102 **<u>1</u>** Introduction

- 103 This document specifies protocol bindings and profiles for the use of SAML assertions and 104 request-response messages in communications protocols and frameworks.
- 105 A separate specification [SAMLCore] defines the SAML assertions and request-response
- 106 messages themselves.

107 <u>1.1</u> Protocol Binding and Profile Concepts

- 108 Mappings from SAML request-response message exchanges into standard messaging or
- 109 communication protocols are called SAML protocol bindings (or just bindings). An instance of
- 110 mapping SAML request-response message exchanges into a specific protocol <FOO> is termed
- 111 a *<FOO>* binding for SAML or a SAML *<FOO>* binding.
- 112 For example, an HTTP binding for SAML describes how SAML request and response message
- exchanges are mapped into HTTP message exchanges. A SAML SOAP binding describes how
- 114 SAML request and response message exchanges are mapped into SOAP message exchanges.
- 115 Sets of rules describing how to embed and extract SAML assertions into a framework or
- protocol are called *profiles of SAML*. A profile describes how SAML assertions are embedded in
- 117 or combined with other objects (for example, files of various types, or protocol data units of
- 118 communication protocols) by an originating party, communicated from the originating site to a
- destination, and subsequently processed at the destination. A particular set of rules for
- embedding SAML assertions into and extracting them from a specific class of <FOO> objects is
- 121 termed a *<FOO> profile of SAML*.
- 122 For example, a SOAP profile of SAML describes how SAML assertions can be added to SOAP
- messages, how SOAP headers are affected by SAML assertions, and how SAML-related error
- states should be reflected in SOAP messages.
- 125 The intent of this specification is to specify a selected set of bindings and profiles in sufficient
- 126 detail to ensure that independently implemented products will interoperate.
- 127 For other terms and concepts that are specific to SAML, refer to the SAML glossary
- 128 [SAMLGloss].

129 <u>1.2</u> Notation

- 130 The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT",
- 131 "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this
- specification are to be interpreted as described in IETF RFC 2119 [RFC2119].

133	Listing	gs of	producti	ions or	c other	normative	code	appear	like	this.		
134												
	_											
							•					
135		Examp	le code	listin	gs appe	ear like th	nıs.					

136 **Note:** Non-normative notes and explanations appear like this.

137 Conventional XML namespace prefixes are used throughout this specification to stand for their

- respective namespaces as follows, whether or not a namespace declaration is present in the example:
- The prefix saml: stands for the SAML assertion namespace [SAMLCore].
 The prefix samle, stands for the SAML request response protocol namespace
- The prefix samlp: stands for the SAML request-response protocol namespace
 [SAMLCore].
- The prefix ds: stands for the W3C XML Signature namespace, http://www.w3.org/2000/09/xmldsig# [XMLSig].
- The prefix SOAP-ENV: stands for the SOAP 1.1 namespace,
 http://schemas.xmlsoap.org/soap/envelope [SOAP1.1].

147 This specification uses the following typographical conventions in text: <SAMLElement>,

148 <ns:ForeignElement>, Attribute, OtherCode. In some cases, angle brackets are used to

indicate nonterminals, rather than XML elements; the intent will be clear from the context.

2 Specification of Additional Protocol Bindings and Profiles

This specification defines a selected set of protocol bindings and profiles, but others will need to be developed. It is not possible for the OASIS SAML Technical Committee to standardize all of these additional bindings and profiles for two reasons: it has limited resources and it does not own the standardization process for all of the technologies used. The following sections offer guidelines for specifying bindings and profiles and a process framework for describing and registering them.

158 <u>2.1</u> Guidelines for Specifying Protocol Bindings and 159 Profiles

160 This section provides a checklist of issues that MUST be addressed by each protocol binding and 161 profile.

- Describe the set of interactions between parties involved in the binding or profile. Any restriction on applications used by each party and the protocols involved in each interaction must be explicitly called out.
- 165
 2. Identify the parties involved in each interaction, including: how many parties are involved, and whether intermediaries may be involved.
- Specify the method of authentication of parties involved in each interaction, including
 whether authentication is required and acceptable authentication types.
- 4. Identify the level of support for message integrity. What mechanisms are used to ensure message integrity?

- Identify the level of support for confidentiality, including whether a third party may view
 the contents of SAML messages and assertions, whether the binding or profile requires
 confidentiality and the mechanisms recommended for achieving confidentiality.
- Identify the error states, including the error states at each participant, especially those that
 receive and process SAML assertions or messages.
- 1767. Identify security considerations, including analysis of threats and description of countermeasures.

Process Framework for Describing and Registering Protocol Bindings and Profiles

For any new protocol binding or profile to be interoperable, it needs to be openly specified. The
 OASIS SAML Technical Committee will maintain a registry and repository of submitted

OASIS SAML Technical Committee will maintain a registry and repository of submittee
 bindings and profiles titled "Additional Bindings and Profiles" at the SAML website

182 (http://www.oasis-open.org/committees/security/) in order to keep the SAML community

184 informed. The Committee will also provide instructions for submission of bindings and profiles

- 185 by OASIS members.
- 186 When a profile or protocol binding is registered, the following information MUST be supplied:
- 1. Identification: Specify a URI that uniquely identifies this protocol binding or profile.
- Contact information: Specify the postal or electronic contact information for the author of
 the protocol binding or profile.
- Description: Provide a text description of the protocol binding or profile. The description
 SHOULD follow the guidelines in Section 2.12.10.
- Updates: Provide references to previously registered protocol bindings or profiles that the current entry improves or obsoletes.

¹⁹⁴ <u>3</u> Protocol Bindings

The following sections define SAML protocol bindings sanctioned by the OASIS SAML
 Committee. Only one binding, the SAML SOAP binding, is defined.

197 **<u>3.1</u>** SOAP Binding for SAML

198

199 SOAP (Simple Object Access Protocol) 1.1 [SOAP1.1] is a specification for RPC-like

200 interactions and message communications using XML and HTTP. It has three main parts. One is

a message format that uses an envelope and body metaphor to wrap XML data for transmission

between parties. The second is a restricted definition of XML data for making strict RPC-like

- calls through SOAP, without using a predefined XML schema. Finally, it provides a binding for
- SOAP messages to HTTP and extended HTTP.

- The SAML SOAP binding defines how to use SOAP to send and receive SAML requests and responses.
- 207 Like SAML, SOAP can be used over multiple underlying transports. This binding has protocol-
- independent aspects, but also calls out the use of SOAP over HTTP as REQUIRED (mandatory to implement).
- 210 3.1.1 Required Information
- 211 Identification:
- 212 http://www.oasis-open.org/security/draft-sstc-bindings-model-<u>12</u>11/bindings/SOAP-binding
- 213 Contact information:
- 214 <u>security-services-comment@lists.oasis-open.org</u>
- 215 Description: Given below.
- 216 Updates: None.

217 <u>3.1.2</u> Protocol-Independent Aspects of the SAML SOAP Binding

- 218 The following sections define aspects of the SAML SOAP binding that are independent of the
- underlying protocol, such as HTTP, on which the SOAP messages are transported.

220 3.1.2.1 Basic Operation

- SOAP messages consist of three elements: an envelope, header data, and a message body. SAML
 request-response protocol elements MUST be enclosed within the SOAP message body.
- SOAP 1.1 also defines an optional data encoding system. This system is not used within the
- SAML SOAP binding. This means that SAML messages can be transported using SOAP without re-encoding from the "standard" SAML schema to one based on the SOAP encoding.
- The system model used for SAML conversations over SOAP is a simple request-response model.
- A system entity acting as a SAML requester transmits a SAML <Request > element
 within the body of a SOAP message to a system entity acting as a SAML responder. The
 SAML requester MUST NOT include more than one SAML request per SOAP message
 or include any additional XML elements in the SOAP body.
- 2. The SAML responder MUST return either a <Response> element within the body of 231 another SOAP message or a SOAP fault code. The SAML responder MUST NOT 232 include more than one SAML response per SOAP message or include any additional 233 XML elements in the SOAP body. If a SAML responder cannot, for some reason, process 234 235 a SAML request, it MUST return a SOAP fault code. SOAP fault codes MUST NOT be sent for errors within the SAML problem domain, for example, inability to find an 236 extension schema or as a signal that the subject is not authorized to access a resource in 237 an authorization query. (SOAP 1.1 faults and fault codes are discussed in [SOAP1.1] 238 §4.1.) 239
- 240

- On receiving a SAML response in a SOAP message, the SAML requester MUST NOT send a
- fault code or other error messages to the SAML responder. Because the format for the message
- interchange is a simple request-response pattern, adding additional items such as error conditions
- 244 would needlessly complicate the protocol.
- 245 [SOAP1.1] references an early draft of the XML Schema specification including an obsolete
- namespace. SAML requesters SHOULD generate SOAP documents referencing only the final
- 247 XML schema namespace. SAML responders MUST be able to process both the XML schema
- namespace used in **[SOAP1.1]** as well as the final XML schema namespace.

249 **<u>3.1.2.2</u>** SOAP Headers

- A SAML requester in a SAML conversation over SOAP MAY add arbitrary headers to the SOAP message. This binding does not define any additional SOAP headers.
- Note: The reason other headers need to be allowed is that some SOAP
 software and libraries might add headers to a SOAP message that are out of
 the control of the SAML-aware process. Also, some headers might be needed
- for underlying protocols that require routing of messages.
- A SAML responder MUST NOT require any headers for the SOAP message.
- Note: The rationale is that requiring extra headers will cause fragmentation
 of the SAML standard and will hurt interoperability.

259 **<u>3.1.2.3</u>** Authentication

Authentication of both the SAML requester and responder is OPTIONAL and depends on the

261 environment of use. Authentication protocols available from the underlying substrate protocol

- MAY be utilized to provide authentication. Section 3.1.2.2 describes authentication in the SOAP
- 263 over HTTP environment.

264 <u>3.1.2.4</u> Message Integrity

Message integrity of both SAML request and response is OPTIONAL and depends on the environment of use. The security layer in the underlying substrate protocol MAY be used to ensure message integrity. Section 3.1.2.3 describes support for message integrity in the SOAP over HTTP environment.

269 <u>3.1.2.5</u> Confidentiality

270 Confidentiality of both SAML request and response is OPTIONAL and depends on the

- environment of use. The security layer in the underlying substrate protocol MAY be used to
- ensure message confidentiality. Section 3.1.2.4 describes support for confidentiality in the SOAP
- 273 over HTTP environment.

274 **<u>3.1.3</u>** Use of SOAP over HTTP

275 A SAML processor that claims conformance to the SAML SOAP binding MUST implement

276 SAML over SOAP over HTTP. This section describes certain specifics of using SOAP over

277 HTTP, including HTTP headers, error reporting, authentication, message integrity and

confidentiality.

279 The HTTP binding for SOAP is described in [SOAP1.1] §6.0. It requires the use of a

280 SOAPAction header as part of a SOAP HTTP request. A SAML responder MUST NOT depend

on the value of this header. A SAML requester MAY set the value of SOAPAction header as
 follows:

283 http://www.oasis-open.org/committees/security

284 **3.1.3.1** HTTP Headers

- 285 HTTP proxies MUST NOT cache responses carrying SAML assertions.
- Both of the following conditions apply when using HTTP 1.1:
- If the value of the Cache-Control header field is **not** set to no-store, then the SAML responder MUST NOT include the Cache-Control header field in the response.
- If the Expires response header field is not disabled by a Cache-Control header field with a value of no-store, then the Expires field SHOULD NOT be included.
- 291 There are no other restrictions on HTTP headers.

292 **<u>3.1.3.2</u>** Authentication

- 293 The SAML requester and responder MUST implement the following authentication methods:
- 1. No client or server authentication.
- 295 2. HTTP basic client authentication **[RFC2617]** with and without SSL 3.0 or TLS 1.0.
- 3. HTTP over SSL 3.0 or TLS 1.0 (see Section <u>550</u>) server authentication with a server-side
 certificate.
- 4. HTTP over SSL 3.0 or TLS 1.0 client authentication with a client-side certificate.
- If a SAML responder uses SSL 3.0 or TLS 1.0, it MUST use a server-side certificate.

300 <u>3.1.3.3</u> Message Integrity

- 301 When message integrity needs to be guaranteed, SAML responders MUST use HTTP over SSL
- 302 3.0 or TLS1.0 (see Section 550) with a server-side certificate.

303 <u>3.1.3.4</u> Message Confidentiality

304 When message confidentiality is required, SAML responders MUST use HTTP over SSL 3.0 or

TLS 1.0 (see Section 550) with a server-side certificate.

306 <u>3.1.3.5</u> Security Considerations

- 307 Before deployment, each combination of authentication, message integrity and confidentiality
- mechanisms SHOULD be analyzed for vulnerability in the context of the deployment
- 309 environment. See the SAML security considerations document [SAMLSec] for a detailed
- 310 discussion.
- 311 RFC 2617 [**RFC2617**] describes possible attacks in <u>the</u> HTTP environment when basic or
- message-digest authentication schemes are used.

313 **<u>3.1.3.6</u>** Error Reporting

- A SAML responder that refuses to perform a message exchange with the SAML requester
- 315 SHOULD return a "403 Forbidden" response. In this case, the content of the HTTP body is not 316 significant.
- As described in **[SOAP1.1]** § 6.2, in the case of a SOAP error while processing a SOAP request,
- 318 the SOAP HTTP server MUST return a "500 Internal Server Error" response and include a
- 319 SOAP message in the response with a SOAP fault element. This type of error SHOULD be
- returned for SOAP-related errors detected before control is passed to the SAML processor, or
- 321 when the SOAP processor reports an internal error (for example, the SOAP XML namespace is
- 322 incorrect, the SAML schema cannot be located, the SAML processor throws an exception, and
- 323 so on).
- In the case of a SAML processing error, the SOAP HTTP server MUST respond with "200 OK"
- and include a SAML-specified error description as the only child of the <SOAP-ENV:Body>
- element. For more information about SAML error codes, see the SAML assertion and protocol
- 327 specification [SAMLCore].

328 **<u>3.1.3.7</u>** Example SAML Message Exchange Using SOAP over HTTP

Following is an example of a request that asks for an assertion containing an authentication statement from a SAML authentication authority.

331	POST /SamlService HTTP/1.1
332	Host: www.example.com
333	Content-Type: text/xml
334	Content-Length: nnn
335	SOAPAction: http://www.oasis-open.org/committees/security
336	<soap-env:envelope< td=""></soap-env:envelope<>
337	<pre>xmlns:SOAP-ENV="http://schemas.xmlsoap.org/soap/envelope/"></pre>
338	<soap-env:body></soap-env:body>
339	<samlp:request xmlns:ds="" xmlns:saml="" xmlns:samlp:=""></samlp:request>
340	<ds:signature> </ds:signature>
341	<samlp:authenticationquery></samlp:authenticationquery>
342	
343	
344	
345	
346	
247 E-11-	in a second s

Following is an example of the corresponding response, which supplies an assertion containing authentication statement as requested.

349 HTTP/1.1 200 OK

_	
350	Content-Type: text/xml
351	Content-Length: nnnn
352	
353	<soap-env:envelope< th=""></soap-env:envelope<>
354	xmlns:SOAP-ENV="http://schemas.xmlsoap.org/soap/envelope/">
355	<soap-env:body></soap-env:body>
356	<pre><samlp:response xmlns:ds="" xmlns:saml="" xmlns:samlp=""></samlp:response></pre>
357	<status></status>
358	<pre><statuscode=#value="samlp:success"></statuscode=#value="samlp:success">#></pre>
359	
360	<pre><ds:signature> </ds:signature></pre>
361	<saml:assertion></saml:assertion>
362	<saml:authenticationstatement></saml:authenticationstatement>
363	
364	
365	
366	
367	
368	

369 **<u>4</u>Profiles**

The following sections define profiles <u>offer</u> SAML that are sanctioned by the OASIS SAML

- 371 Committee.
- Two web browser-based profiles that are designed to support single sign-on (SSO),
 supporting Scenario 1-1 of the SAML requirements document [SAMLReqs]:
- o The browser/artifact profile of SAML
- 375 The browser/POST profile of SAML
- 376

For each type of profile, a section describing the threat model and relevant countermeasures is also included.

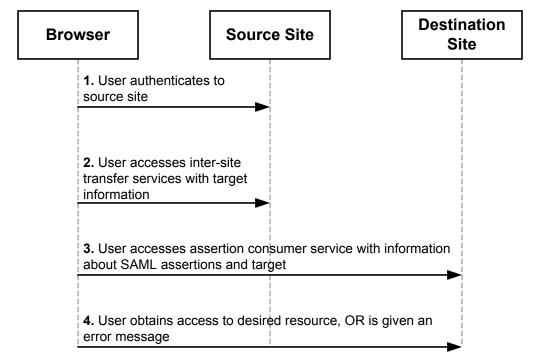

379 **<u>4.1</u>** Web Browser SSO Profiles <u>of for</u> SAML

In the scenario supported by the web browser SSO profiles, a web user authenticates herself to a *source site*. The web user then uses a secured resource at a destination site, without directly authenticating to the *destination site*.

- 383 The following assumptions are made about this scenario for the purposes of these profiles:
- The user is using a standard commercial browser and has authenticated to a source site by some means outside the scope of SAML.
- The source site has some form of security engine in place that can track locally
 authenticated users [WEBSSO]. Typically, this takes the form of a session that might be
 represented by an encrypted cookie or an encoded URL or by the use of some other
 technology [SESSION]. This is a substantial requirement but one that is met by a large
 class of security engines.

At some point, the user attempts to access a *target* resource available from the destination site, and subsequently, through one or more steps (for example, redirection), arrives at an *inter-site*

- *transfer service* (which may be associated with one or more URIs) at the source site. Starting
- from this point, the web browser SSO profiles describe a canonical sequence of HTTP exchanges
- that transfer the user browser to an *assertion consumer service* at the destination site.
- Information about the SAML assertions provided by the source site and associated with the user,
- and the desired target, is conveyed from the source to the destination site by the protocol
- 398 exchange.
- 399 The assertion consumer service at the destination site can examine both the assertions and the
- target information and determine whether to allow access to the target resource, thereby
- 401 achieving web SSO for authenticated users originating from a source site. Often, the destination
- site also utilizes a security engine that will create and maintain a session, possibly utilizing
- information contained in the source site assertions, for the user at the destination site.
- 404 The following figure illustrates this basic template for achieving SSO.

- Two HTTP-based techniques are used in the web browser SSO profiles for conveying information from one site to another via a standard commercial browser.
- SAML artifact: A SAML artifact of "small" bounded size is carried as part of a URL query string such that, when the artifact is conveyed to the source site, the artifact unambiguously references an assertion. The artifact is conveyed via redirection to the destination site, which then acquires the referenced assertion by some further steps. Typically, this involves the use of a registered SAML protocol binding. This technique is used in the browser/artifact profile
- 413 of SAML.
- Form POST: SAML assertions are uploaded to the browser within an HTML form and
- 415 conveyed to the destination site as part of an HTTP POST payload when the user submits the
 416 form. This technique is used in the browser/POST profile of SAML.

- 417 Cookies are not employed in any profile, as cookies impose the limitation that both the source
- and destination site belong to the same "cookie domain."
- In the discussion of the web browser SSO profiles, the term *SSO assertion* will be used to refer
- to an assertion that has (1) \underline{a} <saml: Conditions> element with NotBefore and NotOnOrAfter
- 421 attributes present, and (2) contains one or more authentication statements.

422 <u>4.1.1</u> Browser/Artifact Profile of SAML

423 4.1.1.1 Required Information

- 424 Identification:
- 425 http://www.oasis-open.org/security/draft-sstc-bindings-model_124/profiles/artifact-01
- 426 Contact information:
- 427 <u>security-services-comment@lists.oasis-open.org</u>
- 428 Description: Given below.
- 429 Updates: None.

430 **<u>4.1.1.2</u>** Preliminaries

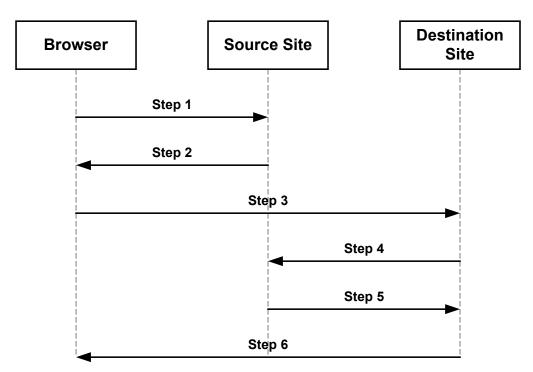

431 The browser/artifact profile of SAML relies on a reference to the needed assertion traveling in a

432 SAML artifact, which the destination site must dereference from the source site in order to

determine whether the user is authenticated.

- Note: The need for a "small" SAML artifact is motivated by restrictions on 434 URL size imposed by commercial web browsers. While RFC 2616 435 [RFC2616] does not specify any restrictions on URL length, in practice 436 commercial web browsers and application servers impose size constraints on 437 URLs, for a maximum size of approximately 2000 characters (see Section 438 770). Further, as developers will need to estimate and set aside URL "real 439 estate" for the artifact, it is important that the artifact have a bounded size, 440 that is, with predefined maximum size. These measures ensure that the 441 artifact can be reliably carried as part of the URL query string and thereby 442 transferred successfully from source to destination site. 443
- The browser/artifact profile consists of a single interaction among three parties (a user equipped with a browser, a source site, and a destination site), with a nested sub-interaction between two parties (the source site and the destination site). The interaction sequence is shown in the
- following figure, with the following sections elucidating each step.

448

- 450 Terminology from RFC 1738 [RFC1738] is used to describe components of a URL. An HTTP
- 451 URL has the following form:
- 452 http://<HOST>:<port>/<path>?<searchpart>
- 453 The following sections specify certain portions of the <searchpart > component of the URL.
- 454 Ellipses will be used to indicate additional but unspecified portions of the <searchpart>
- 455 component.
- 456 HTTP requests and responses MUST be drawn from either HTTP 1.1 [**RFC2616**] or HTTP 1.0
- 457 **[RFC1945]**. Distinctions between the two are drawn only when necessary.

458 **<u>4.1.1.3</u>** Step 1: Accessing the Inter-Site Transfer Service

- 459 In step 1, the user's browser accesses the inter-site transfer service, with information about the
- 460 desired target at the destination site attached to the URL.
- No normative form is given for step 1. It is RECOMMENDED that the HTTP request take thefollowing form:

463 GET http://<inter-site transfer host name and path>?TARGET=<Target>...<HTTP-Version> 464 <other HTTP 1.0 or 1.1 components>

465 Where:

- 466 <inter-site transfer host name and path>
- 467 This provides the host name, port number, and path components of an inter-site transfer URL 468 at the source site.
- 469 Target=<Target>
- This name-value pair occurs in the <searchpart> and is used to convey information about the desired target resource at the destination site
- 471 the desired target resource at the destination site.
- 472 Confidentiality and message integrity MUST be maintained in step 1.

473 **<u>4.1.1.4</u>** Step 2: Redirecting to the Destination Site

- In step 2, the source site's inter-site transfer service responds and redirects the user's browser to
- the assertion consumer service at the destination site.
- The HTTP response MUST take the following form:
- 477 <HTTP-Version> 302 <Reason Phrase>
- 478 <other headers>
- 479 Location : http://<assertion consumer host name and path>?<SAML searchpart>
- 480 <pr
- 481 Where:
- 482 <assertion consumer host name and path>
- This provides the host name, port number, and path components of an assertion consumer URL at the destination site.
- 485 <SAML searchpart>= ...TARGET=<Target>...SAMLart=<SAML artifact> ...
- 486 A single target description MUST be included in the <SAML searchpart > component. At
- least one SAML artifact MUST be included in the SAML <SAML searchpart > component;
 multiple SAML artifacts MAY be included. If more than one artifact is carried within <SAML
- 489 searchpart>, all the artifacts MUST have the same SourceID.
- According to HTTP 1.1 [RFC2616] and HTTP 1.0 [RFC1945], the use of status code 302 is
- recommended to indicate that "the requested resource resides temporarily under a different
- 492 URI". The response may also include additional headers and an optional message body as
- described in those RFCs.
- 494 Confidentiality and message integrity MUST be maintained in step 2. It is RECOMMENDED
- that the inter-site transfer URL be exposed over SSL 3.0 or TLS 1.0 (see Section 550).
- 496 Otherwise, the one or more artifacts returned in step 2 will be available in plain text to an
- 497 attacker who might then be able to impersonate the assertion subject.

498 <u>4.1.1.5</u> Step 3: Accessing the Assertion Consumer Service

- In step 3, the user's browser accesses the assertion consumer service, with a SAML artifact representing the user's authentication information attached to the URL.
- 501 The HTTP request MUST take the form:
- 502 GET http://<assertion consumer host name and path>?<SAML searchpart> <HTTP-Version> 503 <other HTTP 1.0 or 1.1 request components>
- 504 Where:
- 505 <assertion consumer host name and path>
- 506 This provides the host name, port number, and path components of an assertion consumer 507 URL at the destination site.
- 508 <SAML searchpart>= ...TARGET=<Target>...SAMLart=<SAML artifact> ...
- 509 A single target description MUST be included in the <SAML searchpart > component. At
- 510 least one SAML artifact MUST be included in the <SAML searchpart > component; multiple
- 511 SAML artifacts MAY be included. If more than one artifact is carried within < SAML
- 512 searchpart>, all the artifacts MUST have the same SourceID.
- 513 Confidentiality and message integrity MUST be maintained in step 3. It is RECOMMENDED
- that the assertion consumer URL be exposed over SSL 3.0 or TLS 1.0 (see Section 550).

- 515 Otherwise, the artifacts transmitted in step 3 will be available in plain text to any attacker who
- 516 might then be able to impersonate the assertion subject.

517 **<u>4.1.1.6</u>** Steps 4 and 5: Acquiring the Corresponding Assertions

In steps 4 and 5, the destination site, in effect, dereferences the one or more SAML artifacts in its posession in order to acquire the SAML authentication assertion that corresponds to each artifact.

- 520 These steps MUST utilize a SAML protocol binding for a SAML request-response message
- exchange between the destination and source sites. The destination site functions as a SAML
- requester and the source site functions as a SAML responder.
- 523 The destination site MUST send a <samlp:Request> message to the source site, requesting
- s24 assertions by supplying assertion artifacts in the <samlp:AssertionArtifact> element.
- 525 If the source site is able to find or construct the requested assertions, it responds with a
- 526 <samlp:Response> message with the requested assertions. Otherwise, it returns an appropriate
- 527 error code, as defined within the selected SAML binding.
- 528 In the case where the source site returns assertions within <samlp:Response>, it MUST return
- 529 exactly one assertion for each SAML artifact found in the corresponding <samlp:Request>
- element. The case where fewer or greater number of assertions is returned within the
- 531 <samlp:Response> element MUST be treated as an error state by the destination site.
- 532 The source site MUST implement a "one-time request" property for each SAML artifact. Many
- simple implementations meet this constraint by an action such as deleting the relevant assertion
- from persistent storage at the source site after one lookup. If a SAML artifact is presented to the
- source site again, the source site MUST return the same message as it would if it were queried
- 536 with an unknown artifact.
- 537 The selected SAML protocol binding MUST provide confidentiality, message integrity and
- bilateral authentication. The source site MUST implement the SAML SOAP binding with
- support for confidentiality, message integrity, and bilateral authentication.
- 540 The source site MUST return an <u>response with no assertions</u>error code if it receives a
- 541 <samlp:Request> message from an authenticated destination site X containing an artifact issued
- by the source site to some other destination site *Y*, where X <> Y. One way to implement this
- 543 feature is to have source sites maintain a list of artifact and destination site pairs.
- 544 At least one of the SAML assertions returned to the destination site MUST be an *SSO assertion*.
- 545 Authentication statements MAY be distributed across more than one returned assertion.
- 546 The <saml: ConfirmationMethod> element of each assertion MUST be set to <u>"SAMLArtifact"</u>
- 547 (see [SAMLCore]), and the <saml:SubjectConfirmationData> element MUST be present with
- 548 its value being the SAML_artifact supplied to obtain the assertion.-
- Based on the information obtained in the assertions retrieved by the destination site, the
- destination site MAY engage in additional SAML message exchanges with the source site.

551 **<u>4.1.1.7</u>** Step 6: Responding to the User's Request for a Resource

- In step 6, the user's browser is sent an HTTP response that either allows or denies access to the desired resource.
- 554 No normative form is mandated for the HTTP response. The destination site SHOULD provide
- some form of helpful error message in the case where access to resources at that site is
- 556 disallowed.

557 4.1.1.8 Artifact Format

558 The artifact format includes a mandatory two-byte artifact type code, as follows:

559SAML_artifact:= B64 (TypeCode RemainingArtifact)560TypeCode:= Byte1Byte2

- 561Note: Depending on the level of security desired and associated profile562protocol steps, many viable architectures could be developed for the SAML563artifact [CoreAssnEx] [ShibMarlena]. The type code structure
- accommodates variability in the architecture.
- 565 The notation B64 (TypeCode RemainingArtifact) stands for the application of the base-64
- transformation to the catenation of the TypeCode and RemainingArtifact. This profile defines
- an artifact type of type code 0×0001 , which is REQUIRED (mandatory to implement) for any
- implementation of the browser/artifact profile. This artifact type is defined as follows:
- 569TypeCode:= 0x0001570RemainingArtifact:= SourceID AssertionHandle
- 571SourceID:= 20-byte_sequence572AssertionHandle:= 20-byte_sequence
- 573 SourceID is a 20-byte sequence used by the destination site to determine source site identity and 574 location. It is assumed that the destination site will maintain a table of SourceID values as well
- as the URL (or address) for the corresponding SAML responder. This information is
- 576 communicated between the source and destination sites out-of-band. On receiving the SAML
- artifact, the destination site determines if the SourceID belongs to a known source site and
- 578 obtains the site location before sending a SAML request (as described in Section
- 579 <u>4.1.1.64.1.1.6</u>0).
- 580 Any two source sites with a common destination site MUST use distinct SourceID values.
- 581 Construction of AssertionHandle values is governed by the principle that they SHOULD have
- no predictable relationship to the contents of the referenced assertion at the source site and it
- 583 MUST be infeasible to construct or guess the value of a valid, outstanding assertion handle.
- The following practices are RECOMMENDED for the creation of SAML artifacts at source sites:
- Each source site selects a single identification URL. The domain name used within this URL is registered with an appropriate authority and administered by the source site.
- The source site constructs the SourceID component of the artifact by taking the SHA-1 hash of the identification URL.

 The AssertionHandle value is constructed from a cryptographically strong random or pseudorandom number sequence [RFC1750] generated by the source site. The sequence consists of values of at least eight bytes in size. These values should be padded to a total length of 20 bytes.

594 **<u>4.1.1.9</u>** Threat Model and Countermeasures

595 This section utilizes materials from [ShibMarlena] and [Rescorla-Sec].

596 <u>4.1.1.9.1</u> Stolen Artifact

597 **Threat:** If an eavesdropper can copy the real user's SAML artifact, then the eavesdropper could 598 construct a URL with the real user's SAML artifact and be able to impersonate the user at the 599 destination site.

600 **Countermeasure:** As indicated in steps 2, 3, 4, and 5, confidentiality MUST be provided 601 whenever an artifact is communicated between a site and the user's browser. This provides 602 protection against an eavesdropper gaining access to a real user's SAML artifact.

- If an eavesdropper defeats the measures used to ensure confidentiality, additional countermeasures are available:
- The source and destination sites SHOULD make some reasonable effort to ensure that clock settings at both sites differ by at most a few minutes. Many forms of time synchronization service are available, both over the Internet and from proprietary sources.
- SAML assertions communicated in step 5 must MUST include an SSO assertion.
- The source site SHOULD track the time difference between when a SAML artifact is generated and placed on a URL line and when a <samlp:Request> message carrying the artifact is received from the destination. A maximum time limit of a few minutes is recommended. Should an assertion be requested by a destination site query beyond this time limit, a SAML error SHOULD be returned by the source site.
- It is possible for the source site to create SSO assertions either when the corresponding
 SAML artifact is created or when a <samlp:Request> message carrying the artifact is
 received from the destination. The validity period of the assertion SHOULD be set
 appropriately in each case: longer for the former, shorter for the latter.
- Values for NotBefore and NotOnOrAfter attributes of SSO assertions SHOULD have
 the shortest possible validity period consistent with successful communication of the
 assertion from source to destination site. This is typically on the order of a few minutes.
 This ensures that a stolen artifact can only be used successfully within a small time
 window.
- The destination site MUST check the validity period of all assertions obtained from the source site and reject expired assertions. A destination site MAY choose to implement a stricter test of validity for SSO assertions, such as requiring the assertion's IssueInstant or AuthenticationInstant attribute value to be within a few minutes of the time at which the assertion is received at the destination site.

If a received authentication statement includes a <saml:AuthenticationLocality>
 element with the IP address of the user, the destination site MAY check the browser IP
 address against the IP address contained in the authentication statement.

632 <u>4.1.1.9.2</u> Attacks on the SAML Protocol Message Exchange

- Threat: The message exchange in steps 4 and 5 could be attacked in a variety of ways, including artifact or assertion theft, replay, message insertion or modification, and MITM (man-in-the-
- 635 middle attack).
- 636 **Countermeasure:** The requirement for the use of a SAML protocol binding with the properties
- of bilateral authentication, message integrity, and confidentiality defends against these attacks.

638 <u>4.1.1.9.3</u> Malicious Destination Site

- 639 **Threat:** Since the destination site obtains artifacts from the user, a malicious site could
- impersonate the user at some new destination site. The new destination site would obtainassertions from the source site and believe the malicious site to be the user.
- 642 **Countermeasure:** The new destination site will need to authenticate itself to the source site so 643 as to obtain the SAML assertions corresponding to the SAML artifacts. There are two cases to 644 consider:
- If the new destination site has no relationship with the source site, it will be unable toauthenticate and this step will fail.
- 647
 2. If the new destination site has an existing relationship with the source site, the source site
 648 will determine that -assertions are being requested by a site other than that to which the
 649 artifacts were originally sent. In such a case, the source site MUST not provide the assertions
 650 to the new destination site.

651 <u>4.1.1.9.4</u> Forged SAML Artifact

- 652 **Threat:** A malicious user could forge a SAML artifact.
- 653 **Countermeasure:** Section <u>4.1.1.84.1.1.80</u> provides specific recommendations regarding the 654 construction of a SAML artifact such that it is infeasible to guess or construct the value of a
- current, valid, and outstanding assertion handle. A malicious user could attempt to repeatedly
- 656 "guess" a valid SAML artifact value (one that corresponds to an existing assertion at a source
- 657 site), but given the size of the value space, this action would likely require a very large number
- of failed attempts. A source site SHOULD implement measures to ensure that repeated attempts
- at querying against non-existent artifacts result in an alarm.

660 <u>4.1.1.9.5</u> Browser State Exposure

- 661 **Threat:** The SAML artifact profile involves "downloading" of SAML artifacts to the web
- browser from a source site. This information is available as part of the web browser state and is
- usually stored in persistent storage on the user system in a completely unsecured fashion. The
- threat here is that the artifact may be "reused" at some later point in time.

665 **Countermeasure:** The "one-use" property of SAML artifacts ensures that they cannot be reused

- 666 from a browser. Due to the recommended short lifetimes of artifacts and mandatory SSO
- assertions, it is difficult to steal an artifact and reuse it from some other browser at a later time.

668 <u>4.1.2</u> Browser/POST Profile of SAML

669 <u>4.1.2.1</u> Required Information

- 670 Identification:
- 671 http://www.oasis-open.org/security/draft-sstc-bindings-model-121/profiles/browser-post
- 672 Contact information:
- 673 <u>security-services-comment@lists.oasis-open.org</u>
- 674 Description: Given below.
- 675 Updates: None.

676 **<u>4.1.2.2</u>** Preliminaries

The browser/POST profile of SAML allows authentication information to be supplied to a

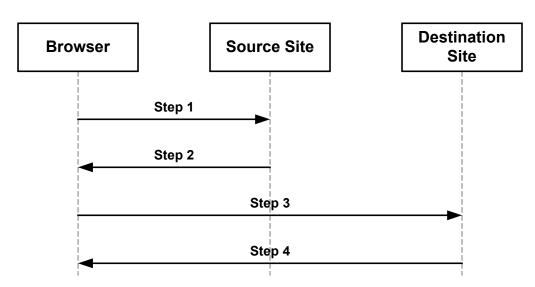

destination site without the use of an artifact. The following figure diagrams the interactions

- 679 between parties in the browser/POST profile.
- The browser/artifact profile consists of a series of two interactions, the first between a user
- equipped with a browser and a source site, and the second directly between the user and the

destination site. The interaction sequence is shown in the following figure, with the following

683 sections elucidating each step.

684

685

686 <u>4.1.2.3</u> Step 1: Accessing the Inter-Site Transfer Service

- In step 1, the user's browser accesses the inter-site transfer service, with information about the desired target at the destination site attached to the URL.
- No normative form is given for step 1. It is RECOMMENDED that the HTTP request take the following form:

691GET http://<inter-site transfer host name and path>?TARGET=<Target>...<HTTP-Version>692<other HTTP 1.0 or 1.1 components>

693 Where:

694 <inter-site transfer host name and path>

- This provides the host name, port number, and path components of an inter-site transfer URL at the source site.
- 697 Target=<Target>
- This name-value pair occurs in the <searchpart> and is used to convey information about the desired target resource at the destination site.

700 <u>4.1.2.4</u> Step 2: Generating and Supplying the Assertion Response

- In step 2, the source site generates HTML form data containing <u>a SAML Response which</u>
 <u>contains</u> an SSO assertion.
- The HTTP response MUST take the form:
- 705 <other HTTP 1.0 or 1.1 components>
- 706 Where:
- 707 <other HTTP 1.0 or 1.1 components>
- This MUST include an HTML FORM [Chapter 17, HTML 4.01] with the following FORMbody:

```
710 <Body>
711 <FORM Method="Post" Action="<assertion consumer host name and path>" ...>
712 <INPUT TYPE="Submit" NAME="button" Value="Submit">
713 <INPUT TYPE="hidden" NAME="SAMLResponseAssertion"</pre>
```

714 Value="B64(<<u>response</u>assertion>>)">

- 715 ... 716 <INPUT TYPE="hidden" NAME="TARGET" Value="<Target>">
- 717 <a></body>
- 718 <assertion consumer host name and path>
- This provides the host name, port number, and path components of an assertion consumerURL at the destination site.
- 721 At least Exactly one SAML response assertion MUST be included within the FORM body with
- the control name SAMLResponseAssertion; multiple SAML assertions MAY be included in the
- 723 <u>Response</u>. <u>At least one of the assertions MUST be a SSO assertion</u>. A single target description
- 724 MUST be included with the control name TARGET.
- 725 The notation B64 (<responseassertion>) stands for the result of applying the base-64
- transformation to the <u>response</u>assertion.
- 727 The Each SAML responseassertion MUST be digitally signed following the guidelines given in
- 728 [SAMLCore] [SAML-DSIG-Profile]. Included assertions MAY be digitally signed.

- Confidentiality and message integrity MUST be maintained for step 2. It is RECOMMENDED
- that the inter-site transfer URL be exposed over SSL 3.0 or TLS 1.0 (see Section 550).
- 731 Otherwise, the assertions returned will be available in plain text to any attacker who might then
- be able to impersonate the assertion subject.

733 **<u>4.1.2.5</u>** Step 3: Posting the Form Containing the <u>ResponseAssertion</u>

In step 3, the browser submits the form containing the <u>SAML response</u> <u>SSO assertion</u> using the

- 735 following HTTP request.
- The HTTP request MUST include the following components:

150	The fiff if request woof menude the following components.
737 738	POST http:// <assertion and="" consumer="" host="" name="" path=""> <other 1.0="" 1.1="" components="" http="" or="" request=""></other></assertion>
739	Where:
740	<pre><other 1.0="" 1.1="" components="" http="" or="" request=""></other></pre>
741	
742	This consists of the form data set derived by the browser processing of the form data received
743	in step 2 according to 17.13.3 of [HTML4.01]. At least Exactly one SAML
744	Responseassertion MUST be included within the form data set with control name
745	SAML <u>ResponseAssertion</u> ; multiple SAML assertions MAY be included in the Response. A
746	single target description MUST be included with the control name set to TARGET.
747	
748	The SAML Response MUST include the Recipient attribute [SAMLCore] with its value set
749	to <assertion and="" consumer="" host="" name="" path="">. At least one of the SAML assertions included</assertion>
750	within the Response MUST be a SSO assertion.
751	
752	At least one of the included SAML assertions MUST be a single-sign on assertion with the
753	additional restriction that the <saml:target> element MUST also be included within the SSO</saml:target>
754	assertion and its value set to <assertion and="" consumer="" host="" name="" path="">. Note the</assertion>
755	distinction between the control name TARGET contained within the HTML form (describes a
756	resource at the destination site) and the <pre>saml:Target> element (describes the destination site).</pre>
757	The destination site MUST ensure a "single use" policy for SSO assertions communicated by

- 758 means of this profile.
 759 Note: The implication here is that the destination site will need to save state.
- A simple implementation might maintain a table of pairs, where each pair consists of the assertion ID and the time at which the entry is to be deleted (where this time is based on the SSO assertion lifetime.). The destination site needs to ensure that there are no duplicate entries. Since SSO assertions containing authentication statements are recommended to have short lifetimes in the web browser context, such a table would be of bounded size.

Confidentiality and message integrity MUST be maintained for the HTTP request in step 3. It is
 RECOMMENDED that the assertion consumer URL be exposed over SSL 3.0 or TLS 1.0 (see
 Section 550). Otherwise, the assertions transmitted in step 3 will be available in plain text to any

769 attacker who might then impersonate the assertion subject.

- 770 The <saml:ConfirmationMethod> element of each assertion MUST be set to <u>"</u>Assertion
- 771 Bearer<u>"</u> (See [SAMLCore]).

772Note: Javascript can be used to avoid an additional "submit" step from the
user as follows [Anders]:

774	<html></html>
775	<body onload="javascript:document.forms[0].submit ()"></body>
776	<form action="destination-site URL" method="POST"></form>
777	
778	<input <="" name="SAMLResponseAssertion" td="" type="HIDDEN"/>
779	VALUE=" assertion response in base64 coding">
780	
781	
782	

783 **<u>4.1.2.6</u>** Step 4: Responding to the User's Request for a Resource

In step 4, the user's browser is sent an HTTP response that either allows or denies access to the desired resource.

No normative form is mandated for the HTTP response. The destination site SHOULD provide

some form of helpful error message in the case where access to resources at that site is

788 disallowed.

789 **<u>4.1.2.7</u>** Threat Model and Countermeasures

790 This section utilizes materials from [ShibMarlena] and [Rescorla-Sec].

791 <u>4.1.2.7.1</u> Stolen Assertion

792 **Threat:** If an eavesdropper can copy the real user's SAML <u>response and included</u> assertion<u>s</u>,

then the eavesdropper could construct an appropriate POST body and be able to impersonate the user at the destination site.

795 **Countermeasure:** As indicated in steps 2 and 3, confidentiality MUST be provided whenever an responseassertion is communicated between a site and the user's browser. This provides

protection against an eavesdropper obtaining a real user's SAML response and assertions.

- If an eavesdropper defeats the measures used to ensure confidentiality, additionalcountermeasures are available:
- The source and destination sites SHOULD make some reasonable effort to ensure that clock settings at both sites differ by at most a few minutes. Many forms of time synchronization service are available, both over the Internet and from proprietary sources.
- SAML assertions communicated in step 3 must MUST include an SSO assertion.
- Values for NotBefore and NotOnOrAfter attributes of SSO assertions SHOULD have
 the shortest possible validity period consistent with successful communication of the
 assertion from source to destination site. This is typically on the order of a few minutes.

- This ensures that a stolen assertion can only be used successfully within a small time window.
- The destination site MUST check the validity period of all assertions obtained from the source site and reject expired assertions. A destination site MAY choose to implement a stricter test of validity for SSO assertions, such as requiring the assertion's
- 813 IssueInstant or AuthenticationInstant attribute value to be within a few minutes of 814 the time at which the assertion is received at the destination site.
- If a received authentication statements includes a <saml:AuthenticationLocality>
 element with the IP address of the user, the destination site MAY check the browser IP
 address against the IP address contained in the authentication statement.

818 <u>4.1.2.7.2</u> MITM Attack

819 **Threat:** Since the destination site obtains bearer SAML assertions from the user by means of an

- HTML form, a malicious site could impersonate the user at some new destination site. The new
- destination site would believe the malicious site to be the subject of the assertion.
- 822 **Countermeasure:** The destination site MUST check the <u>Recipient attribute of the SAML</u>

823 <u>Response to ensure that its value</u>saml:Target> elements of the SSO assertion to ensure that at

824 least one of their values matches the <assertion consumer host name and path>. As the

825 <u>responseassertion</u> is digitally signed, the <u>Recipient</u><<u>saml</u>:<u>Target</u>> value cannot be altered by 826 the malicious site.

827 <u>4.1.2.7.3</u> Forged Assertion

- 828 **Threat:** A malicious user, or the browser user, could forge or alter a SAML assertion.
- 829 **Countermeasure:** The browser/POST profile requires <u>the SAML Response carrying SAML</u>
- assertions to be signed, thus providing both message integrity and authentication. The destination
- site MUST verify the signature and authenticate the issuer.

832 <u>4.1.2.7.4</u> Browser State Exposure

- 833 **Threat:** The browser/POST profile involves uploading of assertions from the web browser to a
- source site. This information is available as part of the web browser state and is usually stored in
- persistent storage on the user system in a completely unsecured fashion. The threat here is that
- the assertion may be "reused" at some later point in time.
- 837 **Countermeasure:** Assertions communicated using this profile must always include an SSO
- assertion. SSO assertions are expected to have short lifetimes and destination sites are expected
- to ensure that <u>SSO</u> assertions are not re-submitted.

⁸⁴⁰ **<u>5</u> Use of SSL 3.0 or TLS 1.0**

In any SAML use of SSL 3.0 or TLS 1.0 [RFC2246], servers MUST authenticate to clients

- using a X.509.v3 certificate. The client MUST establish server identity based on contents of the
- 843 certificate (typically through examination of the certificate subject DN field).

844 **<u>5.1</u>** SAML SOAP Binding

- 845 TLS-capable implementations MUST implement the
- 846 TLS_RSA_WITH_3DES_EDE_CBC_SHA ciphersuite and MAY implement the
- 847 TLS_RSA_AES_128_CBC_SHA ciphersuite [AES].

848 <u>5.2</u> Web Browser Profiles <u>of for SAML</u>

- SSL-capable implementations of the browser/artifact profile or browser/POST profile of SAML
 MUST implement the SSL_RSA_WITH_3DES_EDE_CBC_SHA ciphersuite.
- ⁸⁵⁰ WOST implement the SSE_KSA_wIIII_SDES_EDE_CDC_SIIA
- 851 TLS-capable implementations MUST implement the
- 852 TLS_RSA_WITH_3DES_EDE_CBC_SHA ciphersuite.

⁹¹⁹ <u>7</u> URL Size Restriction (Non-Normative)

- This section describes the URL size restrictions that have been documented for widely used commercial products.
- A Microsoft technical support article [MSURL] provides the following information:
- 923 The information in this article applies to:
- 924Microsoft Internet Explorer (Programming) versions 4.0, 4.01, 4.01 SP1, 4.01925SP2, 5, 5.01, 5.5
- 926 SUMMARY
- Internet Explorer has a maximum uniform resource locator (URL) length of
 2,083 characters, with a maximum path length of 2,048 characters. This limit
 applies to both POST and GET request URLs.
- If you are using the GET method, you are limited to a maximum of 2,048
 characters (minus the number of characters in the actual path, of course).
- POST, however, is not limited by the size of the URL for submitting
 name/value pairs, because they are transferred in the header and not the URL.
- RFC 2616, Hypertext Transfer Protocol -- HTTP/1.1, does not specify any
 requirement for URL length.
- 936 REFERENCES
- Further breakdown of the components can be found in the Wininet header file.
 Hypertext Transfer Protocol -- HTTP/1.1 General Syntax, section 3.2.1
- Additional query words: POST GET URL length
- 940Keywords : kbIE kbIE400 kbie401 kbGrpDSInet kbie500 kbDSupport kbie501941kbie550 kbieFAQ
- 942 Issue type : kbinfo
- 943 Technology :
- An article about xxx[elm1] provides the following information:
- 945 Issue: 19971110-3 Product: Enterprise Server
- 946 Created: 11/10/1997 Version: 2.01
- 947 Last Updated: 08/10/1998 OS: AIX, Irix, Solaris
- 948 Does this article answer your question?
- 949 Please let us know!
- 950 Question:
- How can I determine the maximum URL length that the Enterprise server will
- accept? Is this configurable and, if so, how?
- 953 Answer:

955 **8** Alternative SAML Artifact Format

956 **<u>8.1</u>Required Information**

957 Identification:

954

- http://www.oasis-open.org/security/draft-sstc-bindings-model-0.9/profiles/artifact-02
- 959 Contact information:
- 960 <u>security-services-comment@lists.oasis-open.org</u>
- 961 Description: Given below.
- 962 Updates: None.

963 **8.2** Format Details

An alternative artifact format is described here:

965TypeCode:= 0x0002966RemainingArtifact:= AssertionHandle SourceLocation967AssertionHandle:= 20-byte_sequence968SourceLocation:= URI

969 The SourceLocation URI is the address of the SAML responder associated with the source site.

The assertionHandle is as described in Section 140, and governed by the same requirements.

The destination site MUST process the artifact in a manner identical to that described in Section

972 4.1.14.1.10, with the exception that the location of the SAML responder at the source site MAY

- be obtained directly from the artifact, rather than by look-up, based on sourceID.
- Note: the destination site MUST confirm that assertions were issued by an acceptable issuer, not relying merely on the fact that they were returned in response to a samlp:request.
- 976

978 Appendix A. Notices

- OASIS takes no position regarding the validity or scope of any intellectual property or other
- rights that might be claimed to pertain to the implementation or use of the technology described
- in this document or the extent to which any license under such rights might or might not be
- available; neither does it represent that it has made any effort to identify any such rights.
- 983 Information on OASIS's procedures with respect to rights in OASIS specifications can be found
- at the OASIS website. Copies of claims of rights made available for publication and any
- assurances of licenses to be made available, or the result of an attempt made to obtain a general
- 986 license or permission for the use of such proprietary rights by implementors or users of this
- 987 specification, can be obtained from the OASIS Executive Director.
- OASIS invites any interested party to bring to its attention any copyrights, patents or patent
- applications, or other proprietary rights which may cover technology that may be required to
- ⁹⁹⁰ implement this specification. Please address the information to the OASIS Executive Director.
- 991 Copyright © The Organization for the Advancement of Structured Information Standards
- 992 [OASIS] 2001. All Rights Reserved.
- ⁹⁹³ This document and translations of it may be copied and furnished to others, and derivative works
- that comment on or otherwise explain it or assist in its implementation may be prepared, copied,
- 995 published and distributed, in whole or in part, without restriction of any kind, provided that the
- above copyright notice and this paragraph are included on all such copies and derivative works.
- However, this document itself may not be modified in any way, such as by removing the
- 998 copyright notice or references to OASIS, except as needed for the purpose of developing OASIS
- specifications, in which case the procedures for copyrights defined in the OASIS Intellectual
- 1000 Property Rights document must be followed, or as required to translate it into languages other
- 1001 than English.
- The limited permissions granted above are perpetual and will not be revoked by OASIS or itssuccessors or assigns.
