This document defines the ebXML RegRep profile for publishing, management, discovery and reuse of OWL DL Ontologies.

Status:

This document is a draft specification for review, revision and approval by the OASIS ebXML RegRep TC.

Technical Committee members should send comments on this specification to the Technical Committee's email list. Others should send comments to the Technical Committee by using the "Send A Comment" button on the Technical Committee's web page at http://www.oasis-open.org/ committeees/regrep/.

- 65 Copyright © OASIS® 2008. All Rights Reserved.
- 66 All capitalized terms in the following text have the meanings assigned to them in the OASIS Intellectual
- 67 Property Rights Policy (the "OASIS IPR Policy"). The full Policy may be found at the OASIS website.
- 68 This document and translations of it may be copied and furnished to others, and derivative works that
- comment on or otherwise explain it or assist in its implementation may be prepared, copied, published,
- and distributed, in whole or in part, without restriction of any kind, provided that the above copyright notice
- and this section are included on all such copies and derivative works. However, this document itself may
- not be modified in any way, including by removing the copyright notice or references to OASIS, except as
- 73 needed for the purpose of developing any document or deliverable produced by an OASIS Technical
- 74 Committee (in which case the rules applicable to copyrights, as set forth in the OASIS IPR Policy, must be
- followed) or as required to translate it into languages other than English.
- 76 The limited permissions granted above are perpetual and will not be revoked by OASIS or its successors
- 77 or assigns.
- 78 This document and the information contained herein is provided on an "AS IS" basis and OASIS
- 79 DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY
- 80 WARRANTY THAT THE USE OF THE INFORMATION HEREIN WILL NOT INFRINGE ANY
- 81 OWNERSHIP RIGHTS OR ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A
- 82 PARTICULAR PURPOSE.
- OASIS requests that any OASIS Party or any other party that believes it has patent claims that would
- necessarily be infringed by implementations of this OASIS Committee Specification or OASIS Standard, to
- 85 notify OASIS TC Administrator and provide an indication of its willingness to grant patent licenses to such
- patent claims in a manner consistent with the IPR Mode of the OASIS Technical Committee that produced
- 87 this specification.
- 88 OASIS invites any party to contact the OASIS TC Administrator if it is aware of a claim of ownership of
- any patent claims that would necessarily be infringed by implementations of this specification by a patent
- 90 holder that is not willing to provide a license to such patent claims in a manner consistent with the IPR
- 91 Mode of the OASIS Technical Committee that produced this specification. OASIS may include such
- 92 claims on its website, but disclaims any obligation to do so.
- 93 OASIS takes no position regarding the validity or scope of any intellectual property or other rights that
- might be claimed to pertain to the implementation or use of the technology described in this document or
- 95 the extent to which any license under such rights might or might not be available; neither does it represent
- that it has made any effort to identify any such rights. Information on OASIS' procedures with respect to
- 97 rights in any document or deliverable produced by an OASIS Technical Committee can be found on the
- 98 OASIS website. Copies of claims of rights made available for publication and any assurances of licenses
- to be made available, or the result of an attempt made to obtain a general license or permission for the
- use of such proprietary rights by implementers or users of this OASIS Committee Specification or OASIS
- 101 Standard, can be obtained from the OASIS TC Administrator. OASIS makes no representation that any
- information or list of intellectual property rights will at any time be complete, or that any claims in such list
- 103 are, in fact, Essential Claims.
- The names "OASIS", [insert specific trademarked names, abbreviations, etc. here] are trademarks of
- OASIS, the owner and developer of this specification, and should be used only to refer to the organization
- and its official outputs. OASIS welcomes reference to, and implementation and use of, specifications,

- This chapter provides an introduction to the rest of this document. 189
- The ebXML RegRep's repository contains electronic documents while its registry contains metadata that 190
- describes the documents in the repository. The metadata is defined using the [ebRIM] model which is 191
- quite flexible in its ability to describe the documents in the repository. 192
- However, many applications domains require considerably richer ability to describe information content. 193
- Ontologies are emerging as a means to provide a richer more semantically expressive means to model 194
- information content. One of the driving forces for ontologies is the Semantic Web initiative [LeeHendler]. 195
- As a part of this initiative, W3C's Web Ontology Working Group defined Web Ontology Language [OWL]. 196
- 197 Naturally, there is lot to be gained from using a standard ontology definition language, like OWL, to express richer information modeling semantics in ebXML RegRep. 198

1.1 Scope

- This specification normatively defines the ebXML RegRep profile for Web Ontology Language (OWL) DL. 200 More specifically, this specification normatively specifies the following: 201
- How OWL ontologies MAY be published to an ebXML RegRep server (Publish Profile) 202
 - How ebXML RegRep metadata (RegistryObjects) within and ebXML RegRep server MAY reference published OWL ontology constructs (Semantic Annotation)
 - How ebXML RegRep queries may discover semantically annotated RegistryObjects using published OWL ontologies (Discovery Profile)
 - How ebXML RegRep queries may be used to perform SPARQL queries on the OWL repository content (Invoking SPARQL Queries)
 - How published OWL ontologies may be governed using ebXML RegRep policies and registration procedures (Governance Profile)
- Issue-LB: Will also be good to reference how to deal with SKOS, because OGC, Geonetwork, and MMI 211 have ontologies already in this format. I think now SKOS is OWL-DL?? 212
- The first three items above utilize OWL ontology capabilities to improve the capabilities of ebXML RegRep 213
- while the fourth item utilizes capabilities of ebXML RegRep to provide much needed collaborative ontology 214
- authoring and change management procedures to OWL ontology developers. 215
- 216 This specification specifically does not define mappings from OWL constructs to the [ebRIM] model. This
- is a significant departure from previous versions of this specification. 217

Use Cases for OWL Support in ebXML RegRep 1.1

- This section describes some use cases that have been considered as main motivations for adding OWL 219 features to ebXML RegRep within this profile. 220
- Semantic annotation 221
 - Allow repository content to be described by semantically annotated ebRIM metadata

regrep-owl-profile November 6, 2009 Copyright @ OASIS® 2008. All Rights Reserved. 20 Page 10 of 35

 Support the use of ontological concepts as attribute value for ebRIM objects, specifically as 223 value of slots, association type and other RegistryObject attributes 224

252

253

- Allows discovery of objects such as datasets, services etc. based on a semantic match on a attribute value rather than a precise literal match
- Makes use of domain and mapping ontologies to perform semantic harmonization and determine synonymous terms
- Makes use of ontologies to match parent (broader) and child (narrower) termsMay make use of semantically annotated ebRIM metadata
- Collaborative ontology publishing and management
 - Supports ontology elements to be published by multiple organizations and individuals collaboratively
 - Allows browsing and discovering ontology elements within regrep
 - Provide governance process for managing changes to an ontologies
- Semantic mediation
 - Allows specialized clients to bi-directionally transforms data from one format to another. A specific example is mediation between OGC WFS and JMBL. For example, a client may make a WFS request to a server server that supports JMBL.
 - Allows data registered using different data standards (e.g. 19139, FGDC) to be discovered uniformly using the same query
 - Mediation is an application of semantically enhanced RegRep rather than a feature of it
- In addition to above use cases, this specification aims to address the use cases identified in [ORUC]. 244

Document Organization 1.1

- The document is organized as follows: 246
 - Chapter 1: Introduction provides an introduction to the rest of this document
- Chapter 2: OWL Overview provides an overview of the Web Ontology Language 248
- Chapter 3: Publish Profile specifies how OWL Ontologies are published to the server 249
- Chapter 4: Discovery Profile specifies how discovery queries make use of OWL Ontologies 250 251 available in the server
 - Chapter 5: Governance Profile specifies how OWL ontologies are governed with the server

1.1 Terminology

- The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD 254
- NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this specification are to be interpreted as 255
- described in IETF RFC 2119. 256

2 OWL Overview (Informative)

- This chapter provides an very brief overview of the Web Ontology Language (OWL). For a more complete overview please refer to [OWL].
- 304 OWL is a semantic markup language for publishing and sharing ontologies on the World Wide Web. OWL
- is derived from the DAML+OIL Web Ontology Language [DAML+OIL] and builds upon the Resource
- 306 Description Framework [RDF].

301

308 309

310

311

312

313

314

315

316

320

- 307 OWL provides three decreasingly expressive sub-languages [McGuinness, Harmelen]:
 - OWL Full is meant for users who want maximum expressiveness and the syntactic freedom of RDF with no computational guarantees. It is unlikely that any reasoning software will be able to support complete reasoning for OWL Full.
 - OWL DL supports those users who want the maximum expressiveness while retaining computational completeness (all conclusions are guaranteed to be computable) and decidability (all computations will finish in finite time). OWL DL is so named due to its correspondence with description logics which form the formal foundation of OWL.
 - OWL Lite supports those users primarily needing a classification hierarchy and simple constraints.
- Within the scope of this document, only OWL DL constructs are considered and in the rest of the document, "OWL" is used to mean "OWL DL" unless otherwise stated.
- OWL describes the structure of a domain in terms of classes and properties.

2.1 Semantic Web Languages upon which OWL is Layered

- OWL is one of a set of languages defined for the Semantic Web. It occupies the Ontology layer of an
- 322 architecture sometimes referred to as the Semantic Web Layer Cake. This moniker alludes to the fact
- that each language in the architecture sits on top of another while exposing some of the layer below is
- often seen of a wedding cake. OWL is situated in this architecture directly above the RDF Vocabulary
- 325 Description Language: RDF Schema (RDFS) [RDFS]. RDFS is a language for defining vocabularies or
- models with which to describe or categorize resources in the semantic web. RDFS, in turn, sits atop the
- 327 Resource Description Framework (RDF) [RDF]. RDF provides a basic data model, XML based transfer
- 328 syntax, and other basic tools. The whole Semantic Web stack itself then sits atop XML technologies
- which are used for identification and syntax definition.

This chapter specifies how OWL Ontologies are published to the server. 331

3.1 Publishing OWL

- 333 A client publishes OWL Ontologies to the server using the standard SubmitObjects protocol as defined by [ebRS]. 334
- The following additional requirements are defined for publishing OWL: 335
 - A client MUST publish OWL constructs as a repository item associated with an ExtrinsicObject
- The repository item MUST contain an OWL document in the RDF/XML format as defined by 337 [RDF/XML] 338
- The OWL repository item MUST be syntactically valid or else it MUST return a 339 InvalidRequestException. 340
 - The OWL repository item MAY result in a semantic inconsistency during publish. Semantic inconsistency will be dealt with in the validation and governance steps and not the publish step
 - The ExtrinsicObject MUST have a mimeType attribute with value "application/rdf+xml"
 - The ExtrinsicObject MUST have an objectType attribute that references the canonical ObjectType OWL as defined by this specification. The value of this attribute "urn:oasis:names:tc:ebxml
 - regrep:profile:webontology:ObjectType:RegistryObject:ExtrinsicObject:OWL"
- This specification does not define the granularity of the submitted OWL repository item content. A single 348 OWL repository item MAY be an entire ontology at one extreme or may be a single OWL axiom at the
- other extreme. More commonly a single OWL repository item SHOULD be multiple OWL axioms that 350
- share commonalities such as a single owl:Class and all the properties defined for the class. 351

3.1.1 Import Processing

- A server MUST process import statements while persisting an OWL Ontology to the OWL repository 353
- during publish. The effect of this processing MUST be that the knowledge graph stored in the OWL 354
- repository MUST include the OWL content from the publish OWL file as well as those from OWL files that 355
- are directly or indirectly imported by the published OWL file. 356
- Issue: Should we generate an ExtrinsicObject RepositoryItem pair for each imported document or not. ?? 357
- WSDL profile experience suggests this may not be desirable. 358

3.1 Validating OWL

- When an Ontology is in "Approved" status it MUST be semantically valid. However, during design stage 360 when the Ontology is in "Draft" status an Ontology MAY be semantically invalid or inconsistent. 361
- A server supporting this profile MUST support semantic validation of OWL content at certain points in the 362 lifecycle of OWL content. A server SHOULD NOT perform semantic validation during publishing of OWL 363

regrep-owl-profile 29 November 6, 2009 Page 15 of 35

- content. Semantic validation SHOULD be deferred to the Change Review Process defined by Registration 364 Procedure feature set of [ebRS]. 365
- The following requirements are defined for a server when validating the OWL content during the Change 366 Review process: 367
 - A server MUST provide a Validation Service as defined by [ebRS] for semantically validating OWL content when it is invoked. Additional details of validating OWL content will be presented in the Governance Profile chapter.

3.1 Cataloging OWL

368

369

370

372

375

376

377

378

379

380

381 382

383

384

385

386

387

388

389

390

392

395

- A server MUST provide a cataloging service for OWL content as defined by [ebRS]. The cataloging 373 service MUST minimally catalog the following OWL content as described below: 374
 - //owl:Ontology/owl:versionInfo elements content value MUST be cataloged as a value for the / rim:VersionInfo/@userVersionName attribute value on the ExtrinsicObject for the OWL repository item
 - //owl:Ontology/owl:imports/@rdf:resource attribute values MUST be cataloged as a value for multi-valued "urn:oasis:names:tc:ebxmlcanonical slot with name regrep:profile:webontology:2.0:imports" on the ExtrinsicObject for the OWL repository item
 - //owl:Ontology/rdfs:comment element MUST be cataloged as the value of the Description/LocalizedString/@value attribute of the on the ExtrinsicObject for the OWL repository item.
 - rdfs:comment attribute the lf the has an xml:lang specified then Description/LocalizedString/@locale attribute MUST have the value of that attribute.
 - the rdfs:comment does not have an xml:lang attribute specified then Description/LocalizedString/@locale attribute MUST NOT be specified
 - Issue: how to determine which OWL constructs were published in repository item for which ExtrinsicObject?? Is this a requirement?? Once OWL content is published to OWL repo how do we keep track of units of submission for access control and governance purposes??
- Issue: How do ExtrisicObjects for OWL get linked to reflected imports?? 391

3.1 Updating OWL

A client updates OWL Ontologies using either the standard SubmitObjects or UpdateObjects protocol as 393 defined by [ebRS]. 394

3.2 Deleting OWL

A client deletes OWL Ontologies using the standard RemoveObjects protocol as defined by [ebRS]. 396

regrep-owl-profile 31 November 6, 2009 32 Page 16 of 35

3.3 Semantic Annotation of RegistryObjects 397

- This section specifies how attribute values within a RegistryObject may reference an OWL construct. An 398
- [ebRIM] RegistryObject may reference various types of OWL constructs by using the fully-qualified id of 399
- the OWL construct as the value of an attribute within a class defined by [ebRIM]. 400

3.3.1 Types of OWL Construct References 401

- In general, any RDF resource MAY be referenced via semantic annotations in [ebRIM] RegistryObjects. 402
- 403 Typically however, the following types of OWL constructs are referenced via semantic annotations in
- [ebRIM] RegistryObjects: 404
- owl:Class 405
- owl:Individual 406
- owl:ObjectProperty 407
- owl:DatatypeProperty 408

3.3.1 Use Cases for Semantic Annotations 409

- Some use cases for semantic annotation of RegistryObjects are as follows: 410
- Referencing OWL constructs in Slots 411
- Referencing OWL constructs in Associations as value of type attribute 412
- Referencing OWL constructs in EmailAddress as value of type attribute 413
- Referencing OWL constructs in PostalAddress as value of type attribute 414
- 415 Referencing OWL constructs in TelephoneNumber as value of type attribute
- Referencing OWL constructs in external Classifications as value of nodeRepresentation attribute 416
- The [ebRIM] specification provides a detailed description for the classes and attributes mentioned above. 417
- 418 Among the use cases above all but the first use case can be generalized to the use case of referencing of
- OWL constructs in reference attributes of an [ebRIM] class. 419

3.3.1 Referencing OWL Constructs in Slots

- An [ebRIM] Slot MAY reference a supported OWL construct as follows: 421
- The rim:Slot/rim:ValueList/rim:ValueListItem/@xsi:type attribute value MUST be 422 rim:StringValueType 423
- The content of the rim:Slot/rim:ValueList/rim:ValueListItem/rim:Value element of the Slot MUST 424 be the fully-qualified id of the OWL construct 425
- The rim:Slot/@dataType attribute value of the Slot MUST be defined to have a value 426 "urn:oasis:names:tc:ebxml-regrep:profile:webontology:2.0:resourceReference" 427

regrep-owl-profile 33 November 6, 2009 Copyright @ OASIS® 2008. All Rights Reserved. 34 Page 17 of 35

The following example shows a Person object with a Slot named "foodPreference" that references the owl:Class for VegetarianPizza.

```
430
         <Person id="urn:acme:person:Danyal" ...>
431
           <rim:Slot name="foodPreference"
432
             dataType="urn:oasis:names:tc:ebxml-
433
434
         regrep:profile:webontology:2.0:resourceReference">
435
             <rim: ValueList>
436
               <rim:ValueListItem xsi:type="rim:StringValueType">
437
                  <rim: Value>http://www.co-
438
         ode.org/ontologies/pizza/pizza.owl#VegetarianPizza</rim:Value>
439
                </rim:ValueListItem>
440
              </rim:ValueList>
441
           </rim:Slot>
442
         </Person>
```

3.3.1 Referencing OWL Constructs in Reference Attributes

- 445 A RegistryObject attribute MAY reference a supported OWL construct as follows:
 - The value of the attribute MUST be the fully-qualified id of the OWL construct
- The following example shows an Association between two Person objects where the type attribute references a "hasBrother" ObjectProperty.

```
449 <a href="Association">
<a href="Association">
<a href="Association"</a>
450 sourceObject="urn:acme:person:Danyal"
451 targetObject="urn:acme:person:Omar"
452 type="http://www.mindswap.org/ontologies/family.owl#hasBrother"/>
```

453 Issue: No way to distinguish a normal regrep reference from refrence to an OWL resource?? Should we 454 use a prefix hack like:

type="owlref:http://www.mindswap.org/ontologies/family.owl#hasBrother"

4 Ontology Versioning

- This chapter define how a client creates new versions of an existing ontology and how a server manages
- multiple versions of an ontology simultaneously.
- Details will be added in next draft.

Discovery Profile

This chapter specifies how discovery queries make use of OWL Ontologies available in the server. 463

5.1 Canonical Functions

- The [ebRS] specification defines a set of canonical functions their parameters, their semantics and how 465
- they may be used within queries and query parameters. [ebRS] Will define the Function concept in CD4 466
- 467 per issue 119.

462

464

- This profile defines several additional canonical functions that MUST be supported by a server 468
- implementing this profile. Table 2 summarizes the functions defined by this profile. Subsequent sections 469
- 470 specify them in detail.
- The canonical functions defined in this section, along with semantic annotation of RegistryObjects 471
- described earlier, together enable semantic search capability in standard [ebRS] queries. A client MAY 472
- use these functions within the static part of a query expression or within the value of a parameter to a 473
- parameterized query. A server MUST process the functions according to their behavior as specified in this 474
- section. The function processing model is specified by [ebRS]. 475
- A client MUST use the "owlp:" namespace prefix when using a canonical function efined by this profile. 476

Function Name	Semantics
owlp:dataTypeProperties	Returns the datatype properties for specified class
owlp:equivalentClasses	Returns all equivalent classes for the specified class
owlp:equivalentProperties	Returns all equivalent classes for the specified property.
owlp:instanceOf	Returns all individuals that are instances of specified class
owlp:instances	Returns all Individuals that are instances of specified class
owlp:inverseProperty	Returns the inverse property for the specified property
owlp:objectProperties	Returns the object properties for specified class
owlp:sameAs	Returns all individuals that are same as the specified individual
owlp:subClasses	Returns all sub-classes of the specified class
owlp:subProperties	Returns all sub-properties of the specified property
owlp:superClasses	Returns all super classes of the specified class
owlp:superProperties	Returns all super properties of the specified property
owlp:synonymousTerms	Returns all terms deemed to be semantically synonymous to specified term

Table 2: Canonical Functions Defined By This Profile

5.2 Canonical Function: dataTypeProperties

This canonical function takes an OWL class's id as parameter and returns all dataType properties of the specified class.

5.2.1 Parameter Summary

478

481

482

483

484

485

486

487

488

489

Parameter	Description	Data Type
classId	The value of this parameter SHOULD be the id of an OWL class	string
direct	If true, restrict the properties returned to those directly associated with this class	boolean
delimiter	The value of this parameter specifies the delimiter string to be used as separator between the tokens representing the ids matched by the function	string

5.2.2 Function Semantics

- The server MUST return a string if the query is processed without any exceptions
- The string MAY be empty if no class is found with specified id or if no data properties are found for class matching specified id
- The string MUST consist of a set of data property ids separated by the appropriate delimiter character when any data properties are found for class matching specified id

The following example shows an EJBQL query that matches RegistryObjects that have a slot whose dataType attribute matches any one of the dataType properties of the specified OWL class:

```
490
         <query:QueryRequest ...>
491
492
           <query:Query queryDefinition="urn:oasis:names:tc:ebxml-
493
         regrep:query:AdhocQuery">
494
495
              <rim:Slot name="queryLanguage">
496
                <rim: ValueList>
497
                  <rim:ValueListItem xsi:type="StringValueType"</pre>
         xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
498
499
                    <rim:Value>urn:oasis:names:tc:ebxml-
         regrep:QueryLanguage:EJBQL</rim:Value>
500
501
                  </rim:ValueListItem>
502
                </rim:ValueList>
503
              </rim:Slot>
504
505
              <rim:Slot name="queryExpression">
506
                <rim: ValueList>
507
                  <rim:ValueListItem xsi:type="StringValueType"</pre>
508
         xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
                    <rim: Value > #@SELECT Object(eo) FROM
509
510
         org.freebxml.omar.jaxb.bindings.rim._4_0.ExtrinsicObjectType eo LEFT OUTER
         JOIN eo.slot semref_slot WHERE (semref_slot.dataType IN (@#
511
         owlp:dataTypeProperties(\"http://www.xfront.com/owl/ontologies/camera/#Range\"
512
513
         , true, \",\") #@) )@#</rim:Value>
514
                  </rim:ValueListItem>
515
                </rim:ValueList>
516
              </rim:Slot>

535

536

537

538

Parameter	Description	Data Type
classId	The value of this parameter SHOULD be the id of an OWL class	string
delimiter	The value of this parameter specifies the delimiter string to be used as separator between the tokens representing the ids matched by the function	string

5.3.2 Function Semantics

- The server MUST return a string if the query is processed without any exceptions
- The string MAY be empty if no class is found with specified id or if no equivalent classes are found for class matching specified id
- The string MUST consist of a set of equivalent class ids separated by the appropriate delimiter character when any equivalent classes are found for class matching specified id

5.4 Canonical Function: equivalentProperties

This canonical function takes an OWL property's id as parameter and returns all equivalent properties for 532 the specified property. 533

5.4.1 Parameter Summary

Parameter	Description	Data Type
propertyld	The value of this parameter SHOULD be the id of an OWL property	string
delimiter	The value of this parameter specifies the delimiter string to be used as separator between the tokens representing the ids matched by the function	string

5.4.2 Function Semantics

- The server MUST return a string if the query is processed without any exceptions
- The string MAY be empty if no property is found with specified id or if no equivalent properties are found for property matching specified id

regrep-owl-profile November 6, 2009 Copyright © OASIS® 2008. All Rights Reserved. 44 Page 22 of 35 The string MUST consist of a set of equivalent property ids separated by the appropriate delimiter character when any equivalent properties are found for property matching specified id

540 541

542

545

539

5.5 Canonical Function: instanceOf

This canonical function takes an OWL Individual's id as parameter and returns all classes of which the specified Individual is an instance of.

5.5.1 Parameter Summary

Parameter	Description	Data Type
individualId	The value of this parameter SHOULD be the id of an OWL Individual	string
direct	If true, only consider the direct types of this individual, ignoring the super- classes of the stated types.	boolean
delimiter	The value of this parameter specifies the delimiter string to be used as separator between the tokens representing the ids matched by the function	string

5.5.2 Function Semantics

- The server MUST return a string if the query is processed without any exceptions
- The string MAY be empty if no Individual is found with specified id or if no classes are found that are types for the Individual matching specified id
- The string MUST consist of a set of class ids separated by the appropriate delimiter character when any classes are found that are a type for the Individual matching specified id

5.6 Canonical Function: instances

This canonical function takes an OWL class's id as parameter and returns all individuals that are instances of the specified class.

5.6.1 Parameter Summary

Parameter	Description	Data Type
classId	The value of this parameter SHOULD be the id of an OWL class	string
direct	If true, only direct instances are matched (i.e. instances of sub-classes of this class are not matched)	boolean
delimiter	The value of this parameter specifies the delimiter string to be used as separator between the tokens representing the ids matched by the function	string

 - The string MUST consist of a set of individuals' ids separated by the appropriate delimiter character when any individuals are found that are an instance of the class matching specified id

5.7 Canonical Function: inverseProperties

This canonical function takes an OWL property's id as parameter and returns the inverse properties (if any) for the specified property.

5.7.1 Parameter Summary

Parameter	Description	Data Type
propertyld	The value of this parameter SHOULD be the id of an OWL property	string
delimiter	The value of this parameter specifies the delimiter string to be used as separator between the tokens representing the ids matched by the function	string

5.7.2 Function Semantics

- The server MUST return a string if the query is processed without any exceptions
- The string MAY be empty if no property is found with specified id or if no inverse properties are found for property matching specified id
- The string MUST consist of a set of inverse property ids separated by the appropriate delimiter character when any inverse property is found for property matching specified id

5.8 Canonical Function: objectProperties

This canonical function takes an OWL class's id as parameter and returns all objects properties of the specified class.

5.8.1 Parameter Summary

Parameter	Description	Data Type
classId	The value of this parameter SHOULD be the id of an OWL class	string
direct	If true, restrict the properties returned to those directly associated with this class.	boolean

- The string MUST consist of a set of object property ids separated by the appropriate delimiter character when any object properties are found for class matching specified id

5.9 Canonical Function: sameAs

This canonical function takes an RDF resource id as parameter and returns all resources that are same as 587 the specified resource. 588

5.9.1 Parameter Summary

Parameter	Description	Data Type
resourceld	The value of this parameter SHOULD be the id of an RDF resource	string
delimiter	The value of this parameter specifies the delimiter string to be used as separator between the tokens representing the ids matched by the function	string

5.9.2 Function Semantics

- The server MUST return a string if the query is processed without any exceptions
- The string MAY be empty if no RDF resource is found with specified id or if no RDF resources are found to be same as the specified resource
- The string MUST consist of a set of resources ids separated by the appropriate delimiter character when any resources are found to be same as the resource matching specified id

5.10 Canonical Function: subClasses

This canonical function takes an OWL class's id as parameter and returns all sub-classes (children, 598 grandchildren, etc.) of the specified class. 599

5.10.1 Parameter Summary

Parameter	Description	Data Type

637

638

639

640

- The server MUST return a string if the query is processed without any exceptions
- The string MAY be empty if no class is found with specified id or if no ancestor classes are found for class matching specified id
- The string MUST consist of a set of ancestor class ids separated by the appropriate delimiter character when any ancestor classes are found for class matching specified id

5.13 Canonical Function: superProperties

This canonical function takes an OWL property's id as parameter and returns all ancestor properties (parent, grandparent, etc.) of the specified property.

5.13.1 Parameter Summary

Parameter	Description	Data Type
propertyld	The value of this parameter SHOULD be the id of an OWL property	string
direct	If true, only match the immediate super-properties in the property hierarchy	boolean
delimiter	The value of this parameter specifies the delimiter string to be used as separator between the tokens representing the ids matched by the function	string

5.13.2 Function Semantics

- The server MUST return a string if the query is processed without any exceptions
- The string MAY be empty if no property is found with specified id or if no ancestor properties are found for property matching specified id
- The string MUST consist of a set of ancestor property ids separated by the appropriate delimiter character when any ancestor classes are found for class matching specified id

The following example shows the use of the function in the canonical FindAssociations query defined by [ebRS]. The guery MUST match all Associations where the sourceObject is "urn:acme:Person:Danyal" and the associationType value references the id of an ancestor property for the "http://www.mindswap.org/ ontologies/family.owl#hasBrother" property. For example, this query would match Associations where the type attribute value is "http://www.mindswap.org/ontologies/family.owl#hasSibling"

```
<query:QueryRequest ...>
  <query:Query queryDefinition="urn:oasis:names:tc:ebxml-
regrep:query:FindAssociations">
    <rim:Slot name="sourceObjectId">
      <rim: ValueList>
        <rim:ValueListItem xsi:type="StringValueType">
          <rim: Value>urn:acme:Person:Danyal</rim:Value>
        </rim:ValueListItem>
      </rim:ValueList>
    </rim:Slot>
    <rim:Slot name="associationType">
      <rim: ValueList>
        <rim:ValueListItem xsi:type="StringValueType">
          <rim:Value>owlp:superProperties("http://www.mindswap.org/ontologies/
family.owl#hasBrother", true, ",")#@@#</rim:Value>
        </rim:ValueListItem>
      </rim:ValueList>
    </rim:Slot>
 </query:Query>
</query:QueryRequest>
```

5.14 Canonical Function: synonymousTerms

This canonical function takes a term specified as a string parameter and a threshold specified as a float parameter and returns all terms that are semantically similar to the specified term where the level of similarity is greater than or equal to the specified threshold of similarity.

666

667

668

669

670

671

672

673

674

Parameter	Description	Data Type
term	The value of this parameter may be an arbitrarterm or concept (e.g. temperature)	string
threshold	A value in the range of 0.0 and 1.0 that signifies the minimum level of similarity for matching terms. A value of 0.0 indicates no similarity while a value of 1.0 indicates an exact match or perfect similarity	float
delimiter	The value of this parameter specifies the delimiter string to be used as separator between the tokens representing the ids matched by the function	string

5.14.2 Function Semantics

- The server MUST return a string if the query is processed without any exceptions
- The string MAY be empty if no synonymous terms are found for specified term

regrep-owl-profile November 6, 2009 Copyright @ OASIS® 2008. All Rights Reserved. 56 Page 28 of 35 The string MUST consist of a set of synonymous terms separated by the appropriate delimiter character when any term is found to be synonymous to specified term with a similarity level greater than or equal to the value specified by the threshold parameter

This specification does not define how terms are defined to be synonymous. A server is free to choose any means to support the semantics of this function. For example, a server MAY use a mapping ontology as defined in [ALIGN].

The following example shows how a client MAY use the synonymousTerms function when invoking a stored query to discover datasets to match all datasets that have the specified dataset field or any other dataset field that is synonymous to the specified field name:

5.15 Invoking SPARQL Queries

- A server supporting this profile MUST support the invocation of SPARQL queries as defined by [SPARQL] against the OWL repository content as described in this section.
- A client MAY submit an ad hoc SPARQL query to a server supporting this profile using the standard Query protocol as defined by [ebRS].

5.15.1 QueryRequest Requirements

- A client MAY invoke a SPARQL query to the server using a QueryRequest. The following additional requirements are defined for a client to invoke a QueryRequest for a SPARQL query:
 - The canonical AdhocQuery MUST be used within the query:Query
 - This implies that the query:Query/@queryDefinition MUST be "urn:oasis:names:tc:ebxml-regrep:query:AdhocQuery"
 - The queryLanguage query parameter MUST have a value of "urn:oasis:names:tc:ebxmlregrep:QueryLanguage:SPARQL"
 - The queryExpression query parameter MUST be a valid SPARQL query

715 The following example shows SPARQL query expression within a QueryRequest:

A server MUST process a SPARQL query and return its response within a QueryResponse. The following additional requirements are defined for a server to return a QueryResponse for a SPARQL query:

- A server MUST process the SPARQL query according to [SPARQL] within the context of the OWL content published within its repository. Specifically a server SHOULD NOT need to query its Registry metadata to process the SPARQL query
- A server MUST return the SPARQL response as a sparqlx:sparql element in the SPARQL Query Results XML Format as specified by [SPARQLX]
- The sparqlx:sparql MUST be the child element of a rim:Slot/rim:ValueList/rim:ValueListItem of type rim:AnyValueType within a Slot with name "urn:oasis:names:tc:ebxml-regrep:profile:webontology:2.0:sparqlResponse" and a dataType of "urn:oasis:names:tc:ebxml-regrep:profile:webontology:2.0:sparql" within the guery:QueryResponse element
- The QueryResponse element SHOULD NOT have a query:RegistryObjectsList child element
- The following example shows SPARQL response within a QueryResponse:

6 Governance Profile

- This chapter specifies how OWL Ontologies are governed within ebXML RegRep. The governance of 777
- ontologies within ebXML RegRep are based upon the using the standard Registration Procedures feature 778
- 779 set defined by [ebRS]. A brief description of key governance concepts and activities are described here.
- The reader should consult the Registration Procedures feature set defined by [ebRS] for a detailed 780
- understanding and specification. 781

6.1 Creation of an Ontology Register

- An ontology Register represents an ontological context as described by [ORUC]. Its members consists of 783
- 784 ontology files that share a common context with respect to content, usage and governance policies. An
- ontology register MUST be created within a server by an organization representing a community
- collaborating on development of ontologies . The organization that creates the Register has the role of 786
- 787 RegisterOwner for the Register.
- The ontology Register upon creation MUST have a status of "Draft". Changes to a Register's status trigger 788
- different work flow within the governance process for that Register. 789

6.2 Designation of Organization Roles

- Once a register has been created, the RegisterOwner organization MUST assign various governance 791 792 roles to other organizations within the community as defined by Registration Procedures feature set defined by [ebRS]. Here is a summary of these organization roles: 793
- SubmittingOrganization MUST be assigned to all Organizations who are authorized to submit 794 and change ontologies within the register 795
 - RegisterManager MUST be assigned to one Organizations that is authorized to receive ontology change proposals from SubmittingOrganizations and perform acceptance checks
 - ControlBody MUST be assigned to one Organizations that is authorized to perform detailed review of ontology change proposals from SubmittingOrganizations and to accept or reject each proposed change
- The RegisterOwner organization MAY choose to assign one or more of above roles to itself. 801

6.3 Designation of Person Roles

- Once an organization has been assigned a governance role for a Register it MUST assign various 803 governance roles to persons affiliated with that organization as defined by Registration Procedures feature 804 set defined by [ebRS]. Here is a summary of these person roles: 805
 - ChangeProposalSubmitter The SubmittingOrganization MUST assign this role to all persons within the organization who are authorized to submit and update ontologies within the Register
 - ChangeProposalReceiver The RegisterManager MUST assign this role to all persons or services within the organization that are authorized to receive changes to ontologies within the register and perform basic acceptance checks on the submitted changes

regrep-owl-profile 63 November 6, 2009 Copyright @ OASIS® 2008. All Rights Reserved. Page 32 of 35 ChangeProposalReviewer - The ControlBody MUST assign this role to all persons within the organization who are authorized to review and approve / reject changes to ontologies within the register

6.4 Publishing Draft Ontology Files

- Once an ontology Register has been created and organization and person roles have been assigned 815
- authorized ontology developers MAY begin publishing ontology files to the server as described in Publish
- Profile. Once an ontology file has been published to the server the submitter MAY add it as a members of 817
- an ontology Register that has a status of "Draft". This includes a newly created Register or a new version 818
- of an existing Register. 819

811

812 813

814

827

836

- 820 Throughout the ontology development phase, the ontology Register version stays in a "Draft" status.
- During this time, its ChangeProposalSubmitter MAY freely make changes to the ontology files that are its 821
- members as described in Publish Profile. 822
- The default Register notification policy defined by [ebRS] requires that when members of a "Draft" 823
- Register are changed the server MUST deliver a notification to all subjects that have the role of 824
- ChangeProposalSubmitter for that Register. This is analogous to a commit email that is typical in software 825
- development project teams. 826

6.5 Submitting Ontologies for Review

- When the ontology development cycle is complete the ChangeProposalSubmitter MAY submit the 828
- changes within the "Draft" Register for review and approval by changing the status to "Proposed" as 829
- described by the Registration Procedures feature in [ebRS]. 830
- The default Register notification policy defined by [ebRS] requires that when a Register status is changed 831
- to "Proposed", the server MUST deliver a notification to all persons or services that have the role of 832
- **ChangeProposalReceiver** or ChangeProposalSubmitter for that Register. 833
- Setting a Register status is changed to "Proposed" and subsequent notification initiates the change 834
- proposal receiving and acceptance / rejection activity. 835

6.6 Receiving Ontology Change Proposals

- When a ChangeProposalReceiver is notified of the submission of a ontology changes in an ontology 837
- Register it MAY take on the activity of performing acceptance review for the proposed changes by setting 838
- the status of the Register to "UnderAcceptanceReview". 839
- The default Register notification policy defined by [ebRS] requires that when a Register status is changed 840
- to "UnderAcceptanceReview", the server MUST deliver a notification to all ChangeProposalReceiver's. 841
- This lets other ChangeProposalReceiver's know that a peer has begun working on the activity and they 842
- need not work on it. 843
- The ChangeProposalReceiver MAY then accept (set status to "Accepted") or reject (set status to 844
- 845 "Rejected) the change proposal in it entirety as described in Registration Procedures feature set of
- [ebRS]. 846
- 847 The ChangeProposalReceiver MAY NOT be a person and instead MAY be an automated service that
- implements a NotificationListener interface. 848

65 regrep-owl-profile November 6, 2009 66 Page 33 of 35

- The default Register notification policy defined by [ebRS] requires that when a Register status is changed
- to "Accepted", the server MUST deliver a notification to all ChangeProposalReviewers. This initiates the
- 851 change proposal review activity.

6.7 Reviewing Ontology Change Proposal

- When a ChangeProposalReviewer is notified that ontology changes in an ontology Register have been
- accepted for review, it MAY take on the activity of performing detailed review of the proposed changes by
- setting the status of the Register to "UnderReview".
- 856 The default Register notification policy defined by [ebRS] requires that when a Register status is changed
- 857 to "UnderReview", the server MUST deliver a notification to all ChangeProposalReviewer's. This lets other
- 858 ChangeProposalReviewer's know that a peer has begun working on the activity and they need not work
- 859 on it.

852

- The ChangeProposalReviewer MUST then perform a detailed review of the proposed changes as
- 861 described by [ebRS]. The following OWL specific requirements are defined for the review process:
- 862 Issue: Need OWL specific review requirements (if any) here??
- During the review the ChangeProposalReviewer MAY then approve (set status to "Approved") or reject
- (set status to "Rejected) the change proposal in it entirety or at the granularitry of individual changes as
- described in Registration Procedures feature set of [ebRS].
- The default Register notification policy defined by [ebRS] requires that when a Register status is changed
- to "Approved", the server MUST deliver a notification to all ChangeProposalSubmitters.

6.8 Creating New Version of Ontologies

- 869 Once a specific version of an ontology Register has been reviewed and approved, its ontologies may be
- 870 used by a broader community. This is considered to be the deployment phase for the ontologies in the
- 871 Register. While an older version of an ontology Register is in deployment phase, a new "Draft" version
- may be created at any time to begin a new development phase for making the next round of changes to
- the ontologies that are members of that Register. Details on ontology versioning are described in Ontology
- 874 Versioning.
