Abstract:

The Common Alerting Protocol (CAP) is a simple but general format for exchanging all-hazard emergency alerts and public warnings over all kinds of networks. CAP allows a consistent warning message to be disseminated simultaneously over many different warning systems, thus increasing warning effectiveness while simplifying the warning task. CAP also facilitates the detection of emerging patterns in local warnings of various kinds, such as might indicate an undetected hazard or hostile act. And CAP provides a template for effective warning messages based on best practices identified in academic research and real-world experience.

Status:

This document was last revised or approved by the Emergency Management TC on the above date. The level of approval is also listed above. Check the “Latest Version” or “Latest Approved Version” location noted above for possible later revisions of this document.

Technical Committee members should send comments on this specification to the Technical Committee’s email list. Others should send comments to the Technical Committee by using the “Send A Comment” button on the Technical Committee’s web page at <http://www.oasis-open.org/committees/emergency/>.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Technical Committee web page (<http://www.oasis-open.org/committees/emergency/ipr.php>).

1 Introduction

1.1 Purpose

The Common Alerting Protocol (CAP) provides an open, non-proprietary digital message format for all types of alerts and notifications. It does not address any particular application or telecommunications method. The CAP format is compatible with emerging techniques, such as Web services, as well as existing formats including the Specific Area Message Encoding (SAME) used for the United States' National Oceanic and Atmospheric Administration (NOAA) Weather Radio and the Emergency Alert System (EAS), while offering enhanced capabilities that include:

- Flexible geographic targeting using latitude/longitude shapes and other geospatial representations in three dimensions;
- Multilingual and multi-audience messaging;
- Phased and delayed effective times and expirations;
- Enhanced message update and cancellation features;
- Template support for framing complete and effective warning messages;
- Compatible with digital encryption and signature capability; and,
- Facility for digital images and audio.

Key benefits of CAP will include reduction of costs and operational complexity by eliminating the need for multiple custom software interfaces to the many warning sources and dissemination systems involved in all-hazard warning. The CAP message format can be converted to and from the "native" formats of all kinds of sensor and alerting technologies, forming a basis for a technology-independent national and international "warning internet."

1.2 History

The National Science and Technology Council report on "Effective Disaster Warnings" released in November, 2000 recommended that "a standard method should be developed to collect and relay instantaneously and automatically all types of hazard warnings and reports locally, regionally and nationally for input into a wide variety of dissemination systems."

An international working group of more than 130 emergency managers and information technology and telecommunications experts convened in 2001 and adopted the specific recommendations of the NSTC report as a point of departure for the design of a Common Alerting Protocol (CAP). Their draft went through several revisions and was tested in demonstrations and field trials in Virginia (supported by the ComCARE Alliance) and in California (in cooperation with the California Office of Emergency Services) during 2002 and 2003.

In 2002 the CAP initiative was endorsed by the national non-profit Partnership for Public Warning, which sponsored its contribution in 2003 to the OASIS standards process. In 2004, CAP version 1.0 was adopted as an OASIS Standard. In 2005, changes based on user feedback were incorporated into CAP and version 1.1 was released. As part of the International Telecommunication Union (ITU-T) adoption of CAP, a CAP 1.1 Errata was released in 2007 to support ASN.1 encoding. Version 1.2 is a minor release to resolve issues identified by the EM-TC CAP Call for Comments initiated in April 2008 and also incorporates feedback from CAP profile development efforts.

42 **1.3 Structure of the CAP Alert Message**

43 Each CAP Alert Message consists of an <alert> segment, which may contain one or more <info>
44 segments, each of which may include one or more <area> and/or <resource> segments. Under most
45 circumstances CAP messages with a <msgType> value of “Alert” SHOULD include at least one <info>
46 element. (See the document object model diagram in section 3.1, below.)

47 **1.3.1 <alert>**

48 The <alert> segment provides basic information about the current message: its purpose, its source and
49 its status, as well as a unique identifier for the current message and links to any other, related messages.
50 An <alert> segment may be used alone for message acknowledgements, cancellations or other system
51 functions, but most <alert> segments will include at least one <info> segment.

52 **1.3.2 <info>**

53 The <info> segment describes an anticipated or actual event in terms of its urgency (time available to
54 prepare), severity (intensity of impact) and certainty (confidence in the observation or prediction), as well
55 as providing both categorical and textual descriptions of the subject event. It may also provide
56 instructions for appropriate response by message recipients and various other details (hazard duration,
57 technical parameters, contact information, links to additional information sources, etc.) Multiple <info>
58 segments may be used to describe differing parameters (e.g., for different probability or intensity “bands”)
59 or to provide the information in multiple languages.

60 **1.3.3 <resource>**

61 The <resource> segment provides an optional reference to additional information related to the <info>
62 segment within which it appears in the form of a digital asset such as an image or audio file.

63 **1.3.4 <area>**

64 The <area> segment describes a geographic area to which the <info> segment in which it appears
65 applies. Textual and coded descriptions (such as postal codes) are supported, but the preferred
66 representations use geospatial shapes (polygons and circles) and an altitude or altitude range, expressed
67 in standard latitude / longitude / altitude terms in accordance with a specified geospatial datum.

68 **1.4 Applications of the CAP Alert Message**

69 The primary use of the CAP Alert Message is to provide a single input to activate all kinds of alerting and
70 public warning systems. This reduces the workload associated with using multiple warning systems while
71 enhancing technical reliability and target-audience effectiveness. It also helps ensure consistency in the
72 information transmitted over multiple delivery systems, another key to warning effectiveness.

73 A secondary application of CAP is to normalize warnings from various sources so they can be aggregated
74 and compared in tabular or graphic form as an aid to situational awareness and pattern detection.

75 Although primarily designed as an interoperability standard for use among warning systems and other
76 emergency information systems, the CAP Alert Message can be delivered directly to alert recipients over
77 various networks, including data broadcasts. Location-aware receiving devices could use the information
78 in a CAP Alert Message to determine, based on their current location, whether that particular message
79 was relevant to their users.

80 The CAP Alert Message can also be used by sensor systems as a format for reporting significant events
81 to collection and analysis systems and centers.

82

83 1.5 Terminology

84 The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD
85 NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described
86 in [RFC2119].

87 The words *warning*, *alert* and *notification* are used interchangeably throughout this document.

88 The term “coordinate pair” is used in this document to refer to a comma-delimited pair of decimal values
89 describing a geospatial location in degrees, unprojected, in the form “[latitude],[longitude]”. Latitudes in
90 the Southern Hemisphere and longitudes in the Western Hemisphere are signed negative by means of a
91 leading dash.

129 2 Design Principles and Concepts (non-normative)

130 2.1 Design Philosophy

131 Among the principles which guided the design of the CAP Alert Message were:

- 132 • **Interoperability** – First and foremost, the CAP Alert Message should provide a means for
133 interoperable exchange of alerts and notifications among all kinds of emergency information
134 systems.
- 135 • **Completeness** – The CAP Alert Message format should provide for all the elements of an
136 effective public warning message.
- 137 • **Simple implementation** – The design should not place undue burdens of complexity on
138 technical implementers.
- 139 • **Simple XML and portable structure** – Although the primary anticipated use of the CAP Alert
140 Message is as an XML document, the format should remain sufficiently abstract to be adaptable
141 to other coding schemes.
- 142 • **Multi-use format** – One message schema supports multiple message types (e.g., alert / update /
143 cancellations / acknowledgements / error messages) in various applications (actual / exercise /
144 test / system message).
- 145 • **Familiarity** – The data elements and code values should be meaningful to warning originators
146 and non-expert recipients alike.
- 147 • **Interdisciplinary and international utility** – The design should allow a broad range of
148 applications in public safety and emergency management and allied applications and should be
149 applicable worldwide.

150 2.2 Requirements for Design

151 Note: The following requirements were used as a basis for design and review of the CAP
152 Alert Message format. This list is non-normative and not intended to be exhaustive.

153 The Common Alerting Protocol SHOULD:

- 154 • Provide a specification for a simple, extensible format for digital representation of warning
155 messages and notifications;
- 156 • Enable integration of diverse sensor and dissemination systems;
- 157 • Be usable over multiple transmission systems, including both TCP/IP-based networks and one-
158 way "broadcast" channels;
- 159 • Support credible end-to-end authentication and validation of all messages;
- 160 • Provide a unique identifier (e.g., an ID number) for each warning message and for each message
161 originator;
- 162 • Provide for multiple message types, such as:
 - 163 – Warnings
 - 164 – Acknowledgements
 - 165 – Expirations and cancellations
 - 166 – Updates and amendments
 - 167 – Reports of results from dissemination systems
 - 168 – Administrative and system messages
- 169 • Provide for multiple message types, such as:

- 170 – Geographic targeting
- 171 – Level of urgency
- 172 – Level of certainty
- 173 – Level of threat severity
- 174 • Provide a mechanism for referencing supplemental information (e.g., digital audio or image files,
175 additional text);
- 176 • Use an established open-standard data representation;
- 177 • Be based on a program of real-world cross-platform testing and evaluation;
- 178 • Provide a clear basis for certification and further protocol evaluation and improvement; and,
- 179 • Provide a clear logical structure that is relevant and clearly applicable to the needs of emergency
180 response and public safety users and warning system operators.

181 **2.3 Examples of Use Scenarios**

182 Note: The following examples of use scenarios were used as a basis for design and
183 review of the CAP Alert Message format. These scenarios are non-normative and not
184 intended to be exhaustive or to reflect actual practices.

185 **2.3.1 Manual Origination**

186 The Incident Commander at an industrial fire with potential of a major explosion decides to issue a public
187 alert with three components: a) An evacuation of the area within half a mile of the fire; b) a shelter-in-
188 place instruction for people in a polygon roughly describing a downwind dispersion 'plume' extending
189 several miles downwind and half a mile upwind from the fire; and c) a request for all media and civilian
190 aircraft to remain above 2500 feet above ground level when within a half mile radius of the fire.

191 Using a portable computer and a web page (and a pop-up drawing tool to enter the polygon) the Incident
192 Commander issues the alert as a CAP message to a local alerting network.

193 **2.3.2 Automated Origination by Autonomous Sensor System**

194 A set of automatic tsunami warning sirens has been installed along a popular Northwest beach. A
195 wireless network of sensor devices collocated with the sirens controls their activation. When triggered,
196 each sensor generates a CAP message containing its location and the sensed data at that location that is
197 needed for the tsunami determination. Each siren activates when the combination of its own readings and
198 those reported at by other devices on the network indicate an immediate tsunami threat. In addition, a
199 network component assembles a summary CAP message describing the event and feeds it to regional
200 and national alerting networks.

201 **2.3.3 Aggregation and Correlation on Real-time Map**

202 At the State Operations Center a computerized map of the state depicts, in real time, all current and
203 recent warning activity throughout the state. All major warning systems in the state – the Emergency
204 Alert System, siren systems, telephone alerting and other systems – have been equipped to report the
205 details of their activation in the form of a CAP message. (Since many of them are now activated by way
206 of CAP messages, this is frequently just a matter of forwarding the activation message to the state
207 center.)

208 Using this visualization tool, state officials can monitor for emerging patterns of local warning activity and
209 correlate it with other real time data (e.g., telephone central office traffic loads, 9-1-1 traffic volume,
210 seismic data, automatic vehicular crash notifications, etc.).

211

212 **2.3.4 Integrated Public Alerting**

213 As part of an integrated warning system funded by local industry, all warning systems in a community can
214 be activated simultaneously by the issuance, from an authorized authority, of a single CAP message.

215 Each system converts the CAP message data into the form suitable for its technology (text captioning on
216 TV, synthesized voice on radio and telephone, activation of the appropriate signal on sirens, etc.).

217 Systems that can target their messages to particular geographic areas implement the targeting specified
218 in the CAP message with as little 'spillover' as their technology permits.

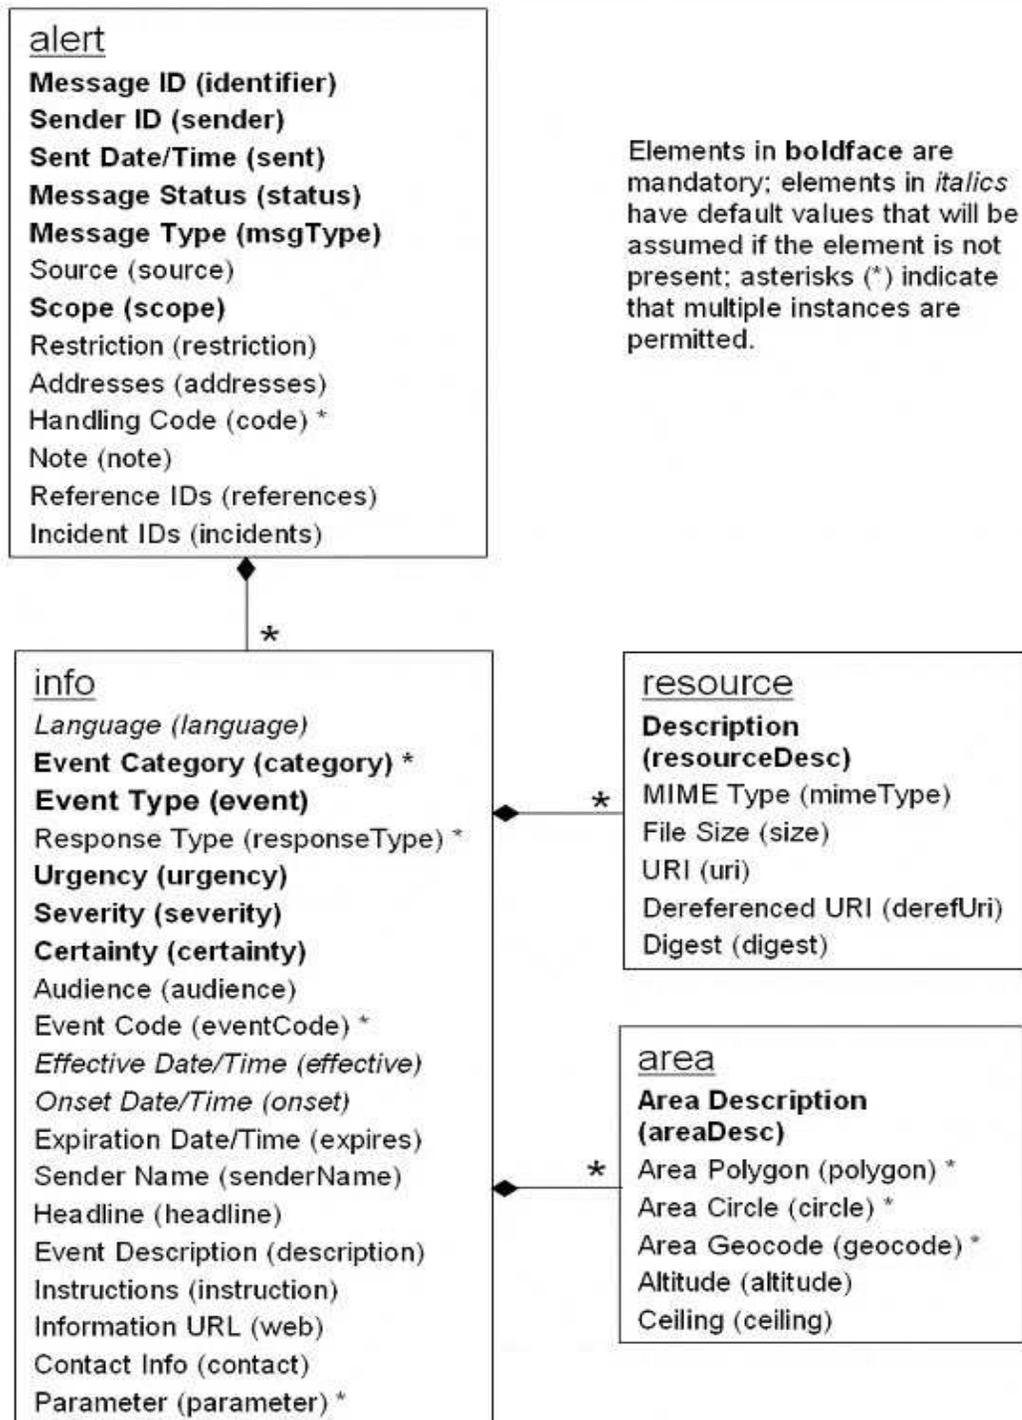

219 In this way, not only is the reliability and reach of the overall warning system maximized, but citizens also
220 get corroboration of the alert through multiple channels, which increases the chance of the warning being
221 acted upon.

222 **2.3.5 Repudiating a False Alarm**

223 Inadvertently the integrated alerting network has been activated with an inaccurate warning message.
224 This activation comes to officials' attention immediately through their own monitoring facilities (e.g., 2.3.3
225 above). Having determined that the alert is, in fact, inappropriate, the officials issue a cancellation
226 message that refers directly to the erroneous prior alert. Alerting systems that are still in the process of
227 delivering the alert (e.g., telephone dialing systems) stop doing so. Broadcast systems deliver the
228 cancellation message. Other systems (e.g., highway signs) simply reset to their normal state.

3 Alert Message Structure (normative)

3.1 Document Object Model

233 **3.2 Data Dictionary**

234 Note: Unless explicitly constrained within this Data Dictionary or the XML Schema
 235 (Section 3.4), CAP elements MAY have null values. Implementers MUST check for this
 236 condition wherever it might affect application performance.

Element Name	Context. Class. Attribute. Representation	Definition and (Optionality)	Notes or Value Domain
3.2.1 "alert" Element and Sub-elements			
alert	cap. alert. group	The container for all component parts of the alert message (REQUIRED)	(1) Surrounds CAP alert message sub-elements. (2) MUST include the xmlns attribute referencing the CAP URN as the namespace, e.g.: <pre><cap:alert xmlns:cap="urn:oasis:names:tc:emergency:cap:1.2"> [sub-elements] </cap:alert></pre> (3) In addition to the specified sub-elements, MAY contain one or more <info> blocks.
identifier	cap. alert. identifier. identifier	The identifier of the alert message (REQUIRED)	(1) A number or string uniquely identifying this message, assigned by the sender. (2) MUST NOT include spaces, commas or restricted characters (< and &).
sender	cap. alert. sender. identifier	The identifier of the sender of the alert message (REQUIRED)	(1) Identifies the originator of this alert. Guaranteed by assigner to be unique globally; e.g., may be based on an Internet domain name. (2) MUST NOT include spaces, commas or restricted characters (< and &).
sent	cap. alert. sent. time	The time and date of the origination of the alert message (REQUIRED)	(1) The date and time SHALL be represented in the DateTime Data Type (See Implementation Notes) format (e.g., "2002-05-24T16:49:00-07:00" for 24 May 2002 at 16:49 PDT). (2) Alphabetic timezone designators such as "Z" MUST NOT be used. The timezone for UTC MUST be represented as "-00:00".

Element Name	Context. Class. Attribute. Representation	Definition and (Optionality)	Notes or Value Domain
status	cap. alert. status. code	The code denoting the appropriate handling of the alert message (REQUIRED)	Code Values: "Actual" - Actionable by all targeted recipients "Exercise" - Actionable only by designated exercise participants; exercise identifier SHOULD appear in <note> "System" - For messages that support alert network internal functions "Test" - Technical testing only, all recipients disregard "Draft" – A preliminary template or draft, not actionable in its current form
msgType	cap. alert. msgType. code	The code denoting the nature of the alert message (REQUIRED)	Code Values: "Alert" - Initial information requiring attention by targeted recipients "Update" - Updates and supercedes the earlier message(s) identified in <references> "Cancel" - Cancels the earlier message(s) identified in <references> "Ack" - Acknowledges receipt and acceptance of the message(s) identified in <references> "Error" - Indicates rejection of the message(s) identified in <references>; explanation SHOULD appear in <note>
source	cap. alert. source. identifier	The text identifying the source of the alert message (OPTIONAL)	The particular source of this alert; e.g., an operator or a specific device.
scope	cap. alert. scope. code	The code denoting the intended distribution of the alert message (REQUIRED)	Code Values: "Public" - For general dissemination to unrestricted audiences "Restricted" - For dissemination only to users with a known operational requirement (see <restriction>, below) "Private" - For dissemination only to specified addresses (see <addresses>, below)

Element Name	Context. Class. Attribute. Representation	Definition and (Optionality)	Notes or Value Domain
restriction	cap. alert. restriction. text	The text describing the rule for limiting distribution of the restricted alert message (CONDITIONAL)	Used when <scope> value is "Restricted".
addresses	cap. alert. addresses. group	The group listing of intended recipients of the private alert message (CONDITIONAL)	<ul style="list-style-type: none"> (1) Used when <scope> value is "Private". (2) Each recipient SHALL be identified by an identifier or an address. (3) Multiple space-delimited addresses MAY be included. Addresses including whitespace MUST be enclosed in double-quotes.
code	cap. alert. code. code	The code denoting the special handling of the alert message (OPTIONAL)	<ul style="list-style-type: none"> (1) Any user-defined flag or special code used to flag the alert message for special handling. (2) Multiple instances MAY occur.
note	cap. alert. note. text	The text describing the purpose or significance of the alert message (OPTIONAL)	The message note is primarily intended for use with <status> "Exercise" and <msgType> "Error".
references	cap. alert. references. group	The group listing identifying earlier message(s) referenced by the alert message (OPTIONAL)	<ul style="list-style-type: none"> (1) The extended message identifier(s) (in the form <i>sender,identifier,sent</i>) of an earlier CAP message or messages referenced by this one. (2) If multiple messages are referenced, they SHALL be separated by whitespace.

Element Name	Context. Class. Attribute. Representation	Definition and (Optionality)	Notes or Value Domain
incidents	cap. alert. incidents. group	The group listing naming the referent incident(s) of the alert message (OPTIONAL)	<ul style="list-style-type: none"> (1) Used to collate multiple messages referring to different aspects of the same incident. (2) If multiple incident identifiers are referenced, they SHALL be separated by whitespace. Incident names including whitespace SHALL be surrounded by double-quotes.
3.2.2 "info" Element and Sub-elements			
info	cap. alertInfo. info. group	The container for all component parts of the info sub-element of the alert message (OPTIONAL)	<ul style="list-style-type: none"> (1) Multiple occurrences are permitted within a single <alert>. If targeting of multiple <info> blocks in the same language overlaps, information in later blocks may expand but may not override the corresponding values in earlier ones. Each set of <info> blocks containing the same language identifier SHALL be treated as a separate sequence. (2) In addition to the specified sub-elements, MAY contain one or more <resource> blocks and/or one or more <area> blocks.
language	cap. alertInfo. language. code	The code denoting the language of the info sub-element of the alert message (OPTIONAL)	<ul style="list-style-type: none"> (1) Code Values: Natural language identifier per [RFC 3066]. (2) If not present, an implicit default value of "en-US" SHALL be assumed. (3) A null value in this element SHALL be considered equivalent to "en-US."

Element Name	Context. Class. Attribute. Representation	Definition and (Optionality)	Notes or Value Domain
category	cap. alertInfo. category. code	The code denoting the category of the subject event of the alert message (REQUIRED)	<p>(1) Code Values:</p> <p>“Geo” - Geophysical (inc. landslide)</p> <p>“Met” - Meteorological (inc. flood)</p> <p>“Safety” - General emergency and public safety</p> <p>“Security” - Law enforcement, military, homeland and local/private security</p> <p>“Rescue” - Rescue and recovery</p> <p>“Fire” - Fire suppression and rescue</p> <p>“Health” - Medical and public health</p> <p>“Env” - Pollution and other environmental</p> <p>“Transport” - Public and private transportation</p> <p>“Infra” - Utility, telecommunication, other non-transport infrastructure</p> <p>“CBRNE” – Chemical, Biological, Radiological, Nuclear or High-Yield Explosive threat or attack</p> <p>“Other” - Other events</p> <p>(2) Multiple instances MAY occur within an <info> block.</p>
event	cap. alertInfo. event. text	The text denoting the type of the subject event of the alert message (REQUIRED)	

Element Name	Context. Class. Attribute. Representation	Definition and (Optionality)	Notes or Value Domain
responseType	cap. alertInfo. responseType. code	The code denoting the type of action recommended for the target audience (OPTIONAL)	<p>(1) Code Values:</p> <p>“Shelter” – Take shelter in place or per <instruction></p> <p>“Evacuate” – Relocate as instructed in the <instruction></p> <p>“Prepare” – Make preparations per the <instruction></p> <p>“Execute” – Execute a pre-planned activity identified in <instruction></p> <p>“Avoid” – Avoid the subject event as per the <instruction></p> <p>“Monitor” – Attend to information sources as described in <instruction></p> <p>“Assess” – Evaluate the information in this message. (This value SHOULD NOT be used in public warning applications.)</p> <p>“AllClear” – The subject event no longer poses a threat or concern and any follow on action is described in <instruction></p> <p>“None” – No action recommended</p> <p>(2) Multiple instances MAY occur within an <info> block.</p>
urgency	cap. alertInfo. urgency. code	The code denoting the urgency of the subject event of the alert message (REQUIRED)	<p>(1) The <urgency>, <severity>, and <certainty> elements collectively distinguish less emphatic from more emphatic messages.</p> <p>(2) Code Values:</p> <p>“Immediate” - Responsive action SHOULD be taken immediately</p> <p>“Expected” - Responsive action SHOULD be taken soon (within next hour)</p> <p>“Future” - Responsive action SHOULD be taken in the near future</p> <p>“Past” - Responsive action is no longer required</p> <p>“Unknown” - Urgency not known</p>

Element Name	Context. Class. Attribute. Representation	Definition and (Optionality)	Notes or Value Domain
severity	cap. alertInfo. severity. code	The code denoting the severity of the subject event of the alert message (REQUIRED)	<p>(1) The <urgency>, <severity>, and <certainty> elements collectively distinguish less emphatic from more emphatic messages.</p> <p>(2) Code Values:</p> <p>“Extreme” - Extraordinary threat to life or property</p> <p>“Severe” - Significant threat to life or property</p> <p>“Moderate” - Possible threat to life or property</p> <p>“Minor” – Minimal to no known threat to life or property</p> <p>“Unknown” - Severity unknown</p>
certainty	cap. alertInfo. certainty. code	The code denoting the certainty of the subject event of the alert message (REQUIRED)	<p>(1) The <urgency>, <severity>, and <certainty> elements collectively distinguish less emphatic from more emphatic messages.</p> <p>(2) Code Values:</p> <p>“Observed” – Determined to have occurred or to be ongoing</p> <p>“Likely” - Likely (p > ~50%)</p> <p>“Possible” - Possible but not likely (p <= ~50%)</p> <p>“Unlikely” - Not expected to occur (p ~ 0)</p> <p>“Unknown” - Certainty unknown</p> <p>(3) For backward compatibility with CAP 1.0, the deprecated value of “Very Likely” SHOULD be treated as equivalent to “Likely”.</p>
audience	cap. alertInfo. audience. text	The text describing the intended audience of the alert message (OPTIONAL)	

Element Name	Context. Class. Attribute. Representation	Definition and (Optionality)	Notes or Value Domain
eventCode	cap. alertInfo. eventCode. code	A system-specific code identifying the event type of the alert message (OPTIONAL)	<p>(1) Any system-specific code for event typing, in the form:</p> <pre data-bbox="899 426 1386 562"><eventCode> <valueName>valueName</valueName> <value>value</value> </eventCode></pre> <p>where the content of "valueName" is a user-assigned string designating the domain of the code, and the content of "value" is a string (which may represent a number) denoting the value itself (e.g., valueName = "SAME" and value="CEM").</p> <p>(2) Values of "valueName" that are acronyms SHOULD be represented in all capital letters without periods (e.g., SAME, FIPS, ZIP).</p> <p>(3) Multiple instances MAY occur within an <info> block.</p>
effective	cap. alertInfo. effective. time	The effective time of the information of the alert message (OPTIONAL)	<p>(1) The date and time SHALL be represented in the DateTime Data Type (See Implementation Notes) format (e.g., "2002-05-24T16:49:00-07:00" for 24 May 2002 at 16: 49 PDT).</p> <p>(2) Alphabetic timezone designators such as "Z" MUST NOT be used. The timezone for UTC MUST be represented as "-00:00".</p> <p>(3) If this item is not included, the effective time SHALL be assumed to be the same as in <sent>.</p>
onset	cap. alertInfo. onset. time	The expected time of the beginning of the subject event of the alert message (OPTIONAL)	<p>(1) The date and time SHALL be represented in the DateTime Data Type (See Implementation Notes) format (e.g., "2002-05-24T16:49:00-07:00" for 24 May 2002 at 16: 49 PDT).</p> <p>(2) Alphabetic timezone designators such as "Z" MUST NOT be used. The timezone for UTC MUST be represented as "-00:00".</p>

Element Name	Context. Class. Attribute. Representation	Definition and (Optionality)	Notes or Value Domain
expires	cap. alertInfo. expires. time	The expiry time of the information of the alert message (OPTIONAL)	<p>(1) The date and time SHALL be represented in the DateTime Data Type (See Implementation Notes) format (e.g., "2002-05-24T16:49:00-07:00" for 24 May 2002 at 16:49 PDT).</p> <p>(2) Alphabetic timezone designators such as "Z" MUST NOT be used. The timezone for UTC MUST be represented as "-00:00".</p> <p>(3) If this item is not provided, each recipient is free to set its own policy as to when the message is no longer in effect.</p>
senderName	cap. alertInfo. senderName. text	The text naming the originator of the alert message (OPTIONAL)	The human-readable name of the agency or authority issuing this alert.
headline	cap. alertInfo. headline. text	The text headline of the alert message (OPTIONAL)	A brief human-readable headline. Note that some displays (for example, short messaging service devices) may only present this headline; it SHOULD be made as direct and actionable as possible while remaining short. 160 characters MAY be a useful target limit for headline length.
description	cap. alertInfo. description. text	The text describing the subject event of the alert message (OPTIONAL)	An extended human readable description of the hazard or event that occasioned this message.
instruction	cap. alertInfo. instruction. text	The text describing the recommended action to be taken by recipients of the alert message (OPTIONAL)	An extended human readable instruction to targeted recipients. If different instructions are intended for different recipients, they should be represented by use of multiple <info> blocks.

Element Name	Context. Class. Attribute. Representation	Definition and (Optionality)	Notes or Value Domain
web	cap alertInfo. web. identifier	The identifier of the hyperlink associating additional information with the alert message (OPTIONAL)	A full, absolute URI for an HTML page or other text resource with additional or reference information regarding this alert.
contact	cap. alertInfo. contact. text	The text describing the contact for follow-up and confirmation of the alert message (OPTIONAL)	
parameter	cap. alertInfo. parameter. code	A system-specific additional parameter associated with the alert message (OPTIONAL)	<p>(1) Any system-specific datum, in the form:</p> <pre data-bbox="898 974 1386 1108"><parameter> <valueName>valueName</valueName> <value>value</value> </parameter></pre> <p>where the content of "valueName" is a user-assigned string designating the domain of the code, and the content of "value" is a string (which may represent a number) denoting the value itself (e.g., valueName = "SAME" and value="CIV").</p> <p>(2) Values of "valueName" that are acronyms SHOULD be represented in all capital letters without periods (e.g., SAME, FIPS, ZIP).</p> <p>(3) Multiple instances MAY occur within an <info> block.</p>

Element Name	Context. Class. Attribute. Representation	Definition and (Optionality)	Notes or Value Domain
3.2.3 "resource" Element and Sub-elements			
resource	cap alertInfoResource. resource. group	The container for all component parts of the resource sub-element of the info sub-element of the alert element (OPTIONAL)	(1) Refers to an additional file with supplemental information related to this <info> element; e.g., an image or audio file. (2) Multiple instances MAY occur within an <info> block.
resourceDesc	cap. alertInfoResource. resourceDesc. text	The text describing the type and content of the resource file (REQUIRED)	The human-readable text describing the type and content, such as "map" or "photo", of the resource file.
contentType	cap. alertInfoResource. contentType. identifier	The identifier of the MIME content type and sub-type describing the resource file (OPTIONAL)	MIME content type and sub-type as described in [RFC 2046] . (As of this document, the current IANA registered MIME types are listed at http://www.iana.org/assignments/media-types/)
size	cap. alertInfoResource. size. integer	The integer indicating the size of the resource file (OPTIONAL)	Approximate size of the resource file in bytes.
uri	cap. alertInfoResource. uri. identifier	The identifier of the hyperlink for the resource file (OPTIONAL)	A full absolute URI, typically a Uniform Resource Locator that can be used to retrieve the resource over the Internet OR a relative URI to name the content of a <derefUri> element if one is present in this resource block.

Element Name	Context. Class. Attribute. Representation	Definition and (Optionality)	Notes or Value Domain
derefUri	cap alertInfoResource. derefUri. data	The base-64 encoded data content of the resource file (CONDITIONAL)	<p>(1) MAY be used either with or instead of the <uri> element in messages transmitted over one-way (e.g., broadcast) data links where retrieval of a resource via a URI is not feasible.</p> <p>(2) Clients intended for use with one-way data links MUST support this element.</p> <p>(3) This element MUST NOT be used unless the sender is certain that all direct clients are capable of processing it.</p> <p>(4) If messages including this element are forwarded onto a two-way network, the forwarder MUST strip the <derefUri> element and SHOULD extract the file contents and provide a <uri> link to a retrievable version of the file.</p> <p>(5) Providers of one-way data links MAY enforce additional restrictions on the use of this element, including message-size limits and restrictions regarding file types.</p>
digest	cap. alertInfoResource. digest. code	The code representing the digital digest ("hash") computed from the resource file (OPTIONAL)	Calculated using the Secure Hash Algorithm (SHA-1) per [FIPS 180-2] .
3.2.4 "area" Element and Sub-elements			
area	cap. alertInfoArea. area. group	The container for all component parts of the area sub-element of the info sub-element of the alert message (OPTIONAL)	<p>(1) Multiple occurrences permitted, in which case the target area for the <info> block is the union of all the included <area> blocks.</p> <p>(2) MAY contain one or multiple instances of <polygon>, <circle> or <geocode>. If multiple <polygon>, <circle> or <geocode> elements are included, the area described by this <area> block is represented by the union of all the included elements.</p>

Element Name	Context. Class. Attribute. Representation	Definition and (Optionality)	Notes or Value Domain
areaDesc	cap. alertInfoArea. areaDesc. text	The text describing the affected area of the alert message (REQUIRED)	A text description of the affected area.
polygon	cap. alertInfoArea. polygon. group	The paired values of points defining a polygon that delineates the affected area of the alert message (OPTIONAL)	<p>(1) Code Values: The geographic polygon is represented by a whitespace-delimited list of [WGS 84] coordinate pairs. (See WGS 84 Note at end of this section)</p> <p>(2) A minimum of 4 coordinate pairs MUST be present and the first and last pairs of coordinates MUST be the same.</p> <p>(3) Multiple instances MAY occur within an <area> block.</p>
circle	cap. alertInfoArea. circle. group	The paired values of a point and radius delineating the affected area of the alert message (OPTIONAL)	<p>(1) Code Values: The circular area is represented by a central point given as a [WGS 84] coordinate pair followed by a space character and a radius value in kilometers. (See WGS 84 Note at end of this section)</p> <p>(2) Multiple instances MAY occur within an <area> block.</p>

Element Name	Context. Class. Attribute. Representation	Definition and (Optionality)	Notes or Value Domain
geocode	cap. alertInfoArea. geocode. code	The geographic code delineating the affected area of the alert message (OPTIONAL)	<p>(1) Any geographically-based code to describe a message target area, in the form:</p> <pre><parameter> <valueName>valueName</valueName> <value>value</value> </parameter></pre> <p>where the content of "valueName" is a user-assigned string designating the domain of the code, and the content of "value" is a string (which may represent a number) denoting the value itself (e.g., valueName = "SAME" and value="006113").</p> <p>(2) Values of "valueName" that are acronyms SHOULD be represented in all capital letters without periods (e.g., SAME, FIPS, ZIP).</p> <p>(3) Multiple instances MAY occur within an <area> block.</p> <p>(4) This element is primarily for compatibility with other systems. Use of this element presumes knowledge of the coding system on the part of recipients; therefore, for interoperability, it SHOULD be used in concert with an equivalent description in the more universally understood <polygon> and <circle> forms whenever possible.</p>
altitude	cap. alertInfoArea. altitude. quantity	The specific or minimum altitude of the affected area of the alert message (OPTIONAL)	<p>(1) If used with the <ceiling> element this value is the lower limit of a range. Otherwise, this value specifies a specific altitude.</p> <p>(2) The altitude measure is in feet above mean sea level per the [WGS 84] datum.</p>
ceiling	cap. alertInfoArea. ceiling. quantity	The maximum altitude of the affected area of the alert message (CONDITIONAL)	<p>(1) MUST NOT be used except in combination with the <altitude> element.</p> <p>(2) The ceiling measure is in feet above mean sea level per the [WGS 84] datum.</p>

238 3.3 Implementation Notes

239 3.3.1 WGS 84 Note

240 Geographic locations in CAP are defined using **[WGS 84]** (World Geodetic System 1984), equivalent to
241 EPSG (European Petroleum Survey Group) code 4326 (2 dimensions). CAP does not assign
242 responsibilities for coordinate transformations from and to other Spatial Reference Systems. See section
243 1.5 Terminology for the format of coordinate pairs within CAP elements.

244 3.3.2 DateTime Data Type

245 All **[dateTime]** elements (<sent>, <effective>, <onset>, and <expires>) SHALL be specified in the form
246 "YYYY-MM-DDThh:mm:ssXzh:zm" where:

- 247 • YYYY indicates the year
- 248 • MM indicates the month
- 249 • DD indicates the day
- 250 • T indicates the symbol "T" marking the start of the required time section
- 251 • hh indicates the hour
- 252 • mm indicates the minute
- 253 • ss indicates the second
- 254 • X indicates either the symbol "+" if the preceding date and time are in a time zone ahead of UTC,
255 or the symbol "-" if the preceding date and time are in a time zone behind UTC. If the time is in
256 UTC, the symbol "-" will be used.
- 257 • zh indicates the hours of offset from the preceding date and time to UTC, or "00" if the preceding
258 time is in UTC
- 259 • zm indicates the minutes of offset from the preceding date and time to UTC, or "00" if the
260 preceding time is in UTC

261 For example, a value of "2002-05-30T09:30:10-05:00" would indicate May 30, 2002 at 9:30:10 AM
262 Eastern Standard Time, which would be 2:30:10PM Universal Coordinated Time (UTC). That same
263 time might be indicated by "2002-05-30T14:30:10-00:00".

264 3.3.3 Character Entity References

265 The use of character entity references, such as HTML entities (e.g.); is discouraged.

266 3.3.4 Security Note

267 Because CAP is an XML-based format, existing XML security mechanisms can be used to secure and
268 authenticate its content. While these mechanisms are available to secure CAP Alert Messages, they
269 should not be used indiscriminately.

270 Note that this section adds two elements to CAP by reference. These are: <Signature> and
271 <EncryptedData>. Both elements are children of the <alert> element and are optional. If the
272 <EncryptedData> element exists, no other elements will be visible until after the message is decrypted.
273 This makes the minimal CAP message an <alert> element which encloses an <EncryptedData> element.
274 The maximal CAP message, if an <EncryptedData> element is present is an <alert> element enclosing a
275 single <EncryptedData> element and one or more <Signature> elements.

276 3.3.4.1 Digital Signatures

277 The <alert> element of a CAP Alert Message MAY have an Enveloped Signature, as described by XML-
278 Signature and Syntax Processing [XMLENSIG]. Other XML signature mechanisms MUST NOT be used in
279 CAP Alert Messages.

280 Processors MUST NOT reject a CAP Alert Message containing such a signature simply because they are
281 not capable of verifying it; they MUST continue processing and MAY inform the user of their failure to
282 validate the signature.

283 In other words, the presence of an element with the namespace URI [XMLENSIG] and a local name of
284 <Signature> as a child of the <alert> element must not cause a processor to fail merely because of its
285 presence.

286 3.3.4.2 Encryption

287 The <alert> element of a CAP Alert Message MAY be encrypted, using the mechanisms described by
288 XML Encryption Syntax and Processing [XMLENC]. Other XML encryption mechanisms MUST NOT be
289 used in CAP Alert Messages; however, transport-layer encryption mechanisms may be used
290 independently of this requirement.

291 3.4 XML Schema

```
292 <?xml version = "1.0" encoding = "UTF-8"?>  
293 <schema xmlns = "http://www.w3.org/2001/XMLSchema"  
294   targetNamespace = "urn:oasis:names:tc:emergency:cap:1.2"  
295   xmlns:cap = "urn:oasis:names:tc:emergency:cap:1.2"  
296   xmlns:xs = "http://www.w3.org/2001/XMLSchema"

513 3.5 Use of ASN.1 to Specify and Encode the CAP Alert Message

514 3.5.1 General

515 The ASN.1 (see ITU-T Rec X.680) schema in 3.5.3 provides an alternative formulation of the XML
516 schema defined in 3.4. If the ASN.1 Extended XML Encoding Rules (see ITU-T Rec X.693) are applied
517 to this ASN.1 schema, the permitted XML is identical to that supported by the XML schema in 3.4. If the
518 ASN.1 Unaligned Packed Encoding Rules (see ITU-T Rec X.691) are applied to it, the resulting binary
519 encodings are more compact than the corresponding XML encodings.

520 3.5.2 Formal Mappings and Specification

521 The normative specification of the compact binary encoding is in 3.5.3 with the application of the ASN.1
522 Unaligned Packed Encoding Rules (see ITU-T Rec. X.691).

523 The semantics of the fields in the ASN.1 specification are identical to those of the XSD specification, and
524 the mapping of the fields from the XSD specification to the ASN.1 specification is formally defined in ITU-
525 T Rec. X.694.

526 Implementations can produce and process the CAP alert XML messages using either ASN.1-based or
527 XSD-based tools (or other ad hoc software).

528 Implementations can produce and process the CAP alert compact binary messages using ASN.1-based
529 tools (or by other ad hoc software).

530 Any XML encoded CAP alert messages can be converted to compact binary messages by decoding with
531 an ASN.1 tool configured for the Extended XML Encoding Rules and re-encoding the resulting abstract
532 values with an ASN.1 tool configured for Unaligned Packed Encoding Rules.

533 Any compact binary CAP alert messages can be converted to XML encoded messages by decoding with
534 an ASN.1 tool configured for Unaligned Packed Encoding Rules and re-encoding the resulting abstract
535 values with an ASN.1 tool configured for Extended XML Encoding Rules.

536 3.5.3 ASN.1 Schema

```

799

800 4 Conformance

801 An implementation conforms to this specification if it satisfies all of the MUST or REQUIRED level
802 requirements defined within this specification.

803 This specification references a number of other specifications. In order to comply with this specification,
804 an implementation MUST implement the portions of referenced specifications necessary to comply with
805 the required provisions of this specification. Additionally, the implementation of the portions of the
806 referenced specifications that are specifically cited in this specification MUST comply with the rules for
807 those portions as established in the referenced specification.

808

809 4.1 Conformance Targets

810 The following conformance targets are defined in order to support the specification of conformance to this
811 standard:

- 812 a) CAP V1.2 Message
- 813 b) CAP V1.2 Message Producer
- 814 c) CAP V1.2 Message Consumer

815

816 4.2 Conformance as a CAP V1.2 Message

817 An XML 1.0 document is a conforming CAP V1.2 Message if and only if:

- 818 a) it is valid according to the schema located at [http://docs.oasis-](http://docs.oasis-open.org/emergency/cap/v1.2/CAP-v1.2.xsd)
819 [open.org/emergency/cap/v1.2/CAP-v1.2.xsd](http://docs.oasis-open.org/emergency/cap/v1.2/CAP-v1.2.xsd) and
- 820 b) the content of its elements and the values of its attributes meet all the additional mandatory
821 requirements specified in Section 3.

822

823 4.3 Conformance as a CAP V1.2 Message Producer

824 A software entity is a conforming CAP V1.2 Message Producer if and only if:

- 825 a) it is constructed in such a way that any XML document produced by it and present in a place in
826 which a conforming CAP V1.2 Message is expected (based on contextual information) is indeed a
827 conforming CAP V1.2 Message according to this standard.

828 The condition in (a) above can be satisfied in many different ways. Here are some examples of possible
829 scenarios:

- 830 – a standard protocol (for example, EDXL-DE) transfers messages carrying CAP V1.2 Messages; a
831 client has sent a request for a CAP V1.2 Message to a server which claims to be a conforming
832 CAP V1.2 Message Producer, and has received a response which is therefore expected to carry
833 a conforming CAP V1.2 Message;
- 834 – a local test environment has been set up, and the application under test (which claims to be a
835 conforming CAP V1.2 Message Producer) has the ability to produce a CAP V1.2 Message and
836 write it to a file in a directory in response to a request coming from the testing tool; the testing tool
837 has sent many requests to the application under test and is now verifying all the files present in
838 the directory, which is expected to contain only conforming CAP V1.2 Messages;

839

840 **4.4 Conformance as a CAP V1.2 Message Consumer**

841 A software entity is a conforming CAP V1.2 Message Consumer if and only if:

842 a) it is constructed in such a way that it is able to successfully validate and ingest a conforming CAP
843 V1.2 Message according to this standard.

844 The condition in (a) above can be satisfied in many different ways. Here is one example of a possible
845 scenario:

846 – a client receives and processes a CAP V1.2 Message from a server which claims to be a
847 conforming CAP V1.2 Message Producer

848

849

850 Appendix A. CAP Alert Message Example

851 A.1. Homeland Security Advisory System Alert

852 The following is a speculative example in the form of a CAP XML message.

```
