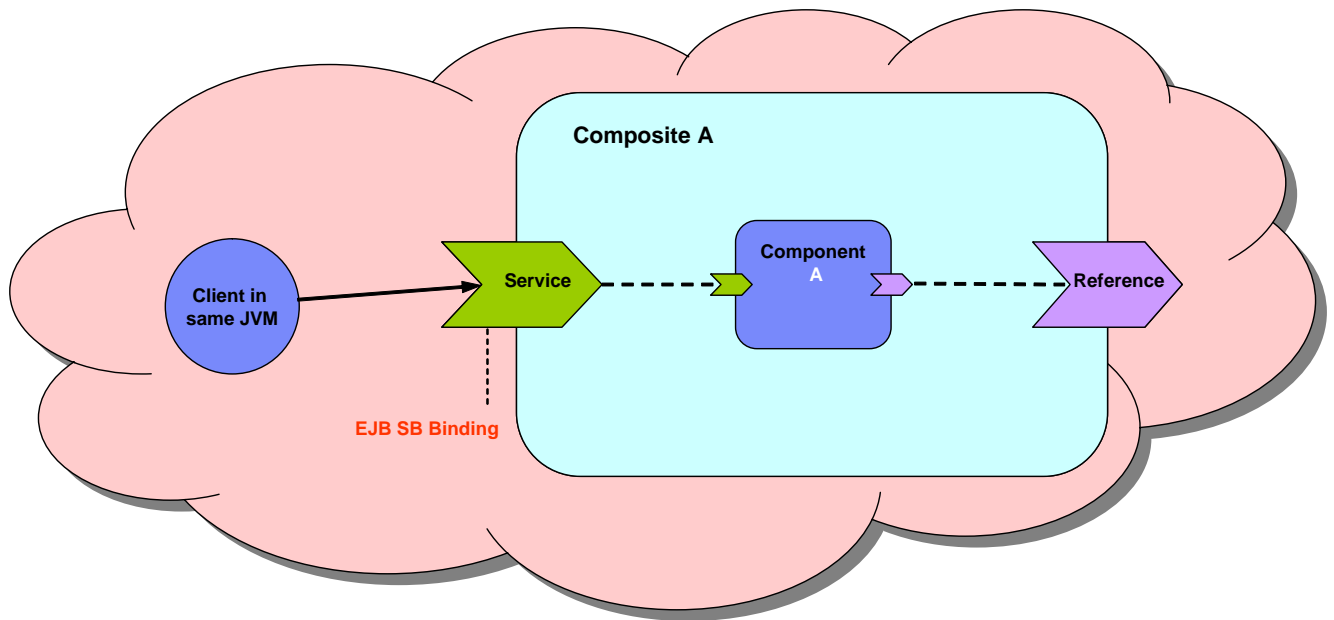

The example below shows the usage of a local interface in the reference definition.

```
<reference name="CandidateCheck">  
  <interface.java interface="com.app.jobbank.CandidateCheckLocal"/>  
  <binding.ejb  
    uri="corbaname:rir:#ejb/CandidateCheckHome"/>  
</reference>
```

405
406
407
408
409
410

A.4 Exposing an SCA Service with a Local SLSB SCA Binding

This use case is similar to the use case in section A.2, except that the SCA service is going to be deployed into the same JVM as the client. This use case allows for the possibility that the SCA service is exposed as a local EJB interface. Note that deployment of this service will effectively result in the generation and deployment of a session bean with a local interface and a local home interface.

Hybrid SCA/JEE runtime – all in one JVM

411

412 *Figure 5: SCA Service exposed as a Local session bean*

413

414 The following is an example:

415

```
416 <service name="CompanyInfo">
417   <interface.java interface="com.app.jobbank.CompanyInfoLocal" />
418   <binding.ejb uri="corbaname:rir#ejb/CompanyInfoHome"
419     homeInterface="com.app.jobbank.CompanyInfoLocalHome" />
420   <reference>CompanyInfoComponent/CompanyInfo</reference>
421 </service>
```

422 A.5 Consuming an EJB Service inside a Java EE EAR file

423 This use case is similar to sections A.1 and A.3, except that the SCA service is going to be
 424 packaged inside a Java EE EAR file. By packaging it in this way, the SCA reference binding can be
 425 configured as if it were an <ejb-ref> with the <ejb-link> subelement.

426 The following is an example of the SCA reference binding.

427

```
428 <reference name="CandidateCheck">
429   <interface.java interface="com.app.jobbank.CandidateChk" />
430   <binding.ejb ejb-link-name="candidateEJB.jar#CandidateChk" />
431 </reference >
```

432

433 The following is an <ejb-ref/> snippet that is functionally equivalent to the SCA reference above.

434

```
435 <ejb-ref>
436   <ejb-ref-name>CandidateCheck</ejb-ref-name>
```

```

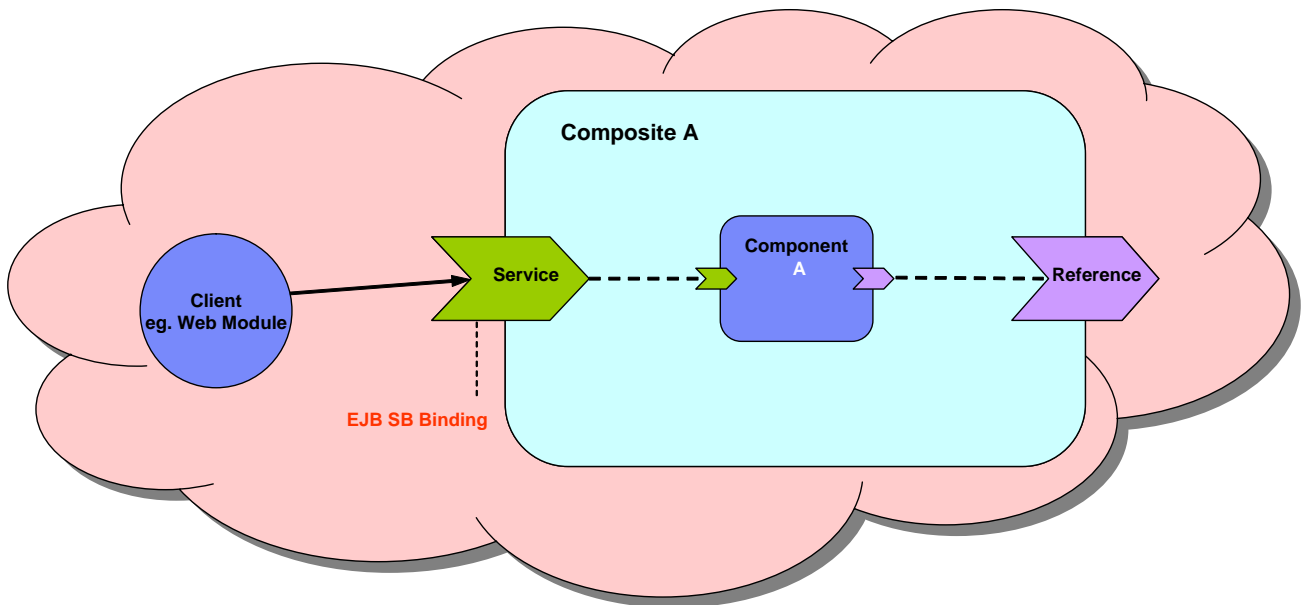

437 <ejb-ref-type>Session</ejb-ref-type>
438 <home>com.app.jobbank.CandidateChkHome</home>
439 <remote>com.app.jobbank.CandidateChk</remote>
440 <ejb-link>candidateEJB.jar#CandidateChk</ejb-link>
441 </ejb-ref>

```

442 A.6 Exposing an SCA Service inside a Java EE EAR file

443 This use case is similar to sections A.2 and A.4, except that the SCA service is going to be
 444 deployed inside a Java EE EAR file so that it can be referenced by an EJB client, using the EJB
 445 assembly model.

446
 447

448 Caller and SCA Composite within one EAR file

449 *Figure 6: SCA Service with client within one EAR file*

450

451 The following is an example of the SCA service binding.

452

```

453 <service name="CompanyInfo">
454 <interface.java interface="com.app.jobbank.CompanyInfo"/>
455 <binding.ejb
456 <homeInterface="com.app.jobbank.CompanyInfoHome"
457 <ejb-link-name="companyInfoEJB.jar#CompanyInfoComponent"/>
458 <reference>CompanyInfoComponent/CompanyInfo</reference>
459 </service>

```

460

461 The following is an example of an EJB deployment descriptor created by the client that is wired to
 462 the SCA Service binding.

```
463
464     <ejb-ref>
465         <ejb-ref-name>ejb/CompanyInfo</ejb-ref-name>
466         <ejb-ref-type>Session</ejb-ref-type>
467         <home>com.app.jobbank.CompanyInfoHome</home>
468         <remote>com.app.jobbank.CompanyInfo</remote>
469         <ejb-link>companyInfoEJB.jar#CompanyInfoComponent</ejb-link>
470     </ejb-ref>
```

471

472 Note: There is a variant of this use case that should be considered. If the SCA service is in the
473 same EJB module as the client, then the ejb-link specified by the client does not have to include
474 the EJB module jar name.

475

476

B. EJB binding schema

```
477 <schema xmlns="http://www.w3.org/2001/XMLSchema"
478         xmlns:sca="http://www.oesa.org/xmlns/sca/1.0"
