Introduction

- 74 This document specifies protocol bindings and profiles for the use of SAML assertions and
- 75 request-response messages in communications protocols and frameworks.
- A separate specification [SAMLCore] defines the SAML assertions and request-response
- 77 messages themselves.

73

78

Protocol Binding and Profile Concepts

- 79 Mappings from SAML request-response message exchanges into standard messaging or
- 80 communication protocols are called SAML protocol bindings (or just bindings). An instance of
- mapping SAML request-response message exchanges into a specific protocol <FOO> is termed
- a < FOO> binding for SAML or a SAML < FOO> binding.
- For example, an HTTP binding for SAML describes how SAML request and response message
- exchanges are mapped into HTTP message exchanges. A SAML SOAP binding describes how
- 85 SAML request and response message exchanges are mapped into SOAP message exchanges.
- 86 Sets of rules describing how to embed and extract SAML assertions into a framework or
- protocol are called *profiles of SAML*. A profile describes how SAML assertions are embedded in
- or combined with other objects (for example, files of various types, or protocol data units of
- so communication protocols) by an originating party, communicated from the originating site to a
- 90 destination, and subsequently processed at the destination. A particular set of rules for
- embedding SAML assertions into and extracting them from a specific class of <FOO> objects is
- 92 termed a <*FOO*> profile of SAML.
- 93 For example, a SOAP profile of SAML describes how SAML assertions can be added to SOAP
- messages, how SOAP headers are affected by SAML assertions, and how SAML-related error
- states should be reflected in SOAP messages.
- The intent of this specification is to specify a selected set of bindings and profiles in sufficient
- 97 detail to ensure that independently implemented products will interoperate.
- 98 For other terms and concepts that are specific to SAML, refer to the SAML glossary
- 99 [SAMLGloss].

100

105

Notation

- The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT",
- "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this
- specification are to be interpreted as described in IETF RFC 2119 [RFC2119].
- 104 Listings of productions or other normative code appear like this.

Example code listings appear like this.

Note: Non-normative notes and explanations appear like this.

- 108 Conventional XML namespace prefixes are used throughout this specification to stand for their
- respective namespaces as follows, whether or not a namespace declaration is present in the
- 110 example:
- The prefix saml: stands for the SAML assertion namespace [SAMLCore].
- The prefix samlp: stands for the SAML request-response protocol namespace [SAMLCore].
- The prefix ds: stands for the W3C XML Signature namespace, http://www.w3.org/2000/09/xmldsig# [XMLSig].
- The prefix SOAP-ENV: stands for the SOAP 1.1 namespace, http://schemas.xmlsoap.org/soap/envelope [SOAP1.1].
- This specification uses the following typographical conventions in text: <SAMLElement>,
- 119 <ns:ForeignElement>, Attribute, OtherCode. In some cases, angle brackets are used to
- indicate nonterminals, rather than XML elements; the intent will be clear from the context.

Specification of Additional Protocol Bindings and **Profiles**

- 123 This specification defines a selected set of protocol bindings and profiles, but others will need to
- be developed. It is not possible for the OASIS SAML Technical Committee to standardize all of
- these additional bindings and profiles for two reasons: it has limited resources and it does not
- own the standardization process for all of the technologies used. The following sections offer
- guidelines for specifying bindings and profiles and a process framework for describing and
- registering them.

121

122

129

135

Guidelines for Specifying Protocol Bindings and Profiles

- This section provides a checklist of issues that MUST be addressed by each protocol binding and profile...
- 132 <u>1.</u> Describe the set of interactions between parties involved in the binding or profile. Any 133 restriction on applications used by each party and the protocols involved in each 134 interaction must be explicitly called out-
- 136
 137
 2. Identify the parties involved in each interaction, including: how many parties are involved, and whether intermediaries may be involved.
- 3. Specify the method of authentication of parties involved in each interaction, including whether authentication is required and acceptable authentication types.
- 4. Identify the level of support for message integrity. What mechanisms are used to ensure message integrity?

- 5.5. Identify the level of support for confidentiality, including whether a third party may view the contents of SAML messages and assertions, whether the binding or profile requires confidentiality and the mechanisms recommended for achieving confidentiality.
 - 6.6. Identify the error states, including the error states at each participant, especially those that receive and process SAML assertions or messages.

148 7. Identify security considerations, including analysis of threats and description of countermeasures.

8. Identify SAML confirmation method identifiers defined and/or utilized by the binding or profile.

Process Framework for Describing and Registering Protocol Bindings and Profiles

- For any new protocol binding or profile to be interoperable, it needs to be openly specified. The
- OASIS SAML Technical Committee will maintain a registry and repository of submitted
- bindings and profiles titled "Additional Bindings and Profiles" at the SAML website
- 159 (http://www.oasis-open.org/committees/security/) in order to keep the SAML community
- informed. The Committee will also provide instructions for submission of bindings and profiles
- by OASIS members.
- 162 When a profile or protocol binding is registered, the following information MUST be supplied:
 - 1. Identification: Specify a URI that uniquely identifies this protocol binding or profile.
 - 2. Contact information: Specify the postal or electronic contact information for the author of the protocol binding or profile.
 - 3. Description: Provide a text description of the protocol binding or profile. The description SHOULD follow the guidelines in Section 0.
 - 4. Updates: Provide references to previously registered protocol bindings or profiles that the current entry improves or obsoletes.

Protocol Bindings

- 171 The following sections define SAML protocol bindings sanctioned by the OASIS SAML
- 172 Committee. Only one binding, the SAML SOAP binding, is defined.

SOAP Binding for SAML

165

166

167

168

169

- SOAP (Simple Object Access Protocol) 1.1 [SOAP1.1] is a specification for RPC-like
- interactions and message communications using XML and HTTP. It has three main parts. One is
- a message format that uses an envelope and body metaphor to wrap XML data for transmission
- between parties. The second is a restricted definition of XML data for making strict RPC-like
- calls through SOAP, without using a predefined XML schema. Finally, it provides a binding for
- SOAP messages to HTTP and extended HTTP.
- The SAML SOAP binding defines how to use SOAP to send and receive SAML requests and
- 182 responses.
- Like SAML, SOAP can be used over multiple underlying transports. This binding has protocol-
- independent aspects, but also calls out the use of SOAP over HTTP as REQUIRED (mandatory
- to implement).

Required Information

187 Identification:

186

199

- 188 http://www.oasis-open.org/security/
- 190 urn:oasis:names:tc:SAML:1.0:bindings:SOAP-binding
- 192 Contact information:
- 193 <u>security-services-comment@lists.oasis-open.org</u>
- 194 Description: Given below.
- 195 Updates: None.

Protocol-Independent Aspects of the SAML SOAP Binding

- The following sections define aspects of the SAML SOAP binding that are independent of the
- underlying protocol, such as HTTP, on which the SOAP messages are transported.

Basic Operation

- SOAP messages consist of three elements: an envelope, header data, and a message body. SAML
- request-response protocol elements MUST be enclosed within the SOAP message body.
- SOAP 1.1 also defines an optional data encoding system. This system is not used within the
- SAML SOAP binding. This means that SAML messages can be transported using SOAP without
- re-encoding from the "standard" SAML schema to one based on the SOAP encoding.
- The system model used for SAML conversations over SOAP is a simple request-response model.
- 1. A system entity acting as a SAML requester transmits a SAML <Request> element within the body of a SOAP message to a system entity acting as a SAML responder. The SAML requester MUST NOT include more than one SAML request per SOAP message or include any additional XML elements in the SOAP body.

2. The SAML responder MUST return either a <Response> element within the body of another SOAP message or a SOAP fault code. The SAML responder MUST NOT include more than one SAML response per SOAP message or include any additional XML elements in the SOAP body. If a SAML responder cannot, for some reason, process a SAML request, it MUST return a SOAP fault code. SOAP fault codes MUST NOT be sent for errors within the SAML problem domain, for example, inability to find an extension schema or as a signal that the subject is not authorized to access a resource in an authorization query. (SOAP 1.1 faults and fault codes are discussed in [SOAP1.1] §4.1.)

219

228

238

210

211

212

213

214

215

216

217

218

- On receiving a SAML response in a SOAP message, the SAML requester MUST NOT send a
- fault code or other error messages to the SAML responder. Because the format for the message
- interchange is a simple request-response pattern, adding additional items such as error conditions
- would needlessly complicate the protocol.
- [SOAP1.1] references an early draft of the XML Schema specification including an obsolete
- 225 namespace. SAML requesters SHOULD generate SOAP documents referencing only the final
- 226 XML schema namespace. SAML responders MUST be able to process both the XML schema
- namespace used in [SOAP1.1] as well as the final XML schema namespace.

SOAP Headers

- 229 A SAML requester in a SAML conversation over SOAP MAY add arbitrary headers to the
- SOAP message. This binding does not define any additional SOAP headers.
- Note: The reason other headers need to be allowed is that some SOAP
- software and libraries might add headers to a SOAP message that are out of
- 233 the control of the SAML-aware process. Also, some headers might be needed
- for underlying protocols that require routing of messages.
- A SAML responder MUST NOT require any headers for the SOAP message.
- Note: The rationale is that requiring extra headers will cause fragmentation
- of the SAML standard and will hurt interoperability.

Authentication

- Authentication of both the SAML requester and responder is OPTIONAL and depends on the
- environment of use. Authentication protocols available from the underlying substrate protocol
- MAY be utilized to provide authentication. Section 3.1.2.2 describes authentication in the SOAP
- over HTTP environment.

243 Message Integrity

- Message integrity of both SAML request and response is OPTIONAL and depends on the
- environment of use. The security layer in the underlying substrate protocol MAY be used to
- ensure message integrity. Section 3.1.2.3 describes support for message integrity in the SOAP
- over HTTP environment.

248 Confidentiality

- 249 Confidentiality of both SAML request and response is OPTIONAL and depends on the
- environment of use. The security layer in the underlying substrate protocol MAY be used to
- ensure message confidentiality. Section 3.1.2.4 describes support for confidentiality in the SOAP
- over HTTP environment.

Use of SOAP over HTTP

- A SAML processor that claims conformance to the SAML SOAP binding MUST implement
- 255 SAML over SOAP over HTTP. This section describes certain specifics of using SOAP over
- 256 HTTP, including HTTP headers, error reporting, authentication, message integrity and
- 257 confidentiality.
- The HTTP binding for SOAP is described in [SOAP1.1] §6.0. It requires the use of a
- 259 SOAPAction header as part of a SOAP HTTP request. A SAML responder MUST NOT depend
- on the value of this header. A SAML requester MAY set the value of SOAPAction header as
- 261 follows:

253

266

267

268

269

http://www.oasis-open.org/committees/security

263 HTTP Headers

- 264 HTTP proxies MUST NOT cache responses carrying SAML assertions.
- Both of the following conditions apply when using HTTP 1.1:
 - If the value of the Cache-Control header field is **not** set to no-store, then the SAML responder MUST NOT include the Cache-Control header field in the response.
 - If the Expires response header field is **not** disabled by a Cache-Control header field with a value of no-store, then the Expires field SHOULD NOT be included.
- There are no other restrictions on HTTP headers.

271 Authentication

- 272 The SAML requester and responder MUST implement the following authentication methods:
- 273 1. No client or server authentication.
- 2. HTTP basic client authentication [RFC2617] with and without SSL 3.0 or TLS 1.0.
- 275 3. HTTP over SSL 3.0 or TLS 1.0 (see Section 0) server authentication with a server-side
- 276 certificate.

- 4. HTTP over SSL 3.0 or TLS 1.0 client authentication with a client-side certificate.
- 278 If a SAML responder uses SSL 3.0 or TLS 1.0, it MUST use a server-side certificate.

279 Message Integrity

- 280 When message integrity needs to be guaranteed, SAML responders MUST use HTTP over SSL
- 3.0 or TLS1.0 (see Section 0) with a server-side certificate.

282 Message Confidentiality

- 283 When message confidentiality is required, SAML responders MUST use HTTP over SSL 3.0 or
- TLS 1.0 (see Section 0) with a server-side certificate.

285 **Security Considerations**

- 286 Before deployment, each combination of authentication, message integrity and confidentiality
- mechanisms SHOULD be analyzed for vulnerability in the context of the deployment
- environment. See the SAML security considerations document [SAMLSec] for a detailed
- 289 discussion.
- 290 RFC 2617 [RFC2617] describes possible attacks in the HTTP environment when basic or
- 291 message-digest authentication schemes are used.

292 Error Reporting

- A SAML responder that refuses to perform a message exchange with the SAML requester
- 294 SHOULD return a "403 Forbidden" response. In this case, the content of the HTTP body is not
- significant.
- As described in [SOAP1.1] § 6.2, in the case of a SOAP error while processing a SOAP request,
- 297 the SOAP HTTP server MUST return a "500 Internal Server Error" response and include a
- SOAP message in the response with a SOAP fault element. This type of error SHOULD be
- returned for SOAP-related errors detected before control is passed to the SAML processor, or
- when the SOAP processor reports an internal error (for example, the SOAP XML namespace is
- incorrect, the SAML schema cannot be located, the SAML processor throws an exception, and
- 302 so on).

307

- In the case of a SAML processing error, the SOAP HTTP server MUST respond with "200 OK"
- and include a SAML-specified error description as the only child of the <SOAP-ENV: Body>
- element. For more information about SAML error codes, see the SAML assertion and protocol
- specification [SAMLCore].

Example SAML Message Exchange Using SOAP over HTTP

Following is an example of a request that asks for an assertion containing an authentication statement from a SAML authentication authority.

```
POST /SamlService HTTP/1.1
Host: www.example.com
```

```
312
            Content-Type: text/xml
313
            Content-Length: nnn
314
            SOAPAction: http://www.oasis-open.org/committees/security
315
            <SOAP-ENV:Envelope
316
                xmlns:SOAP-ENV="http://schemas.xmlsoap.org/soap/envelope/">
317
                <SOAP-ENV:Body>
318
                     <samlp:Request xmlns:samlp:="..." xmlns:saml="..."</pre>
319
            xmlns:ds="...">
320
                         <ds:Signature> ... </ds:Signature>
321
                         <samlp:AuthenticationQuery>
322
323
                         </samlp:AuthenticationQuery>
324
                     </samlp:Request>
325
                 </SOAP-ENV:Body>
326
            </SOAP-ENV:Envelope>
```

Following is an example of the corresponding response, which supplies an assertion containing authentication statement as requested.

```
329
            HTTP/1.1 200 OK
330
            Content-Type: text/xml
331
            Content-Length: nnnn
332
333
            <SOAP-ENV:Envelope
334
                xmlns:SOAP-ENV="http://schemas.xmlsoap.org/soap/envelope/">
335
                <SOAP-ENV:Body>
336
                     <samlp:Response xmlns:samlp="..." xmlns:saml="..."</pre>
337
            xmlns:ds="...">
338
                         <Status>
339
                            <StatusCodevalue="samlp:Success"/>
340
341
                     <ds:Signature> ... </ds:Signature>
342
                     <saml:Assertion>
343
                         <saml:AuthenticationStatement>
344
345
                         </saml:AuthenticationStatement>
346
                     </saml:Assertion>
347
                     </samlp:Response>
348
                 </SOAP-Env:Body>
349
            </SOAP-ENV:Envelope>
```

Profiles

- The following sections define profiles of SAML that are sanctioned by the OASIS SAML
- 352 Committee.

350

357

327

328

- Two web browser-based profiles that are designed to support single sign-on (SSO), supporting
- Scenario 1-1 of the SAML requirements document [SAMLRegs]:
- o The browser/artifact profile of SAML
- o The browser/POST profile of SAML

For each type of profile, a section describing the threat model and relevant countermeasures is

359 also included.

Web Browser SSO Profiles of SAML

- In the scenario supported by the web browser SSO profiles, a web user authenticates herself to a
- *source site.* The web user then uses a secured resource at a destination site, without directly
- authenticating to the *destination site*.
- The following assumptions are made about this scenario for the purposes of these profiles:
 - The user is using a standard commercial browser and has authenticated to a source site by some means outside the scope of SAML.
 - The source site has some form of security engine in place that can track locally authenticated users [WEBSSO]. Typically, this takes the form of a session that might be represented by an encrypted cookie or an encoded URL or by the use of some other technology [SESSION]. This is a substantial requirement but one that is met by a large class of security engines.
- At some point, the user attempts to access a *target* resource available from the destination site,
- and subsequently, through one or more steps (for example, redirection), arrives at an *inter-site*
- 374 transfer service (which may be associated with one or more URIs) at the source site. Starting
- from this point, the web browser SSO profiles describe a canonical sequence of HTTP exchanges
- that transfer the user browser to an assertion consumer service at the destination site.
- Information about the SAML assertions provided by the source site and associated with the user,
- and the desired target, is conveyed from the source to the destination site by the protocol
- exchange.

360

365

366

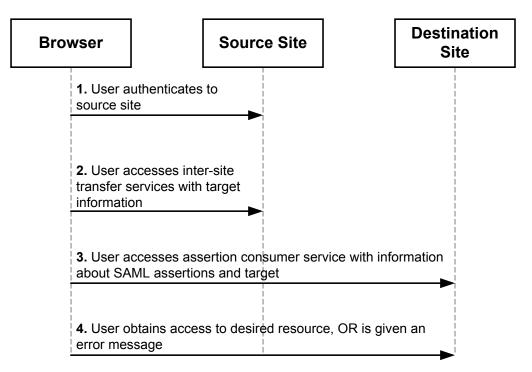

367

368

369

370

- The assertion consumer service at the destination site can examine both the assertions and the
- target information and determine whether to allow access to the target resource, thereby
- achieving web SSO for authenticated users originating from a source site. Often, the destination
- site also utilizes a security engine that will create and maintain a session, possibly utilizing
- information contained in the source site assertions, for the user at the destination site.
- The following figure illustrates this basic template for achieving SSO.

Two HTTP-based techniques are used in the web browser SSO profiles for conveying information from one site to another via a standard commercial browser.

- **SAML artifact:** A SAML artifact of "small" bounded size is carried as part of a URL query string such that, when the artifact is conveyed to the source site, the artifact unambiguously references an assertion. The artifact is conveyed via redirection to the destination site, which then acquires the referenced assertion by some further steps. Typically, this involves the use of a registered SAML protocol binding. This technique is used in the browser/artifact profile of SAML.
- **Form POST:** SAML assertions are uploaded to the browser within an HTML form and conveyed to the destination site as part of an HTTP POST payload when the user submits the form. This technique is used in the browser/POST profile of SAML.
- Cookies are not employed in any profile, as cookies impose the limitation that both the source and destination site belong to the same "cookie domain."
- In the discussion of the web browser SSO profiles, the term *SSO assertion* will be used to refer to an assertion that has (1) a <saml:Conditions> element with NotBefore and NotOnOrAfter attributes present, and (2) contains one or more authentication statements.

Browser/Artifact Profile of SAML

418	Preliminaries
419 420 421	The browser/artifact profile of SAML relies on a reference to the needed assertion traveling in a SAML artifact, which the destination site must dereference from the source site in order to determine whether the user is authenticated.
422 423 424 425 426 427 428 429 430 431	Note: The need for a "small" SAML artifact is motivated by restrictions on URL size imposed by commercial web browsers. While RFC 2616 [RFC2616] does not specify any restrictions on URL length, in practice commercial web browsers and application servers impose size constraints on URLs, for a maximum size of approximately 2000 characters (see Section 0). Further, as developers will need to estimate and set aside URL "real estate" for the artifact, it is important that the artifact have a bounded size, that is, with predefined maximum size. These measures ensure that the artifact can be reliably carried as part of the URL query string and thereby transferred successfully from source to destination site.
432 433 434 435	The browser/artifact profile consists of a single interaction among three parties (a user equipped with a browser, a source site, and a destination site), with a nested sub-interaction between two parties (the source site and the destination site). The interaction sequence is shown in the following figure, with the following sections elucidating each step.

- Terminology from RFC 1738 [RFC1738] is used to describe components of a URL. An HTTP
- 439 URL has the following form:
- 440 http://<HOST>:<port>/<path>?<searchpart>
- The following sections specify certain portions of the <searchpart > component of the URL.
- Ellipses will be used to indicate additional but unspecified portions of the <searchpart>
- component.

- HTTP requests and responses MUST be drawn from either HTTP 1.1 [RFC2616] or HTTP 1.0
- [RFC1945]. Distinctions between the two are drawn only when necessary.

Step 1: Accessing the Inter-Site Transfer Service

- In step 1, the user's browser accesses the inter-site transfer service, with information about the
- desired target at the destination site attached to the URL.
- No normative form is given for step 1. It is RECOMMENDED that the HTTP request take the
- 450 following form:
- 451 GET http://<inter-site transfer host name and path>?TARGET=<Tarqet>...<HTTP-
- 452 Version>
- 454 Where:
- 455 <inter-site transfer host name and path>
- This provides the host name, port number, and path components of an inter-site transfer URL at the source site.
- 458 Target=<Target>
- This name-value pair occurs in the <searchpart > and is used to convey information about the desired target resource at the destination site.
- Confidentiality and message integrity MUST be maintained in step 1.

Step 2: Redirecting to the Destination Site

- In step 2, the source site's inter-site transfer service responds and redirects the user's browser to
- the assertion consumer service at the destination site.
- The HTTP response MUST take the following form:
- 466 <hre><http-Version> 302 <Reason Phrase>
- 467 <other headers>
- 468 Location: http://<assertion consumer host name and path>?<SAML searchpart>
- 469 <other HTTP 1.0 or 1.1 components>
- 470 Where:

462

- 471 <assertion consumer artifact receiver host name and path>
- This provides the host name, port number, and path components of an <u>artifact receiver</u>
- 473 <u>assertion consumer URL associated with the assertion consumer service</u> at the destination site.
- 475 <SAML searchpart>= ...TARGET=<Target>...SAMLart=<SAML artifact> ...
- A single target description MUST be included in the <SAML searchpart > component. At
- least one SAML artifact MUST be included in the SAML <SAML searchpart > component;
- multiple SAML artifacts MAY be included. If more than one artifact is carried within <SAML
- searchpart>, all the artifacts MUST have the same SourceID.
- According to HTTP 1.1 [RFC2616] and HTTP 1.0 [RFC1945], the use of status code 302 is
- recommended to indicate that "the requested resource resides temporarily under a different
- 482 URI". The response may also include additional headers and an optional message body as
- described in those RFCs.
- Confidentiality and message integrity MUST be maintained in step 2. It is RECOMMENDED
- that the inter-site transfer URL be protected by exposed over SSL 3.0 or TLS 1.0 (see Section 0).
- Otherwise, the one or more artifacts returned in step 2 will be available in plain text to an
- attacker who might then be able to impersonate the assertion subject.

Step 3: Accessing the **Artifact Receiver URL** Assertion Consumer Service

- In step 3, the user's browser accesses the artifact receiver URLassertion consumer service, with a
- 490 SAML artifact representing the user's authentication information attached to the URL.
- The HTTP request MUST take the form:
- 492 GET http://<assertion_consumer artifact receiver host name and path>?<SAML
- 493 searchpart> <http-//ersion>
- Where:

- 496 <assertion consumer artifact receiver host name and path>
- This provides the host name, port number, and path components of an artifact receiver
- 498 <u>assertion consumer URL associated with the assertion consumer service</u> at the destination site.
- 500 <SAML searchpart>= ...TARGET=<Target>...SAMLart=<SAML artifact> ...
- A single target description MUST be included in the <SAML searchpart > component. At
- least one SAML artifact MUST be included in the <SAML searchpart > component; multiple
- SAML artifacts MAY be included. If more than one artifact is carried within <SAML
- searchpart>, all the artifacts MUST have the same sourceID.

- 505 Confidentiality and message integrity MUST be maintained in step 3. It is RECOMMENDED
- that the assertion consumer URL be protected by exposed over SSL 3.0 or TLS 1.0 (see Section
- 507 0). Otherwise, the artifacts transmitted in step 3 will be available in plain text to any attacker
- who might then be able to impersonate the assertion subject.

Steps 4 and 5: Acquiring the Corresponding Assertions

- In steps 4 and 5, the destination site, in effect, dereferences the one or more SAML artifacts in its
- posession in order to acquire the SAML authentication assertion that corresponds to each artifact.
- These steps MUST utilize a SAML protocol binding for a SAML request-response message
- exchange between the destination and source sites. The destination site functions as a SAML
- requester and the source site functions as a SAML responder.
- The destination site MUST send a <samlp: Request > message to the source site, requesting
- assertions by supplying assertion artifacts in the <samlp:AssertionArtifact> element.
- If the source site is able to find or construct the requested assertions, it responds with a
- 518 <samlp:Response> message with the requested assertions. Otherwise, it returns an appropriate
- error code, as defined within the selected SAML binding.
- In the case where the source site returns assertions within <samlp:Response>, it MUST return
- exactly one assertion for each SAML artifact found in the corresponding <samlp:Request>
- element. The case where fewer or greater number of assertions is returned within the
- 523 <samlp:Response> element MUST be treated as an error state by the destination site.
- The source site MUST implement a "one-time request" property for each SAML artifact. Many
- simple implementations meet this constraint by an action such as deleting the relevant assertion
- from persistent storage at the source site after one lookup. If a SAML artifact is presented to the
- source site again, the source site MUST return the same message as it would if it were queried
- with an unknown artifact.

- 529 The selected SAML protocol binding MUST provide confidentiality, message integrity and
- 530 bilateral authentication. The source site MUST implement the SAML SOAP binding with
- support for confidentiality, message integrity, and bilateral authentication.
- The source site MUST return a response with no assertions if it receives a <samlp: Request>
- message from an authenticated destination site X containing an artifact issued by the source site
- to some other destination site Y, where $X \Leftrightarrow Y$. One way to implement this feature is to have
- source sites maintain a list of artifact and destination site pairs.
- At least one of the SAML assertions returned to the destination site MUST be an SSO assertion.
- Authentication statements MAY be distributed across more than one returned assertion.
- The <saml: ConfirmationMethod> element of each assertion MUST be set to "SAMLArtifact"
- 539 (see [SAMLCore]). urn:oasis:names:tc:SAML:1.0:cm:artifact-01
- Based on the information obtained in the assertions retrieved by the destination site, the
- destination site MAY engage in additional SAML message exchanges with the source site.

Step 6: Responding to the User's Request for a Resource

- In step 6, the user's browser is sent an HTTP response that either allows or denies access to the
- desired resource.
- No normative form is mandated for the HTTP response. The destination site SHOULD provide
- some form of helpful error message in the case where access to resources at that site is
- 547 disallowed.

542

548

555

579

580

Artifact Format

The artifact format includes a mandatory two-byte artifact type code, as follows:

```
550 SAML_artifact := B64(TypeCode RemainingArtifact)
551 TypeCode := Byte1Byte2
```

Note: Depending on the level of security desired and associated profile protocol steps, many viable architectures could be developed for the SAML artifact [CoreAssnEx] [ShibMarlena]. The type code structure

accommodates variability in the architecture.

- The notation B64 (TypeCode RemainingArtifact) stands for the application of the base64
- [RFC2045] transformation to the catenation of the TypeCode and RemainingArtifact. This
- profile defines an artifact type of type code 0x0001, which is REQUIRED (mandatory to
- implement) for any implementation of the browser/artifact profile. This artifact type is defined as
- 560 follows:
- TypeCode $:= 0 \times 0001$
- RemainingArtifact := SourceID AssertionHandle
- 563 SourceID := 20-byte_sequence 564 AssertionHandle := 20-byte sequence
- sourceID is a 20-byte sequence used by the destination site to determine source site identity and
- location. It is assumed that the destination site will maintain a table of SourceID values as well
- as the URL (or address) for the corresponding SAML responder. This information is
- communicated between the source and destination sites out-of-band. On receiving the SAML
- artifact, the destination site determines if the sourceID belongs to a known source site and
- obtains the site location before sending a SAML request (as described in Section 0).
- Any two source sites with a common destination site MUST use distinct sourceID values.
- 572 Construction of AssertionHandle values is governed by the principle that they SHOULD have
- 573 no predictable relationship to the contents of the referenced assertion at the source site and it
- MUST be infeasible to construct or guess the value of a valid, outstanding assertion handle.
- The following practices are RECOMMENDED for the creation of SAML artifacts at source sites:
- Each source site selects a single identification URL. The domain name used within this URL is registered with an appropriate authority and administered by the source site.
 - The source site constructs the SourceID component of the artifact by taking the SHA-1 hash of the identification URL.

• The AssertionHandle value is constructed from a cryptographically strong random or pseudorandom number sequence [RFC1750] generated by the source site. The sequence consists of values of at least eight bytes in size. These values should be padded to a total length of 20 bytes.

Threat Model and Countermeasures

This section utilizes materials from [ShibMarlena] and [Rescorla-Sec].

Stolen Artifact

- Threat: If an eavesdropper can copy the real user's SAML artifact, then the eavesdropper could
- construct a URL with the real user's SAML artifact and be able to impersonate the user at the
- 590 destination site.
- Countermeasure: As indicated in steps 2, 3, 4, and 5, confidentiality MUST be provided
- 592 whenever an artifact is communicated between a site and the user's browser. This provides
- 593 protection against an eavesdropper gaining access to a real user's SAML artifact.
- If an eavesdropper defeats the measures used to ensure confidentiality, additional
- 595 countermeasures are available:
 - The source and destination sites SHOULD make some reasonable effort to ensure that clock settings at both sites differ by at most a few minutes. Many forms of time synchronization service are available, both over the Internet and from proprietary sources
 - SAML assertions communicated in step 5 must MUST include an SSO assertion.
 - The source site SHOULD track the time difference between when a SAML artifact is generated and placed on a URL line and when a <samlp:Request> message carrying the artifact is received from the destination. A maximum time limit of a few minutes is recommended. Should an assertion be requested by a destination site query beyond this time limit, a SAML error SHOULD be returned by the source site.
 - It is possible for the source site to create SSO assertions either when the corresponding SAML artifact is created or when a <samlp:Request> message carrying the artifact is received from the destination. The validity period of the assertion SHOULD be set appropriately in each case: longer for the former, shorter for the latter.
 - Values for NotBefore and NotOnOrAfter attributes of SSO assertions SHOULD have the shortest possible validity period consistent with successful communication of the assertion from source to destination site. This is typically on the order of a few minutes. This ensures that a stolen artifact can only be used successfully within a small time window.
 - The destination site MUST check the validity period of all assertions obtained from the source site and reject expired assertions. A destination site MAY choose to implement a stricter test of validity for SSO assertions, such as requiring the assertion's IssueInstant or AuthenticationInstant attribute value to be within a few minutes of the time at which the assertion is received at the destination site.

• If a received authentication statement includes a <saml:AuthenticationLocality>
621 element with the IP address of the user, the destination site MAY check the browser IP
622 address against the IP address contained in the authentication statement.

623 Attacks on the SAML Protocol Message Exchange

- Threat: The message exchange in steps 4 and 5 could be attacked in a variety of ways, including
- artifact or assertion theft, replay, message insertion or modification, and MITM (man-in-the-
- 626 middle attack).
- 627 **Countermeasure:** The requirement for the use of a SAML protocol binding with the properties
- of bilateral authentication, message integrity, and confidentiality defends against these attacks.

629 Malicious Destination Site

- Threat: Since the destination site obtains artifacts from the user, a malicious site could
- impersonate the user at some new destination site. The new destination site would obtain
- assertions from the source site and believe the malicious site to be the user.
- 633 **Countermeasure:** The new destination site will need to authenticate itself to the source site so
- as to obtain the SAML assertions corresponding to the SAML artifacts. There are two cases to
- 635 consider:
- 1. If the new destination site has no relationship with the source site, it will be unable to authenticate and this step will fail.
- 2. If the new destination site has an existing relationship with the source site, the source site
- will determine that assertions are being requested by a site other than that to which the
- artifacts were originally sent. In such a case, the source site MUST not provide the assertions
- to the new destination site.

642 Forged SAML Artifact

- Threat: A malicious user could forge a SAML artifact.
- 644 **Countermeasure:** Section 0 provides specific recommendations regarding the construction of a
- SAML artifact such that it is infeasible to guess or construct the value of a current, valid, and
- outstanding assertion handle. A malicious user could attempt to repeatedly "guess" a valid
- SAML artifact value (one that corresponds to an existing assertion at a source site), but given the
- size of the value space, this action would likely require a very large number of failed attempts. A
- source site SHOULD implement measures to ensure that repeated attempts at querying against
- non-existent artifacts result in an alarm.

Browser State Exposure

- Threat: The SAML artifact profile involves "downloading" of SAML artifacts to the web
- browser from a source site. This information is available as part of the web browser state and is
- usually stored in persistent storage on the user system in a completely unsecured fashion. The
- threat here is that the artifact may be "reused" at some later point in time.

- 656 **Countermeasure:** The "one-use" property of SAML artifacts ensures that they cannot be reused
- 657 from a browser. Due to the recommended short lifetimes of artifacts and mandatory SSO
- assertions, it is difficult to steal an artifact and reuse it from some other browser at a later time.

Browser/POST Profile of SAML

Required Information

- 661 Identification:
- urn:oasis:names:tc:SAML:1.0:profiles:browser-post
- 663 Contact information:
- security-services-comment@lists.oasis-open.org
- 665 SAML Confirmation Method Identifiers: The "Bearer" confirmation method identifier is used
- by this profile. The following identifier has been assigned to this confirmation method:
- urn:oasis:names:tc:SAML:1.0:cm:bearer
- 668

671

659

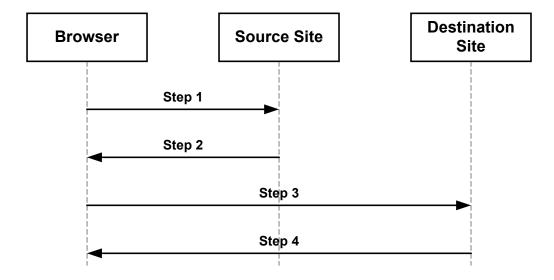

660

- 669 Description: Given below.
- 670 Updates: None.

Preliminaries

- The browser/POST profile of SAML allows authentication information to be supplied to a
- destination site without the use of an artifact. The following figure diagrams the interactions
- between parties in the browser/POST profile.
- The browser/POST artifact profile consists of a series of two interactions, the first between a user
- equipped with a browser and a source site, and the second directly between the user and the
- destination site. The interaction sequence is shown in the following figure, with the following
- sections elucidating each step.

679

Step 1: Accessing the Inter-Site Transfer Service

- In step 1, the user's browser accesses the inter-site transfer service, with information about the
- desired target at the destination site attached to the URL.
- No normative form is given for step 1. It is RECOMMENDED that the HTTP request take the
- 685 following form:
- 686 GET http://<inter-site transfer host name and path>?TARGET=<Target>...<HTTP-
- 687 Version>
- 688 <other HTTP 1.0 or 1.1 components>
- 689 Where:

681

- 690 <inter-site transfer host name and path>
- This provides the host name, port number, and path components of an inter-site transfer URL at the source site.
- 693 Target=<Target>
- This name-value pair occurs in the <searchpart > and is used to convey information about
- the desired target resource at the destination site.

Step 2: Generating and Supplying the Response

- In step 2, the source site generates HTML form data containing a SAML Response which
- 698 contains an SSO assertion.
- The HTTP response MUST take the form:
- 700 <hTTP-Version 200 <Reason Phrase>
- 701 <other HTTP 1.0 or 1.1 components>
- 702 Where:

- 703 <other HTTP 1.0 or 1.1 components>
- This MUST include an HTML FORM [Chapter 17, HTML 4.01] with the following FORM body:
- 706 < Body>
- 707 < FORM Method="Post" Action="<assertion consumer host name and path>" ...>
- 708 <INPUT TYPE="Submit" NAME="button" Value="Submit">
- 709 <INPUT TYPE="hidden" NAME="SAMLResponse" Value="B64(<response>)">
- 710 ...
- 711 <INPUT TYPE="hidden" NAME="TARGET" Value="<Target>">
- 712 </Body>
- 713 <assertion consumer host name and path>
- This provides the host name, port number, and path components of an assertion consumer
- 715 URL at the destination site.
- Exactly one SAML response MUST be included within the FORM body with the control name
- 717 SAMLResponse; multiple SAML assertions MAY be included in the Response. At least one of the
- assertions MUST be a SSO assertion. A single target description MUST be included with the
- 719 control name TARGET.
- The notation B64 (<response>) stands for the result of applying the base64 transformation to
- 721 the response.
- The SAML response MUST be digitally signed following the guidelines given in [SAMLCore].
- 723 Included assertions MAY be digitally signed.

- Confidentiality and message integrity MUST be maintained for step 2. It is RECOMMENDED 724
- that the inter-site transfer URL be protected by exposed over SSL 3.0 or TLS 1.0 (see Section 0). 725
- Otherwise, the assertions returned will be available in plain text to any attacker who might then 726
- 727 be able to impersonate the assertion subject.

Step 3: Posting the Form Containing the Response

In step 3, the browser submits the form containing the SAML response using the following 729

HTTP request. 730

728

731

732

733

734

735

736

737 738

739

740

741 742

743

744 745

746

751

757

758

759

760 761

Note: Posting the form can be triggered by various means. For example, a "submit" button could be included in Step 2 by including the following line:

```
<INPUT TYPE="Submit" NAME="button" Value="Submit">
```

This requires the user to explicitly "submit" the form for the POST request to be sent. Alternatively, Javascript can be used to avoid an additional "submit" step from the user as follows [Anders]:

```
<BODY Onload="javascript:document.forms[0].submit ()">
   <FORM METHOD="POST" ACTION="destination-site URL">
      _
<INPUT TYPE="HIDDEN" NAME="SAMLResponse"
       VALUE=" response in base64 coding">
 /BODY>
```

The HTTP request MUST include the following components:

```
747
     POST http://<assertion consumer host name and path>
748
     <other HTTP 1.0 or 1.1 request components>
```

Where: 749

```
750
     <other HTTP 1.0 or 1.1 request components>
```

This consists of the form data set derived by the browser processing of the form data received in 752 step 2 according to 17.13.3 of [HTML4.01]. Exactly one SAML Response MUST be included 753 within the form data set with control name SAMLResponse; multiple SAML assertions MAY be 754 included in the Response. A single target description MUST be included with the control name 755

set to TARGET. 756

> The SAML Response MUST include the Recipient attribute [SAMLCore] with its value set to <assertion consumer host name and path>. At least one of the SAML assertions included within the Response MUST be a SSO assertion.

762 The destination site MUST ensure a "single use" policy for SSO assertions communicated by means of this profile. 763

Note: The implication here is that the destination site will need to save state.

A simple implementation might maintain a table of pairs, where each pair consists of the assertion ID and the time at which the entry is to be deleted (where this time is based on the SSO assertion lifetime.). The destination site needs to ensure that there are no duplicate entries. Since SSO assertions containing authentication statements are recommended to have short lifetimes in the web browser context, such a table would be of bounded size.

- Confidentiality and message integrity MUST be maintained for the HTTP request in step 3. It is
- RECOMMENDED that the assertion consumer URL be protected by exposed over SSL 3.0 or
- 773 TLS 1.0 (see Section 0). Otherwise, the assertions transmitted in step 3 will be available in plain
- text to any attacker who might then impersonate the assertion subject.
- 775 The <saml: ConfirmationMethod> element of each assertion MUST be set to "Assertion
- 776 Bearer" (See [SAMLCore]): urn:oasis:names:tc:SAML:1.0:cm:bearer

777

778

779

789

795

797

Note: Javascript can be used to avoid an additional "submit" step from the user as follows [Anders]:

Step 4: Responding to the User's Request for a Resource

- In step 4, the user's browser is sent an HTTP response that either allows or denies access to the
- 791 desired resource.
- No normative form is mandated for the HTTP response. The destination site SHOULD provide
- some form of helpful error message in the case where access to resources at that site is
- 794 disallowed.

Threat Model and Countermeasures

796 This section utilizes materials from [ShibMarlena] and [Rescorla-Sec].

Stolen Assertion

- 798 **Threat:** If an eavesdropper can copy the real user's SAML response and included assertions,
- then the eavesdropper could construct an appropriate POST body and be able to impersonate the
- user at the destination site.

- 801 **Countermeasure:** As indicated in steps 2 and 3, confidentiality MUST be provided whenever a
- response is communicated between a site and the user's browser. This provides protection
- against an eavesdropper obtaining a real user's SAML response and assertions.
- 804 If an eavesdropper defeats the measures used to ensure confidentiality, additional
- 805 countermeasures are available:

807

808 809

810

811

812

813

814

815

816

817

818

819

820

821

822

823

836

- The source and destination sites SHOULD make some reasonable effort to ensure that clock settings at both sites differ by at most a few minutes. Many forms of time synchronization service are available, both over the Internet and from proprietary sources.
- SAML assertions communicated in step 3-must-MUST include an SSO assertion.
- Values for NotBefore and NotOnOrAfter attributes of SSO assertions SHOULD have
 the shortest possible validity period consistent with successful communication of the
 assertion from source to destination site. This is typically on the order of a few minutes.
 This ensures that a stolen assertion can only be used successfully within a small time
 window
 - The destination site MUST check the validity period of all assertions obtained from the source site and reject expired assertions. A destination site MAY choose to implement a stricter test of validity for SSO assertions, such as requiring the assertion's IssueInstant or AuthenticationInstant attribute value to be within a few minutes of the time at which the assertion is received at the destination site.
 - If a received authentication statement includes a <saml:AuthenticationLocality> element with the IP address of the user, the destination site MAY check the browser IP address against the IP address contained in the authentication statement.

824 MITM Attack

- 825 **Threat:** Since the destination site obtains bearer SAML assertions from the user by means of an
- HTML form, a malicious site could impersonate the user at some new destination site. The new
- destination site would believe the malicious site to be the subject of the assertion.
- 828 **Countermeasure:** The destination site MUST check the Recipient attribute of the SAML
- Response to ensure that its value matches the <assertion consumer host name and path>.
- As the response is digitally signed, the Recipient value cannot be altered by the malicious site.

831 Forged Assertion

- Threat: A malicious user, or the browser user, could forge or alter a SAML assertion.
- 833 **Countermeasure:** The browser/POST profile requires the SAML Response carrying SAML
- assertions to be signed, thus providing both message integrity and authentication. The destination
- site MUST verify the signature and authenticate the issuer.

Browser State Exposure

837 838 839 840	Threat: The browser/POST profile involves uploading of assertions from the web browser to a source site. This information is available as part of the web browser state and is usually stored in persistent storage on the user system in a completely unsecured fashion. The threat here is that the assertion may be "reused" at some later point in time.
841 842 843	Countermeasure: Assertions communicated using this profile must always include an SSO assertion. SSO assertions are expected to have short lifetimes and destination sites are expected to ensure that SSO assertions are not re-submitted.
844	
845	Confirmation Method Identifiers
846	
847	Holder Of Key
848	<u>URI:</u>
849	urn:oasis:names:tc:SAML:1.0:cm:holder-of-key
850	A <da: vayinfa=""> alament MIIST he present within the <subject confirmation=""> alament</subject></da:>
851 852	A <ds:keyinfo> element MUST be present within the <subjectconfirmation> element. As described in [DSIG], the <ds:keyinfo> element holds a key or information that enables an</ds:keyinfo></subjectconfirmation></ds:keyinfo>
853	application to obtain a key. The subject of the assertion is the party that can demonstrate that it is
854	the holder of the key.
855	
856	Sender Vouches
857	<u>URI:</u>
858	urn:oasis:names:tc:SAML:1.0:cm:sender-vouches
859 860	Indicates that no other information is available about the context of use of the assertion. The
861	relying party SHOULD utilize other means to determine if it should process the assertion further.
862	
0.62	SAMI Artifact
863	SAML Artifact
864 865	<pre>URI: urn:oasis:names:tc:SAML:1.0:cm:artifact-01</pre>
866	ulli.oasis.liames.tc.samb.i.o.cm.aicliacc-oi
867 868	The subject of the assertion is the party that presented a SAML artifact, which the relying party used to obtain the assertion from the party that created the artifact. See also Section 4.1.1.1.

870	Bearer
871	<u>URI:</u>
872 873	urn:oasis:names:tc:SAML:1.0:cm:bearer
874	The subject of the assertion is the bearer of the assertion. See also Section 4.1.2.1.
875	

Use of SSL 3.0 or TLS 1.0

- In any SAML use of SSL 3.0 or TLS 1.0 [RFC2246], servers MUST authenticate to clients
- using a X.509.v3 certificate. The client MUST establish server identity based on contents of the
- certificate (typically through examination of the certificate subject DN field).

SAML SOAP Binding

876

880

889

- TLS-capable implementations MUST implement the
- TLS RSA WITH 3DES EDE CBC SHA ciphersuite and MAY implement the
- TLS_RSA_AES_128_CBC_SHA ciphersuite [AES].

884 Web Browser Profiles of SAML

- SSL-capable implementations of the browser/artifact profile or browser/POST profile of SAML
- 886 MUST implement the SSL RSA WITH 3DES EDE CBC SHA ciphersuite.
- TLS-capable implementations MUST implement the
- TLS RSA WITH 3DES EDE CBC SHA ciphersuite.

URL Size Restriction (Non-Normative)

- This section describes the URL size restrictions that have been documented for widely used commercial products.
- A Microsoft technical support article [MSURL] provides the following information:
- The information in this article applies to:
- Microsoft Internet Explorer (Programming) versions 4.0, 4.01, 4.01 SP1, 4.01
- 967 SP2, 5, 5.01, 5.5
- 968 SUMMARY

- Internet Explorer has a maximum uniform resource locator (URL) length of 2,083 characters, with a maximum path length of 2,048 characters. This limit
- applies to both POST and GET request URLs.
- If you are using the GET method, you are limited to a maximum of 2,048
- characters (minus the number of characters in the actual path, of course).
- POST, however, is not limited by the size of the URL for submitting
- name/value pairs, because they are transferred in the header and not the URL.
- 976 RFC 2616, Hypertext Transfer Protocol -- HTTP/1.1, does not specify any
- 977 requirement for URL length.
- 978 REFERENCES

979 980	Hypertext Transfer Protocol HTTP/1.1 General Syntax, section 3.2.1
981	Additional query words: POST GET URL length
982 983	Keywords: kbIE kbIE400 kbie401 kbGrpDSInet kbie500 kbDSupport kbie501 kbie550 kbieFAQ
984	Issue type: kbinfo
985	Technology:
986	An article about Netscape Enterprise Server[elm1]provides the following information:
987	Issue: 19971110-3 Product: Enterprise Server
988	Created: 11/10/1997 Version: 2.01
989	Last Updated: 08/10/1998 OS: AIX, Irix, Solaris
990	Does this article answer your question?
991	Please let us know!
992	Question:
993 994	How can I determine the maximum URL length that the Enterprise server will accept? Is this configurable and, if so, how?
995	Answer:
996	Any single line in the headers has a limit of 4096 chars; it is not configurable.

Alternative SAML Artifact Format

Required Information

999 Identification:

1000

1006

997

998

- urn:oasis:names:tc:SAML:1.0:draft-sstc-bindings-model-13:profiles:artifact-02
- 1002 Contact information:
- 1003 <u>security-services-comment@lists.oasis-open.org</u>
- 1004 Description: Given below.
- 1005 Updates: None.

Format Details

- 1007 An alternative artifact format is described here:
- 1008 TypeCode := 0×0002
- 1009 RemainingArtifact := AssertionHandle SourceLocation

1010 1011	AssertionHandle := 20-byte_sequence SourceLocation := URI
1012 1013 1014 1015 1016	The SourceLocation URI is the address of the SAML responder associated with the source site. The assertionHandle is as described in Section 0, and governed by the same requirements. The destination site MUST process the artifact in a manner identical to that described in Section 0, with the exception that the location of the SAML responder at the source site MAY be obtained directly from the artifact, rather than by look-up, based on sourceID.
1017 1018	Note: the destination site MUST confirm that assertions were issued by an acceptable issuer, not relying merely on the fact that they were returned in response to a samlp:request.

Appendix A. Notices

- OASIS takes no position regarding the validity or scope of any intellectual property or other
- rights that might be claimed to pertain to the implementation or use of the technology described
- in this document or the extent to which any license under such rights might or might not be
- available; neither does it represent that it has made any effort to identify any such rights.
- 1026 Information on OASIS's procedures with respect to rights in OASIS specifications can be found
- at the OASIS website. Copies of claims of rights made available for publication and any
- assurances of licenses to be made available, or the result of an attempt made to obtain a general
- license or permission for the use of such proprietary rights by implementors or users of this
- specification, can be obtained from the OASIS Executive Director.
- OASIS invites any interested party to bring to its attention any copyrights, patents or patent
- applications, or other proprietary rights which may cover technology that may be required to
- implement this specification. Please address the information to the OASIS Executive Director.
