## 44 1 Introduction

45 This document describes how to use the UsernameToken with the Web Services Security (WSS)  
46 specification. More specifically, it describes how a web service consumer can supply a  
47 UsernameToken as a means of identifying the requestor by "username", and optionally using a  
48 password (or shared secret, or password equivalent) to authenticate that identity to the web  
49 service producer

50

51 Section 1 is non-normative.

---

## 52 2 Notations and Terminology

53 This section specifies the notations, namespaces, and terminology used in this specification.

### 54 2,1 Notational Conventions

55 The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT",  
56 "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this  
57 document are to be interpreted as described in RFC 2119.

58 When describing abstract data models, this specification uses the notational  
59 convention used by the XML Infoset. Specifically, abstract property names always  
60 appear in square brackets (e.g., [some property]).

61 When describing concrete XML schemas, this specification uses the notational convention of  
62 WSS: SOAP Message Security. Specifically, each member of an element's [children] or  
63 [attributes] property is described using an XPath-like notation (e.g.,  
64 /x:MyHeader/x:SomeProperty/@value1). The use of {any} indicates the presence of an element  
65 wildcard (<xs:any/>). The use of @{any} indicates the presence of an attribute wildcard  
66 (<xs:anyAttribute/>)

67 This specification is designed to work with the general SOAPmessage structure and message  
68 processing model, and should be applicable to any version of SOAP. The current SOAP 1.2  
69 namespace URI is used herein to provide detailed examples, but there is no intention to limit the  
70 applicability of this specification to a single version of SOAP.

71 Readers are presumed to be familiar with the terms in the [Internet Security Glossary](#).

---

## 72 3 Terminology

73 The key words *must*, *must not*, *required*, *shall*, *shall not*, *should*, *should not*, *recommended*, *may*,  
74 and *optional* in this document are to be interpreted as described in RFC2119 [12].

75

76 Namespace URIs (of the general form "some-URI") represent some application-dependent or  
77 context-dependent URI as defined in RFC 2396 [13].

Deleted: 30

Deleted: June

78

79 This specification design is intended to work with any version the general SOAP [3] message  
80 structure and processing model, though the SOAP 1.2 namespace URI is used in examples.

81

82 Commonly used security terms are defined in the Internet Security Glossary [14].

83

84 The namespaces used in this document are shown in the following table.

85

Prefix	Namespace
S	<a href="http://www.w3.org/2001/12/soap-envelope">http://www.w3.org/2001/12/soap-envelope</a>
wsse	<a href="http://schemas.xmlsoap.org/ws/2003/06/secext">http://schemas.xmlsoap.org/ws/2003/06/secext</a>
<u>wsu</u>	<a href="http://schemas.xmlsoap.org/ws/2003/06/utility">http://schemas.xmlsoap.org/ws/2003/06/utility</a>

## 87 4 Acronyms and Abbreviations

Term	Definition
SHA	Secure Hash Algorithm
SOAP	Simple Object Access Protocol
URI	Uniform Resource Identifier
UCS	Universal Character Set
UTF8	UCS Transformation Format, 8-bit form
XML	Extensible Markup Language

---

## 88 3 UsernameToken Extensions

### 89 Usernames and Passwords

90 The <wsse:UsernameToken> element is introduced in the WSS-SOAP Message Security  
91 documents as a way of providing a username.

92

93 Within this element, a <wsse:Password> element may be specified. Passwords of type  
94 wsse:PasswordText are not limited to actual passwords, although this is a common case. Any  
95 password equivalent such as a derived password or S/KEY (one time password) can be used.

Deleted: 30

Deleted: June

96 Having a type of `wsse:PasswordText` merely implies that the information held in the password  
97 is "in the clear", as opposed to holding a "digest" of the ~~information~~. For example, if a server does  
98 not have access to the clear text of a password but does have the hash, then the hash is  
99 considered a *password equivalent* and can be used anywhere where a "password" is indicated in  
100 this specification. It is not the intention of this specification to require that all implementations  
101 have access to clear text passwords.

Deleted: information..

102  
103 Passwords of type `wsse:PasswordDigest` are defined as being the Base64 [16] encoded, SHA -1  
104 hash value, of the UTF8 [17] encoded password (or equivalent).. However, unless this digested  
105 password is sent on a secured channel, the digest offers no real additional security over use of  
106 `wsse:PasswordText`.

107  
108 Two optional elements are introduced in the `<wsse:UsernameToken>` element to provide a  
109 countermeasure for replay attacks: `<wsse:Nonce>` and `<wsu:Created>`. A nonce is a random  
110 value that the sender creates to include in each Username token that it sends. Although using a  
111 nonce is an effective countermeasure against replay attacks, it requires a server to maintain a  
112 cache of used nonces, consuming server resources. Combining a nonce with a creation  
113 timestamp has the advantage of allowing a server to limit the cache of nonces to a "freshness"  
114 time period, establishing a bound on resource requirements. If either or both of `<wsse:Nonce>`  
115 and `<wsu:Created>` are present they must be included in the digest value as follows:

Deleted: To address this issue, two optional elements are introduced in the `<wsse:UsernameToken>` element: `<wsse:Nonce>` and `<wsu:Created>`. If either or both of these are present, they must be included in the digest value as follows:

116  
117 Password\_Digest = Base64 ( SHA -1 ( nonce + created + password ) )

Deleted: SHA-1 has

118  
119 That is, concatenate the nonce, creation timestamp, and the password (or shared secret or  
120 password equivalent), digest the combination using the SHA-1 hash algorithm, then include the  
121 Base64 encoding of that result as the Password (digest). This helps obscure the password and  
122 offers a basis for preventing replay attacks. For web service providers to effectively thwart replay  
123 attacks, three counter measures are recommended:

- 124 1. First, it is recommended that web service providers reject any UsernameToken *not*  
125 using *both* nonce *and* creation timestamps.
- 126 2. Second, it is recommended that web service producers provide a timestamp  
127 "freshness" limitation, and that any UsernameToken with "stale" timestamps be  
128 rejected. As a guideline, a value of five minutes can be used as a minimum to  
129 detect, and thus reject, replays.
- 130 3. Third, it is recommended that used nonces be cached for a period at least as long  
131 as the timestamp freshness limitation period, above, and that UsernameTokens with  
132 nonces that have already been used (and are thus in the cache) be rejected

133  
134 Note that the nonce is hashed using the octet sequence of its decoded value while the timestamp  
135 is hashed using the octet sequence of its UTF8 encoding as specified in the contents of the  
136 element.

137  
138 Note that passwords of either type (`wsse:PasswordText` or `wsse:PasswordDigest`) can only be  
139 used if the plain text password (or password equivalent) is available to both the requestor and the  
140 recipient..

Deleted: 30

Deleted: June

141  
142 The following illustrates the XML [2] syntax of this element:

```
143 <wsse:UsernameToken wsu:Id="Example-1">
```

145  
146  
147  
148  
149  
150  
151  
152  
153  
154  
155  
156  
157  
158  
159  
160

```
<wsse:Username> ... </wsse:Username>
<wsse:Password Type="..."> ... </wsse:Password>
<wsse:Nonce EncodingType="..."> ... </wsse:Nonce>
<wsu:Created> ... </wsu:Created>
</wsse:UsernameToken>
```

The following describes the attributes and elements listed in the example above:

*/wsse:UsernameToken/Password*

This optional element provides password information (or equivalent such as a hash). It is recommended that this element only be passed when a secure transport is being used.

*/wsse:UsernameToken/Password/@Type*

This optional attribute specifies the type of password being provided. The following table identifies the pre-defined types:

Value	Description
wsse:PasswordText (default)	The actual password for the username, the password hash, or derived password or S/KEY.
wsse:PasswordDigest	The digest of the password (and optionally nonce and/or creation timestamp) for the username using the algorithm described above.

161  
162  
163  
164

*/wsse:UsernameToken/Password/@{any}*

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

165

*/wsse:UsernameToken/wsse:Nonce*

This optional element specifies a cryptographically random nonce. Each message including a Nonce element should use a new nonce value in order for web service providers to detect replay attacks

166

*/wsse:UsernameToken/wsse:Nonce/@EncodingType*

This optional attribute specifies the encoding type of the nonce (see the definition of <wsse:BinarySecurityToken> for valid values). If this attribute isn't specified then the default of Base64 encoding is used.

167

*/wsse:UsernameToken/wsui:Created*

This optional <wsu:Created> element specifies a timestamp used to indicate the creation time. It is defined as part of the <wsu:Timestamp> definition.

168

All compliant implementations must be able to process the <wsse:UsernameToken> element. The following example illustrates the use of this element. In this example the password is sent as clear text and therefore this message should be sent over a confidential channel:

169

```
<S:Envelope xmlns:S="http://www.w3.org/2001/12/soap-envelope"
  xmlns:wsse="http://schemas.xmlsoap.org/ws/2003/06/secext">
  <S:Header>
    ...
```

## Error Codes

Implementations may use custom error codes defined in private namespaces if needed. But it is recommended that they use the error handling codes defined in the WSS: SOAP Message Security specification for signature, decryption, encoding and token header errors. When using custom error codes, implementations should be careful not to introduce security vulnerabilities that may assist an attacker in the error codes returned.

## Threat Model

The use of the UsernameToken introduces no new threats beyond those already identified for other types of SecurityTokens. Replay attacks can be addressed by using message timestamps, nonces, and caching, as well as other application-specific tracking mechanisms. Token ownership is verified by use of keys and man-in-the-middle attacks are generally mitigated. Transport-level security may be used to provide confidentiality and integrity of both the Username token and the entire message body.

**[DIGSIG]** Informational RFC 2828, "Internet Security Glossary," May 2000.

**[KEYWORDS]** S. Bradner, "Key words for use in RFCs to Indicate Requirement Levels," RFC 2119, Harvard University, March 1997.

**[SOAP11]** W3C Note, "SOAP: Simple Object Access Protocol 1.1," 08 May 2000.

**[SOAP12]** W3C Working Draft, "SOAP Version 1.2 Part 1: Messaging Framework", 26 June 2002.

**[URI]** T. Berners-Lee, R. Fielding, L. Masinter, "Uniform Resource Identifiers (URI): Generic Syntax," RFC 2396, MIT/LCS, U.C. Irvine, Xerox Corporation, August 1998.

**[WS-Security]** "Web Services Security Language", IBM, Microsoft, VeriSign, April 2002. "WS-Security Addendum", IBM, Microsoft, VeriSign, August 2002. "WS-Security XML Tokens", IBM, Microsoft, VeriSign, August 2002.

**[XML-C14N]** W3C Recommendation, "Canonical XML Version 1.0," 15 March 2001

**[EXC-C14N]** W3C Recommendation, "Exclusive XML Canonicalization Version 1.0," 8 July 2002.

**[XML-Encrypt]** W3C Working Draft, "XML Encryption Syntax and Processing," 04 March 2002  
W3C Recommendation, "Decryption Transform for XML Signature", 10 December 2002.

**[XML-ns]** W3C Recommendation, "Namespaces in XML," 14 January 1999.

**[XML-Schema]** W3C Recommendation, "XML Schema Part 1: Structures," 2 May 2001. W3C Recommendation, "XML Schema Part 2: Datatypes," 2 May 2001.

**[XML Signature]** W3C Recommendation, "XML Signature Syntax and Processing," 12 February 2002.

**[XPath]** W3C Recommendation, "XML Path Language", 16 November 1999

**[XPointer]** "XML Pointer Language (XPointer) Version 1.0, Candidate Recommendation", DeRose, Maler, Daniel, 11 September 2001.

## Appendix A. Revision History

Rev	Date	By Whom	What
Wd-1.0	2002-12-16	Phil Griffin	Initial version cloned from the WSS core specification
Wd-1.1	2003-01-26	Anthony Nadalin	Bring in line with WSS-Core Update
Wd-1.2	2003-02-23	Anthony Nadalin	Editorial Updates
Wd-1.3	2003-06-30	Anthony Nadalin	Editorial Updates
<u>Wd-1.4</u>	<u>2003-08-11</u>	<u>Anthony Nadalin</u>	<u>Editorial Updates</u>

## Appendix B. Notices

268 OASIS takes no position regarding the validity or scope of any intellectual property or other rights  
269 that might be claimed to pertain to the implementation or use of the technology described in this  
270 document or the extent to which any license under such rights might or might not be available;  
271 neither does it represent that it has made any effort to identify any such rights. Information on  
272 OASIS's procedures with respect to rights in OASIS specifications can be found at the OASIS  
273 website. Copies of claims of rights made available for publication and any assurances of licenses  
274 to be made available, or the result of an attempt made to obtain a general license or permission  
275 for the use of such proprietary rights by implementors or users of this specification, can be  
276 obtained from the OASIS Executive Director.

277 OASIS invites any interested party to bring to its attention any copyrights, patents or patent  
278 applications, or other proprietary rights which may cover technology that may be required to  
279 implement this specification. Please address the information to the OASIS Executive Director.

280 Copyright © The Organization for the Advancement of Structured Information Standards [OASIS]  
281 2002. All Rights Reserved.

282 This document and translations of it may be copied and furnished to others, and derivative works  
283 that comment on or otherwise explain it or assist in its implementation may be prepared, copied,  
284 published and distributed, in whole or in part, without restriction of any kind, provided that the  
285 above copyright notice and this paragraph are included on all such copies and derivative works.  
286 However, this document itself does not be modified in any way, such as by removing the  
287 copyright notice or references to OASIS, except as needed for the purpose of developing OASIS  
288 specifications, in which case the procedures for copyrights defined in the OASIS Intellectual  
289 Property Rights document must be followed, or as required to translate it into languages other  
290 than English.

291 The limited permissions granted above are perpetual and will not be revoked by OASIS or its  
292 successors or assigns.

293 This document and the information contained herein is provided on an "AS IS" basis and OASIS  
294 DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO  
295 ANY WARRANTY THAT THE USE OF THE INFORMATION HEREIN WILL NOT INFRINGE  
296 ANY RIGHTS OR ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A  
297 PARTICULAR PURPOSE.
