1 Introduction

The capture and expression of non-functional requirements is an important aspect of service definition and has an impact on SCA throughout the lifecycle of components and compositions. SCA provides a framework to support specification of constraints, capabilities and QoS expectations from component design through to concrete deployment. This specification describes the framework and its usage.

Specifically, this section describes the SCA policy association framework that allows policies and policy subjects specified using [WS-Policy](#) [WS-Policy] and ~~WS-PolicyAttachment~~ [WS-\[WS-PolicyAttach\]](#), as well as with other policy languages, to be associated with SCA components.

This document should be read in conjunction with the [SCA Assembly Specification](#) [SCA-Assembly]. Details of policies for specific policy domains can be found in sections 7, 8 and 9.

1.1 Terminology

The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described in [\[RFC2119\]](#).

1.2 XML Namespaces

Prefixes and Namespaces used in this Specification

Prefix	XML Namespace	Specification
sca	<code>docs.oasis-open.org/ns/opencsa/sca/200903</code> This is assumed to be the default namespace in this specification. xs:QNames that appear without a prefix are from the SCA namespace.	[SCA-Assembly]
acme	Some namespace; a generic prefix	
wsp	<code>http://www.w3.org/2006/07/ws-policy</code>	[WS-Policy]

55 1.4 Naming Conventions

56 This specification follows some naming conventions for artifacts defined by the specification, as follows:

- 57 • For the names of elements and the names of attributes within XSD files, the names follow the
58 CamelCase convention, with all names starting with a lower case letter, e.g. <element
59 name="policySet" type="..."/>.
- 60 • For the names of types within XSD files, the names follow the CamelCase convention with all names
61 starting with an upper case letter, e.g. <complexType name="PolicySet">.
- 62 • For the names of intents, the names follow the CamelCase convention, with all names starting with a
63 lower case letter, EXCEPT for cases where the intent represents an established acronym, in which
64 case the entire name is in upper case. An example of an intent which is an acronym is the "SOAP"
65 intent.

66 2 Overview

67 2.1 Policies and PolicySets

68 The term **Policy** is used to describe some capability or constraint that can be applied to service
69 components or to the interactions between service components represented by services and references.
70 An example of a policy is that messages exchanged between a service client and a service provider have
71 to be encrypted, so that the exchange is confidential and cannot be read by someone who intercepts the
72 messages.

73 In SCA, services and references can have policies applied to them that affect the form of the interaction
74 that takes place at runtime. These are called **interaction policies**.

75 Service components can also have other policies applied to them, which affect how the components
76 themselves behave within their runtime container. These are called **implementation policies**.

77 How particular policies are provided varies depending on the type of runtime container for implementation
78 policies and on the binding type for interaction policies. Some policies can be provided as an inherent part
79 of the container or of the binding – for example a binding using the https protocol will always provide
80 encryption of the messages flowing between a reference and a service. Other policies can optionally be
81 provided by a container or by a binding. It is also possible that some kinds of container or kinds of binding
82 are incapable of providing a particular policy at all.

83 In SCA, policies are held in **policySets**, which can contain one or many policies, expressed in some
84 concrete form, such as WS-Policy assertions. Each policySet targets a specific binding type or a specific
85 implementation type. PolicySets are used to apply particular policies to a component or to the binding of a
86 service or reference, through configuration information attached to a component or attached to a
87 composite.

88 For example, a service can have a policy applied that requires all interactions (messages) with the service
89 to be encrypted. A reference which is wired to that service needs to support sending and receiving
90 messages using the specified encryption technology if it is going to use the service successfully.

91 In summary, a service presents a set of interaction policies, which it requires the references to use. In
92 turn, each reference has a set of policies, which define how it is capable of interacting with any service to
93 which it is wired. An implementation or component can describe its requirements through a set of
94 attached implementation policies.

95 2.2 Intents describe the requirements of Components, Services and 96 References

97 SCA **intents** are used to describe the abstract policy requirements of a component or the requirements of
98 interactions between components represented by services and references. Intents provide a means for
99 the developer and the assembler to state these requirements in a high-level abstract form, independent of
100 the detailed configuration of the runtime and bindings, which involve the role of application deployer.
101 Intents support late binding of services and references to particular SCA bindings, since they assist the
102 deployer in choosing appropriate bindings and concrete policies which satisfy the abstract requirements
103 expressed by the intents.

104 It is possible in SCA to attach policies to a service, to a reference or to a component at any time during
105 the creation of an assembly, through the configuration of bindings and the attachment of policy sets.
106 Attachment can be done by the developer of a component at the time when the component is written or it
107 can be done later by the deployer at deployment time. SCA recommends a late binding model where the
108 bindings and the concrete policies for a particular assembly are decided at deployment time.

109 SCA favors the late binding approach since it promotes re-use of components. It allows the use of
110 components in new application contexts, which might require the use of different bindings and different

111 concrete policies. Forcing early decisions on which bindings and policies to use is likely to limit re-use and
112 limit the ability to use a component in a new context.

113 For example, in the case of authentication, a service which requires the client to be authenticated can be
114 marked with an intent called "**clientAuthentication**". This intent marks the service as requiring the client
115 to be authenticated without being prescriptive about how it is achieved. At deployment time, when the
116 binding is chosen for the service (say SOAP over HTTP), the deployer can apply suitable policies to the
117 service which provide aspects of WS-Security and which supply a group of one or more authentication
118 technologies.

119 In many ways, intents can be seen as restricting choices at deployment time. If a service is marked with
120 the **confidentiality** intent, then the deployer has to use a binding and a policySet that provides for the
121 encryption of the messages.

122 The set of intents available to developers and assemblers can be extended by policy administrators. The
123 SCA Policy Framework specification does define a set of intents which address the infrastructure
124 capabilities relating to security, transactions and reliable messaging.

125 **2.3 Determining which policies apply to a particular wire**

126 Multiple policies can be attached to both services and to references. Where there are multiple policies,
127 they can be organized into policy domains, where each domain deals with some particular aspect of the
128 interaction. An example of a policy domain is confidentiality, which covers the encryption of messages
129 sent between a reference and a service. Each policy domain can have one or more policy. Where
130 multiple policies are present for a particular domain, they represent alternative ways of meeting the
131 requirements for that domain. For example, in the case of message integrity, there could be a set of
132 policies, where each one deals with a particular security token to be used: e.g. X509, SAML, Kerberos.
133 Any one of the tokens can be used - they will all ensure that the overall goal of message integrity is
134 achieved.

135 In order for a service to be accessed by a wide range of clients, it is good practice for the service to
136 support multiple alternative policies within a particular domain. So, if a service requires message
137 confidentiality, instead of insisting on one specific encryption technology, the service can have a policySet
138 which has a number of alternative encryption technologies, any of which are acceptable to the service.
139 Equally, a reference can have a policySet attached which defines the range of encryption technologies
140 which it is capable of using. Typically, the set of policies used for a given domain will reflect the
141 capabilities of the binding and of the runtime being used for the service and for the reference.

142 When a service and a reference are wired together, the policies declared by the policySets at each end of
143 the wire are matched to each other. SCA does not define how policy matching is done, but instead
144 delegates this to the policy language (e.g. WS-Policy) used for the binding. For example, where WS-
145 Policy is used as the policy language, the matching procedure looks at each domain in turn within the
146 policy sets and looks for 1 or more policies which are in common between the service and the reference.
147 When only one match is found, the matching policy is used. Where multiple matches are found, then the
148 SCA runtime can choose to use any one of the matching policies. No match implies that the configuration
149 is not valid and the deployer needs to take an action.

3 Framework Model

The SCA Policy Framework model is comprised of *intents* and *policySets*. Intents represent abstract assertions and Policy Sets contain concrete policies that can be applied to SCA bindings and implementations. The framework describes how intents are related to policySets. It also describes how intents and policySets are utilized to express the constraints that govern the behavior of SCA bindings and implementations. Both intents and policySets can be used to specify QoS requirements on services and references.

The following section describes the Framework Model and illustrates it using Interaction Policies. Implementation Policies follow the same basic model and are discussed later in section 1.5.

3.1 Intents

As discussed earlier, an *intent* is an abstract assertion about a specific Quality of Service (QoS) characteristic that is expressed independently of any particular implementation technology. An intent is thus used to describe the desired runtime characteristics of an SCA construct. Typically, intents are defined by a policy administrator. See section [Policy Administrator] for a more detailed description of SCA roles with respect to Policy concepts, their definition and their use. The semantics of an intent can not always be available normatively, but could be expressed with documentation that is available and accessible.

For example, an intent named *integrity* can be specified to signify that communications need to be protected from possible tampering. This specific intent can be declared as a requirement by some SCA artifacts, e.g. a reference. Note that this intent can be satisfied by a variety of bindings and with many different ways of configuring those bindings. Thus, the reference where the intent is expressed as a requirement could eventually be wired using either a web service binding (SOAP over HTTP) or with an EJB binding that communicates with an EJB via RMI/IIOP.

Intents can be used to express requirements for *interaction policies* or *implementation policies*. The *integrity* intent in the above example is used to express a requirement for an interaction policy. Interaction policies are, typically, applied to a *service* or *reference*. They are meant to govern the communication between a client and a service provider. Intents can also be applied to SCA component implementations as requirements for *implementation policies*. These intents specify the qualities of service that need to be provided by a container as it runs the component. An example of such an intent could be a requirement that the component needs to run in a transaction.

If the configured instance of a binding is in conflict with the intents and policy sets selected for that instance, the SCA runtime MUST raise an error. If the configured instance of a binding is in conflict with the intents and policy sets selected for that instance, the SCA runtime MUST raise an error. [POL30001].

For example, a web service binding which requires the SOAP intent but which points to a WSDL binding that does not specify SOAP.

For convenience and conciseness, it is often desirable to declare a single, higher-level intent to denote a requirement that could be satisfied by one of a number of lower-level intents. For example, the *confidentiality* intent requires either message-level encryption or transport-level encryption.

Both of these are abstract intents because the representation of the configuration necessary to realize these two kinds of encryption could vary from binding to binding, and each would also require additional parameters for configuration.

An intent that can be completely satisfied by one of a choice of lower-level intents is referred to as a *qualifiable intent*. In order to express such intents, the intent name can contain a qualifier: a "." followed by a *xs:string* name. An intent name that includes a qualifier in its name is referred to as a *qualified intent*, because it is "qualifying" how the qualifiable intent is satisfied. A qualified intent can only qualify one qualifiable intent, so the name of the qualified intent includes the name of the qualifiable intent as a prefix, for example, *clientAuthentication.message*.

198 In general, SCA allows the developer or assembler to attach multiple qualifiers for a single
199 qualifiable intent to the same SCA construct. However, domain-specific constraints can prevent the use of
200 some combinations of qualifiers (from the same qualifiable intent).
201 Intents, their qualifiers and their defaults are defined using the pseudo schema in Snippet 3-1:

202

```
203 <intent name="xs:NCName"  
204     constrains="list of QName"?  
205     requires="list of QName"?  
206     excludes="list of QName"?  
207     mutuallyExclusive="boolean"?  
208     intentType="xs:string"? >  
209   <description> xs:string.</description?>  
210   <qualifier name="xs:string" default="xs:boolean" ?>*</qualifier>  
211   <description> xs:string.</description?>  
212 </intent>
```

214 *Snippet 3-1: intent Pseudo-Schema*

215

216 Where the intent element has the following attributes:

- 217 • @name (1..1) - an NCName that defines the name of the intent. **The QName for an intent MUST be**
218 **unique amongst the set of intents in the SCA Domain. The QName for an intent MUST be unique**
219 **amongst the set of intents in the SCA Domain.** [POL30002]
- 220 • @constrains (0..1) - a list of QNames that specifies the SCA constructs that this intent is meant to
221 configure. If a value is not specified for this attribute then the intent can apply to any SCA element.
222 Note that the "constrains" attribute can name an abstract element type, such as sca:binding in our
223 running example. This means that it will match against any binding used within an SCA composite
224 file. An SCA element can match @constrains if its type is in a substitution group.
- 225 • @requires (0..1) - contains a list of QNames of intents which defines the set of all intents that the
226 referring intent requires. In essence, the referring intent requires all the intents named to be satisfied.
227 This attribute is used to compose an intent from a set of other intents. **Each QName in the @requires**
228 **attribute MUST be the QName of an intent in the SCA Domain. Each QName in the @requires**
229 **attribute MUST be the QName of an intent in the SCA Domain.** [POL30015] This use is further
230 described in [Section 3.3](#).
- 231 • @excludes (0..1) - a list of QNames of intents that cannot be used with this intent. Intents might
232 describe a policy that is incompatible or otherwise unrealizable when specified with other intents, and
233 therefore are considered to be mutually exclusive. **Each QName in the @excludes attribute MUST be**
234 **the QName of an intent in the SCA Domain.** [POL30016]

235 Two intents are mutually exclusive when any of the following are true:

- 236 – One of the two intents lists the other intent in its @excludes list.
- 237 – Both intents list the other intent in their respective @excludes list.

238 Where one intent is attached to an element of an SCA composite and another intent is attached to
239 one of the element's parents, the intent(s) that are effectively attached to the element differs
240 depending on whether the two intents are mutually exclusive (see @excludes above and section 4.5 -
241 [Attaching intents Usage of @requires attribute for specifying intents](#)).

- 242 • @mutuallyExclusive (0..1) - a boolean with a default of "false". If this attribute is present and has a
243 value of "true" it indicates that the qualified intents defined for this intent are mutually exclusive.
- 244 • @intentType attribute (0..1) defines whether the intent is an interaction intent or an implementation
245 intent. A value of "interaction", which is the default value, indicates that the intent is an interaction
246 intent. A value of "implementation" indicates that the intent is an implementation intent.

247 One or more <qualifier> child elements can be used to define qualifiers for the intent. The attributes of
248 the qualifier element are:

- 249 • @name (1..1) - declares the name of the qualifier. **The name of each qualifier MUST be unique within**
250 **the intent definition. The name of each qualifier MUST be unique within the intent definition.**
251 **[POL30005].**
- 252 • @default (0..1) - a boolean value with a default value of "false". If @default="true" the particular
253 qualifier is the default qualifier for the intent. **If an intent has more than one qualifier, one and only**
254 **one MUST be declared as the default qualifier. If an intent has more than one qualifier, one and only**
255 **one MUST be declared as the default qualifier. [POL30004]. If only one qualifier for an intent is given**
256 **it MUST be used as the default qualifier for the intent. If only one qualifier for an intent is given it**
257 **MUST be used as the default qualifier for the intent. [POL30025]**
- 258 • qualifier/description (0..1) - an xs:string that holds a textual description of the qualifier.

259 For example, the **confidentiality** intent which has qualified intents called
260 **confidentiality.transport** and **confidentiality.message** can be defined as:

261

```
262 <intent name="confidentiality" constrains="sca:binding">  
263   <description>  
264     Communication through this binding must prevent  
265     unauthorized users from reading the messages.  
266   </description>  
267   <qualifier name="transport">  
268     <description>Automatic encryption by transport  
269   </description>  
270   </qualifier>  
271   <qualifier name="message" default='true'>  
272     <description>Encryption applied to each message  
273   </description>  
274   </qualifier>  
275 </intent>
```

276 *Snippet 3-2: Example intent Definition*

277

278 All the intents in a SCA Domain are defined in a global, domain-wide file named definitions.xml. Details
279 of this file are described in the [SCA Assembly Model](#) [SCA-Assembly].

280 SCA normatively defines a set of core intents that all SCA implementations are expected to support, to
281 ensure a minimum level of portability. Users of SCA can define new intents, or extend the qualifier set of
282 existing intents. **An SCA Runtime MUST include in the Domain the set of intent definitions contained in**
283 **the Policy_Intents_Definitions.xml described in the appendix "Intent Definitions" of the SCA Policy**
284 **specification. An SCA Runtime MUST include in the Domain the set of intent definitions contained in the**
285 **Policy_Intents_Definitions.xml described in the appendix "Intent Definitions" of the SCA Policy**
286 **specification; [POL30024]** It is also good practice for the Domain to include concrete policies which satisfy
287 these intents (this may be achieved through the provision of appropriate binding types and
288 implementation types, augmented by policy sets that apply to those binding types and implementation
289 types).

290 3.2 Interaction Intents and Implementation Intents

291 An interaction intent is an intent designed to influence policy which applies to a service, a reference and
292 the wires that connect them. Interaction intents affect wire matching between the two ends of a wire
293 and/or the set of bytes that flow between the reference and the service when a service invocation takes
294 place.

295 Interaction intents typically apply to <binding/> elements.

296 An implementation intent is an intent designed to influence policy which applies to an implementation
297 artifact or to the relationship of that artifact to the runtime code which is used to execute the artifact.

298 Implementation intents do not affect wire matching between references and services, nor do they affect
299 the bytes that flow between a reference and a service.
300 Implementation intents often apply to <implementation/> elements, but they can also apply to <binding/>
301 elements, where the desire is to influence the activity of the binding implementation code and how it
302 interacts with the remainder of the runtime code for the implementation.
303 Interaction intents and implementation intents are distinguished by the value of the @intentType attribute
304 in the intent definition.

305 3.3 Profile Intents

306 An intent that is satisfied only by satisfying *all* of a set of other intents is called a **profile intent**. It can be
307 used in the same way as any other intent.

308 The presence of @requires attribute in the intent definition signifies that this is a profile intent. The
309 @requires attribute can include all kinds of intents, including qualified intents and other profile intents.
310 However, while a profile intent can include qualified intents, it cannot be a qualified intent. Thus, **the**
311 **name of a profile intent MUST NOT have a "." in it, the name of a profile intent MUST NOT have a "." in it.**
312 [POL30006]

313 Requiring a profile intent is semantically identical to requiring the list of intents that are listed in its
314 @requires attribute. **If a profile intent is attached to an artifact, all the intents listed in its @requires**
315 **attribute MUST be satisfied as described in section 4.12. If a profile intent is attached to an artifact, all the**
316 **intents listed in its @requires attribute MUST be satisfied as described in section 4.12.** [POL30007]

317 An example of a profile intent is an intent called **messageProtection** which is a shortcut for specifying
318 both **confidentiality** and **integrity**, where **integrity** means to protect against modification, usually by
319 signing. The intent definition is shown in Snippet 3-3:

```
320  
321 <intent name="messageProtection"  
322   constrains="sca:binding"  
323   requires="confidentiality integrity">  
324   <description>  
325     Protect messages from unauthorized reading or modification.  
326   </description>  
327 </intent>
```

328 *Snippet 3-3: Example Profile Intent*

329 3.4 PolicySets

330 A **policySet** element is used to define a set of concrete policies that apply to some binding type or
331 implementation type, and which correspond to a set of intents provided by the policySet.

332 The pseudo schema for policySet is shown in Snippet 3-4:

```
333  
334 <policySet name="NCName"  
335   provides="listOfQNames"?  
336   appliesTo="xs:string"?  
337   attachTo="xs:string"?  
338   xmlns=http://docs.oasis-open.org/ns/opencsa/sca/200903  
339   xmlns:wsp="http://schemas.xmlsoap.org/ws/2004/09/policy">  
340   <policySetReference name="xs:QName"/>*  
341   <intentMap/>*<br>  
342   <xs:any>*<br>  
343 </policySet>
```

344 *Snippet 3-4: policySet Pseudo-Schema*

345

346 PolicySet has the attributes:

- 347 • @name (1..1) - the name for the policySet. The value of the @name attribute is the local part of a
348 QName. **The QName for a policySet MUST be unique amongst the set of policySets in the SCA
349 Domain. The QName for a policySet MUST be unique amongst the set of policySets in the SCA
350 Domain.** [POL30017]

351 @appliesTo (0..1) - a string which is an XPath 1.0 expression identifying one or more SCA constructs
352 this policySet can configure. **The contents of @appliesTo MUST match the XPath 1.0 [XPATH]
353 production Expr. The contents of @appliesTo MUST match the XPath 1.0 [XPATH] production Expr.**
354 [POL30018] The @appliesTo attribute uses the "Infoset for External Attachment" as described in
355 Section 4.4.1 **"The Form of the @attachTo Attribute The Form of the @attachTo Attribute"**.
356 @attachTo (0..1) - a string which is an XPath 1.0 expression identifying one or more elements in the
357 Domain. It is used to declare which set of elements the policySet is actually attached to. **The
358 contents of @attachTo MUST match the XPath 1.0 production Expr.** [POL30019] See the section
359 on **"Attaching Intents and PolicySets to SCA Constructs"** for more details on how this
360 attribute is used.

361 @provides (0..1) - a list of intent QNames (that can be qualified), which declares the intents the
362 PolicySet provides.

Formatted: Font color: Auto

Formatted: Font color: Auto

Formatted: Font: Italic, Font color: Blue

363 PolicySet contains one or more of the element children

- 364 • intentMap element
- 365 • policySetReference element
- 366 • xs:any extensibility element

367 Any mix of the above types of elements, in any number, can be included as children of the policySet
368 element including extensibility elements. There are likely to be many different policy languages for
369 specific binding technologies and domains. In order to allow the inclusion of any policy language within a
370 policySet, the extensibility elements can be from any namespace and can be intermixed.

371 The SCA policy framework expects that **WS-Policy** will be a common policy language for expressing
372 interaction policies, especially for Web Service bindings. Thus a common usecase is to attach WS-
373 Policies directly as children of <policySet> elements; either directly as <wsp:Policy> elements, or as
374 <wsp:PolicyReference> elements or using <wsp:PolicyAttachment>. These three elements, and others,
375 can be attached using the extensibility point provided by the <xs:any> in the pseudo schema above. See
376 example below.

377 For example, the policySet element below declares that it provides
378 **serverAuthentication.message** and **reliability** for the "binding.ws" SCA binding.

```

379 <policySet name="SecureReliablePolicy"
380   provides="serverAuthentication.message exactlyOne"
381   appliesTo="sca:binding.ws"
382   xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200903"
383   xmlns:wsp="http://schemas.xmlsoap.org/ws/2004/09/policy">
384   <wsp:PolicyAttachment>
385     <!-- policy expression and policy subject for
386       "basic server authentication" -->
387     ...
388   </wsp:PolicyAttachment>
389   <wsp:PolicyAttachment>
390     <!-- policy expression and policy subject for
391       "reliability" -->
392     ...
393   </wsp:PolicyAttachment>
394 </policySet>

```

396 *Snippet 3-5: Example policySet Definition*

397
398 PolicySet authors need to be aware of the evaluation of the @appliesTo attribute in order to designate
399 meaningful values for this attribute. Although policySets can be attached to any element in an SCA

400 composite, the applicability of a policySet is not scoped by where it is attached in the SCA framework.
401 Rather, policySets always apply to either binding instances or implementation elements regardless of
402 where they are attached. In this regard, the SCA policy framework does not scope the applicability of the
403 policySet to a specific attachment point in contrast to other frameworks, such as WS-Policy.

404 When computing the policySets that apply to a particular element, the @appliesTo attribute of each
405 relevant policySet is checked against the element. If a policySet that is attached to an ancestor element
406 does not apply to the element in question, it is simply discarded.

407 With this design principle in mind, an XPath expression that is the value of an @appliesTo attribute
408 designates what a policySet applies to. Note that the XPath expression will always be evaluated within
409 the context of an attachment considering elements where binding instances or implementations are
410 allowed to be present. The expression is evaluated against *the parent element of any binding or*
411 *implementation element*. The policySet will apply to any child binding or implementation elements
412 returned from the expression. So, for example, appliesTo="binding.ws" will match any web service
413 binding. If appliesTo="binding.ws[@impl='axis']" then the policySet would apply only to web service
414 bindings that have an @impl attribute with a value of 'axis'.

415 When writing policySets, the author needs to ensure that the policies contained in the policySet always
416 satisfy the intents in the @provides attribute. Specifically, when using [WS-Policy](#) the optional attribute
417 and the exactlyOne operator can result in alternative policies and uncertainty as to whether a particular
418 alternative satisfies the advertised intents.

419 If the WS-Policy attribute optional = 'true' is attached to a policy assertion, it results in two policy
420 alternatives, one that includes and one that does not include the assertion. During wire validation it is
421 impossible to predict which of the two alternatives will be selected -if the absence of the policy assertion
422 does not satisfy the intent, then it is possible that the intent is not actually satisfied when the policySet is
423 used.

424 Similarly, if the WS-Policy operator exactlyOne is used, only one of the set of policy assertions within
425 the operator is actually used at runtime. If the set of assertions is intended to satisfy one or
426 more intents, it is vital to ensure that each policy assertion in the set actually satisfies the
427 intent(s).

428 Note that section 4.10.1 on Wire Validity specifies that the strict version of the WS-Policy
429 intersection algorithm is used to establish wire validity and determine the policies to be
430 used. The strict version of policy intersection algorithm ignores the ignorable attribute on
431 assertions. This means that the ignorable facility of WS-Policy cannot be used in policySets.

432 For further discussion on attachment of policySets and the computation of applicable
433 policySets, please refer to [Section 4](#).

434 All the policySets in a SCA Domain are defined in a global, domain-wide file named
435 definitions.xml. Details of this file are described in the [SCA Assembly Model](#) [SCA-
436 Assembly].

437 3.4.1 IntentMaps

438 Intent maps contain the concrete policies and policy subjects that are used to realize a specific intent that
439 is provided by the policySet.

440 The pseudo-schema for intentMaps is given in Snippet 3-6:

441

```
442 <intentMap provides="xs:QName">  
443   <qualifier name="xs:string"?>  
444     <xs:any*>  
445   </qualifier>  
446 </intentMap>
```

447 *Snippet 3-6: intentMap Pseudo-Schema*

448

449 **When a policySet element contains a set of intentMap children, the value of the @provides attribute of**
450 **each intentMap MUST correspond to an unqualified intent that is listed within the @provides attribute**
451 **value of the parent policySet element. When a policySet element contains a set of intentMap children, the**
452 **value of the @provides attribute of each intentMap MUST correspond to an unqualified intent that is listed**
453 **within the @provides attribute value of the parent policySet element. [POL30008]**

Formatted: Font color: Auto

454 **If a policySet specifies a qualifiable intent in the @provides attribute, then it MUST include an intentMap**
455 **element that specifies all possible qualifiers for that intent. If a policySet specifies a qualifiable intent in the**
456 **@provides attribute, then it MUST include an intentMap element that specifies all possible qualifiers for**
457 **that intent. [POL30020]**

Formatted: Font color: Auto

458 **For each qualifiable intent listed as a member of the @provides attribute list of a policySet element, there**
459 **MUST be no more than one corresponding intentMap element that declares the unqualified form of that**
460 **intent in its @provides attribute. In other words, each intentMap within a given policySet uniquely provides**
461 **for a specific intent. For each qualifiable intent listed as a member of the @provides attribute list of a**
462 **policySet element, there MUST be no more than one corresponding intentMap element that declares the**
463 **unqualified form of that intent in its @provides attribute. In other words, each intentMap within a given**
464 **policySet uniquely provides for a specific intent. [POL30010]**

Formatted: Font color: Auto

465 **The @provides attribute value of each intentMap that is an immediate child of a policySet MUST be**
466 **included in the @provides attribute of the parent policySet. The @provides attribute value of each**
467 **intentMap that is an immediate child of a policySet MUST be included in the @provides attribute of the**
468 **parent policySet. [POL30021]**

Formatted: Font color: Auto

469 An intentMap element contains qualifier element children. Each qualifier element corresponds to a
470 qualified intent where the unqualified form of that intent is the value of the @provides attribute value of
471 the parent intentMap. The qualified intent is either included explicitly in the value of the enclosing
472 policySet's @provides attribute or implicitly by that @provides attribute including the unqualified form of
473 the intent.

474 A qualifier element designates a set of concrete policy attachments that correspond to a qualified intent.
475 The concrete policy attachments can be specified using wsp:PolicyAttachment element children or using
476 extensibility elements specific to an environment.

477 As an example, the policySet element in Snippet 3-7 declares that it provides **confidentiality** using the
478 @provides attribute. The alternatives (transport and message) it contains each specify the policy and
479 policy subject they provide. The default is "transport".

```
480
481 <policySet name="SecureMessagingPolicies"
482   provides="confidentiality"
483   appliesTo="binding.ws"
484   xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200903"
485   xmlns:wsp="http://schemas.xmlsoap.org/ws/2004/09/policy">
486   <intentMap provides="confidentiality" >
487     <qualifier name="transport">
488       <wsp:PolicyAttachment>
489         <!-- policy expression and policy subject for
490           "transport" alternative -->
491         ...
492       </wsp:PolicyAttachment>
493     </qualifier>
494     <qualifier name="message">
495       <wsp:PolicyAttachment>
496         <!-- policy expression and policy subject for
497           "message" alternative -->
498         ...
499       </wsp:PolicyAttachment>
500     </qualifier>
501   </intentMap>
```

505 </policySet>

506 *Snippet 3-7: Example policySet with an intentMap*

507

508 PolicySets can embed policies that are defined in any policy language. Although WS-Policy is the most
509 common language for expressing interaction policies, it is possible to use other policy languages. Snippet
510 3-8 is an example of a policySet that embeds a policy defined in a proprietary language. This policy
511 provides "serverAuthentication" for binding.ws.

512

```
513 <policySet name="AuthenticationPolicy"  
514   provides="serverAuthentication"  
515   appliesTo="binding.ws"  
516   xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200903">  
517   <e:policyConfiguration xmlns:e="http://example.com">  
518     <e:authentication type="X509"/>  
519     <e:trustedCAStore type="JKS"/>  
520     <e:keyStoreFile>Foo.jks</e:keyStoreFile>  
521     <e:keyStorePassword>l23</e:keyStorePassword>  
522   </e:authentication>  
523 </e:policyConfiguration>  
524 </policySet>
```

525 *Snippet 3-8: Example policySet Using a Proprietary Language*

526 3.4.2 Direct Inclusion of Policies within PolicySets

527 In cases where there is no need for defaults or overriding for an intent included in the @provides of a
528 policySet, the policySet element can contain policies or policy attachment elements directly without the
529 use of intentMaps or policy set references. There are two ways of including policies directly within a
530 policySet. Either the policySet contains one or more wsp:policyAttachment elements directly as children
531 or it contains extension elements (using xs:any) that contain concrete policies.

532 **Following the inclusion of all policySet references, when a policySet element directly contains**
533 **wsp:policyAttachment children or policies using extension elements, the set of policies specified as**
534 **children MUST satisfy all the intents expressed using the @provides attribute value of the policySet**
535 **element. Following the inclusion of all policySet references, when a policySet element directly contains**
536 **wsp:policyAttachment children or policies using extension elements, the set of policies specified as**
537 **children MUST satisfy all the intents expressed using the @provides attribute value of the policySet**
538 **element.** [POL30011] The intent names in the @provides attribute of the policySet can include names of
539 profile intents.

Formatted: Font: (Default) Arial

540 3.4.3 Policy Set References

541 A policySet can refer to other policySets by using sca:PolicySetReference element. This provides a
542 recursive inclusion capability for intentMaps, policy attachments or other specific mappings from different
543 domains.

544 When a policySet element contains policySetReference element children, the @name attribute of a
545 policySetReference element designates a policySet defined with the same value for its @name attribute.
546 Therefore, the @name attribute is a QName.

547 **The set of intents in the @provides attribute of a referenced policySet MUST be a subset of the set of**
548 **intents in the @provides attribute of the referencing policySet. The set of intents in the @provides**
549 **attribute of a referenced policySet MUST be a subset of the set of intents in the @provides attribute of the**
550 **referencing policySet.** [POL30013] Qualified intents are a subset of their parent qualifiable intent.

Formatted: Font color: Auto

551 The usage of a policySetReference element indicates a copy of the element content children of the
552 policySet that is being referred is included within the referring policySet. If the result of inclusion results in
553 a reference to another policySet, the inclusion step is repeated until the contents of a policySet does not
554 contain any references to other policySets.

555 When a policySet is applied to a particular element, the policies in the policy set
556 include any standalone polices plus the policies from each intent map contained in the
557 PolicySet, as described below.

558 Note that, since the attributes of a referenced policySet are effectively removed/ignored by this process, it
559 is the responsibility of the author of the referring policySet to include any necessary intents in the
560 @provides attribute of the policySet making the reference so that the policySet correctly advertises its
561 aggregate policy.

562 The default values when using this aggregate policySet come from the defaults in the included policySets.
563 A single intent (or all qualified intents that comprise an intent) in a referencing policySet ought to be
564 included once by using references to other policySets.

565 Snippet 3-9 is an example to illustrate the inclusion of two other policySets in a policySet element:

566

```
567 <policySet name="BasicAuthMsgProtSecurity"  
568   provides="serverAuthentication confidentiality"  
569   appliesTo="binding.ws"  
570   xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200903">  
571   <policySetReference name="acme:ServerAuthenticationPolicies"/>  
572   <policySetReference name="acme:ConfidentialityPolicies"/>  
573 </policySet>
```

574 *Snippet 3-9: Example policySet Including Other policySets*

575

576 The policySet in Snippet 3-9 refers to policySets for **serverAuthentication** and
577 **confidentiality** and, by reference, provides policies and policy subject alternatives in these
578 domains.

579 If the policySets referred to in Snippet 3-9 have the following content:

580

```
581 <policySet name="ServerAuthenticationPolicies"  
582   provides="serverAuthentication"  
583   appliesTo="binding.ws"  
584   xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200903">  
585   <wsp:PolicyAttachment>  
586     <!-- policy expression and policy subject for  
587        "basic server authentication" -->  
588     ...  
589   </wsp:PolicyAttachment>  
590 </policySet>  
591  
592 <policySet name="acme:ConfidentialityPolicies"  
593   provides="confidentiality"  
594   bindings="binding.ws"  
595   xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200903">  
596   <intentMap provides="confidentiality" >  
597     <qualifier name="transport">  
598       <wsp:PolicyAttachment>  
599         <!-- policy expression and policy subject for  
600            "transport" alternative -->  
601         ...  
602       </wsp:PolicyAttachment>  
603       <wsp:PolicyAttachment>  
604         ...  
605       </wsp:PolicyAttachment>  
606     </qualifier>  
607     <qualifier name="message">  
608       <wsp:PolicyAttachment>  
609         <!-- policy expression and policy subject for
```

```
610         "message" alternative" -->
611         ...
612         </wsp:PolicyAttachment>
613     </qualifier>
614 </intentMap>
615 </policySet>
```

616 *Snippet 3-10: Example Included policySets for Snippet 3-9*

617

618 The result of the inclusion of policySets via policySetReferences would be semantically
619 equivalent to Snippet 3-11.

620

```
621 <policySet name="BasicAuthMsgProtSecurity"
622     provides="serverAuthentication confidentiality" appliesTo="binding.ws"
623     xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200903">
624     <wsp:PolicyAttachment>
625         <!-- policy expression and policy subject for
626             "basic server authentication" -->
627         ...
628     </wsp:PolicyAttachment>
629     <intentMap provides="confidentiality" >
630         <qualifier name="transport">
631             <wsp:PolicyAttachment>
632                 <!-- policy expression and policy subject for
633                     "transport" alternative -->
634                 ...
635             </wsp:PolicyAttachment>
636             <wsp:PolicyAttachment>
637                 ...
638             </wsp:PolicyAttachment>
639         </qualifier>
640         <qualifier name="message">
641             <wsp:PolicyAttachment>
642                 <!-- policy expression and policy subject for
643                     "message" alternative -->
644                 ...
645             </wsp:PolicyAttachment>
646         </qualifier>
647     </intentMap>
648 </policySet>
```

649 *Snippet 3-11: Equivalent policySet*

4 Attaching Intents and PolicySets to SCA Constructs

650

651 This section describes how intents and policySets are associated with SCA constructs. It describes the
652 various attachment points and semantics for intents and policySets and their relationship to other SCA
653 elements and how intents relate to policySets in these contexts.

4.1 Attachment Rules - Intents

654

655 Intents can be attached to any SCA element used in the definition of components and composites **since**
656 **an intent specifies an abstract requirement. The `Intent` attachment is specified by using the `@requires`**
657 **attribute or the `<requires>` child element. The `@requires` attribute takes as its value a list of intent**
658 **names. Similarly, the `<requires>` attribute takes as its value a list of intent names. Intents can also be**
659 **attached to applied to interface definitions. For WSDL portType elements (WSDL 1.1) the `@requires`**
660 **attribute can be applied that holds a list of intent names that are needed by the interface. Similarly, the**
661 **WSDL portType element can have a `<requires>` child element that holds a list of intent names. Other**
662 **interface languages can define their own mechanism for attaching specifying a list of intents.**

663

664

665 **Error! Not a valid bookmark self-reference. Any intents attached to an interface definition artifact, such**
666 **as a WSDL portType, MUST be added to the intents defined in the `@requires` list of the service or**
667 **reference to which the interface definition applies. If the `@requires` list of the service or reference is empty**
668 **then the intents attached to the interface definition artifact become the only contents of the relevant**
669 **`@requires` list. [POL40027]**

670 Because intents specified on interfaces can be seen by both the provider and the client of a service, it is
671 appropriate to use them to specify characteristics of the service that both the developers of provider and
672 the client need to know.

673 For example:

674

```
675 <service> or <reference>...  
676   <binding.binding-type requires="listOfQNames"  
677   </binding.binding-type>  
678   ...  
679 </service> or </reference>
```

680 *Snippet 4-1: Example of `@requires` on a service or reference*

```
681 <service> or <reference>...  
682   <binding.binding-type  
683   ...  
684   <requires> ListOfQNames </requires>  
685   </binding.binding-type>  
686   ...  
687 </service> or </reference>
```

688 *Snippet 4-2: Example of a `<requires>` child element to attach intents to a service or reference*

689

4.2 Attachment Rules - PolicySets

690

691 One or more policySets can be attached to any SCA element used in the definition of components and
692 composites. The attachment can be specified by using the following two mechanisms:

- 693 • **Direct Attachment** mechanism which is described in Section 4.3.
- 694 • **External Attachment** mechanism which is described in Section 4.4.

695 SCA runtimes MUST support at least one of the Direct Attachment and External Attachment mechanisms
696 for policySet attachment. SCA runtimes MUST support at least one of the Direct Attachment and External
697 Attachment mechanisms for policySet attachment. [POL40010] SCA implementations supporting only the
698 External Attachment mechanism MUST ignore the policy sets that are applicable via the Direct
699 Attachment mechanism. SCA implementations supporting only the External Attachment mechanism
700 MUST ignore the policy sets that are applicable via the Direct Attachment mechanism. [POL40011] SCA
701 implementations supporting only the Direct Attachment mechanism MUST ignore the policy sets that are
702 applicable via the External Attachment mechanism. SCA implementations supporting only the Direct
703 Attachment mechanism MUST ignore the policy sets that are applicable via the External Attachment
704 mechanism. [POL40012] SCA implementations supporting both Direct Attachment and External
705 Attachment mechanisms MUST ignore policy sets applicable to any given SCA element via the Direct
706 Attachment mechanism when there exist policy sets applicable to the same SCA element via the External
707 Attachment mechanism. SCA implementations supporting both Direct Attachment and External Attachment
708 mechanisms MUST ignore policy sets applicable to any given SCA element via the Direct Attachment
709 mechanism when there exist policy sets applicable to the same SCA element via the External Attachment
710 mechanism. [POL40001]

711 4.3 Direct Attachment of PolicySets

712 Direct Attachment of PolicySets can be achieved by

- 713 • Using the optional **@policySets** attribute of the SCA element
- 714 • Adding an optional child **<policySetAttachment/>** element to the SCA element

715 The policySets attribute takes as its value a list of policySet names.

716 For example:

717

```
718 <service> or <reference>...  
719   <binding.binding-type policySets="listOfQNames">  
720   </binding.binding-type>  
721   ...  
722 </service> or </reference>
```

723 *Snippet 4-32: Example of @policySets on a service*

724

725 The <policySetAttachment> element is an alternative way to attach a policySet to an SCA composite.

726

```
727 <policySetAttachment name="xs:QName"/>
```

728 *Snippet 4-43: policySetAttachment Pseudo-Schema*

729

- 730 • @name (1..1) – the QName of a policySet.

731

732 For example:

733

```
734 <service> or <reference>...  
735   <binding.binding-type>  
736     <policySetAttachment name="sns:EnterprisePolicySet">  
737     </binding.binding-type>  
738   ...  
739 </service> or </reference>
```

740 *Snippet 4-54: Example of policySetAttachment in a service or reference*

741

742 Where an element has both a @policySets attribute and a <policySetAttachment/> child element, the
743 policySets declared by both are attached to the element.

744 The SCA Policy framework enables two distinct cases for utilizing intents and PolicySets:

- 745 • It is possible to specify QoS requirements by specifying abstract intents **utilizing the @requires-**
746 **element on** an element at the time of development. In this case, it is implied that the concrete
747 bindings and policies that satisfy the abstract intents are not assigned at development time but the
748 intents are used **to select the concrete Bindings and Policies** at deployment time. Concrete
749 policies are encapsulated within policySets that are applied during deployment using the external
750 attachment mechanism. The intents associated with a SCA element is the union of intents specified
751 for it and its parent elements subject to the detailed rules below.
- 752 • It is also possible to specify QoS requirements for an element by using both intents and concrete
753 policies contained in directly attached policySets at development time. In this case, it is possible **to**
754 **configure the policySets, by overriding the default settings in the specified policySets using**
755 **intents**. The policySets associated with a SCA element is the union of policySets specified for it and
756 its parent elements subject to the detailed rules below.

757 See also section 4.12.1 for a discussion of how intents are used to guide the selection and application of
758 specific policySets.

759 4.4 External Attachment of PolicySets Mechanism

760 The External Attachment mechanism for policySets is used for deployment-time application of policySets
761 and policies to SCA elements. It is called "external attachment" because the principle of the mechanism
762 is that the place that declares the attachment is separate from the composite files that contain the
763 elements. This separation provides the deployer with a way to attach policies and policySets without
764 having to modify the artifacts where they apply.

765 A PolicySet is attached to one or more elements in one of two ways:

- 766 a) through the @attachTo attribute of the policySet
- 767 b) through a reference (via policySetReference) from a policySet that uses the @attachTo attribute.

768 During the deployment of SCA composites, all policySets within the Domain with an attachTo attribute
769 MUST be evaluated to determine which policySets are attached to the newly deployed composite.
770 [POL40013]

771 During the deployment of an SCA policySet, the behavior of an SCA runtime MUST take ONE of the
772 following forms:

- 773 • The policySet is immediately attached to all deployed composites which satisfy the @attachTo
774 attribute of the policySet.
- 775 The policySet is attached to a deployed composite which satisfies the @attachTo attribute of the
776 policySet when the composite is re-deployed. During the deployment of an SCA policySet, the
777 behavior of an SCA runtime MUST take ONE of the following forms:
- 778 • The policySet is immediately attached to all deployed composites which satisfy the @attachTo
779 attribute of the policySet.
- 780 • The policySet is attached to a deployed composite which satisfies the @attachTo attribute of the
781 policySet when the composite is re-deployed.

782 [POL40026]

783 4.4.1 The Form of the @attachTo Attribute

784 The @attachTo attribute of a policySet is an XPath1.0 expression identifying a SCA element to which the
785 policySet is attached.

786 The XPath applies to the *Infoset for External Attachment* – i.e. to SCA composite files, with the special
787 characteristics:

Formatted: List Bullet

Formatted: Pattern: Clear (Yellow)

- 788 1. The Domain is treated as a special composite, with a blank name - ""
789 2. Where one composite includes one or more other composites, it is the including composite which is
790 addressed by the XPath and its contents are the result of preprocessing all of the include elements

791 Where the policySet is intended to be specific to a particular use of a composite file (rather than to all
792 uses of the composite), the structuralURI of a component is used to attach policySet to a specific use
793 of a nested component, as described in the SCA Assembly specification [SCA-Assembly].

794 The XPath expression can make use of the unique URI to indicate specific use instances, where
795 different policySets need to be used for those different instances.

796 Special case. Where the @attachTo attribute of a policySet is absent or is blank, the policySet cannot be
797 used on its own for external attachment. It can be used:

- 798 1. For direct attachment (using a @policySet attribute on an element or a <policySetAttachment/>
799 subelement)

- 800 2. By reference from another policySet element

801 **The SCA runtime MUST raise an error if the @attachTo XPath expression resolves to an SCA <property>**
802 **element, or any of its children. The SCA runtime MUST raise an error if the @attachTo XPath expression**
803 **resolves to an SCA <property> element, or any of its children. [POL40002]**

804 The XPath expression for the @attachTo attribute can make use of a series of XPath functions which
805 enable the expression to easily identify elements with specific characteristics that are not easily
806 expressed with pure XPath. These functions enable:

- 807 • the identification of elements to which specific intents apply.
808 This permits the attachment of a policySet to be linked to specific intents on the target element - for
809 example, a policySet relating to encryption of messages can be targeted to services and references
810 which have the **confidentiality** intent applied.
- 811 • the targeting of subelements of an interface, including operations and messages.
812 This permits the attachment of a policySet to an individual operation or to an individual message
813 within an interface, separately from the policies that apply to other operations or messages in the
814 interface.
- 815 • the targeting of a specific use of a component, through its unique URI.
816 This permits the attachment of a policySet to a specific use of a component in one context, that can
817 be different from the policySet(s) that are applied to other uses of the same component.

818 Detail of the available XPath functions is given in the section "[XPath Functions for the @attachTo](#)
819 [Attribute](#)".

820 Examples of @attachTo attribute:

821
822 1. `//component[@name="test3"]`

823 *Snippet :Example attachTo all Instances of a Name*

824
825 attach to all instances of a component named "test3"

826
827 2. `//component[URIRef("top_level/test1/test3")]`

828 *Snippet 4-5: Example attachTo a Specific Instance via a Path*

829
830 attach to the unique instance of component "test3" when used by component "test1" when used by
831 component "top_level" (top_level is a component at the Domain level)

832

833 `3. //component[@name="test3"]/service[IntentRefs("intent1")]`

834 *Snippet : Example attachTo Instances with an intent*

835

836 selects the services of component "test3" which have the intent "intent1" applied

837

838 `4. //component/binding.ws`

839 *Snippet 4-6: Example attachTo Instances with a binding*

840

841 selects the web services binding of all components with a service or reference with a Web services
842 binding

843

844 `5. /composite[@name=""]/component[@name="fred"]`

845 *Snippet : Example attachTo a Specific Instance via Patha and Name*

846

847 selects a component with the name "fred" at the Domain level

848 **4.4.2 Cases Where Multiple PolicySets are attached to a Single Artifact**

849 Multiple PolicySets can be attached to a single artifact. This can happen either as the result of one or
850 more direct attachments or as the result of one or more external attachments which target the particular
851 artifact.

852 **4.4.3 XPath Functions for the @attachTo Attribute**

853 Utility functions are useful in XPath expressions where otherwise it would be complex to write the XPath
854 expression to identify the elements concerned.

855 This particularly applies in SCA to Interfaces and the child parts of interfaces (operations and messages).
856 XPath Functions exist for the following:

- 857 • Picking out a specific interface
- 858 • Picking out a specific operation in an interface
- 859 • Picking out a specific message in an operation in an interface
- 860 • Picking out artifacts with specific intents

861 **4.4.3.1 Interface Related Functions**

862 **InterfaceRef(InterfaceName)**

863 picks out an interface identified by InterfaceName

864 **OperationRef(InterfaceName/OperationName)**

865 picks out the operation OperationName in the interface InterfaceName

866 **MessageRef(InterfaceName/OperationName/MessageName)**

867 picks out the message MessageName in the operation OperationName in the interface
868 InterfaceName.

- 869 • "*" can be used for wildcarding of any of the names.

870 The interface is treated as if it is a WSDL interface (for other interface types, they are treated as if
871 mapped to WSDL using their regular mapping rules).

872 Examples of the Interface functions:

873

```
874 InterfaceRef( "MyInterface" )
```

875 *Snippet 4-7: Example use of InterfaceRef*

876

877 picks out an interface with the name "MyInterface"

878

```
879 OperationRef( "MyInterface/MyOperation" )
```

880 *Snippet 4-8: Example use of OperationRef with a Path*

881

882 picks out the operation named "MyOperation" within the interface named "MyInterface"

883

```
884 OperationRef( "*/MyOperation" )
```

885 *Snippet 4-9: Example use of OperationRef without a Path*

886

887 picks out the operation named "MyOperation" from any interface

888

```
889 MessageRef( "MyInterface/MyOperation/MyMessage" )
```

890 *Snippet 4-10: Example use of MessageRef with a Path*

891

892 picks out the message named "MyMessage" from the operation named "MyOperation" within the interface
893 named "MyInterface"

894

```
895 MessageRef( "*/*/MyMessage" )
```

896 *Snippet 4-11: Example use of MessageRef with a Path with Wildcards*

897

898 picks out the message named "MyMessage" from any operation in any interface

899 **4.4.3.2 Intent Based Functions**

900 For the following intent-based functions, it is the total set of intents which apply to the artifact which are
901 examined by the function, including directly attached intents plus intents acquired from the structural
902 hierarchy and from the implementation hierarchy.

903 **IntentRefs(IntentList)**

904 picks out an element where the intents applied match the intents specified in the IntentList:

905

```
906 IntentRefs( "intent1" )
```

907 *Snippet 4-12: Example use of InterntRef*

908

909 picks out an artifact to which intent named "intent1" is attached

910

```
911 IntentRefs( "intent1 intent2" )
```

912 *Snippet 4-13: Example use of IntentRef with Multiple intents*

913

914 picks out an artifact to which intents named "intent1" AND "intent2" are attached

915

```
916 IntentRefs( "intent1 !intent2" )
```

917 *Snippet 4-14: Example use of IntentRef with Not Operator*

918

919 picks out an artifact to which intent named "intent1" is attached but NOT the intent named "intent2"

920 4.4.3.3 URI Based Function

921 The URIRef function is used to pick out a particular use of a nested component – ie where some Domain
922 level component is implemented using a composite implementation, which in turn has one or more
923 components implemented with the composite (and so on to an arbitrary level of nesting):

924 URIRef(URI)

925 picks out the particular use of a component identified by the structuralURI string URI.

926 For a full description of structuralURIs, see the SCA Assembly specification [SCA-Assembly].

927 Example:

928

```
929 URIRef( "top_comp_name/middle_comp_name/lowest_comp_name" )
```

930 *Snippet 4-15: Example use of URIRef*

931

932 picks out the particular use of a component – where component lowest_comp_name is used within the
933 implementation of middle_comp_name within the implementation of the top-level (Domain level)
934 component top_comp_name.

935 4.5 Usage of @requires attribute for specifying Attaching intents to 936 SCA elements

937 A list of intents can be specified for any SCA element by using the @requires attribute or the <requires>
938 child element.

939 The intents which apply to a given element depend on

- 940 • the intents expressed in its @requires attribute or the <requires> child element.
- 941 • intents derived from the structural hierarchy of the element
- 942 • intents derived from the implementation hierarchy of the element

943 When computing the intents that apply to a particular element, the @constrains attribute of each relevant
944 intent is checked against the element. If the intent in question does not apply to that element it is simply
945 discarded.

946 **Any two intents applied to a given element MUST NOT be mutually exclusive** [POL40009]. Specific
947 examples are discussed later in this document.

948 4.5.1 Implementation Hierarchy of an Element

949 The **implementation hierarchy** occurs where a component configures an implementation and also
950 where a composite promotes a service or reference of one of its components. The implementation
951 hierarchy involves:

- 952 • a composite service or composite reference element is in the implementation hierarchy of the
953 component service/component reference element which they promote
- 954 • the component element and its descendent elements (for example, service, reference,
955 implementation) configure aspects of the implementation. Each of these elements is in the

956 implementation hierarchy of the **corresponding** element in the componentType of the
957 implementation.

958 Rule 1: **The intents declared on elements lower in the implementation hierarchy of a given element MUST**
959 **be applied to the element. The intents declared on elements lower in the implementation hierarchy of a**
960 **given element MUST be applied to the element. [POL40014] A qualifiable intent expressed lower in the**
961 **hierarchy can be qualified further up the hierarchy, in which case the qualified version of the intent MUST**
962 **apply to the higher level element. A qualifiable intent expressed lower in the hierarchy can be qualified**
963 **further up the hierarchy, in which case the qualified version of the intent MUST apply to the higher level**
964 **element. [POL40004]**

Formatted: Font color: Auto, English (U.S.)

Formatted: Font color: Auto

965 4.5.2 Structural Hierarchy of an Element

966 The structural hierarchy of an element consists of its parent element, grandparent element and so on up
967 to the <composite/> element in the composite file containing the element.

968 As an example, for the composite in Snippet 4-16:

969

```
970 <composite name="C1" requires="i1">  
971   <service name="CS" promotes="X/S">  
972     <binding.ws requires="i2">  
973     </service>  
974   <component name="X">  
975     <implementation.java class="foo"/>  
976     <service name="S" requires="i3">  
977     </component>  
978 </composite>
```

979 *Snippet 4-16: Example Composite to Illustrate Structural Hierarchy*

980

981 - the structural hierarchy of the component service element with the name "S" is the component element
982 named "X" and the composite element named "C1". Service "S" has intent "i3" and also has the intent "i1"
983 if i1 is not mutually exclusive with i3.

984 **Rule2: The intents declared on elements higher in the structural hierarchy of a given element MUST be**
985 **applied to the element EXCEPT,**

Formatted: Font color: Auto, English (U.S.)

986 • **if any of the inherited intents is mutually exclusive with an intent applied on the element, then the**
987 **inherited intent MUST be ignored.**

Formatted: Font color: Auto, English (U.S.)

988 **—if the overall set of intents from the element itself and from its structural hierarchy contains both an**
989 **unqualified version and a qualified version of the same intent, the qualified version of the intent MUST**
990 **be used. Rule2: The intents declared on elements higher in the structural hierarchy of a given element**
991 **MUST be applied to the element EXCEPT**

Formatted: Font color: Black, English (U.K.)

Formatted: List Bullet

992 • **if any of the inherited intents is mutually exclusive with an intent applied on the element, then the**
993 **inherited intent MUST be ignored**

994 • **if the overall set of intents from the element itself and from its structural hierarchy contains both an**
995 **unqualified version and a qualified version of the same intent, the qualified version of the intent MUST**
996 **be used.**

997 [POL40005]

998 4.5.3 Combining Implementation and Structural Policy Data

999 When there are intents present in both hierarchies implementation intents are calculated before the
1000 structural intents. In other words, **when combining implementation hierarchy and structural hierarchy**
1001 **policy data, Rule 1 MUST be applied BEFORE Rule 2. [POL40015]**

1002 Note that each of the elements in the hierarchy below a <component> element, such as <service/>,
1003 <reference/> or <binding/>, inherits intents from the equivalent elements in the componentType of the

1004 implementation used by the component. So the <service/> element of the <component> inherits any
1005 intents on the <service/> element with the same name in the <componentType> - and a <binding/>
1006 element under the service in the component inherits any intents on the <binding/> element of the service
1007 (with the same name) in the componentType. Errors caused by mutually exclusive intents appearing on
1008 corresponding elements in the component and on the componentType only occur when those elements
1009 match one-to-one. Mutually exclusive intents can validly occur on elements that are at different levels in
1010 the structural hierarchy (as defined in Rule 2).

1011 Note that it might often be the case that <binding/> elements will be specified in the structure under the
1012 <component/> element in the composite file (especially at the Domain level, where final deployment
1013 configuration is applied) - these elements might have no corresponding elements defined in the
1014 componentType structure. In this situation, the <binding/> elements don't acquire any intents from the
1015 componentType directly (ie there are no elements in the implementation hierarchy of the <binding/>
1016 elements), but those <binding/> elements will acquire intents "flowing down" their structural hierarchy as
1017 defined in Rule 2 - so, for example if the <service/> element is marked with @requires="confidentiality",
1018 the bindings of that service will all inherit that intent, assuming that they don't have their own exclusive
1019 intents specified.

1020 Also, for example, where say a component <service.../> element has an intent that is mutually exclusive
1021 with an intent in the componentType<service.../> element with the same name, it is an error, but this
1022 differs when compared with the case of the <component.../> element having an intent that is mutually
1023 exclusive with an intent on the componentType <service/> element - because they are at different
1024 structural levels: the intent on the <component/> is ignored for that <service/> element and there is no
1025 error.

1026 4.5.4 Examples

1027 As an example, consider the composite in Snippet 4-17:

1028

```
1029 <composite name="C1" requires="i1">  
1030   <service name="CS" promotes="X/S">  
1031     <binding.ws requires="i2">  
1032     </service>  
1033   <component name="X">  
1034     <implementation.java class="foo"/>  
1035     <service name="S" requires="i3">  
1036     </component>  
1037 </composite>
```

1038 *Snippet 4-17: Example composite with intents*

1039

1040 ...the component service with name "S" has the service named "S" in the componentType of
1041 the implementation in its implementation hierarchy, and the composite service named "CS"
1042 has the component service named "S" in its implementation hierarchy. Service "CS"
1043 acquires the intent "i3" from service "S" - and also gets the intent "i1" from its containing
1044 composite "C1" IF i1 is not mutually exclusive with i3.

1045 When intents apply to an element following the rules described and where no policySets are
1046 attached to the element, the intents for the element can be used to select appropriate
1047 policySets during deployment, using the external attachment mechanism.

1048 Consider the composite in Snippet 4-18:

1049

```
1050 <composite requires="confidentiality">  
1051   <service name="foo" .../>  
1052   <reference name="bar" requires="confidentiality.message"/>  
1053 </composite>
```

1054 *Snippet 4-18: Example reference with intents*

1055

1056 ...in this case, the composite declares that all of its services and references guarantee confidentiality in
1057 their communication, but the “bar” reference further qualifies that requirement to specifically require
1058 message-level security. The “foo” service element has the default qualifier specified for the confidentiality
1059 intent (which might be transport level security) while the “bar” reference has the **confidentiality.message**
1060 intent.

1061 Consider the variation in Snippet 4-19 where a qualified intent is specified at the composite level:

1062

```
1063 <composite requires="confidentiality.transport">  
1064   <service name="foo" .../>  
1065   <reference name="bar" requires="confidentiality.message"/>  
1066 </composite>
```

1067 *Snippet 4-19: Example Qualified intents*

1068

1069 In this case, both the **confidentiality.transport** and the **confidentiality.message** intent
1070 are applied for the reference ‘bar’. If there are no bindings that support this combination, an
1071 error will be generated. However, since in some cases multiple qualifiers for the same intent
1072 can be valid or there might be bindings that support such combinations, the SCA
1073 specification allows this.

1074 It is also possible for a qualified intent to be further qualified. In our example, the
1075 **confidentiality.message** intent could be further qualified to indicate whether just the body of a message
1076 is protected, or the whole message (including headers) is protected. So, the second-level qualifiers might
1077 be “body” and “whole”. The default qualifier might be “whole”. If the “bar” reference from Snippet 4-19
1078 wanted only body confidentiality, it would state:

1079

```
1080 <reference name="bar" requires="acme:confidentiality.message.body"/>
```

1081 *Snippet 4-20: Example Second Level Qualifier*

1082

1083 The definition of the second level of qualification for an intent follows the same rules. As with other
1084 qualified intents, the name of the intent is constructed using the name of the qualifiable intent, the
1085 delimiter “.”, and the name of the qualifier.

1086 4.6 Usage of Intent and Policy Set Attachment together

1087 As indicated above, it is possible to attach both intents and policySets to an SCA element during
1088 development. The most common use cases for attaching both intents and concrete policySets to an
1089 element are with binding and reference elements.

1090 When the @requires attribute or the **<requires> child element to attach intents** and one or both of the
1091 direct policySet attachment mechanisms are used together during development, it indicates the intention
1092 of the developer to configure the element, such as a binding, by the application of specific policySet(s) to
1093 this element.

1094 Developers who attach intents and policySets in conjunction with each other need to be aware of the
1095 implications of how the policySets are selected and how the intents are utilized to select specific
1096 intentMaps, override defaults, etc. The details are provided in the Section [Guided Selection of
1097 PolicySets using Intents](#).

1098 4.7 Intents and PolicySets on Implementations and Component Types

1099 It is possible to specify intents and policySets within a component’s implementation, which get exposed to
1100 SCA through the corresponding *component type*. How the intents or policies are specified within an

1101 implementation depends on the implementation technology. For example, Java can use an @requires
1102 annotation to specify intents.
1103 The intents and policySets specified within an implementation can be found on the
1104 <sca:implementation.*> and the <sca:service> and <sca:reference> elements of the component type, for
1105 example:

```
1107 <componentType>  
1108   <implementation.* requires="listOfQNames" policySets="listOfQNames">  
1109     ...  
1110   </implementation>  
1111   <service name="myService" requires="listOfQNames"  
1112     policySets="listOfQNames">  
1113     ...  
1114   </service>  
1115   <reference name="myReference" requires="listOfQNames"  
1116     policySets="listOfQNames">  
1117     ...  
1118   </reference>  
1119   ...  
1120 </componentType>
```

1121 *Snippet 4-21: Example of intents on an implementation*

1122
1123 Intents expressed in the component type are handled according to the rule defined for the implementation
1124 hierarchy. See [Intent rule 2](#)

1125 For explicitly listed policySets, the list in the component using the implementation can override policySets
1126 from the component type. **If a component has any policySets attached to it (by any means), then any
1127 policySets attached to the componentType MUST be ignored. If a component has any policySets attached
1128 to it (by any means), then any policySets attached to the componentType MUST be ignored.** [POL40006]

1129 4.8 Intents on Interfaces

1130 Interfaces are used in association with SCA services and references. These interfaces can be declared
1131 in SCA composite files and also in SCA componentType files. The interfaces can be defined using a
1132 number of different interface definition languages which include WSDL, Java interfaces and C++ header
1133 files.

1134 It is possible for some interfaces to be referenced from an implementation rather than directly from any
1135 SCA files. An example of this usage is a Java implementation class file that has a reference declared
1136 that in turn uses a Java interface defined separately. When this occurs, the interface definition is treated
1137 from an SCA perspective as part of the componentType of the implementation, logically being part of the
1138 declaration of the related service or reference element.

1139 Both the declaration of interfaces in SCA and also the definitions of interfaces can carry policy-related
1140 information. In particular, both the declarations and the definitions can have either intents attached to
1141 them, or policySets attached to them - or both. For SCA declarations, the intents and policySets always
1142 apply to the whole of the interface (ie all operations and all messages within each operation). For
1143 interface definitions, intents and policySets can apply to the whole interface or they can apply only to
1144 specific operations within the interface or they can even apply only to specific messages within particular
1145 operations. (To see how this is done, refer to the places in the SCA specifications that deal with the
1146 relevant interface definition language)

1147 This means, in effect, that there are 4 places which can hold policy related information for interfaces:

- 1148 1. The interface definition file that is referenced from the component type.
- 1149 2. The interface declaration for a service or reference in the component type
- 1150 3. The interface definition file that is referenced from the component declaration in a composite

1151 4. The interface declaration within a component

1152 **When calculating the set of intents and set of policySets which apply to either a service element or to a**
1153 **reference element of a component, intents and policySets from the interface definition and from the**
1154 **interface declaration(s) MUST be applied to the service or reference element and to the binding**
1155 **element(s) belonging to that element. When calculating the set of intents and set of policySets which apply**
1156 **to either a service element or to a reference element of a component, intents and policySets from the**
1157 **interface definition and from the interface declaration(s) MUST be applied to the service or reference**
1158 **element and to the binding element(s) belonging to that element. [POL40016]**

1159 **The locations where interfaces are defined and where interfaces are declared in the componentType and**
1160 **in a component MUST be treated as part of the implementation hierarchy as defined in Section 4.5**
1161 **Attaching intents to SCA Elements. The locations where interfaces are defined and where interfaces are**
1162 **declared in the componentType and in a component MUST be treated as part of the implementation**
1163 **hierarchy as defined in Section 4.5 Usage of @requires attribute for specifying intents. [POL40019]**

1164 **4.9 BindingTypes and Related Intents**

1165 SCA Binding types implement particular communication mechanisms for connecting components
1166 together. See detailed discussion in the [SCA Assembly Specification](#) [SCA-Assembly]. Some binding
1167 types can realize intents inherently by virtue of the kind of protocol technology they implement (e.g. an
1168 SSL binding would natively support confidentiality). For these kinds of binding types, it might be the case
1169 that using that binding type, without any additional configuration, provides a concrete realization of an
1170 intent. In addition, binding instances which are created by configuring a binding type might be able to
1171 provide some intents by virtue of their configuration. It is important to know, when selecting a binding to
1172 satisfy a set of intents, just what the binding types themselves can provide and what they can be
1173 configured to provide.

1174 The bindingType element is used to declare a class of binding available in a SCA Domain. The pseudo-
1175 schema for the bindingType element is shown in Snippet 4-22:

1176

```
1177 <bindingType type="NCName"  
1178     alwaysProvides="listOfQNames"?  
1179     mayProvide="listOfQNames"?/>
```

1180 *Snippet 4-22: bindingTypePseudo-Schema*

1181

- 1182 • @type (1..1) – declares the NCName of the bindingType, which is used to form the QName of the
1183 bindingType. **The QName of the bindingType MUST be unique amongst the set of bindingTypes in**
1184 **the SCA Domain. [POL40020]**
- 1185 • @alwaysProvides (0..1) – a list of intent QNames that are natively provided. A natively provided intent
1186 is hard-coded into the binding implementation. The function represented by the intent cannot be
1187 turned off.
- 1188 • @mayProvides (0..1) – a list of intent QNames that are natively provided by the binding
1189 implementation, but which are activated only when present in the intent set that is applied to a binding
1190 instance.

1191 **A binding implementation MUST implement all the intents listed in the @alwaysProvides and**
1192 **@mayProvides attributes. A binding implementation MUST implement all the intents listed in the**
1193 **@alwaysProvides and @mayProvides attributes. [POL40021]**

1194 The kind of intents a given binding might be capable of providing, beyond these inherent intents, are
1195 implied by the presence of policySets that declare the given binding in their @appliesTo attribute. An
1196 exception is binding.sca which is configured entirely by the intents listed in its @mayProvide and
1197 @alwaysProvides lists. There are no policySets with appliesTo="binding.sca".

1198 For example, if the policySet in Snippet 4-23 is available in a SCA Domain it says that the (example)
1199 foo:binding.ssl can provide "reliability" in addition to any other intents it might provide inherently.

1200
1201
1202
1203
1204

```
<policySet name="ReliableSSL" provides="exactlyOnce"  
  appliesTo="foo:binding.ssl">  
  ...  
</policySet>
```

1205 *Snippet 4-23: Example policySet Applied to a binding*

1206 4.10 Treatment of Components with Internal Wiring

1207 This section discusses the steps involved in the development and deployment of a component and its
1208 relationship to selection of bindings and policies for wiring services and references.

1209 The SCA developer starts by defining a component. Typically, this contains services and references. It
1210 can also have intents defined at various locations within composite and component types as well as
1211 policySets defined at various locations.

1212 Both for ease of development as well as for deployment, the wiring constraints to relate services and
1213 references need to be determined. This is accomplished by matching constraints of the services and
1214 references to those of corresponding references and services in other components.

1215 In this process, the intents, and the policySets that apply to both sides of a wire play an important role. In
1216 addition, concrete policies need to be selected that satisfy the intents for the service and the reference
1217 and are also compatible with each other. For services and references that make use of bidirectional
1218 interfaces, the same determination of matching policySets also has to take place for callbacks.

1219 Determining compatibility of wiring plays an important role prior to deployment as well as during the
1220 deployment phases of a component. For example, during development, it helps a developer to determine
1221 whether it is possible to wire services and references using the policySets available in the development
1222 environment. During deployment, the wiring constraints determine whether wiring can be achievable. It
1223 also aids in adding additional concrete policies or making adjustments to concrete policies in order to
1224 deliver the constraints. Here are the concepts that are needed in making wiring decisions:

- 1225 • The set of intents that individually apply to *each* service or reference.
- 1226 • When possible the intents that are applied to the service, the reference and callback (if any) at the
1227 other end of the wire. This set is called the *required intent set* and only applies when dealing with a
1228 wire connecting two components within the same SCA Domain. When external connections are
1229 involved, from clients or to services that are outside the SCA domain, intents are only available for the
1230 end of the connection that is inside the domain. See Section ["Preparing Services and References
1231 for External Connection"](#) for more details.
- 1232 • The policySets that apply to each service or reference.

1233 The set of provided intents for a binding instance is the union of the set of intents listed in the
1234 "alwaysProvides" attribute and the set of intents listed in the "mayProvides" attribute of its binding type.
1235 The capabilities represented by the "alwaysProvides" intent set are always present, irrespective of the
1236 configuration of the binding instance. Each capability represented by the "mayProvides" intent set is only
1237 present when the list of intents applied to the binding instance (either applied directly, or inherited)
1238 contains the particular intent (or a qualified version of that intent, if the intent set contains an unqualified
1239 form of a qualifiable intent). When an intent is directly provided by the binding type, there is no need to
1240 apply a policy set that provides that intent.

1241 When bidirectional interfaces are in use, the same process of selecting policySets to provide the intents is
1242 also performed for the callback bindings.

1243 4.10.1 Determining Wire Validity and Configuration

1244 The above approach determines the policySets that are used in conjunction with the binding instances
1245 listed for services and references. For services and references that are resolved using SCA wires, the
1246 policySets chosen on each side of the wire might or might not be compatible. The following approach is
1247 used to determine whether they are compatible and whether the wire is valid. If the wire

1248 uses a bidirectional interface, then the following technique ensures that valid configured
1249 policySets can be found for both directions of the bidirectional interface.

1250 ~~The SCA runtime MUST determine the compatibility of the policySets at each end of a wire using the~~
1251 ~~compatibility rules of the policy language used for those policySets. The SCA runtime MUST determine~~
1252 ~~the compatibility of the policySets at each end of a wire using the compatibility rules of the policy~~
1253 ~~language used for those policySets. [POL40022] The policySets at each end of a wire MUST be~~
1254 ~~incompatible if they use different policy languages. The policySets at each end of a wire MUST be~~
1255 ~~incompatible if they use different policy languages. [POL40023]~~ However, there is a special case worth
1256 mentioning:

- 1257 • If both sides of the wire use identical policySets (by referring to the same policySet by its QName in
1258 both sides of the wire), then they are compatible.

1259 ~~Where the policy language in use for a wire is WS-Policy, strict WS-Policy intersection MUST be used to~~
1260 ~~determine policy compatibility. Where the policy language in use for a wire is WS-Policy, strict WS-Policy~~
1261 ~~intersection MUST be used to determine policy compatibility. [POL40024]~~

1262 ~~In order for a reference to connect to a particular service, the policies of the reference MUST intersect~~
1263 ~~with the policies of the service. In order for a reference to connect to a particular service, the policies of~~
1264 ~~the reference MUST intersect with the policies of the service. [POL40025]~~

Formatted: Font color: Auto

1265 4.11 Preparing Services and References for External Connection

1266 Services and references are sometimes not intended for SCA wiring, but for communication with software
1267 that is outside of the SCA domain. References can contain bindings that specify the endpoint address of
1268 a service that exists outside of the current SCA domain. Services can specify bindings that can be
1269 exposed to clients that are outside of the SCA domain.

1270 ~~Matching service/reference policies across the SCA Domain boundary MUST use WS-Policy compatibility~~
1271 ~~(strict WS-Policy intersection) if the policies are expressed in WS-Policy syntax. Matching~~
1272 ~~service/reference policies across the SCA Domain boundary MUST use WS-Policy compatibility (strict~~
1273 ~~WS-Policy intersection) if the policies are expressed in WS-Policy syntax. [POL40007]~~ For other policy
1274 languages, the policy language defines the comparison semantics.

Formatted: Font color: Auto

1275 For external services and references that make use of bidirectional interfaces, the same determination
1276 of matching policies has to also take place for the callback.

1277 The policies that apply to the service/reference are computed as discussed in [Guided Selection of](#)
1278 [PolicySets using Intents](#).

1279 4.12 Guided Selection of PolicySets using Intents

1280 This section describes the selection of concrete policies that provide a set of intents
1281 expressed for an element. The purpose is to construct the set of concrete policies that are attached to an
1282 element taking into account the explicitly declared policySets that are attached to an element as well as
1283 policySets that are externally attached. The aim is to satisfy all of the intents expressed for each element.

1284 4.12.1 Matching Intents and PolicySets

1285 **Note:** In the following, the following rule is observed when an intent set is computed.

1286 When a profile intent is encountered in either a global @requires, intent/@requires, <requires> or
1287 policySet/@provides attribute, the profile intent is immediately replaced by the intents that it composes
1288 (i.e. all the intents that appear in the profile intent's @requires attribute). This rule is applied recursively
1289 until profile intents do not appear in an intent set. [This is stated generally here, in order to not have to
1290 restate this at multiple places].

1291 The **required intent set** that is attached to an element is:

- 1292 1. The set of intents specified in the element's @requires attribute.

- 1293 2. add any intents found in any related interface definition or declaration, as described in the section
1294 [Intents on Interfaces](#).
- 1295 3. add any intents found on elements below the target element in its implementation hierarchy as
1296 defined in Rule 1 in Section 4.5
- 1297 4. add any intents found in the @requires attributes [or <requires> child elements](#) of each ancestor
1298 element in the element's structural hierarchy as defined in [Rule 2](#) in Section 4.5
- 1299 5. less any intents that do not include the target element's type in their @constrains attribute.
- 1300 6. remove the unqualified version of an intent if the set also contains a qualified version of that intent

1301 **If the required intent set contains a mutually exclusive pair of intents the SCA runtime MUST reject the**
1302 **document containing the element and raise an error.** **If the required intent set contains a mutually**
1303 **exclusive pair of intents the SCA runtime MUST reject the document containing the element and raise an**
1304 **error.** [POL40017]

1305 The **directly provided intent set** for an element is the set of intents listed in the @alwaysProvides
1306 attribute combined with the set of intents listed in the @mayProvides attribute of the bindingType or
1307 implementationType declaration for a binding or implementation element respectively.

1308 The **set of PolicySets attached to an element** include those **explicitly specified** using the @policySets
1309 attribute or the <policySetAttachment/> element and those which are **externally attached**.

1310 A policySet **applies to** a target element if the result of the XPath expression contained in the policySet's
1311 @appliesTo attribute, when evaluated against the document containing the target element, includes the
1312 target element. For example, @appliesTo="binding.ws[@impl='axis']" matches any binding.ws element
1313 that has an @impl attribute value of 'axis'.

1314 The set of **explicitly specified** policySets for an element is:

- 1315 1. The union of the policySets specified in the element's @policySets attribute and those specified in
1316 any <policySetAttachment/> child element(s).
- 1317 2. add the policySets declared in the @policySets attributes and <policySetAttachment/> elements from
1318 elements in the structural hierarchy of the element.
- 1319 3. remove any policySet where the policySet does not apply to the target element.
1320 *It is not an error for a policySet to be attached to an element to which it doesn't apply.*

1321 The set of **externally attached** policySets for an element is:

- 1322 1. Each <PolicySet/> in the Domain where the element is targeted by the @attachTo attribute of the
1323 policySet
- 1324 2. remove any policySet where the policySet does not apply to the target element.
1325 *It is not an error for a policySet to be attached to an element to which it doesn't apply.*

1326 A policySet **provides an intent** if any of the statements are true:

- 1327 1. The intent is contained in the policySet @provides list.
- 1328 2. The intent is a qualified intent and the unqualified form of the intent is contained in the policySet
1329 @provides list.
- 1330 3. The policySet @provides list contains a qualified form of the intent (where the intent is qualifiable).

1331 **All intents in the required intent set for an element MUST be provided by the directly provided intents set**
1332 **and the set of policySets that apply to the element.** **All intents in the required intent set for an element**
1333 **MUST be provided by the directly provided intents set and the set of policySets that apply to the element.**
1334 [POL40018]

1335 If the combination of implementationType / bindingType / collection of policySets does not satisfy all of
1336 the intents which apply to the element, the configuration is not valid. When the configuration is not valid, it
1337 means that the intents are not being correctly satisfied. However, an SCA Runtime can allow a deployer
1338 to force deployment even in the presence of such errors. The behaviors and options enforced by a
1339 deployer are not specified.

1340

5 Implementation Policies

1341 The basic model for Implementation Policies is very similar to the model for interaction policies described
1342 above. Abstract QoS requirements, in the form of intents, can be associated with SCA component
1343 implementations to indicate implementation policy requirements. These abstract capabilities are mapped
1344 to concrete policies via policySets at deployment time. Alternatively, policies can be associated directly
1345 with component implementations using policySets.

1346 Snippet 5-1 shows how intents can be associated with an implementation:

1347

```
1348 <component name="xs:NCName" ... >  
1349   <implementation.* ... requires="listOfQNames">  
1350     ...  
1351   </implementation>  
1352   ...  
1353 </component>
```

1354 *Snippet 5-1: Example of intents Associated with an implementation*

1355

1356 If, for example, one of the intent names in the value of the @requires attribute is 'logging', this indicates
1357 that all messages to and from the component has to be logged. The technology used to implement the
1358 logging is unspecified. Specific technology is selected when the intent is mapped to a policySet (unless
1359 the implementation type has native support for the intent, as described in the next section). A list of
1360 implementation intents can also be specified by any ancestor element of the <sca:implementation>
1361 element. The effective list of implementation intents is the union of intents specified on the
1362 implementation element and all its ancestors.

1363 In addition, one or more policySets can be specified directly by associating them with the implementation
1364 of a component.

1365

```
1366 <component name="xs:NCName" ... >  
1367   <implementation.* ... policySets="listOfQNames">  
1368     ...  
1369   </implementation>  
1370   ...  
1371 </component>
```

1372 *Snippet 5-2: Example of policySets Associated with an implementation*

1373

1374 Snippet 5-2 shows how intents and policySets can be specified on a component. It is also possible to
1375 specify intents and policySets within the implementation. How this is done is defined by the
1376 implementation type.

1377 The intents and policy sets are specified on the <sca:implementation.*> element within the component
1378 type. This is important because intent and policy set definitions need to be able to specify that they
1379 constrain an appropriate implementation type.

1380

```
1381 <componentType>  
1382   <implementation.* requires="listOfQNames" policySets="listOfQNames">  
1383     ...  
1384   </implementation>  
1385   ...  
1386 </componentType>
```

1387 *Snippet 5-3: intents and policySets Constraining an implementation*

1388

1389 When applying policies, the intents attached to the implementation are added to the intents attached to
1390 the using component. For the explicitly listed policySets, the list in the component can override policySets
1391 from the componentType.

1392 Some implementation intents are targeted at <binding/> elements rather than at <implementation/>
1393 elements. This occurs in cases where there is a need to influence the operation of the binding
1394 implementation code rather than the code directly related to the implementation itself. Implementation
1395 elements of this kind will have a @constrains attribute pointing to a binding element, with a @intentType
1396 of "implementation".

1397 5.1 Natively Supported Intents

1398 Each implementation type (e.g. <sca:implementation.java> or <sca:implementation.bpel>) has an
1399 **implementation type definition** within the SCA Domain. An implementation type definition is declared
1400 using an implementationType element within a <definitions/> declaration. The pseudo-schema for the
1401 implementationType element is shown in Snippet 5-4:

1402

```
1403 <implementationType type="QName"  
1404 alwaysProvides="listOfQNames"? mayProvide="listOfQNames"? />
```

1405 *Snippet 5-4: implementationType Pseudo-Schema*

1406

1407 The implementation Type element has the following attributes:

- 1408 • **name : QName (1..1)** - the name of the implementationType. **The implementationType name attribute**
1409 **MUST be the QName of an XSD global element definition used for implementation elements of that**
1410 **type. The implementationType name attribute MUST be the QName of an XSD global element**
1411 **definition used for implementation elements of that type.** [POL50001] For example:
1412 "sca:implementation.java".
- 1413 • **alwaysProvides : list of QNames (0..1)** - a set of intents. The intents in the alwaysProvides set are
1414 always provided by this implementation type, whether the intents are attached to the using
1415 component or not.
- 1416 • **mayProvide : list of QNames (0..1)** - a set of intents. The intents in the mayProvide set are provided
1417 by this implementation type if the intent in question is attached to the using component.

Formatted: Font color: Auto

1418 5.2 Writing PolicySets for Implementation Policies

1419 The @appliesTo attribute for a policySet takes an XPath expression that is applied to a service,
1420 reference, binding or an implementation element. For implementation policies, in most cases, all that is
1421 needed is the QName of the implementation type. Implementation policies can be expressed using any
1422 policy language (which is to say, any configuration language). For example, XACML or EJB-style
1423 annotations can be used to declare authorization policies. Other capabilities could be configured using
1424 completely proprietary configuration formats.

1425 For example, a policySet declared to turn on trace-level logging for a BPEL component would be declared
1426 as is Snippet 5-5:

1427

```
1428 <policySet name="loggingPolicy" provides="acme:logging.trace"  
1429 appliesTo="sca:implementation.bpel" ...>  
1430 <acme:processLogging level="3"/>  
1431 </policySet>
```

1432 *Snippet 5-5: Example policySet Applied to implementation.bpel*

1433 **5.2.1 Non WS-Policy Examples**

1434 Authorization policies expressed in XACML [could](#) be used in the framework in two ways:

1435 1. Embed XACML expressions directly in the PolicyAttachment element using the extensibility elements
1436 discussed above, or

1437 2. Define WS-Policy assertions to wrap XACML expressions.

1438 For EJB-style authorization policy, [the same approach could be used](#):

1439 1. Embed EJB-annotations in the PolicyAttachment element using the extensibility elements discussed
1440 above, or

1441 2. Use the WS-Policy assertions defined as wrappers for EJB annotations.

1442 6 Roles and Responsibilities

1443 There are 4 roles that are significant for the SCA Policy Framework. The following is a list of the roles and
1444 the artifacts that the role creates:

- 1445 • Policy Administrator – policySet definitions and intent definitions
- 1446 • Developer – Implementations and component types
- 1447 • Assembler - Composites
- 1448 • Deployer – Composites and the SCA Domain (including the logical Domain-level composite)

1449 6.1 Policy Administrator

1450 An intent represents a requirement that a developer or assembler can make, which ultimately have to be
1451 satisfied at runtime. The full definition of the requirement is the informal text description in the intent
1452 definition.

1453 The **policy administrator**'s job is to both define the intents that are available and to define the policySets
1454 that represent the concrete realization of those informal descriptions for some set of binding type or
1455 implementation types. See the sections on intent and policySet definitions for the details of those
1456 definitions.

1457 6.2 Developer

1458 When it is possible for a component to be written without assuming a specific binding type for its services
1459 and references, then the **developer** uses intents to specify requirements in a binding neutral way.

1460 If the developer requires a specific binding type for a component, then the developer can specify bindings
1461 and policySets with the implementation of the component. Those bindings and policySets will be
1462 represented in the component type for the implementation (although that component type might be
1463 generated from the implementation).

1464 If any of the policySets used for the implementation include intentMaps, then the default choice for the
1465 intentMap can be overridden by an assembler or deployer by requiring a qualified intent that is present in
1466 the intentMap.

1467 6.3 Assembler

1468 An **assembler** creates composites. Because composites are implementations, an assembler is like a
1469 developer, except that the implementations created by an assembler are composites made up of other
1470 components wired together. So, like other developers, the assembler can specify intents or bindings or
1471 policySets on any service or reference of the composite.

1472 However, in addition the definition of composite-level services and references, it is also possible for the
1473 assembler to use the policy framework to further configure components within the composite. The
1474 assembler can add additional requirements to any component's services or references or to the
1475 component itself (for implementation policies). The assembler can also override the bindings or
1476 policySets used for the component. See the assembly specification's description of overriding rules for
1477 details on overriding.

1478 As a shortcut, an assembler can also specify intents and policySets on any element in the composite
1479 definition, which has the same effect as specifying those intents and policySets on every applicable
1480 binding or implementation below that element (where applicability is determined by the @appliesTo
1481 attribute of the policySet definition or the @constrains attribute of the intent definition).

1482 **6.4 Deployer**

1483 A **deployer** deploys implementations (typically composites) into the SCA Domain. It is the
1484 deployers job to make the final decisions about all configurable aspects of an implementation that is to be
1485 deployed and to make sure that all intents are satisfied.

1486 If the deployer determines that an implementation is correctly configured as it is, then the implementation
1487 can be deployed directly. However, more typically, the deployer will create a new composite, which
1488 contains a component for each implementation to be deployed along with any changes to the bindings or
1489 policySets that the deployer desires.

1490 When the deployer is determining whether the existing list of policySets is correct for a component, the
1491 deployer needs to consider both the explicitly listed policySets as well as the policySets that will be
1492 chosen according to the algorithm specified in [Guided Selection of PolicySets using Intents](#).

1493

7 Security Policy

1494 The SCA Security Model provides SCA developers the flexibility to specify the necessary level of security
1495 protection for their components to satisfy business requirements without the burden of understanding
1496 detailed security mechanisms.

1497 The SCA Policy framework distinguishes between two types of policies: **interaction policy** and
1498 **implementation policy**. Interaction policy governs the communications between clients and service
1499 providers and typically applies to Services and References. In the security space, interaction policy is
1500 concerned with client and service provider authentication and message protection requirements.
1501 Implementation policy governs security constraints on service implementations and typically applies to
1502 Components. In the security space, implementation policy concerns include access control, identity
1503 delegation, and other security quality of service characteristics that are pertinent to the service
1504 implementations.

1505 The SCA security interaction policy can be specified via intents or policySets. Intents represent security
1506 quality of service requirements at a high abstraction level, independent from security protocols, while
1507 policySets specify concrete policies at a detailed level, which are typically security protocol specific.

1508 The SCA security policy can be specified either in an SCA composite or by using the External Policy
1509 Attachment Mechanism or by annotations in the implementation code. Language-specific annotations are
1510 described in the respective language Client and Implementation specifications.

7.1 SCA Security Intents

1512 The SCA security specification defines the following intents to specify interaction policy:

1513 serverAuthentication, clientAuthentication, confidentiality, and integrity.

- 1514 • **serverAuthentication** – **When serverAuthentication is present, an SCA runtime MUST ensure that**
1515 **the server is authenticated by the client. When serverAuthentication is present, an SCA runtime MUST**
1516 **ensure that the server is authenticated by the client.** [POL70013]
- 1517 • **clientAuthentication** – **When clientAuthentication is present, an SCA runtime MUST ensure that the**
1518 **client is authenticated by the server. When clientAuthentication is present, an SCA runtime MUST**
1519 **ensure that the client is authenticated by the server.** [POL70014]
- 1520 • **authentication** – this is a profile intent that requires only clientAuthentication. It is included for
1521 backwards compatibility.
- 1522 • **mutualAuthentication** – this is a profile intent that includes the serverAuthentication and the
1523 clientAuthentication intents just described.
- 1524 • **confidentiality** – the confidentiality intent is used to indicate that the contents of a message are
1525 accessible only to those authorized to have access (typically the service client and the service
1526 provider). A common approach is to encrypt the message, although other methods are possible.
1527 **When confidentiality is present, an SCA Runtime MUST ensure that only authorized entities can view**
1528 **the contents of a message.** [POL70009]
- 1529 • **integrity** – the integrity intent is used to indicate that assurance is that the contents of a message
1530 have not been tampered with and altered between sender and receiver. A common approach is to
1531 digitally sign the message, although other methods are possible. **When integrity is present, an SCA**
1532 **Runtime MUST ensure that the contents of a message are not altered. When integrity is present, an**
1533 **SCA Runtime MUST ensure that the contents of a message are not altered.** [POL70010]

1534 The formal definitions of these intents are in the [Intent Definitions appendix](#).

Formatted: Font color: Auto

Formatted: Font color: Auto

1535 **7.2 Interaction Security Policy**

1536 Any one of the three security intents can be further qualified to specify more specific business
1537 requirements. Two qualifiers are defined by the SCA security specification: transport and message, which
1538 can be applied to any of the above three intent's.

1539 **7.2.1 Qualifiers**

1540 **transport** – the transport qualifier specifies that the qualified intent is realized at the transport or transfer
1541 layer of the communication protocol, such as HTTPS. When a serverAuthentication, clientAuthentication,
1542 confidentiality or integrity intent is qualified by message, an SCA Runtime MUST delegate
1543 serverAuthentication, clientAuthentication, confidentiality and integrity, respectively, to the message layer
1544 of the communication protocol. [POL70011]

1545 **message** – the message qualifier specifies that the qualified intent is realized at the message level of the
1546 communication protocol. When a serverAuthentication, clientAuthentication, confidentiality or integrity
1547 intent is qualified by message, an SCA Runtime MUST delegate serverAuthentication,
1548 clientAuthentication, confidentiality and integrity, respectively, to the message layer of the communication
1549 protocol. When a serverAuthentication, clientAuthentication, confidentiality or integrity intent is qualified by
1550 message, an SCA Runtime MUST delegate serverAuthentication, clientAuthentication, confidentiality and
1551 integrity, respectively, to the message layer of the communication protocol. [POL70012]

1552

1553 Snippet 7-1 shows the usage of intents and qualified intents.

1554

```
1555 <composite name="example" requires="confidentiality">  
1556   <service name="foo"/>  
1557   ...  
1558   <reference name="bar" requires="confidentiality.message"/>  
1559 </composite>
```

1560 *Snippet 7-1: Example using Qualified Intents*

1561

1562 In this case, the composite declares that all of its services and references have to guarantee
1563 confidentiality in their communication by setting requires="confidentiality". This applies to the "foo"
1564 service. However, the "bar" reference further qualifies that requirement to specifically require message-
1565 level security by setting requires="confidentiality.message".

1566 **7.3 Implementation Security Policy Intent**

1567 The SCA Security specification defines the **authorization** intent to specify implementation policy.

1568 **authorization** – the authorization intent is used to indicate that a client needs to be authorized before
1569 being allowed to use the service. Being authorized means that a check is made as to whether any
1570 policies apply to the client attempting to use the service, and if so, those policies govern whether or not
1571 the client is allowed access. When authorization is present, an SCA Runtime MUST ensure that the client
1572 is authorized to use the service. When authorization is present, an SCA Runtime MUST ensure that the
1573 client is authorized to use the service. [POL70001]

1574 This unqualified authorization intent implies that basic "Subject-Action-Resource" authorization support is
1575 required, where Subject may be as simple as a single identifier representing the identity of the client,
1576 Action may be a single identifier representing the operation the client intends to apply to the Resource,
1577 and the Resource may be a single identifier representing the identity of the Resource to which the Action
1578 is intended to be applied.

1579 **7.3.1 Qualifier**

1580 ***fineGrain*** – the fineGrain qualifier specifies that the component requires authorization capabilities more
1581 complex than simple Subject-Action-Resource which is provided by the unqualified authorization intent.

1582

8 Reliability Policy

1583

Failures can affect the communication between a service consumer and a service provider.

1584

Depending on the characteristics of the binding, these failures could cause messages to be redelivered, delivered in a different order than they were originally sent out or even worse, could cause messages to be lost. Some transports like JMS provide built-in reliability features such as "at least once" and "exactly once" message delivery. Other transports like HTTP need to have additional layers built on top of them to provide some of these features.

1586

1587

1588

1589

The events that occur due to failures in communication can affect the outcome of the service invocation. For an implementation of a stock trade service, a message redelivery could result in a new trade. A client (i.e. consumer) of the same service could receive a fault message if trade orders are not delivered to the service implementation in the order they were sent out. In some cases, these failures could have dramatic consequences.

1590

1591

1592

1593

1594

An SCA developer can anticipate some types of failures and work around them in service implementations. For example, the implementation of a stock trade service could be designed to support duplicate message detection. An implementation of a purchase order service could have built in logic that orders the incoming messages. In these cases, service implementations don't need the binding layers to provide these reliability features (e.g. duplicate message detection, message ordering). However, this comes at a cost: extra complexity is built in the service implementation. Along with business logic, the service implementation has additional logic that handles these failures.

1595

1596

1597

1598

1599

1600

1601

Although service implementations can work around some of these types of failures, it is worth noting that workarounds are not always possible. A message can be lost or expire even before it is delivered to the service implementation.

1602

1603

1604

Instead of handling some of these issues in the service implementation, a better way is to use a binding or a protocol that supports reliable messaging. This is better, not just because it simplifies application development, it can also lead to better throughput. For example, there is less need for application-level acknowledgement messages. A binding supports reliable messaging if it provides features such as message delivery guarantees, duplicate message detection and message ordering.

1605

1606

1607

1608

1609

It is very important for the SCA developer to be able to require, at design-time, a binding or protocol that supports reliable messaging. SCA defines a set of policy intents that can be used for specifying reliable messaging Quality of Service requirements. These reliable messaging intents establish a contract between the binding layer and the application layer (i.e. service implementation or the service consumer implementation) (see below).

1610

1611

1612

1613

1614

8.1 Policy Intents

1615

Based on the use-cases described above, the following policy intents are defined:

1616

1. **atLeastOnce** - The binding implementation guarantees that a message that is successfully sent by a service consumer is delivered to the destination (i.e. service implementation). The message could be delivered more than once to the service implementation. **When atLeastOnce is present, an SCA Runtime MUST deliver a message to the destination service implementation, and MAY deliver duplicates of a message to the service implementation. When atLeastOnce is present, an SCA Runtime MUST deliver a message to the destination service implementation, and MAY deliver duplicates of a message to the service implementation. [POL80001]**

1617

1618

1619

1620

1621

1622

The binding implementation guarantees that a message that is successfully sent by a service implementation is delivered to the destination (i.e. service consumer). The message could be delivered more than once to the service consumer.

1623

1624

1625

1626

2. **atMostOnce** - The binding implementation guarantees that a message that is successfully sent by a service consumer is not delivered more than once to the service implementation. The binding implementation does not guarantee that the message is delivered to the service implementation.

1627

1628

1629 | **When *atMostOnce* is present, an SCA Runtime MAY deliver a message to the destination service**
1630 | **implementation, and MUST NOT deliver duplicates of a message to the service implementation.****When**
1631 | ***atMostOnce* is present, an SCA Runtime MAY deliver a message to the destination service**
1632 | **implementation, and MUST NOT deliver duplicates of a message to the service implementation.**
1633 | [POL80002]

1634 | The binding implementation guarantees that a message that is successfully sent by a service
1635 | implementation is not delivered more than once to the service consumer. The binding implementation
1636 | does not guarantee that the message is delivered to the service consumer.

1637 | 3. **ordered** – The binding implementation guarantees that the messages sent by a service client via a
1638 | single service reference are delivered to the target service implementation in the order in which they
1639 | were sent by the service client. This intent does not guarantee that messages that are sent by a
1640 | service client are delivered to the service implementation. Note that this intent has nothing to say
1641 | about the ordering of messages sent via different service references by a single service client, even if
1642 | the same service implementation is targeted by each of the service references. **When *ordered* is**
1643 | **present, an SCA Runtime MUST deliver messages sent by a single source to a single destination**
1644 | **service implementation in the order that the messages were sent by that source.****When *ordered* is**
1645 | **present, an SCA Runtime MUST deliver messages sent by a single source to a single destination**
1646 | **service implementation in the order that the messages were sent by that source.** [POL80003]

1647 | For service interfaces that involve messages being sent back from the service implementation to the
1648 | service client (eg. a service with a callback interface), for this intent, the binding implementation
1649 | guarantees that the messages sent by the service implementation over a given wire are delivered to
1650 | the service client in the order in which they were sent by the service implementation. This intent does
1651 | not guarantee that messages that are sent by the service implementation are delivered to the service
1652 | consumer.

1653 | 4. **exactlyOnce** - The binding implementation guarantees that a message sent by a service consumer is
1654 | delivered to the service implementation. Also, the binding implementation guarantees that the
1655 | message is not delivered more than once to the service implementation. **When *exactlyOnce* is**
1656 | **present, an SCA Runtime MUST deliver a message to the destination service implementation and**
1657 | **MUST NOT deliver duplicates of a message to the service implementation.****When *exactlyOnce* is**
1658 | **present, an SCA Runtime MUST deliver a message to the destination service implementation and**
1659 | **MUST NOT deliver duplicates of a message to the service implementation.** [POL80004]

1660 | The binding implementation guarantees that a message sent by a service implementation is delivered
1661 | to the service consumer. Also, the binding implementation guarantees that the message is not
1662 | delivered more than once to the service consumer.

1663 | NOTE: This is a profile intent, which is composed of *atLeastOnce* and *atMostOnce*.

1664 | This is the most reliable intent since it guarantees the following:

- 1665 | – message delivery – all the messages sent by a sender are delivered to the service
1666 | implementation (i.e. Java class, BPEL process, etc.).
- 1667 | – duplicate message detection and elimination – a message sent by a sender is not processed
1668 | more than once by the service implementation.

1669 | The formal definitions of these intents are in the [Intent Definitions appendix](#).

1670 | How can a binding implementation guarantee that a message that it receives is delivered to the service
1671 | implementation? One way to do it is by persisting the message and keeping redelivering it until it is
1672 | processed by the service implementation. That way, if the system crashes after delivery but while
1673 | processing it, the message will be redelivered on restart and processed again. Since a message could be
1674 | delivered multiple times to the service implementation, this technique usually requires the service
1675 | implementation to perform duplicate message detection. However, that is not always possible. Often
1676 | times service implementations that perform critical operations are designed without having support for
1677 | duplicate message detection. Therefore, they cannot *process* an incoming
1678 | message more than once.

1679 Also, consider the scenario where a message is delivered to a service implementation that does not
1680 handle duplicates - the system crashes after a message is delivered to the service implementation but
1681 before it is completely processed. Does the underlying layer redeliver the message on restart? If it did
1682 that, there is a risk that some critical operations (e.g. sending out a JMS message or updating a DB table)
1683 will be executed again when the message is processed. On the other hand, if the underlying layer does
1684 not redeliver the message, there is a risk that the message is never completely processed.

1685 This issue cannot be safely solved unless all the critical operations performed by the service
1686 implementation are running in a transaction. Therefore, *exactlyOnce* cannot be assured without involving
1687 the service implementation. In other words, an *exactlyOnce* message delivery does not guarantee
1688 *exactlyOnce* message processing unless the service implementation is transactional. It's worth noting that
1689 this is a necessary condition but not sufficient. The underlying layer (e.g. binding implementation,
1690 container) would have to ensure that a message is not redelivered to the service implementation after the
1691 transaction is committed. As an example, a way to ensure it when the binding uses JMS is by making
1692 sure the operation that acknowledges the message is executed in the same transaction the service
1693 implementation is running in.

1694 **8.2 End-to-end Reliable Messaging**

1695 Failures can occur at different points in the message path: in the binding layer on the sender side, in the
1696 transport layer or in the binding layer on the receiver side. The SCA service developer doesn't really care
1697 where the failure occurs. Whether a message was lost due to a network failure or due to a crash of the
1698 machine where the service is deployed, is not that important. What is important is that the contract
1699 between the application layer (i.e. service implementation or service consumer) and the binding layer is
1700 not violated (e.g. a message that was successfully transmitted by a sender is always delivered to the
1701 destination; a message that was successfully transmitted by a sender is not delivered more than once to
1702 the service implementation, etc). It is worth noting that the binding layer could throw an exception when a
1703 sender (e.g. service consumer, service implementation) sends a message out. This is not considered a
1704 successful message transmission.

1705 In order to ensure the semantics of the reliable messaging intents, the entire message path, which is
1706 composed of the binding layer on the client side, the transport layer and the binding layer on the service
1707 side, has to be reliable.

1708

9 Transactions

1709 SCA recognizes that the presence or absence of infrastructure for ACID transaction coordination has a
1710 direct effect on how business logic is coded. In the absence of ACID transactions, developers have to
1711 provide logic that coordinates the outcome, compensates for failures, etc. In the presence of ACID
1712 transactions, the underlying infrastructure is responsible for ensuring the ACID nature of all interactions.
1713 SCA provides declarative mechanisms for describing the transactional environment needed by the
1714 business logic.

1715 Components that use a synchronous interaction style can be part of a single, distributed ACID transaction
1716 within which all transaction resources are coordinated to either atomically commit or rollback. The
1717 transmission or receipt of oneway messages can, depending on the transport binding, be coordinated as
1718 part of an ACID transaction as illustrated in the [OneWay Invocations](#) section below.
1719 Well-known, higher-level patterns such as store-and-forward queuing can be accomplished by composing
1720 transacted one-way messages with reliable-messaging policies.

1721 This document describes the set of abstract policy intents – both implementation intents and interaction
1722 intents – that can be used to describe the requirements on a concrete service component and binding
1723 respectively.

9.1 Out of Scope

1724 The following topics are outside the scope of this document:

- 1726 • The means by which transactions are created, propagated and established as part of an execution
1727 context. These are details of the SCA runtime provider and binding provider.
- 1728 • The means by which a transactional resource manager (RM) is accessed. These include, but are not
1729 restricted to:
 - 1730 – abstracting an RM as an `sca:component`
 - 1731 – accessing an RM directly in a language-specific and RM-specific fashion
 - 1732 – abstracting an RM as an `sca:binding`

9.2 Common Transaction Patterns

1734 In the absence of any transaction policies there is no explicit transactional behavior defined for the SCA
1735 service component or the interactions in which it is involved and the transactional behavior is
1736 environment-specific. An SCA runtime provider can choose to define an out of band default transactional
1737 behavior that applies in the absence of any transaction policies.

1738 Environment-specific default transactional behavior can be overridden by specifying transactional intents
1739 described in this document. The most common transaction patterns can be summarized:

1740 **Managed, shared global transaction pattern** – the service always runs in a global transaction context
1741 regardless of whether the requester runs under a global transaction. If the requester does run under a
1742 transaction, the service runs under the same transaction. Any outbound, synchronous request-response
1743 messages will – unless explicitly directed otherwise – propagate the service's transaction context. This
1744 pattern offers the highest degree of data integrity by ensuring that any transactional updates are
1745 committed atomically

1746 **Managed, local transaction pattern** – the service always runs in a managed local transaction context
1747 regardless of whether the requester runs under a transaction. Any outbound messages will not propagate
1748 any transaction context. This pattern is advisable for services that wish the SCA runtime to demarcate
1749 any resource manager local transactions and do not require the overhead of atomicity.

1750 The use of transaction policies to specify these patterns is illustrated later in [Table 9-2](#) and [Table 9-3](#).

Formatted: Font: Italic

1751 9.3 Summary of SCA transaction policies

1752 This specification defines implementation and interaction policies that relate to transactional QoS in
1753 components and their interactions. The SCA transaction policies are specified as intents which represent
1754 the transaction quality of service behavior offered by specific component implementations or bindings.

1755 SCA transaction policy can be specified either in an SCA composite or annotatively in the implementation
1756 code. Language-specific annotations are described in the respective language binding specifications, for
1757 example the [SCA Java Common Annotations and APIs specification](#) [SCA-Java-Annotations].

1758 This specification defines the following implementation transaction policies:

- 1759 • managedTransaction – Describes the service component’s transactional environment.
- 1760 • transactedOneWay and immediateOneWay – two mutually exclusive intents that describe whether
1761 the SCA runtime will process OneWay messages immediately or will enqueue (from a client
1762 perspective) and dequeue (from a service perspective) a OneWay message as part of a global
1763 transaction.

1764 This specification also defines the following interaction transaction policies:

- 1765 • propagatesTransaction and suspendsTransaction – two mutually exclusive intents that describe
1766 whether the SCA runtime propagates any transaction context to a service or reference on a
1767 synchronous invocation.

1768 Finally, this specification defines a profile intent called managedSharedTransaction that combines the
1769 managedTransaction intent and the propagatesTransaction intent so that the **managed, shared global**
1770 **transaction pattern** is easier to configure.

1771 9.4 Global and local transactions

1772 This specification describes “managed transactions” in terms of either “global” or “local” transactions. The
1773 “managed” aspect of managed transactions refers to the transaction environment provided by the SCA
1774 runtime for the business component. Business components can interact with other business components
1775 and with resource managers. The managed transaction environment defines the transactional context
1776 under which such interactions occur.

1777 9.4.1 Global transactions

1778 From an SCA perspective, a global transaction is a unit of work scope within which transactional work is
1779 atomic. If multiple transactional resource managers are accessed under a global transaction then the
1780 transactional work is coordinated to either atomically commit or rollback regardless using a 2PC protocol.
1781 A global transaction can be propagated on synchronous invocations between components – depending
1782 on the interaction intents described in this specification - such that multiple, remote service providers can
1783 execute distributed requests under the same global transaction.

1784 9.4.2 Local transactions

1785 From a resource manager perspective a resource manager local transaction (RMLT) is simply the
1786 absence of a global transaction. But from an SCA perspective it is not enough to simply declare that a
1787 piece of business logic runs without a global transaction context. Business logic might need to access
1788 transactional resource managers without the presence of a global transaction. The business logic
1789 developer still needs to know the expected semantic of making one or more calls to one or more resource
1790 managers, and needs to know when and/or how the resource managers local transactions will be
1791 committed. The term *local transaction containment* (LTC) is used to describe the SCA environment where
1792 there is no global transaction. The boundaries of an LTC are scoped to a remotable service provider
1793 method and are not propagated on invocations between components. Unlike the resources in a global
1794 transaction, RMLTs coordinated within a LTC can fail independently.

1795

1796 The two most common patterns for components using resource managers outside a global transaction
1797 are:

- 1798 • The application desires each interaction with a resource manager to commit after every interaction.
1799 This is the default behavior provided by the **noManagedTransaction** policy (defined below in
1800 Transaction implementation policy) in the absence of explicit use of RMLT verbs by the application.
- 1801 • The application desires each interaction with a resource manager to be part of an extended local
1802 transaction that is committed at the end of the method. This behavior is specified by the
1803 **managedTransaction.local** policy (defined below in Transaction implementation policy).

1804 While an application can use interfaces provided by the resource adapter to explicitly demarcate resource
1805 manager local transactions (RMLT), this is a generally undesirable burden on applications, which typically
1806 prefer all transaction considerations to be managed by the SCA runtime. In addition, once an application
1807 codes to a resource manager local transaction interface, it might never be redeployed with a different
1808 transaction environment since local transaction interfaces might not be used in the presence of a global
1809 transaction. This specification defines intents to support both these common patterns in order to provide
1810 portability for applications regardless of whether they run under a global transaction or not.

1811 9.5 Transaction implementation policy

1812 9.5.1 Managed and non-managed transactions

1813 The mutually exclusive **managedTransaction** and **noManagedTransaction** intents describe the
1814 transactional environment needed by a service component or composite. SCA provides transaction
1815 environments that are managed by the SCA runtime in order to remove the burden of coding transaction
1816 APIs directly into the business logic. The **managedTransaction** and **noManagedTransaction** intents
1817 can be attached to the `sca:composite` or `sca:componentType` elements.

1818 The mutually exclusive **managedTransaction** and **noManagedTransaction** intents are defined as
1819 follows:

- 1820 • **managedTransaction** – a managed transaction environment is necessary in order to run this
1821 component. The specific type of managedTransaction needed is not constrained. The valid qualifiers
1822 for this intent are mutually exclusive.
 - 1823 – **managedTransaction.global** – There has to be an atomic transaction in order to run this
1824 component. For a component marked with `managedTransaction.global`, the SCA runtime
1825 MUST ensure that a global transaction is present before dispatching any method on the
1826 component. [POL90003] The SCA runtime uses any transaction propagated from the client
1827 or else begins and completes a new transaction. See the **propagatesTransaction** intent
1828 below for more details.
 - 1829 – **managedTransaction.local** – indicates that the component cannot tolerate running as part
1830 of a global transaction. A component marked with `managedTransaction.local` MUST run
1831 within a local transaction containment (LTC) that is started and ended by the SCA runtime.
1832 [POL90004] Any global transaction context that is propagated to the hosting SCA runtime is
1833 not visible to the target component. Any interaction under this policy with a resource manager
1834 is performed in an extended resource manager local transaction (RMLT). Upon successful
1835 completion of the invoked service method, any RMLTs are implicitly requested to commit by
1836 the SCA runtime. Note that, unlike the resources in a global transaction, RMLTs so
1837 coordinated in a LTC can fail independently. If the invoked service method completes with a
1838 non-business exception then any RMLTs are implicitly rolled back by the SCA runtime. In this
1839 context a business exception is any exception that is declared on the component interface
1840 and is therefore anticipated by the component implementation. The manner in which
1841 exceptions are declared on component interfaces is specific to the interface type – for
1842 example, Java interface types declare Java exceptions, WSDL interface types define
1843 `wsdl:faults`. Local transactions MUST NOT be propagated outbound across remotable
1844 interfaces. [POL90006]

- 1845 • **noManagedTransaction** – indicates that the component runs without a managed transaction, under
1846 neither a global transaction nor an LTC. A transaction that is propagated to the hosting SCA runtime
1847 MUST NOT be joined by the hosting runtime on behalf of a component marked with
1848 noManagedTransaction. [POL90007] When interacting with a resource manager under this policy, the
1849 application (and not the SCA runtime) is responsible for controlling any resource manager local
1850 transaction boundaries, using resource-provider specific interfaces (for example a Java
1851 implementation accessing a JDBC provider has to choose whether a Connection is set to
1852 autoCommit(true) or else it has to call the Connection commit or rollback method). SCA defines no
1853 APIs for interacting with resource managers.
- 1854 • **(absent)** – The absence of a transaction implementation intent leads to runtime-specific behavior. A
1855 runtime that supports global transaction coordination can choose to provide a default behavior that is
1856 the managed, shared global transaction pattern but it is not mandated to do so.
- 1857 The formal definitions of these intents are in the [Intent Definitions appendix](#).

1858 9.5.2 OneWay Invocations

1859 When a client uses a reference and sends a OneWay message then any client transaction context is not
1860 propagated. However, the OneWay invocation on the reference can itself be **transacted**. Similarly, from a
1861 service perspective, any received OneWay message cannot propagate a transaction context but the
1862 delivery of the OneWay message can be **transacted**. A **transacted** OneWay message is a one-way
1863 message that - because of the capability of the service or reference binding - can be enqueued (from a
1864 client perspective) or dequeued (from a service perspective) as part of a global transaction.

1865 SCA defines two mutually exclusive implementation intents, **transactedOneWay** and
1866 **immediateOneWay**, that determine whether OneWay messages are transacted or delivered immediately.

1867 Either of these intents can be attached to the sca:service or sca:reference elements or they can be
1868 attached to the sca:component element, indicating that the intent applies to any service or reference
1869 element children.

1870 The intents are defined as follows:

- 1871 • **transactedOneWay** – When a reference is marked as transactedOneWay, any OneWay invocation
1872 messages MUST be transacted as part of a client global transaction. [POL90008]
1873 If the client component is not configured to run under a global transaction or if the binding does not
1874 support transactional message sending, then a reference MUST NOT be marked as
1875 transactedOneWay. [POL90009] If a service is marked as transactedOneWay, any OneWay
1876 invocation message MUST be received from the transport binding in a transacted fashion, under the
1877 target service's global transaction. [POL90010] The receipt of the message from the binding is not
1878 committed until the service transaction commits; if the service transaction is rolled back the
1879 message remains available for receipt under a different service transaction. If the component is not
1880 configured to run under a global transaction or if the binding does not support transactional message
1881 receipt, then a service MUST NOT be marked as transactedOneWay. [POL90011]
- 1882 • **immediateOneWay** – When applied to a reference indicates that any OneWay invocation messages
1883 MUST be sent immediately regardless of any client transaction. [POL90012] When applied to a
1884 service indicates that any OneWay invocation MUST be received immediately regardless of any
1885 target service transaction. [POL90013] The outcome of any transaction under which an
1886 immediateOneWay message is processed has no effect on the processing (sending or receipt) of that
1887 message.

1888 The absence of either intent leads to runtime-specific behavior. The SCA runtime can send or receive a
1889 OneWay message immediately or as part of any sender/receiver transaction. The results of combining
1890 this intent and the **managedTransaction** implementation policy of the component sending or receiving
1891 the transacted OneWay invocation are summarized below in Table 9-1.

1892

transacted/immediate intent	managedTransaction (client or service implementation intent)	Results
transactedOneWay	managedTransaction.global	OneWay interaction (either client message enqueue or target service dequeue) is committed as part of the global transaction.
transactedOneWay	managedTransaction.local or noManagedTransaction	If a transactedOneWay intent is combined with the managedTransaction.local or noManagedTransaction implementation intents for either a reference or a service then an error MUST be raised during deployment. If a transactedOneWay intent is combined with the managedTransaction.local or noManagedTransaction implementation intents for either a reference or a service then an error MUST be raised during deployment. [POL90027]
immediateOneWay	Any value of managedTransaction	The OneWay interaction occurs immediately and is not transacted.
<absent>	Any value of managedTransaction	Runtime-specific behavior. The SCA runtime can send or receive a OneWay message immediately or as part of any sender/receiver transaction.

1893 Table 9-1 Transacted OneWay interaction intent

1894

1895 The formal definitions of these intents are in the [Intent Definitions appendix](#).

1896 9.6 Transaction interaction policies

1897 The mutually exclusive *propagatesTransaction* and *suspendsTransaction* intents can be attached
 1898 either to an interface (e.g. Java annotation or WSDL attribute) or explicitly to an `sca:service` and
 1899 `sca:reference` XML element to describe how any client transaction context will be made available and
 1900 used by the target service component. Section 9.6.1 considers how these intents apply to service
 1901 elements and Section 9.6.2 considers how these intents apply to reference elements.

1902 The formal definitions of these intents are in the [Intent Definitions appendix](#).

1903 9.6.1 Handling Inbound Transaction Context

1904 The mutually exclusive *propagatesTransaction* and *suspendsTransaction* intents can be attached to
 1905 an `sca:service` XML element to describe how a propagated transaction context is handled by the SCA
 1906 runtime, prior to dispatching a service component. If the service requester is running within a transaction
 1907 and the service interaction policy is to propagate that transaction, then the primary business effects of the
 1908 provider's operation are coordinated as part of the client's transaction – if the client rolls back its
 1909 transaction, then work associated with the provider's operation will also be rolled back. This allows clients
 1910 to know that no compensation business logic is necessary since transaction rollback can be used.

1911 These intents specify a contract that has to be implemented by the SCA runtime. This aspect of a
 1912 service component is most likely captured during application design. The *propagatesTransaction* or

1913 **suspendsTransaction** intent can be attached to sca:service elements and their children. The intents are
1914 defined as follows:

- 1915 • **propagatesTransaction** – A service marked with propagatesTransaction MUST be dispatched under
1916 any propagated (client) transaction. [POL90015] Use of the **propagatesTransaction** intent on a
1917 service implies that the service binding MUST be capable of receiving a transaction context. Use of
1918 the **propagatesTransaction** intent on a service implies that the service binding MUST be capable of
1919 receiving a transaction context. [POL90016] However, it is important to understand that some
1920 binding/policySet combinations that provide this intent for a service will *need* the client to propagate a
1921 transaction context.
1922 In SCA terms, for a reference wired to such a service, this implies that the reference has to use either
1923 the **propagatesTransaction** intent or a binding/policySet combination that does propagate a
1924 transaction. If, on the other hand, the service does not *need* the client to provide a transaction (even
1925 though it has the *capability* of joining the client's transaction), then some care is needed in the
1926 configuration of the service. One approach to consider in this case is to use two distinct bindings on
1927 the service, one that uses the **propagatesTransaction** intent and one that does not - clients that do
1928 not propagate a transaction would then wire to the service using the binding without the
1929 **propagatesTransaction** intent specified.

- 1930 • **suspendsTransaction** – A service marked with suspendsTransaction MUST NOT be dispatched
1931 under any propagated (client) transaction. [POL90017]

1932 The absence of either interaction intent leads to runtime-specific behavior; the client is unable to
1933 determine from transaction intents whether its transaction will be joined.

1934 The SCA runtime MUST ignore the propagatesTransaction intent for OneWay methods. [POL90025]

1935 These intents are independent from the implementation's **managedTransaction** intent and provides no
1936 information about the implementation's transaction environment.

1937 The combination of these service interaction policies and the **managedTransaction** implementation
1938 policy of the containing component completely describes the transactional behavior of an invoked service,
1939 as summarized in [Table 9-2](#)~~Table 9-3~~:

1940

service interaction intent	managedTransaction (component implementation intent)	Results
propagatesTransaction	managedTransaction.global	Component runs in propagated transaction if present, otherwise a new global transaction. This combination is used for the managed, shared global transaction pattern described in Common Transaction Patterns. This is equivalent to the managedSharedTransaction intent defined in section 9.6.3.
propagatesTransaction	managedTransaction.local or noManagedTransaction	A service MUST NOT be marked with "propagatesTransaction" if the component is marked with "managedTransaction.local" or with "noManagedTransaction". A service MUST NOT be marked with "propagatesTransaction" if the component is marked with "managedTransaction.local" or with "noManagedTransaction". [POL90019]
suspendsTransaction	managedTransaction.global	Component runs in a new global transaction
suspendsTransaction	managedTransaction.local	Component runs in a managed local transaction containment. This combination is used for the managed, local transaction pattern described in Common Transaction Patterns. This is the default behavior for a runtime that does not support global transactions.
suspendsTransaction	noManagedTransaction	Component is responsible for managing its own local transactional resources.

1941 Table 9-23 Combining service transaction intents

1942

1943 Note - the absence of either interaction or implementation intents leads to runtime-specific behavior. A
 1944 runtime that supports global transaction coordination can choose to provide a default behavior that is the
 1945 managed, shared global transaction pattern.

1946 **9.6.2 Handling Outbound Transaction Context**

1947 The mutually exclusive **propagatesTransaction** and **suspendsTransaction** intents can also be attached
 1948 to an sca:reference XML element to describe whether any client transaction context is propagated to a
 1949 target service when a synchronous interaction occurs through the reference. These intents specify a
 1950 contract that has to be implemented by the SCA runtime. This aspect of a service component is most
 1951 likely captured during application design.

1952 Either the **propagatesTransaction** or **suspendsTransaction** intent can be attached to sca:service
 1953 elements and their children. The intents are defined as defined in Section 9.6.1.

1954 When used as a reference interaction intent, the meaning of the qualifiers is as follows:

- 1955 • **propagatesTransaction** – When a reference is marked with `propagatesTransaction`, any transaction
1956 context under which the client runs MUST be propagated when the reference is used for a request-
1957 response interaction [POL90020] The binding of a reference marked with `propagatesTransaction` has
1958 to be capable of propagating a transaction context. The reference needs to be wired to a service that
1959 can join the client's transaction. For example, any service with an intent that `@requires`
1960 **`propagatesTransaction`** can always join a client's transaction. The reference consumer can then be
1961 designed to rely on the work of the target service being included in the caller's transaction.
- 1962 • **suspendsTransaction** – When a reference is marked with `suspendsTransaction`, any transaction
1963 context under which the client runs MUST NOT be propagated when the reference is used.
1964 [POL90022] The reference consumer can use this intent to ensure that the work of the target service
1965 is not included in the caller's transaction. .
- 1966 • The absence of either interaction intent leads to runtime-specific behavior. The SCA runtime can
1967 choose whether or not to propagate any client transaction context to the referenced service,
1968 depending on the SCA runtime capability.

1969 These intents are independent from the client's **`managedTransaction`** implementation intent. The
1970 combination of the interaction intent of a reference and the **`managedTransaction`** implementation policy
1971 of the containing component completely describes the transactional behavior of a client's invocation of a
1972 service. [Table 9-3](#)[Table 9-5](#) summarizes the results of the combination of either of these interaction
1973 intents with the **`managedTransaction`** implementation policy of the containing component.

1974

reference interaction intent	managedTransaction (client implementation intent)	Results
<code>propagatesTransaction</code>	<code>managedTransaction.global</code>	Target service runs in the client's transaction. This combination is used for the managed, shared global transaction pattern described in Common Transaction Patterns.
<code>propagatesTransaction</code>	<code>managedTransaction.local</code> or <code>noManagedTransaction</code>	A reference MUST NOT be marked with <code>propagatesTransaction</code> if component is marked with <code>"ManagedTransaction.local"</code> or with <code>"noManagedTransaction"</code> [POL90023]
<code>suspendsTransaction</code>	Any value of <code>managedTransaction</code>	The target service will not run under the same transaction as any client transaction. This combination is used for the managed, local transaction pattern described in Common Transaction Patterns.

1975 [Table 9-35](#) Transaction propagation reference intents

1976

1977 Note - the absence of either interaction or implementation intents leads to runtime-specific behavior. A
1978 runtime that supports global transaction coordination can choose to provide a default behavior that is the
1979 managed, shared global transaction pattern.

1980 [Table 9-4](#)[Table 9-7](#) shows the valid combination of interaction and implementation intents on the client
1981 and service that result in a single global transaction being used when a client invokes a service through a
1982 reference.

1983

managedTransaction (client implementation intent)	reference interaction intent	service interaction intent	managedTransaction (service implementation intent)
managedTransaction.global	propagatesTransaction	propagatesTransaction	managedTransaction.global

1984 Table 9-47 Intents for end-to-end transaction propagation

1985

1986 **Transaction context MUST NOT be propagated on OneWay messages. Transaction context MUST NOT**
 1987 **be propagated on OneWay messages.** [POL90024] The SCA runtime ignores *propagatesTransaction*
 1988 for OneWay operations.

1989 9.6.3 Combining implementation and interaction intents

1990 The *managed, local transaction pattern* can be configured quite easily by combining the
 1991 managedTransaction.global intent with the propagatesTransaction intent. This is illustrated in **Error!**
 1992 **Reference source not found.** In order to enable easier configuration of this pattern, a profile intent
 1993 called managedSharedTransaction is defined as in section **Error! Reference source not found.**

1994 9.6.4 Web services binding for propagatesTransaction policy

1995 Snippet 9-1 shows a policySet that provides the *propagatesTransaction* intent and applies to a Web
 1996 service binding (binding.ws). When used on a service, this policySet would require the client to send a
 1997 transaction context using the mechanisms described in the [Web Services Atomic Transaction](#) [WS-
 1998 AtomicTransaction] specification.

1999

```
2000 <policySet name="JoinsTransactionWS" provides="sca:propagatesTransaction"
2001           appliesTo="sca:binding.ws">
2002   <wsp:Policy>
2003     <wsat:ATAssertion
2004       xmlns:wsat="http://docs.oasis-open.org/ws-tx/wsat/2006/06"/>
2005   </wsp:Policy>
2006 </policySet>
```

2007 Snippet 9-1: Example policySet Providing propagatesTransaction

2008

10 Miscellaneous Intents

2009 The following are standard intents that apply to bindings and are not related to either security, reliable
2010 messaging or transactionality:

- 2011 • **SOAP** – The SOAP intent specifies that the SOAP messaging model is used for delivering messages.
2012 It does not require the use of any specific transport technology for delivering the messages, so for
2013 example, this intent can be supported by a binding that sends SOAP messages over HTTP, bare
2014 TCP or even JMS. If the intent is attached in an unqualified form then any version of SOAP is
2015 acceptable. Standard mutually exclusive qualified intents also exist for SOAP.1.1 and SOAP.1.2,
2016 which specify the use of versions 1.1 or 1.2 of SOAP respectively. *When SOAP is present, an SCA
2017 Runtime MUST use the SOAP messaging model to deliver messages. When SOAP is present, an
2018 SCA Runtime MUST use the SOAP messaging model to deliver messages. [POL100001] When a
2019 SOAP intent is qualified with 1.1 or 1.2, then SOAP version 1.1 or SOAP version 1.2 respectively
2020 MUST be used to deliver messages. When a SOAP intent is qualified with 1.1 or 1.2, then SOAP
2021 version 1.1 or SOAP version 1.2 respectively MUST be used to deliver messages. [POL100002]*
- 2022 • **JMS** – The JMS intent does not specify a wire-level transport protocol, but instead requires that
2023 whatever binding technology is used, the messages are able to be delivered and received via the
2024 JMS API. *When JMS is present, an SCA Runtime MUST ensure that the binding used to send and
2025 receive messages supports the JMS API. When JMS is present, an SCA Runtime MUST ensure that
2026 the binding used to send and receive messages supports the JMS API. [POL100003]*
- 2027 • **noListener** – This intent can only be used within the @requires attribute of a reference. *The
2028 noListener intent MUST only be declared on a @requires attribute of a reference. The noListener
2029 intent MUST only be declared on a @requires attribute of a reference. [POL100004]* It states that the
2030 client is not able to handle new inbound connections. It requires that the binding and callback binding
2031 be configured so that any response (or callback) comes either through a back channel of the
2032 connection from the client to the server or by having the client poll the server for messages. *When
2033 noListener is present, an SCA Runtime MUST not establish any connection from a service to a
2034 client. When noListener is present, an SCA Runtime MUST not establish any connection from a
2035 service to a client. [POL100005]* An example policy assertion that would guarantee this is a WS-
2036 Policy assertion that applies to the <binding.ws> binding, which requires the use of WS-Addressing
2037 with anonymous responses (e.g. <wsaw:Anonymous>required</wsaw:Anonymous>” – see
2038 <http://www.w3.org/TR/ws-addr-wsdl/#anonelement>).
- 2039 • **asyncInvocation** – This intent can be attached to an operation or a complete interface, indicating
2040 that the operation(s) are long-running request-response operation(s) [SCA-Assembly]. It is also
2041 possible for a service to set the asyncInvocation intent when using an interface which is not marked
2042 with the asyncInvocation intent. This can be useful when reusing an existing interface definition that
2043 does not contain SCA information.

2044 The formal definitions of these intents are in the [Intent Definitions appendix](#).

2045

11 Conformance

2046 The XML schema available at the namespace URI, defined by this specification, is considered to be
2047 authoritative and takes precedence over the XML Schema defined in the appendix of this document.

2048 ~~An SCA runtime MUST reject a composite file that does not conform to the sca-policy-1.1.xsd schema.~~
2049 ~~SCA runtime MUST reject a composite file that does not conform to the sca-policy-1.1.xsd schema.~~
2050 [POL110001]

2051 An implementation that claims to conform to this specification MUST meet the following conditions:

- 2052 1. The implementation MUST conform to the SCA Assembly Model Specification [Assembly].
- 2053 2. The implementation does not have to support any intents listed in this specification, and MAY reject
2054 SCDL documents that contain them. If a specific intent is supported any relevant Conformance Items
2055 in Appendix C related to the intent and the SCA Runtime MUST be followed.
- 2056 3. With the exception of 2, the implementation MUST comply with all statements in [Appendix](#)
2057 [C](#): Conformance Items related to an SCA Runtime, notably all MUST statements have to
2058 be implemented.

B XML Files

2173 This appendix contains normative XML files that are defined by this specification.

2174

B.1 Intent Definitions

2175 Intent definitions are contained within a Definitions file called Policy_Intents_Definitions.xml, which
2176 contain a <definitions/> element as follows:

```
2177 <?xml version="1.0" encoding="UTF-8"?>
2178 <!-- Copyright (C) OASIS (R) 2005,2009. All Rights Reserved.
2179 OASIS trademark, IPR and other policies apply. -->

C Conformance

2430

C.1 Conformance Targets

2431

The conformance items listed in the section below apply to the following conformance targets:

2432

- Document artifacts (or constructs within them) that can be checked statically.

2433

- SCA runtimes, which we may require to exhibit certain behaviors.

2434

C.2 Conformance Items

2435

This section contains a list of conformance items for the SCA Policy Framework specification.

2436

Conformance ID

Description

[POL30001][POL30001]

If the configured instance of a binding is in conflict with the intents and policy sets selected for that instance, the SCA runtime MUST raise an error.

[POL30002][POL30002]

The QName for an intent MUST be unique amongst the set of intents in the SCA Domain.

[POL30004][POL30004]

If an intent has more than one qualifier, one and only one MUST be declared as the default qualifier.

[POL30005][POL30005]

The name of each qualifier MUST be unique within the intent definition.

[POL30006][POL30006]

the name of a profile intent MUST NOT have a "." in it.

[POL30007][POL30007]

If a profile intent is attached to an artifact, all the intents listed in its @requires attribute MUST be satisfied as described in section 4.12.

[POL30008][POL30008]

When a policySet element contains a set of intentMap children, the value of the @provides attribute of each intentMap MUST correspond to an unqualified intent that is listed within the @provides attribute value of the parent policySet element.

Formatted: Font color: Black

[POL30010][POL30010]

For each qualifiable intent listed as a member of the @provides attribute list of a policySet element, there MUST be no more than one corresponding intentMap element that declares the unqualified form of that intent in its @provides attribute. In other words, each intentMap within a given policySet uniquely provides for a specific intent.

Formatted: Font color: Black

[POL30011][POL30011]

Following the inclusion of all policySet references, when a policySet element directly contains wsp:policyAttachment children or policies using extension elements, the set of policies specified as children MUST satisfy all the intents expressed using the @provides attribute value of the policySet element.

[POL30013][POL30013]

The set of intents in the @provides attribute of a referenced policySet MUST be a subset of the set of intents in the @provides attribute of the referencing policySet.

Formatted: Font color: Black

[POL30015][POL30015]	Each QName in the @requires attribute MUST be the QName of an intent in the SCA Domain.	
[POL30016][POL30016]	Each QName in the @excludes attribute MUST be the QName of an intent in the SCA Domain.	
[POL30017][POL30017]	The QName for a policySet MUST be unique amongst the set of policySets in the SCA Domain.	
[POL30018][POL30018]	The contents of @appliesTo MUST match the XPath 1.0 [XPATH] production <i>Expr</i> .	
[POL30019][POL30019]	The contents of @attachTo MUST match the XPath 1.0 production <i>Expr</i> .	
[POL30020][POL30020]	If a policySet specifies a qualifiable intent in the @provides attribute, then it MUST include an intentMap element that specifies all possible qualifiers for that intent.	Formatted: Font color: Black
[POL30021][POL30021]	The @provides attribute value of each intentMap that is an immediate child of a policySet MUST be included in the @provides attribute of the parent policySet.	Formatted: Font color: Black
[POL30024][POL30024]	An SCA Runtime MUST include in the Domain the set of intent definitions contained in the Policy_Intents_Definitions.xml described in the appendix "Intent Definitions" of the SCA Policy specification.	Formatted: Font color: Auto
[POL30025][POL30025]	If only one qualifier for an intent is given it MUST be used as the default qualifier for the intent.	
[POL40001][POL40001]	SCA implementations supporting both Direct Attachment and External Attachment mechanisms MUST ignore policy sets applicable to any given SCA element via the Direct Attachment mechanism when there exist policy sets applicable to the same SCA element via the External Attachment mechanism	
[POL40002][POL40002]	The SCA runtime MUST raise an error if the @attachTo XPath expression resolves to an SCA <property> element, or any of its children.	
[POL40004][POL40004]	A qualifiable intent expressed lower in the hierarchy can be qualified further up the hierarchy, in which case the qualified version of the intent MUST apply to the higher level element.	Formatted: Font color: Black
[POL40005][POL40005]	<p>Rule2: The intents declared on elements higher in the structural hierarchy of a given element MUST be applied to the element EXCEPT</p> <ul style="list-style-type: none"> if any of the inherited intents is mutually exclusive with an intent applied on the element, then the inherited intent MUST be ignored if the overall set of intents from the element itself and from its structural hierarchy contains both an unqualified version and a qualified version of the same intent, the qualified version of the intent MUST be used. 	Formatted: Font color: Black
[POL40006][POL40006]	If a component has any policySets attached to it (by any means), then any policySets attached to the componentType MUST be	Formatted: Font color: Black

ignored.

[POL40007][POL40007]

Matching service/reference policies across the SCA Domain boundary MUST use WS-Policy compatibility (strict WS-Policy intersection) if the policies are expressed in WS-Policy syntax.

Formatted: Font color: Black

[POL40009][POL40009]

Any two intents applied to a given element MUST NOT be mutually exclusive

Formatted: Font color: Black

[POL40010][POL40010]

SCA runtimes MUST support at least one of the Direct Attachment and External Attachment mechanisms for policySet attachment.

[POL40011][POL40011]

SCA implementations supporting only the External Attachment mechanism MUST ignore the policy sets that are applicable via the Direct Attachment mechanism.

[POL40012][POL40012]

SCA implementations supporting only the Direct Attachment mechanism MUST ignore the policy sets that are applicable via the External Attachment mechanism.

[POL40013][POL40013]

During the deployment of SCA composites, all policySets within the Domain with an attachTo attribute MUST be evaluated to determine which policySets are attached to the newly deployed composite.

[POL40014][POL40014]

The intents declared on elements lower in the implementation hierarchy of a given element MUST be applied to the element.

Formatted: Font color: Black

[POL40015][POL40015]

when combining implementation hierarchy and structural hierarchy policy data, Rule 1 MUST be applied BEFORE Rule 2.

Formatted: Font color: Auto

Formatted: English (U.K.)

[POL40016][POL40016]

When calculating the set of intents and set of policySets which apply to either a service element or to a reference element of a component, intents and policySets from the interface definition and from the interface declaration(s) MUST be applied to the service or reference element and to the binding element(s) belonging to that element.

Formatted: Font color: Black

[POL40017][POL40017]

If the required intent set contains a mutually exclusive pair of intents the SCA runtime MUST reject the document containing the element and raise an error.

[POL40018]
[POL40018]

All intents in the required intent set for an element MUST be provided by the directly provided intents set and the set of policySets that apply to the element.

Formatted: Font color: Black

Formatted: Space Before: 0 pt, After: 0 pt, Don't adjust space between Latin and Asian text

[POL40019][POL40019]

The locations where interfaces are defined and where interfaces are declared in the componentType and in a component MUST be treated as part of the implementation hierarchy as defined in Section 4.5 [Usage of @requires attribute for specifying intents](#).
[Attaching intents to SCA Elements.](#)

Formatted: Font color: Black

[POL40020][POL40020]

The QName of the bindingType MUST be unique amongst the set of bindingTypes in the SCA Domain.

Formatted: Font color: Black

Formatted: Font: (Default) Arial, Font color: Black

[POL40021][POL40021]

A binding implementation MUST implement all the intents listed in the @alwaysProvides and @mayProvides attributes.

Formatted: Font color: Black

[POL40022][POL40022]

The SCA runtime MUST determine the compatibility of the policySets at each end of a wire using the compatibility rules of

Formatted: Font color: Black

Formatted: Font color: Black

the policy language used for those policySets.

[POL40023][POL40023]

The policySets at each end of a wire MUST be incompatible if they use different policy languages.

Formatted: Font color: Black

[POL40024][POL40024]

Where the policy language in use for a wire is WS-Policy, strict WS-Policy intersection MUST be used to determine policy compatibility.

Formatted: Font color: Black

[POL40025][POL40025]

In order for a reference to connect to a particular service, the policies of the reference MUST intersect with the policies of the service.

Formatted: Font color: Black

[POL40026]

[POL40026]

During the deployment of an SCA policySet, the behavior of an SCA runtime MUST take ONE of the following forms:

- The policySet is immediately attached to all deployed composites which satisfy the @attachTo attribute of the policySet.
- The policySet is attached to a deployed composite which satisfies the @attachTo attribute of the policySet when the composite is re-deployed.

[POL40027][POL40027]

Error! Not a valid bookmark self-reference. Any intents attached to an interface definition artifact, such as a WSDL portType, MUST be added to the intents defined in the @requires list of the service or reference to which the interface definition applies. If the @requires list of the service or reference is empty, then the intents attached to the interface definition artifact become the only contents of the relevant @requires list.

[POL50001][POL50001]

The implementationType name attribute MUST be the QName of an XSD global element definition used for implementation elements of that type.

Formatted: Font color: Black

[POL70001][POL70001]

When *authorization* is present, an SCA Runtime MUST ensure that the client is authorized to use the service.

[POL70009][POL70009]

When *confidentiality* is present, an SCA Runtime MUST ensure that only authorized entities can view the contents of a message.

Formatted: Font color: Auto

[POL70010][POL70010]

When *integrity* is present, an SCA Runtime MUST ensure that the contents of a message are not altered.

[POL70011][POL70011]

When a serverAuthentication, clientAuthentication, confidentiality or integrity intent is qualified by transport, an SCA Runtime MUST delegate serverAuthentication, clientAuthentication, confidentiality and integrity, respectively, to the transport layer of the communication protocol.

Formatted: Font color: Black

[POL70012][POL70012]

When a serverAuthentication, clientAuthentication, confidentiality or integrity intent is qualified by message, an SCA Runtime MUST delegate serverAuthentication, clientAuthentication, confidentiality and integrity, respectively, to the message layer of the communication protocol.

Formatted: Font color: Black

[POL70013][POL70013]	When <i>serverAuthentication</i> is present, an SCA runtime MUST ensure that the server is authenticated by the client.
[POL70014][POL70014]	When <i>clientAuthentication</i> is present, an SCA runtime MUST ensure that the client is authenticated by the server.
[POL80001][POL80001]	When <i>atLeastOnce</i> is present, an SCA Runtime MUST deliver a message to the destination service implementation, and MAY deliver duplicates of a message to the service implementation.
[POL80002][POL80002]	When <i>atMostOnce</i> is present, an SCA Runtime MAY deliver a message to the destination service implementation, and MUST NOT deliver duplicates of a message to the service implementation.
[POL80003][POL80003]	When <i>ordered</i> is present, an SCA Runtime MUST deliver messages sent by a single source to a single destination service implementation in the order that the messages were sent by that source.
[POL80004][POL80004]	When <i>exactlyOnce</i> is present, an SCA Runtime MUST deliver a message to the destination service implementation and MUST NOT deliver duplicates of a message to the service implementation.
[POL90003][POL90003]	For a component marked with <i>managedTransaction.global</i> , the SCA runtime MUST ensure that a global transaction is present before dispatching any method on the component.
[POL90004][POL90004]	A component marked with <i>managedTransaction.local</i> MUST run within a local transaction containment (LTC) that is started and ended by the SCA runtime.
[POL90006][POL90006]	Local transactions MUST NOT be propagated outbound across remotable interfaces.
[POL90007][POL90007]	A transaction that is propagated to the hosting SCA runtime MUST NOT be joined by the hosting runtime on behalf of a component marked with <i>noManagedtransaction</i> .
[POL90008][POL90008]	When a reference is marked as <i>transactedOneWay</i> , any <i>OneWay</i> invocation messages MUST be transacted as part of a client global transaction.
[POL90009][POL90009]	If the client component is not configured to run under a global transaction or if the binding does not support transactional message sending, then a reference MUST NOT be marked as <i>transactedOneWay</i> .
[POL90010][POL90010]	If a service is marked as <i>transactedOneWay</i> , any <i>OneWay</i> invocation message MUST be received from the transport binding in a transacted fashion, under the target service's global transaction.
[POL90011][POL90011]	If the component is not configured to run under a global transaction or if the binding does not support transactional message receipt, then a service MUST NOT be marked as <i>transactedOneWay</i> .
[POL90012][POL90012]	When applied to a reference indicates that any <i>OneWay</i>

Formatted: Font color: Black

	invocation messages MUST be sent immediately regardless of any client transaction.
[POL90013][POL90013]	When applied to a service indicates that any OneWay invocation MUST be received immediately regardless of any target service transaction.
[POL90015][POL90015]	A service marked with propagatesTransaction MUST be dispatched under any propagated (client) transaction.
[POL90016][POL90016]	Use of the propagatesTransaction intent on a service implies that the service binding MUST be capable of receiving a transaction context.
[POL90017][POL90017]	A service marked with suspendsTransaction MUST NOT be dispatched under any propagated (client) transaction.
[POL90019][POL90019]	A service MUST NOT be marked with "propagatesTransaction" if the component is marked with "managedTransaction.local" or with "noManagedTransaction"
[POL90020][POL90020]	When a reference is marked with propagatesTransaction, any transaction context under which the client runs MUST be propagated when the reference is used for a request-response interaction
[POL90022][POL90022]	When a reference is marked with suspendsTransaction, any transaction context under which the client runs MUST NOT be propagated when the reference is used.
[POL90023][POL90023]	A reference MUST NOT be marked with propagatesTransaction if component is marked with "ManagedTransaction.local" or with "noManagedTransaction"
[POL90024][POL90024]	Transaction context MUST NOT be propagated on OneWay messages.
[POL90025][POL90025]	The SCA runtime MUST ignore the propagatesTransaction intent for OneWay methods.
[POL90027][POL90027]	If a transactedOneWay intent is combined with the managedTransaction.local or noManagedTransaction implementation intents for either a reference or a service then an error MUST be raised during deployment.
[POL100001][POL100001]	When SOAP is present, an SCA Runtime MUST use the SOAP messaging model to deliver messages.
[POL100002][POL100002]	When a SOAP intent is qualified with 1_1 or 1_2, then SOAP version 1.1 or SOAP version 1.2 respectively MUST be used to deliver messages.
[POL100003][POL100003]	When JMS is present, an SCA Runtime MUST ensure that the binding used to send and receive messages supports the JMS API.
[POL100004][POL100004]	The noListener intent MUST only be declared on a @requires attribute of a reference.
[POL100005][POL100005]	When noListener is present, an SCA Runtime MUST not establish any connection from a service to a client.
[POL110001][POL110001]	An SCA runtime MUST reject a composite file that does not conform to the sca-policy-1.1.xsd schema.

E Revision History

[optional; should not be included in OASIS Standards]

Revision	Date	Editor	Changes Made
2	Nov 2, 2007	David Booz	Inclusion of OSOA errata and Issue 8
3	Nov 5, 2007	David Booz	Applied resolution of Issue 7, to Section 4.1 and 4.10. Fixed misc. typos/grammatical items.
4	Mar 10, 2008	David Booz	Inclusion of OSOA Transaction specification as Chapter 11. There are no textual changes other than formatting.
5	Apr 28 2008	Ashok Malhotra	Added resolutions to issues 17, 18, 24, 29, 37, 39 and 40,
6	July 7 2008	Mike Edwards	Added resolution for Issue 38
7	Aug 15 2008	David Booz	Applied Issue 26, 27
8	Sept 8 2008	Mike Edwards	Applied resolution for Issue 15
9	Oct 17 2008	David Booz	Various formatting changes Applied 22 – Deleted text in Ch 9 Applied 42 – In section 3.3 Applied 46 – Many sections Applied 52,55 – Many sections Applied 53 – In section 3.3 Applied 56 – In section 3.1 Applied 58 – Many sections
10	Nov 26	David Booz	Applied camelCase words from Liason Applied 54 – many sections Applied 59 – section 4.2, 4.4.2 Applied 60 – section 8.1 Applied 61 – section 4.10, 4.12 Applied 63 – section 9
11	Dec 10	Mike Edwards	Applied 44 - section 3.1, 3.2 (new), 5.0, A.1 Renamed file to sca-policy-1.1-spec-CD01-Rev11
12	Dec 25	Ashok Malhotra	Added RFC 2119 keywords Renamed file to sca-policy-1.1-spec-CD01-Rev12
13	Feb 06 2009	Mike Edwards, Eric	All changes accepted

		Wells, Dave Booz	Revision of the RFC 2119 keywords and the set of normative statements - done in drafts a through g
14	Feb 10 2009	Mike Edwards	All changes accepted, comments removed.
15	Feb 10 2009	Mike Edwards	Issue 64 - Sections A1, B, 10, 9, 8
16	Feb 12, 2009	Ashok Malhotra	Issue 5 The single sca namespace is listed on the title page. Issue 32 clientAuthentication and serverAuthentication Issue 35 Conformance targets added to Appendix C Issue 48 Transaction defaults are not optional Issue 66 Tighten schema for intent Issue 67 Remove 'conversational'
17	Feb 16, 2009	Dave Booz	Issues 57, 69, 70, 71
CD02	Feb 21, 2009	Dave Booz	Editorial changes to make a CD
CD02-rev1	April 7, 2009	Dave Booz	Applied 72, 74,75,77
CD02-rev2	July 21, 2009	Dave Booz	Applied 81,84,85,86,95,96,98,99
CD02-rev3	Aug 12, 2009	Dave Booz	Applied 73,76,78,80,82,83,88,102
CD03-rev4	Sept 3, 2009	Dave Booz	Editorial cleanup to match OASIS templates
