26 Abstract:

27This specification defines protocol bindings and profiles for the use of SAML assertions and28request-response messages in communications protocols and frameworks.

29 Status:

- This is a stable Committee Specification that is undergoing a vote of the OASIS membership in pursuit of OASIS Standard status.
- If you are on the security-services@lists.oasis-open.org list for committee members, send
 comments there. If you are not on that list, subscribe to the security-services comment@lists.oasis-open.org list and send comments there. To subscribe, send an email
 message to security-services-comment-request@lists.oasis-open.org with the word "subscribe"
 as the body of the message.

- 37 The errata document for this specification is located at http://www.oasis-
- 38 open.org/committees/security/docs/. Its document identifier is draft-sstc-cs-errata-*nn*.
- 39 For information on whether any patents have been disclosed that may be essential to
- 40 implementing this specification, and any offers of patent licensing terms, please refer to the

113 **1 Introduction**

114 This document specifies protocol bindings and profiles for the use of SAML assertions and request-115 response messages in communications protocols and frameworks.

- 116 A separate specification **[SAMLCore]** defines the SAML assertions and request-response messages
- 117 themselves.

118 **1.1 Protocol Binding and Profile Concepts**

- 119 Mappings from SAML request-response message exchanges into standard messaging or communication
- protocols are called SAML *protocol bindings* (or just *bindings*). An instance of mapping SAML request-
- response message exchanges into a specific protocol <FOO> is termed a <FOO> binding for SAML or a SAML <FOO> binding.
- 123 For example, an HTTP binding for SAML describes how SAML request and response message
- exchanges are mapped into HTTP message exchanges. A SAML SOAP binding describes how SAML
 request and response message exchanges are mapped into SOAP message exchanges.
- 126 Sets of rules describing how to embed and extract SAML assertions into a framework or protocol are
- 127 called *profiles of SAML*. A profile describes how SAML assertions are embedded in or combined with
- 128 other objects (for example, files of various types, or protocol data units of communication protocols) by an
- 129 originating party, communicated from the originating site to a destination, and subsequently processed at
- 130 the destination. A particular set of rules for embedding SAML assertions into and extracting them from a
- specific class of <FOO> objects is termed a <FOO> profile of SAML.
- 132 For example, a SOAP profile of SAML describes how SAML assertions can be added to SOAP
- messages, how SOAP headers are affected by SAML assertions, and how SAML-related error states
 should be reflected in SOAP messages.
- 135 The intent of this specification is to specify a selected set of bindings and profiles in sufficient detail to 136 ensure that independently implemented products will interoperate.
- 137 For other terms and concepts that are specific to SAML, refer to the SAML glossary [SAMLGloss].

138 **1.2 Notation**

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD"
NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this specification are to be interpreted as
described in IETF RFC 2119 [RFC2119].

| 142 | Listings of productions or other normative code appear like this. | | | | | |
|------------|---|--|--|--|--|--|
| 143 | | | | | | |
| 144 | Example code listings appear like this. | | | | | |
| 145 | Note: Non-normative notes and explanations appear like this. | | | | | |
| 146 147 | Conventional XML namespace prefixes are used throughout this specification to stand for their respective namespaces as follows, whether or not a namespace declaration is present in the example: | | | | | |
| 148 | • The prefix saml: stands for the SAML assertion namespace [SAMLCore]. | | | | | |
| 149 | • The prefix samlp: stands for the SAML request-response protocol namespace [SAMLCore]. | | | | | |
| 150 151 | • The prefix ds: stands for the W3C XML Signature namespace, http://www.w3.org/2000/09/xmldsig# [XMLSig] . | | | | | |

 The prefix SOAP-ENV: stands for the SOAP 1.1 namespace, http://schemas.xmlsoap.org/soap/envelope [SOAP1.1].

- 154 This specification uses the following typographical conventions in text: <SAMLElement>,
- 155 <ns:ForeignElement>, Attribute, OtherCode. In some cases, angle brackets are used to indicate
- 156 nonterminals, rather than XML elements; the intent will be clear from the context.

157 2 Specification of Additional Protocol Bindings and 158 Profiles

This specification defines a selected set of protocol bindings and profiles, but others will need to be developed. It is not possible for the OASIS SAML Technical Committee to standardize all of these additional bindings and profiles for two reasons: it has limited resources and it does not own the standardization process for all of the technologies used. The following sections offer guidelines for specifying bindings and profiles and a process framework for describing and registering them.

164 2.1 Guidelines for Specifying Protocol Bindings and Profiles

- 165 This section provides a checklist of issues that MUST be addressed by each protocol binding and profile.
- Describe the set of interactions between parties involved in the binding or profile. Any restriction on applications used by each party and the protocols involved in each interaction must be explicitly called out
- Identify the parties involved in each interaction, including: how many parties are involved, and whether intermediaries may be involved.
- Specify the method of authentication of parties involved in each interaction, including whether
 authentication is required and acceptable authentication types.
- 173 4. Identify the level of support for message integrity. What mechanisms are used to ensure message integrity?
- Identify the level of support for confidentiality, including whether a third party may view the contents of
 SAML messages and assertions, whether the binding or profile requires confidentiality and the
 mechanisms recommended for achieving confidentiality.
- Identify the error states, including the error states at each participant, especially those that receive and process SAML assertions or messages.
- 180 7. Identify security considerations, including analysis of threats and description of countermeasures.
- 181 8. Identify SAML confirmation method identifiers defined and/or utilized by the binding or profile.

182 2.2 Process Framework for Describing and Registering Protocol 183 Bindings and Profiles

- 184 For any new protocol binding or profile to be interoperable, it needs to be openly specified. The OASIS
- 185 SAML Technical Committee will maintain a registry and repository of submitted bindings and profiles titled
- 186 "Additional Bindings and Profiles" at the SAML website (http://www.oasis-open.org/committees/security/)
- 187 in order to keep the SAML community informed. The Committee will also provide instructions for
- submission of bindings and profiles by OASIS members.
- 189 When a profile or protocol binding is registered, the following information MUST be supplied:
- 190 1. Identification: Specify a URI that uniquely identifies this protocol binding or profile.
- Contact information: Specify the postal or electronic contact information for the author of the protocol binding or profile.
- Bescription: Provide a text description of the protocol binding or profile. The description SHOULD follow the guidelines in Section 2.1.
- Updates: Provide references to previously registered protocol bindings or profiles that the current entry improves or obsoletes.

197 **3 Protocol Bindings**

198 The following sections define SAML protocol bindings sanctioned by the OASIS SAML Committee. Only 199 one binding, the SAML SOAP binding, is defined.

200 3.1 SOAP Binding for SAML

SOAP (Simple Object Access Protocol) 1.1 **[SOAP1.1]** is a specification for RPC-like interactions and message communications using XML and HTTP. It has three main parts. One is a message format that uses an envelope and body metaphor to wrap XML data for transmission between parties. The second is a restricted definition of XML data for making strict RPC-like calls through SOAP, without using a

205 predefined XML schema. Finally, it provides a binding for SOAP messages to HTTP and extended HTTP.

206 The SAML SOAP binding defines how to use SOAP to send and receive SAML requests and responses.

207 Like SAML, SOAP can be used over multiple underlying transports. This binding has protocol-

independent aspects, but also calls out the use of SOAP over HTTP as REQUIRED (mandatory to implement).

210 **3.1.1 Required Information**

- 211 Identification: urn:oasis:names:tc:SAML:1.0:bindings:SOAP-binding
- 212 Contact information: security-services-comment@lists.oasis-open.org
- 213 **Description:** Given below.
- 214 Updates: None.

215 **3.1.2 Protocol-Independent Aspects of the SAML SOAP Binding**

The following sections define aspects of the SAML SOAP binding that are independent of the underlying protocol, such as HTTP, on which the SOAP messages are transported.

218 **3.1.2.1 Basic Operation**

- SOAP messages consist of three elements: an envelope, header data, and a message body. SAML
 request-response protocol elements MUST be enclosed within the SOAP message body.
- SOAP 1.1 also defines an optional data encoding system. This system is not used within the SAML
 SOAP binding. This means that SAML messages can be transported using SOAP without re-encoding
 from the "standard" SAML schema to one based on the SOAP encoding.
- 224 The system model used for SAML conversations over SOAP is a simple request-response model.
- A system entity acting as a SAML requester transmits a SAML <Request> element within the body of a SOAP message to a system entity acting as a SAML responder. The SAML requester MUST NOT include more than one SAML request per SOAP message or include any additional XML elements in the SOAP body.
- 229 2. The SAML responder MUST return either a <Response> element within the body of another SOAP 230 message or a SOAP fault code. The SAML responder MUST NOT include more than one SAML 231 response per SOAP message or include any additional XML elements in the SOAP body. If a SAML responder cannot, for some reason, process a SAML request, it MUST return a SOAP fault code. 232 SOAP fault codes MUST NOT be sent for errors within the SAML problem domain, for example, 233 inability to find an extension schema or as a signal that the subject is not authorized to access a 234 resource in an authorization query. (SOAP 1.1 faults and fault codes are discussed in [SOAP1.1] 235 236 §4.1.)

- 237 On receiving a SAML response in a SOAP message, the SAML requester MUST NOT send a fault code
- or other error messages to the SAML responder. Because the format for the message interchange is a
- simple request-response pattern, adding additional items such as error conditions would needlessly
 complicate the protocol.
- [SOAP1.1] references an early draft of the XML Schema specification including an obsolete namespace.
- 242 SAML requesters SHOULD generate SOAP documents referencing only the final XML schema
- 243 namespace. SAML responders MUST be able to process both the XML schema namespace used in
- **[SOAP1.1]** as well as the final XML schema namespace.

245 3.1.2.2 SOAP Headers

- A SAML requester in a SAML conversation over SOAP MAY add arbitrary headers to the SOAP
 message. This binding does not define any additional SOAP headers.
- 248 Note: The reason other headers need to be allowed is that some SOAP software and
 249 libraries might add headers to a SOAP message that are out of the control of the SAML 250 aware process. Also, some headers might be needed for underlying protocols that
 251 require routing of messages.
- 252 A SAML responder MUST NOT require any headers for the SOAP message.
- Note: The rationale is that requiring extra headers will cause fragmentation of the SAML
 standard and will hurt interoperability.

255 3.1.2.3 Authentication

Authentication of both the SAML requester and responder is OPTIONAL and depends on the environment of use. Authentication protocols available from the underlying substrate protocol MAY be utilized to provide authentication. Section 3.1.2.2 describes authentication in the SOAP over HTTP environment.

260 3.1.2.4 Message Integrity

261 Message integrity of both SAML request and response is OPTIONAL and depends on the environment of 262 use. The security layer in the underlying substrate protocol MAY be used to ensure message integrity.

263 Section 3.1.2.3 describes support for message integrity in the SOAP over HTTP environment.

264 3.1.2.5 Confidentiality

265 Confidentiality of both SAML request and response is OPTIONAL and depends on the environment of 266 use. The security layer in the underlying substrate protocol MAY be used to ensure message

267 confidentiality. Section 3.1.2.4 describes support for confidentiality in the SOAP over HTTP environment.

268 3.1.3 Use of SOAP over HTTP

- A SAML processor that claims conformance to the SAML SOAP binding MUST implement SAML over SOAP over HTTP. This section describes certain specifics of using SOAP over HTTP, including HTTP headers, error reporting, authentication, message integrity and confidentiality.
- 272 The HTTP binding for SOAP is described in [SOAP1.1] §6.0. It requires the use of a SOAPAction
- header as part of a SOAP HTTP request. A SAML responder MUST NOT depend on the value of this
- 274 header. A SAML requester MAY set the value of SOAPAction header as follows:
- 275 http://www.oasis-open.org/committees/security

276 **3.1.3.1 HTTP Headers**

277 HTTP proxies MUST NOT cache responses carrying SAML assertions.

- Both of the following conditions apply when using HTTP 1.1:
- If the value of the Cache-Control header field is not set to no-store, then the SAML
 responder MUST NOT include the Cache-Control header field in the response.
- If the Expires response header field is not disabled by a Cache-Control header field with a value of no-store, then the Expires field SHOULD NOT be included.
- 283 There are no other restrictions on HTTP headers.

284 3.1.3.2 Authentication

- 285 The SAML requester and responder MUST implement the following authentication methods:
- 286 1. No client or server authentication.
- 287 2. HTTP basic client authentication **[RFC2617]** with and without SSL 3.0 or TLS 1.0.
- 288 3. HTTP over SSL 3.0 or TLS 1.0 (see Section 6) server authentication with a server-side certificate.
- 289 4. HTTP over SSL 3.0 or TLS 1.0 client authentication with a client-side certificate.
- 290 If a SAML responder uses SSL 3.0 or TLS 1.0, it MUST use a server-side certificate.

291 3.1.3.3 Message Integrity

When message integrity needs to be guaranteed, SAML responders MUST use HTTP over SSL 3.0 or TLS1.0 (see Section 6) with a server-side certificate.

294 3.1.3.4 Message Confidentiality

When message confidentiality is required, SAML responders MUST use HTTP over SSL 3.0 or TLS 1.0 (see Section 6) with a server-side certificate.

297 3.1.3.5 Security Considerations

- 298 Before deployment, each combination of authentication, message integrity and confidentiality
- 299 mechanisms SHOULD be analyzed for vulnerability in the context of the deployment environment. See 300 the SAML security considerations document **[SAMLSec]** for a detailed discussion.
- 301 RFC 2617 **[RFC2617]** describes possible attacks in the HTTP environment when basic or message-302 digest authentication schemes are used.

303 3.1.3.6 Error Reporting

- A SAML responder that refuses to perform a message exchange with the SAML requester SHOULD return a "403 Forbidden" response. In this case, the content of the HTTP body is not significant.
- 306 As described in **[SOAP1.1]** § 6.2, in the case of a SOAP error while processing a SOAP request, the
- 307 SOAP HTTP server MUST return a "500 Internal Server Error" response and include a SOAP
- 308 message in the response with a SOAP fault element. This type of error SHOULD be returned for SOAP-
- related errors detected before control is passed to the SAML processor, or when the SOAP processor
- 310 reports an internal error (for example, the SOAP XML namespace is incorrect, the SAML schema cannot
- be located, the SAML processor throws an exception, and so on).
- In the case of a SAML processing error, the SOAP HTTP server MUST respond with "200 OK" and
- 313 include a SAML-specified error description as the only child of the <SOAP-ENV: Body> element. For more
- 314 information about SAML error codes, see the SAML assertion and protocol specification [SAMLCore].

315 **3.1.3.7 Example SAML Message Exchange Using SOAP over HTTP**

- Following is an example of a request that asks for an assertion containing an authentication statement
- 317 from a SAML authentication authority.

| 318 | POST /SamlService HTTP/1.1 | | | | | | | |
|-------|--|--|--|--|--|--|--|--|
| 319 | Host: www.example.com | | | | | | | |
| 320 | Content-Type: text/xml | | | | | | | |
| 321 | Content-Length: nnn | | | | | | | |
| 322 | SOAPAction: http://www.oasis-open.org/committees/security | | | | | | | |
| 323 | <soap-env:envelope< th=""></soap-env:envelope<> | | | | | | | |
| 324 | xmlns:SOAP-ENV="http://schemas.xmlsoap.org/soap/envelope/"> | | | | | | | |
| 325 | <soap-env:body></soap-env:body> | | | | | | | |

| 352 | | | | | | | | |
| 353 | | | | | | | | |
| 354 | | | | | | | | |
| 355 | | | | | | | | |

356 **4 Profiles**

357 The following sections define profiles of SAML that are sanctioned by the OASIS SAML Committee.

Two web browser-based profiles that are designed to support single sign-on (SSO), supporting Scenario 1-1 of the SAML requirements document **[SAMLReqs]**:

- The browser/artifact profile of SAML
- The browser/POST profile of SAML
- For each type of profile, a section describing the threat model and relevant countermeasures is also included.

364 4.1 Web Browser SSO Profiles of SAML

In the scenario supported by the web browser SSO profiles, a web user authenticates herself to a *source site*. The web user then uses a secured resource at a destination site, without directly authenticating to
 the *destination site*.

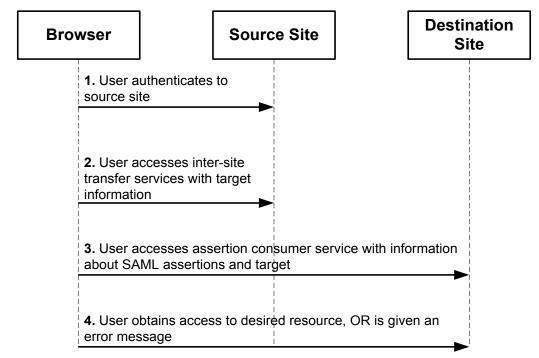

368 The following assumptions are made about this scenario for the purposes of these profiles:

- The user is using a standard commercial browser and has authenticated to a source site by some means outside the scope of SAML.
- The source site has some form of security engine in place that can track locally authenticated users [WEBSSO]. Typically, this takes the form of a session that might be represented by an encrypted cookie or an encoded URL or by the use of some other technology [SESSION]. This is a substantial requirement but one that is met by a large class of security engines.

At some point, the user attempts to access a *target* resource available from the destination site, and subsequently, through one or more steps (for example, redirection), arrives at an *inter-site transfer service* (which may be associated with one or more URIs) at the source site. Starting from this point, the web browser SSO profiles describe a canonical sequence of HTTP exchanges that transfer the user browser to an *assertion consumer service* at the destination site. Information about the SAML assertions provided by the source site and associated with the user, and the desired target, is conveyed from the source to the destination site by the protocol exchange.

The assertion consumer service at the destination site can examine both the assertions and the target information and determine whether to allow access to the target resource, thereby achieving web SSO for authenticated users originating from a source site. Often, the destination site also utilizes a security engine that will create and maintain a session, possibly utilizing information contained in the source site assertions, for the user at the destination site.

387 The following figure illustrates this basic template for achieving SSO.

388

Two HTTP-based techniques are used in the web browser SSO profiles for conveying information from one site to another via a standard commercial browser.

- SAML artifact: A SAML artifact of "small" bounded size is carried as part of a URL query string such that, when the artifact is conveyed to the source site, the artifact unambiguously references an assertion. The artifact is conveyed via redirection to the destination site, which then acquires the referenced assertion by some further steps. Typically, this involves the use of a registered SAML protocol binding. This technique is used in the browser/artifact profile of SAML.
- Form POST: SAML assertions are uploaded to the browser within an HTML form and conveyed to the destination site as part of an HTTP POST payload when the user submits the form. This technique is used in the browser/POST profile of SAML.
- Cookies are not employed in any profile, as cookies impose the limitation that both the source and destination site belong to the same "cookie domain."
- 401 In the discussion of the web browser SSO profiles, the term SSO assertion will be used to refer to an
- 402 assertion that has (1) a <saml:Conditions> element with NotBefore and NotOnOrAfter attributes
 403 present, and (2) contains one or more authentication statements.

404 4.1.1 Browser/Artifact Profile of SAML

405 **4.1.1.1 Required Information**

- 406 Identification: urn:oasis:names:tc:SAML:1.0:profiles:artifact-01
- 407 Contact information: security-services-comment@lists.oasis-open.org
- 408 **SAML Confirmation Method Identifiers:** The "SAML artifact" confirmation method identifier is used by
- 409 this profile. The following identifier has been assigned to this confirmation method:
- 410 urn:oasis:names:tc:SAML:1.0:cm:artifact-01
- 411 **Description:** Given below.
- 412 Updates: None.

413 4.1.1.2 Preliminaries

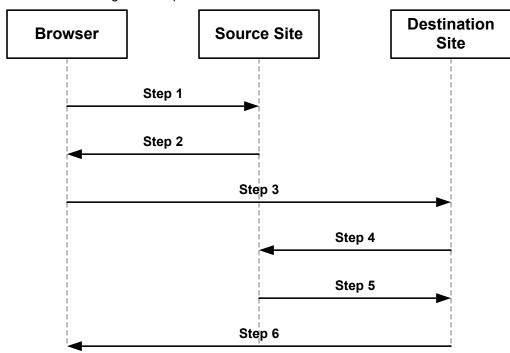

The browser/artifact profile of SAML relies on a reference to the needed assertion traveling in a SAML

artifact, which the destination site must dereference from the source site in order to determine whether
 the user is authenticated.

Note: The need for a "small" SAML artifact is motivated by restrictions on URL size 417 imposed by commercial web browsers. While RFC 2616 [RFC2616] does not specify any 418 419 restrictions on URL length, in practice commercial web browsers and application servers 420 impose size constraints on URLs, for a maximum size of approximately 2000 characters 421 (see Section 8). Further, as developers will need to estimate and set aside URL "real estate" for the artifact, it is important that the artifact have a bounded size, that is, with 422 423 predefined maximum size. These measures ensure that the artifact can be reliably carried as part of the URL query string and thereby transferred successfully from source 424 425 to destination site.

426 The browser/artifact profile consists of a single interaction among three parties (a user equipped with a

browser, a source site, and a destination site), with a nested sub-interaction between two parties (the
 source site and the destination site). The interaction sequence is shown in the following figure, with the
 following sections elucidating each step.

- 430
- 431 Terminology from RFC 1738 [RFC1738] is used to describe components of a URL. An HTTP URL has
 432 the following form:
- 433 http://<HOST>:<port>/<path>?<searchpart>
- The following sections specify certain portions of the <searchpart> component of the URL. Ellipses will
 be used to indicate additional but unspecified portions of the <searchpart> component.
- 436 HTTP requests and responses MUST be drawn from either HTTP 1.1 [**RFC2616**] or HTTP 1.0
- 437 **[RFC1945]**. Distinctions between the two are drawn only when necessary.

438 4.1.1.3 Step 1: Accessing the Inter-Site Transfer Service

In step 1, the user's browser accesses the inter-site transfer service, with information about the desired
 target at the destination site attached to the URL.

441 No normative form is given for step 1. It is RECOMMENDED that the HTTP request take the following 442 form:

```
443
          GET http://<inter-site transfer host name and path>?TARGET=<Target>...<HTTP-
444
          Version>
445
          <other HTTP 1.0 or 1.1 components>
```

446 Where:

- 447 <inter-site transfer host name and path>
- 448 This provides the host name, port number, and path components of an inter-site transfer URL at the 449 source site.
- 450 Target=<Target>
- 451 This name-value pair occurs in the searchpart> and is used to convey information about the 452 desired target resource at the destination site.
- 453 Confidentiality and message integrity MUST be maintained in step 1.

4.1.1.4 Step 2: Redirecting to the Destination Site 454

- 455 In step 2, the source site's inter-site transfer service responds and redirects the user's browser to the 456 assertion consumer service at the destination site.
- 457 The HTTP response MUST take the following form:

```
458
```

```
<http-Version> 302 <Reason Phrase>
459
          <other headers>
460
          Location : http://<artifact receiver host name and path>?<SAML searchpart>
461
          <other HTTP 1.0 or 1.1 components>
```

- 462 Where:
- 463 <artifact receiver host name and path>
- 464 This provides the host name, port number, and path components of an artifact receiver URL 465 associated with the assertion consumer service at the destination site.
- 466 <SAML searchpart>= ...TARGET=<Target>...SAMLart=<SAML artifact> ...
- 467 A single target description MUST be included in the <SAML searchpart > component. At least 468 one SAML artifact MUST be included in the SAML <SAML searchpart > component; multiple SAML 469 artifacts MAY be included. If more than one artifact is carried within <SAML searchpart>, all the
- artifacts MUST have the same SourceID. 470
- 471 According to HTTP 1.1 [RFC2616] and HTTP 1.0 [RFC1945], the use of status code 302 is
- 472 recommended to indicate that "the requested resource resides temporarily under a different URI". The 473 response may also include additional headers and an optional message body as described in those
- RFCs. 474
- 475 Confidentiality and message integrity MUST be maintained in step 2. It is RECOMMENDED that the inter-
- 476 site transfer URL be protected by SSL 3.0 or TLS 1.0 (see Section 6). Otherwise, the one or more 477 artifacts returned in step 2 will be available in plain text to an attacker who might then be able to
- 478 impersonate the assertion subject.

4.1.1.5 Step 3: Accessing the Artifact Receiver URL 479

- 480 In step 3, the user's browser accesses the artifact receiver URL, with a SAML artifact representing the user's authentication information attached to the URL. 481
- 482 The HTTP request MUST take the form:

```
483
          GET http://<artifact receiver host name and path>?<SAML searchpart> <HTTP-
484
          Version>
485
          <other HTTP 1.0 or 1.1 request components>
```

- 486 Where:
- 487 <artifact receiver host name and path>
- 488 This provides the host name, port number, and path components of an artifact receiver URL 489 associated with the assertion consumer service at the destination site.
- 490 <SAML searchpart>= ...TARGET=<Target>...SAMLart=<SAML artifact> ...

A single target description MUST be included in the <SAML searchpart> component. At least one
 SAML artifact MUST be included in the <SAML searchpart> component; multiple SAML artifacts
 MAY be included. If more than one artifact is carried within <SAML searchpart>, all the artifacts
 MUST have the same SourceID.

Confidentiality and message integrity MUST be maintained in step 3. It is RECOMMENDED that the

artifact receiver URL be protected by SSL 3.0 or TLS 1.0 (see Section 6). Otherwise, the artifacts
 transmitted in step 3 will be available in plain text to any attacker who might then be able to impersonate
 the appertian subject

the assertion subject.

499 **4.1.1.6 Steps 4 and 5: Acquiring the Corresponding Assertions**

500 In steps 4 and 5, the destination site, in effect, dereferences the one or more SAML artifacts in its 501 posession in order to acquire the SAML authentication assertion that corresponds to each artifact.

- 502 These steps MUST utilize a SAML protocol binding for a SAML request-response message exchange 503 between the destination and source sites. The destination site functions as a SAML requester and the 504 source site functions as a SAML responder.
- 505 The destination site MUST send a <samlp:Request> message to the source site, requesting assertions 506 by supplying assertion artifacts in the <samlp:AssertionArtifact> element.
- 507 If the source site is able to find or construct the requested assertions, it responds with a
- 508 <samlp:Response> message with the requested assertions. Otherwise, it returns an appropriate error 509 code, as defined within the selected SAML binding.
- 510 In the case where the source site returns assertions within <samlp:Response>, it MUST return exactly
- 511 one assertion for each SAML artifact found in the corresponding <samlp:Request> element. The case
- 512 where fewer or greater number of assertions is returned within the <samlp:Response> element MUST
- 513 be treated as an error state by the destination site.
- 514 The source site MUST implement a "one-time request" property for each SAML artifact. Many simple
- 515 implementations meet this constraint by an action such as deleting the relevant assertion from persistent
- storage at the source site after one lookup. If a SAML artifact is presented to the source site again, the
- 517 source site MUST return the same message as it would if it were queried with an unknown artifact.
- The selected SAML protocol binding MUST provide confidentiality, message integrity and bilateral
 authentication. The source site MUST implement the SAML SOAP binding with support for confidentiality,
 message integrity, and bilateral authentication.
- 521 The source site MUST return a response with no assertions if it receives a <samlp:Request> message
- from an authenticated destination site X containing an artifact issued by the source site to some other destination site Y, where X <> Y. One way to implement this feature is to have source sites maintain a list
- 524 of artifact and destination site pairs.
- 525 At least one of the SAML assertions returned to the destination site MUST be an SSO assertion.
- 526 Authentication statements MAY be distributed across more than one returned assertion.
- 527 The <saml:ConfirmationMethod> element of each assertion MUST be set to
- 528 urn:oasis:names:tc:SAML:1.0:cm:artifact-01.
- 529 Based on the information obtained in the assertions retrieved by the destination site, the destination site
- 530 MAY engage in additional SAML message exchanges with the source site.

4.1.1.7 Step 6: Responding to the User's Request for a Resource

- 532 In step 6, the user's browser is sent an HTTP response that either allows or denies access to the desired 533 resource.
- 534 No normative form is mandated for the HTTP response. The destination site SHOULD provide some form 535 of helpful error message in the case where access to resources at that site is disallowed.

536 4.1.1.8 Artifact Format

537 The artifact format includes a mandatory two-byte artifact type code, as follows:

| | SAML_artifact | := B64(TypeCode RemainingArtifact) |
|-----|---------------|------------------------------------|
| 539 | TypeCode | := Byte1Byte2 |

540 541

542

562

563

Note: Depending on the level of security desired and associated profile protocol steps, many viable architectures could be developed for the SAML artifact **[CoreAssnEx] [ShibMarlena]**. The type code structure accommodates variability in the architecture.

543 The notation B64 (TypeCode RemainingArtifact) stands for the application of the base64 544 [RFC2045] transformation to the catenation of the TypeCode and RemainingArtifact. This profile 545 defines an artifact type of type code 0x0001, which is REQUIRED (mandatory to implement) for any 546 implementation of the browser/artifact profile. This artifact type is defined as follows:

| - 1 1 | • | 0x0001 SourceID AssertionHandle |
|-----------|---|--------------------------------------|
| | | 20-byte_sequence 20-byte_sequence |

551 SourceID is a 20-byte sequence used by the destination site to determine source site identity and 552 location. It is assumed that the destination site will maintain a table of SourceID values as well as the 553 URL (or address) for the corresponding SAML responder. This information is communicated between the 554 source and destination sites out-of-band. On receiving the SAML artifact, the destination site determines 555 if the SourceID belongs to a known source site and obtains the site location before sending a SAML 556 request (as described in Section 4.1.1.6).

557 Any two source sites with a common destination site MUST use distinct <code>SourceID</code> values. Construction

558 of AssertionHandle values is governed by the principle that they SHOULD have no predictable 559 relationship to the contents of the referenced assertion at the source site and it MUST be infeasible to

- 560 construct or guess the value of a valid, outstanding assertion handle.
- 561 The following practices are RECOMMENDED for the creation of SAML artifacts at source sites:
 - Each source site selects a single identification URL. The domain name used within this URL is registered with an appropriate authority and administered by the source site.
- The source site constructs the SourceID component of the artifact by taking the SHA-1 hash of the identification URL.
- The AssertionHandle value is constructed from a cryptographically strong random or
 pseudorandom number sequence [RFC1750] generated by the source site. The sequence
 consists of values of at least eight bytes in size. These values should be padded to a total length
 of 20 bytes.

570 **4.1.1.9 Threat Model and Countermeasures**

571 This section utilizes materials from [ShibMarlena] and [Rescorla-Sec].

572 4.1.1.9.1 Stolen Artifact

573 **Threat:** If an eavesdropper can copy the real user's SAML artifact, then the eavesdropper could construct 574 a URL with the real user's SAML artifact and be able to impersonate the user at the destination site.

- 575 **Countermeasure:** As indicated in steps 2, 3, 4, and 5, confidentiality MUST be provided whenever an 576 artifact is communicated between a site and the user's browser. This provides protection against an 577 eavesdropper gaining access to a real user's SAML artifact.
- 578 If an eavesdropper defeats the measures used to ensure confidentiality, additional countermeasures are 579 available:
- The source and destination sites SHOULD make some reasonable effort to ensure that clock
 settings at both sites differ by at most a few minutes. Many forms of time synchronization service
 are available, both over the Internet and from proprietary sources.
- SAML assertions communicated in step 5 MUST include an SSO assertion.
- The source site SHOULD track the time difference between when a SAML artifact is generated and placed on a URL line and when a <samlp:Request> message carrying the artifact is received from the destination. A maximum time limit of a few minutes is recommended. Should an assertion be requested by a destination site query beyond this time limit, a SAML error SHOULD be returned by the source site.
- It is possible for the source site to create SSO assertions either when the corresponding SAML artifact is created or when a <samlp:Request> message carrying the artifact is received from the destination. The validity period of the assertion SHOULD be set appropriately in each case: longer for the former, shorter for the latter.
- Values for NotBefore and NotOnOrAfter attributes of SSO assertions SHOULD have the shortest possible validity period consistent with successful communication of the assertion from source to destination site. This is typically on the order of a few minutes. This ensures that a stolen artifact can only be used successfully within a small time window.
- The destination site MUST check the validity period of all assertions obtained from the source site and reject expired assertions. A destination site MAY choose to implement a stricter test of validity for SSO assertions, such as requiring the assertion's IssueInstant or
 AuthenticationInstant attribute value to be within a few minutes of the time at which the assertion is received at the destination site.
- If a received authentication statement includes a <saml:SubjectLocality> element with the
 IP address of the user, the destination site MAY check the browser IP address against the IP
 address contained in the authentication statement.

605 4.1.1.9.2 Attacks on the SAML Protocol Message Exchange

- 606 **Threat:** The message exchange in steps 4 and 5 could be attacked in a variety of ways, including artifact 607 or assertion theft, replay, message insertion or modification, and MITM (man-in-the-middle attack).
- 608 **Countermeasure:** The requirement for the use of a SAML protocol binding with the properties of bilateral 609 authentication, message integrity, and confidentiality defends against these attacks.

610 4.1.1.9.3 Malicious Destination Site

- 611 **Threat:** Since the destination site obtains artifacts from the user, a malicious site could impersonate the 612 user at some new destination site. The new destination site would obtain assertions from the source site 613 and believe the malicious site to be the user.
- 614 **Countermeasure:** The new destination site will need to authenticate itself to the source site so as to 615 obtain the SAML assertions corresponding to the SAML artifacts. There are two cases to consider:
- 6161. If the new destination site has no relationship with the source site, it will be unable to authenticate and617 this step will fail.
- 618
 2. If the new destination site has an existing relationship with the source site, the source site will
 619
 619 determine that assertions are being requested by a site other than that to which the artifacts were
 620 originally sent. In such a case, the source site MUST not provide the assertions to the new
 621 destination site.

622 4.1.1.9.4 Forged SAML Artifact

623 Threat: A malicious user could forge a SAML artifact.

624 **Countermeasure:** Section 4.1.1.8 provides specific recommendations regarding the construction of a

625 SAML artifact such that it is infeasible to guess or construct the value of a current, valid, and outstanding

assertion handle. A malicious user could attempt to repeatedly "guess" a valid SAML artifact value (one

627 that corresponds to an existing assertion at a source site), but given the size of the value space, this

action would likely require a very large number of failed attempts. A source site SHOULD implement

629 measures to ensure that repeated attempts at querying against non-existent artifacts result in an alarm.

630 4.1.1.9.5 Browser State Exposure

631 Threat: The SAML artifact profile involves "downloading" of SAML artifacts to the web browser from a 632 source site. This information is available as part of the web browser state and is usually stored in 633 persistent storage on the user system in a completely unsecured fashion. The threat here is that the 634 artifact may be "reused" at some later point in time.

635 **Countermeasure:** The "one-use" property of SAML artifacts ensures that they cannot be reused from a 636 browser. Due to the recommended short lifetimes of artifacts and mandatory SSO assertions, it is difficult

637 to steal an artifact and reuse it from some other browser at a later time.

638 4.1.2 Browser/POST Profile of SAML

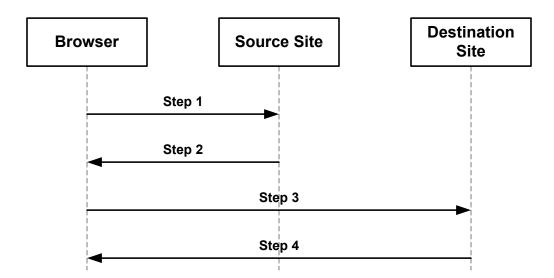

639 4.1.2.1 Required Information

- 640 Identification: urn:oasis:names:tc:SAML:1.0:profiles:browser-post
- 641 **Contact information:** security-services-comment@lists.oasis-open.org
- 642 **SAML Confirmation Method Identifiers:** The "Bearer" confirmation method identifier is used by this 643 profile. The following identifier has been assigned to this confirmation method:
- 644 urn:oasis:names:tc:SAML:1.0:cm:bearer
- 645 **Description:** Given below.
- 646 Updates: None.

647 **4.1.2.2 Preliminaries**

648 The browser/POST profile of SAML allows authentication information to be supplied to a destination site 649 without the use of an artifact. The following figure diagrams the interactions between parties in the

- 650 browser/POST profile.
- 651 The browser/POST profile consists of a series of two interactions, the first between a user equipped with
- a browser and a source site, and the second directly between the user and the destination site. The
- 653 interaction sequence is shown in the following figure, with the following sections elucidating each step.

654

660

661

662

4.1.2.3 Step 1: Accessing the Inter-Site Transfer Service

In step 1, the user's browser accesses the inter-site transfer service, with information about the desired target at the destination site attached to the URL.

No normative form is given for step 1. It is RECOMMENDED that the HTTP request take the following form:

```
GET http://<inter-site transfer host name and path>?TARGET=<Target>...<HTTP-
Version>
<other HTTP 1.0 or 1.1 components>
```

663 Where:

```
664 <inter-site transfer host name and path>
```

- 665 This provides the host name, port number, and path components of an inter-site transfer URL at the 666 source site.
- 667 Target=<Target>
- 668 This name-value pair occurs in the <searchpart> and is used to convey information about the 669 desired target resource at the destination site.

670 4.1.2.4 Step 2: Generating and Supplying the Response

- In step 2, the source site generates HTML form data containing a SAML Response which contains anSSO assertion.
- 673 The HTTP response MUST take the form:

```
674<HTTP-Version 200 <Reason Phrase>675<other HTTP 1.0 or 1.1 components>
```

676 Where:

677 <other HTTP 1.0 or 1.1 components>

This MUST include an HTML FORM [Chapter 17, **[HTML401]**] with the following FORM body:

```
679<Body>680<FORM Method="Post" Action="<assertion consumer host name and path>" ...>681<INPUT TYPE="hidden" NAME="SAMLResponse" Value="B64(<response>)">682...683<INPUT TYPE="hidden" NAME="TARGET" Value="<Target>">684</body>
```

- 685 <assertion consumer host name and path>
- 686 This provides the host name, port number, and path components of an assertion consumer URL at 687 the destination site.
- 688 Exactly one SAML response MUST be included within the FORM body with the control name

689 SAMLResponse; multiple SAML assertions MAY be included in the Response. At least one of the

assertions MUST be an SSO assertion. A single target description MUST be included with the control
 name TARGET.

- 692 The notation B64 (<response>) stands for the result of applying the base64 transformation to the 693 response.
- The SAML response MUST be digitally signed following the guidelines given in **[SAMLCore]**. Included assertions MAY be digitally signed.
- 696 Confidentiality and message integrity MUST be maintained for step 2. It is RECOMMENDED that the
- inter-site transfer URL be protected by SSL 3.0 or TLS 1.0 (see Section 6). Otherwise, the assertions
 returned will be available in plain text to any attacker who might then be able to impersonate the assertion
 subject.

4.1.2.5 Step 3: Posting the Form Containing the Response

- In step 3, the browser submits the form containing the SAML response using the following HTTP request.
- Note: Posting the form can be triggered by various means. For example, a "submit"
 button could be included in Step 2 by including the following line:

<INPUT TYPE="Submit" NAME="button" Value="Submit">

This requires the user to explicitly "submit" the form for the POST request to be sent.
Alternatively, JavaScript[™] can be used to avoid an additional "submit" step from the user as follows [Anders]:

```
708
                <HTMT.>
709
                <BODY Onload="document.forms[0].submit()">
710
                       <FORM METHOD="POST" ACTION="<assertion consumer host name and</pre>
711
                path>">
712
713
                       <INPUT TYPE="HIDDEN" NAME="SAMLResponse"
714
                        VALUE=" response in base64 coding">
715
                      <INPUT TYPE="hidden" NAME="TARGET" Value="<Target>">
716
                     </FORM>
717
                </BODY>
718
                </HTML>
```

719 The HTTP request MUST include the following components:

```
720 POST http://<assertion consumer host name and path>
721 cother HTTP 1.0 or 1.1 request components>
```

722 Where:

704

723 <other HTTP 1.0 or 1.1 request components>

This consists of the form data set derived by the browser processing of the form data received in step 2 according to 17.13.3 of [HTML4.01]. Exactly one SAML Response MUST be included within the form data set with control name SAMLResponse; multiple SAML assertions MAY be included in the Response. A single target description MUST be included with the control name set to TARGET.

728 The SAML response MUST include the Recipient attribute [SAMLCore] with its value set to

729 <assertion consumer host name and path>. At least one of the SAML assertions included within 730 the response MUST be an SSO assertion.

- The destination site MUST ensure a "single use" policy for SSO assertions communicated by means ofthis profile.
- Note: The implication here is that the destination site will need to save state. A simple implementation might maintain a table of pairs, where each pair consists of the assertion ID and the time at which the entry is to be deleted (where this time is based on the SSO assertion lifetime.). The destination site needs to ensure that there are no duplicate entries. Since SSO assertions containing authentication statements are recommended to have a bett lifetime in the work of the state of the state.
- have short lifetimes in the web browser context, such a table would be of bounded size.
- 739 Confidentiality and message integrity MUST be maintained for the HTTP request in step 3. It is
- 740 RECOMMENDED that the assertion consumer URL be protected by SSL 3.0 or TLS 1.0 (see Section 6).
- 741 Otherwise, the assertions transmitted in step 3 will be available in plain text to any attacker who might 742 then impersonate the assertion subject.
- 743 The <saml:ConfirmationMethod> element of each assertion MUST be set to
- 744 urn:oasis:names:tc:SAML:1.0:cm:bearer.

745 4.1.2.6 Step 4: Responding to the User's Request for a Resource

- In step 4, the user's browser is sent an HTTP response that either allows or denies access to the desiredresource.
- No normative form is mandated for the HTTP response. The destination site SHOULD provide some form of helpful error message in the case where access to resources at that site is disallowed.

750 4.1.2.7 Threat Model and Countermeasures

751 This section utilizes materials from [ShibMarlena] and [Rescorla-Sec].

752 4.1.2.7.1 Stolen Assertion

- **Threat:** If an eavesdropper can copy the real user's SAML response and included assertions, then the
- eavesdropper could construct an appropriate POST body and be able to impersonate the user at thedestination site.
- Countermeasure: As indicated in steps 2 and 3, confidentiality MUST be provided whenever a response
 is communicated between a site and the user's browser. This provides protection against an
 eavesdropper obtaining a real user's SAML response and assertions.
- If an eavesdropper defeats the measures used to ensure confidentiality, additional countermeasures areavailable:
- The source and destination sites SHOULD make some reasonable effort to ensure that clock
 settings at both sites differ by at most a few minutes. Many forms of time synchronization service
 are available, both over the Internet and from proprietary sources.
- SAML assertions communicated in step 3 MUST include an SSO assertion.
- Values for NotBefore and NotOnOrAfter attributes of SSO assertions SHOULD have the shortest possible validity period consistent with successful communication of the assertion from source to destination site. This is typically on the order of a few minutes. This ensures that a stolen assertion can only be used successfully within a small time window.
- The destination site MUST check the validity period of all assertions obtained from the source site and reject expired assertions. A destination site MAY choose to implement a stricter test of validity for SSO assertions, such as requiring the assertion's IssueInstant or AuthenticationInstant attribute value to be within a few minutes of the time at which the assertion is received at the destination site.
- If a received authentication statement includes a <saml:SubjectLocality> element with the IP address of the user, the destination site MAY check the browser IP address against the IP address contained in the authentication statement.

777 4.1.2.7.2 MITM Attack

- 778 **Threat:** Since the destination site obtains bearer SAML assertions from the user by means of an HTML
- form, a malicious site could impersonate the user at some new destination site. The new destination site would believe the malicious site to be the subject of the assertion.
- 781 **Countermeasure:** The destination site MUST check the Recipient attribute of the SAML Response to
- 782 ensure that its value matches the <assertion consumer host name and path>. As the response
- 783 is digitally signed, the Recipient value cannot be altered by the malicious site.

784 4.1.2.7.3 Forged Assertion

- 785 **Threat:** A malicious user, or the browser user, could forge or alter a SAML assertion.
- 786 **Countermeasure:** The browser/POST profile requires the SAML Response carrying SAML assertions to
- 787 be signed, thus providing both message integrity and authentication. The destination site MUST verify the 788 signature and authenticate the issuer.
- signature and authenticate the issuer.

789 4.1.2.7.4 Browser State Exposure

- 790 **Threat:** The browser/POST profile involves uploading of assertions from the web browser to a source
- site. This information is available as part of the web browser state and is usually stored in persistent
- storage on the user system in a completely unsecured fashion. The threat here is that the assertion may
 be "reused" at some later point in time.
- 794 **Countermeasure:** Assertions communicated using this profile must always include an SSO assertion.
- 795 SSO assertions are expected to have short lifetimes and destination sites are expected to ensure that 796 SSO assertions are not re-submitted.

797 **5 Confirmation Method Identifiers**

- 798 The SAML assertion and protocol specification [SAMLCore] defines <ConfirmationMethod> as part 799 of the <SubjectConfirmation> element. The <SubjectConfirmation> element SHOULD be used 800 by the Relying Party to confirm that the request or message came from the System Entity that 801 corresponds to the Subject in the statement. The <ConfirmationMethod> indicates the specific 802 method which the Relying Party should use to make this judgment. This may or may not have any 803 relationship to an authentication that was performed previously. Unlike AuthenticationMethod, 804 <ConfirmationMethod> will often be accompanied with some piece of information, such as a 805 certificate or key. in the <SubjectConfirmationData> and/or <ds:KeyInfo> elements, which will 806 allow the relying party to perform the necessary check. 807 It is anticipated that profiles and bindings will define and use several different values for
- 808 <ConfirmationMethod>, each corresponding to a different SAML usage scenario. Some examples 809 are as follows:
- A website employs the browser/artifact profile of SAML to sign in a user. The
 <ConfirmationMethod> in the resulting assertion is set to
 urn:oasis:names:tc:SAML:1.0:cm:artifact-01.
- There is no login, but an application request sent to a relying party includes SAML assertions and is digitally signed. The associated public key from the <ds:KeyInfo> element is used for confirmation.

816 **5.1 Holder of Key**

- 817 URI: urn:oasis:names:tc:SAML:1.0:cm:holder-of-key
- 818 A <ds:KeyInfo> element MUST be present within the <SubjectConfirmation> element.
- 819 As described in **[XMLSig]**, the <ds:KeyInfo> element holds a key or information that enables an
- application to obtain a key. The subject of the assertion is the party that can demonstrate that it is the
- 821 holder of the key.

822 **5.2 Sender Vouches**

- 823 URI: urn:oasis:names:tc:SAML:1.0:cm:sender-vouches
- 824 Indicates that no other information is available about the context of use of the assertion. The relying party 825 SHOULD utilize other means to determine if it should process the assertion further.

826 5.3 SAML Artifact

- 827 **URI:** urn:oasis:names:tc:SAML:1.0:cm:artifact-01
- The subject of the assertion is the party that presented a SAML artifact, which the relying party used to obtain the assertion from the party that created the artifact. See also Section 4.1.1.1.

830 **5.4 Bearer**

- 831 URI: urn:oasis:names:tc:SAML:1.0:cm:bearer\
- The subject of the assertion is the bearer of the assertion. See also Section 4.1.2.1.

833 6 Use of SSL 3.0 or TLS 1.0

In any SAML use of SSL 3.0 or TLS 1.0 [RFC2246], servers MUST authenticate to clients using a
 X.509.v3 certificate. The client MUST establish server identity based on contents of the certificate
 (typically through examination of the certificate subject DN field).

837 6.1 SAML SOAP Binding

TLS-capable implementations MUST implement the TLS_RSA_WITH_3DES_EDE_CBC_SHA cipher suite and MAY implement the TLS_RSA_AES_128_CBC_SHA cipher suite **[AES]**.

840 6.2 Web Browser Profiles of SAML

- 841 SSL-capable implementations of the browser/artifact profile or browser/POST profile of SAML MUST
- implement the SSL_RSA_WITH_3DES_EDE_CBC_SHA cipher suite.
- TLS-capable implementations MUST implement the TLS_RSA_WITH_3DES_EDE_CBC_SHA cipher

suite.

903 8 URL Size Restriction (Non-Normative)

| 904 905 | This section describes the URL size restrictions that have been documented for widely used commercial products. |
|-------------------|--|
| 906 | A Microsoft technical support article [MSURL] provides the following information: |
| 907 | The information in this article applies to: |
| 908 909 | Microsoft Internet Explorer (Programming) versions 4.0, 4.01, 4.01 SP1, 4.01 SP2, 5, 5.01, 5.5 |
| 910 | SUMMARY |
| 911 912 913 | Internet Explorer has a maximum uniform resource locator (URL) length of 2,083 characters, with a maximum path length of 2,048 characters. This limit applies to both POST and GET request URLs. |
| 914 915 | If you are using the GET method, you are limited to a maximum of 2,048 characters (minus the number of characters in the actual path, of course). |
| 916 917 | POST, however, is not limited by the size of the URL for submitting name/value pairs, because they are transferred in the header and not the URL. |
| 918 919 | RFC 2616, Hypertext Transfer Protocol HTTP/1.1, does not specify any requirement for URL length. |
| 920 | REFERENCES |
| 921 922 | Further breakdown of the components can be found in the Wininet header file. Hypertext Transfer Protocol HTTP/1.1 General Syntax, section 3.2.1 |
| 923 | Additional query words: POST GET URL length |
| 924 925 | Keywords : kbIE kbIE400 kbie401 kbGrpDSInet kbie500 kbDSupport kbie501 kbie550 kbieFAQ |
| 926 | Issue type : kbinfo |
| 927 | Technology : |
| 928 | An article about Netscape Enterprise Server provides the following information: |
| 929 | Issue: 19971110-3 Product: Enterprise Server |
| 930 | Created: 11/10/1997 Version: 2.01 |
| 931 | Last Updated: 08/10/1998 OS: AIX, Irix, Solaris |
| 932 | Does this article answer your question? |
| 933 | Please let us know! |
| 934 | Question: |
| 935 936 | How can I determine the maximum URL length that the Enterprise server will accept? Is this configurable and, if so, how? |
| 937 | Answer: |
| 938 | Any single line in the headers has a limit of 4096 chars; it is not configurable. |

939 9 Alternative SAML Artifact Format

940 9.1 Required Information

- 941 Identification: urn:oasis:names:tc:SAML:1.0:draft-sstc-bindings-model-13:profiles:artifact-02
- 942 Contact information: security-services-comment@lists.oasis-open.org
- 943 **Description:** Given below.
- 944 **Updates:** None.

945 9.2 Format Details

946 An alternative artifact format is described here:

```
947TypeCode:= 0x0002948RemainingArtifact:= AssertionHandle SourceLocation949AssertionHandle:= 20-byte_sequence950SourceLocation:= URI
```

951 The SourceLocation URI is the address of the SAML responder associated with the source site. The 952 assertionHandle is as described in Section 0, and governed by the same requirements. The

destination site MUST process the artifact in a manner identical to that described in Section 4.1.1, with
 the exception that the location of the SAML responder at the source site MAY be obtained directly from
 the artifact, rather than by look-up, based on sourceID.

Note: the destination site MUST confirm that assertions were issued by an acceptable issuer, not relying
 merely on the fact that they were returned in response to a samlp:Request.

958 Appendix A. Acknowledgments

The editors would like to acknowledge the contributions of the OASIS SAML Technical Committee, whose voting members at the time of publication were:

- Allen Rogers, Authentica
- 962 Irving Reid, Baltimore Technologies
- 963 Krishna Sankar, Cisco Systems
- 964 Ronald Jacobson, Computer Associates
- Hal Lockhart, Entegrity
- Carlisle Adams, Entrust Inc.
- 967 Robert Griffin, Entrust Inc.
- Robert Zuccherato, Entrust Inc.
- 969 Don Flinn, Hitachi
- 970 Joe Pato, Hewlett-Packard (co-chair)
- 971 Jason Rouault, Hewlett-Packard
- 972 Marc Chanliau, Netegrity
- 973 Chris McLaren, Netegrity
- 974 Prateek Mishra, Netegrity
- 975 Charles Knouse, Oblix
- 976 Steve Anderson, OpenNetwork
- 977 Rob Philpott, RSA Security
- 978 Jahan Moreh, Sigaba
- Bhavna Bhatnagar, Sun Microsystems
- Jeff Hodges, Sun Microsystems (co-chair)
- Eve Maler, Sun Microsystems (former chair)
- 982 Aravindan Ranganathan, Sun Microsystems
- Emily Xu, Sun Microsystems
- Bob Morgan, University of Washington and Internet2
- Phillip Hallam-Baker, VeriSign

986 Appendix B. Notices

987 OASIS takes no position regarding the validity or scope of any intellectual property or other rights that 988 might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; neither does it 989 990 represent that it has made any effort to identify any such rights. Information on OASIS's procedures with 991 respect to rights in OASIS specifications can be found at the OASIS website. Copies of claims of rights 992 made available for publication and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by 993 994 implementors or users of this specification, can be obtained from the OASIS Executive Director.

- OASIS invites any interested party to bring to its attention any copyrights, patents or patent applications,
 or other proprietary rights which may cover technology that may be required to implement this
 specification. Please address the information to the OASIS Executive Director.
