Core Components Technical Specification, Part 1

8 February 2002 Version 1.8

UN/CEFACT Core Components Technical Specification V1.8 Page 1 of 97

DRAFT United Nations Centre for Trade Facilitation and Electronic Business

14 **1 Status of This Document**

15 This Technical Specification is being developed in accordance with the

UN/CEFACT

- 16 UN/CEFACT/TRADE/22 Open Development Process for Technical Specifications. It
- 17 has been approved by the eBTWG for public review as defined in Step 5 of the Open
- 18 Development Process.

19 This document contains information to guide in the interpretation or implementation 20 of ebXML concepts.

- 21 Distribution of this document is unlimited.
- 22 The document formatting is based on the Internet Society's Standard RFC format.
- This version: *Core Components* Technical Specification, Version 1.80 of 8 February
 2002
- 25 Previous version: Core Components Technical specification, Version 1.75 of 15
- 26 January 2002

182 **4** Introduction

183 This Core Components technical specification describes and specifies a new approach

to the well-understood problem of the lack of information interoperability between

applications in the e-business arena. Traditionally, standards for the exchange of

- business data have been focused on static message definitions that have not enabled a
- sufficient degree of interoperability or flexibility. A more flexible and interoperable
- 188 way of standardising business semantics is required. The UN/CEFACT *Core*
- 189 Component solution described in this technical specification presents a methodology 190 for developing a common set of semantic building blocks that represent the general
- 190 for developing a common set of semantic bundli 191 types of business data in use today.

192 The keywords MUST, MUST NOT, REQUIRED, SHALL, SHALL NOT, SHOULD,

193 SHOULD NOT, RECOMMENDED, MAY, and OPTIONAL, when they appear in

- this document, are to be interpreted as described in Internet Engineering Task Force
- (IETF) Request For Comments (RFC) 2119.¹

1964.1Scope and Focus

197 This *Core Components Technical Specification* can be employed wherever business 198 information is being shared or exchanged amongst and between enterprises,

199 governmental agencies, and/or other organisations in an open and worldwide

200 environment. The prime users are business people, business process modellers, and

201 application developers of different organisations that require interoperability of

202 business information. This interoperability covers both interactive and batch

- 203 exchanges of business data between applications through the use of Internet and Web
- 204 based information exchanges as well as traditional Electronic Data Interchange (EDI)
- 205 systems.

This document will form the basis for standards development work of business analysts, business users and information technology specialists supplying the content of and implementing applications that will employ the UN/CEFACT *Core Component*

- 209 *Library* (CCL).
- 210 Due to the evolving nature of the UN/CEFACT Core Component Library, the
- 211 specification includes material that focuses on the business community doing further
- 212 discovery and analysis work. Some of the contents of this specification are not typical
- 213 of this type of technical document. However, they are critical for successful adoption
- and standardisation in this area to move forward.

¹ Key words for use in RFCs to Indicate Requirement Levels - Internet Engineering Task Force, Request For Comments 2119, March 1997, http://www.ietf.org/rfc/rfc2119.txt?number=2119

215 4.2 Structure of this Specification

216 Due to the diversity of the intended audience, this document has been divided into217 five main Sections.

218 219 220	 Section 5: Working Process and Methodology for Business Users—Discovery, Harmonisation, Assessment and How to Use [informative]
221	• Section 6: Technical Details— <i>Core Components</i> and Context [normative]
222	• Section 7: Technical Details—Storage and Metadata [normative]
223 224	• Section 8: Technical Details—Approved <i>Core Component Type</i> , Content, and <i>Supplementary Components</i> [normative]
225	• Section 9: Definition of Terms [normative]

226 Sections 5, 6, 7 and 8 are complementary, but may also be used independently of each 227 other. Section 5 is informative. A business audience may choose to read through the

228 working process and methodology section (Section 5) and only reference the

Technical Details (Sections 6, 7 and 8) as needed. Sections 6, 7 and 8 are normative.

A technical audience may choose to focus on the technical details (Sections 6, 7, and

8), referring to the methodology (Section 5) and example (Part 2 a separate document)

232 sections as appropriate, using the current approved *Core Component Type*, *Content*,

and *Supplementary Components* (Section 8) and the glossary (Section 9).

234 In addition, the Core Components Team has prepared the Core Components Technical

235 Specification, Parts 2 and 3. Part 2—Core Components Primer details how the

contents of Sections 5, 6, and 7 would be used. Part 3—Catalogue of Discovered

237 Core Components represents the work of various organisations working in a joint

endeavour to develop a beginning catalogue of *Core Components*.

239 **4.2.1** Notation

240 [Definition] - A formal definition of a term. Definitions are normative.

241 [Example] - A representation of a definition or a rule. Examples are informative.

242 [Note] – Explanatory information. Notes are informative.

243 [Rn] - Identification of a rule that requires conformance to ensure discovered *Core*

244 *Components* are properly discovered, named and stored. The value R is a prefix to

categorise the type of rule where R=B for Business Information rule, R=C for *Core*

246 Component rule, or R=S for Storage rule; and n (1..n) indicates the sequential number

of the rule]. Rules are normative.

290 4.4 Overview

291 This Core Components Technical Specification provides a way to identify, capture 292 and maximise the reuse of business information to support and enhance information

293 interoperability across multiple business situations. The specification focuses both on

294 human-readable and machine-processable representations of this information.

295 The Core Components approach described in this document is more flexible than 296 current standards in this area because the semantic standardisation is done in a syntax-297 neutral fashion. Using Core Components as part of the ebXML framework will help 298 to ensure that two trading partners using different syntaxes (e.g. XML and EDIFACT) 299 are using business semantics in the same way on condition that both syntaxes have 300 been based on the same Core Components. This enables clean mapping between 301 disparate message definitions across syntaxes, industry and regional boundaries.

302 UN/CEFACT Business Process and Core Component solutions capture a wealth of 303 information about the business reasons for variation in message semantics and 304 structure. In the past, such variations have introduced incompatibilities. The Core 305 Components mechanism uses this rich information to allow identification of exact

similarities and differences between semantic models. Incompatibility becomes 306

307 incremental rather than wholesale, i.e. the detailed points of difference are noted,

308 rather than a whole model being dismissed as incompatible.

4.5 **Core Component Key Concepts** 309

310 The key concepts in the *Core Components Technical Specification* are:

311 Core Component — The Core Component is a semantic building block • 312 that is used as a basis to construct all electronic business messages.

313	[Definition] Core Component (CC)	
314 315 316	A building block for the creation of a semantically correct and meaningful information exchange 'parcel'. It contains only the information pieces necessary to describe a specific concept.	

317	• Business Context – Business Context is a mechanism for qualifying and
318	refining Core Components according to their use within a particular
319	process. Once business contexts are identified, the appropriate Core
320	Components can be selected or created and differentiated to indicate any
321	necessary qualification and refinement needed to support the business
322	process in a given business context.

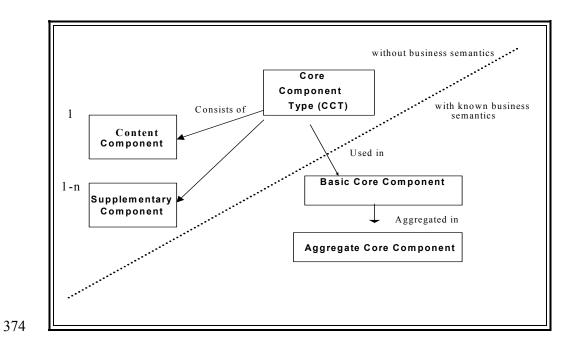

r	
323	[Definition] Business Context
324 325 326	The formal description of a specific business circumstance as identified by the values of a set of context categories, allowing different business circumstances to be uniquely distinguished.
327 328 329 330	• Business Information Entity –When a Core Component is used in a real business situation it is used to define a Business Information Entity. The Business Information Entity is the result of using a Core Component within a specific business context.
331	[Definition] Business Information Entity (BIE)
332 333 334	A piece of business data or a group of pieces of business data with a unique business semantic definition. A <i>Business Information Entity</i> can be either a <i>Basic Business Information Entity</i> (BBIE) or an <i>Aggregate Business Information Entity</i> (ABIE).
335 336 337	There are three different categories of <i>Core Components: Basic Core Component</i> , <i>Core Component Type</i> and <i>Aggregate Core Component</i> . The following definitions explain each of these:
338	[Definition] Basic Core Component (BCC)
339 340 341 342	A <i>Core Component</i> that represents a singular business concept with a unique business semantic definition. A <i>Basic Core Component</i> is constructed by using a <i>Core Component Type. Basic Core Components</i> are used in developing <i>Aggregate Core Components</i> .
343	
344	[Definition] Core Component Type (CCT)
345 346 347 348	A <i>Core Component</i> that consists of one and only one <i>Content Component</i> that carries the actual content plus one or more <i>Supplementary Components</i> giving an essential extra definition to the <i>Content Component. Core Component Types</i> do not have business meaning.
349	
350	[Example] Core Component Types
351 352 353 354	For a <i>Core Component Type</i> of <i>Amount. Type</i> , the <i>Content Component</i> carries the value of <i>12 and</i> this value has no meaning on its own. But <i>12 Kilometres</i> or <i>12 Euro</i> , where <i>Kilometres</i> or <i>Euro</i> are the <i>Supplementary Component</i> that gives essential extra definition, do have meaning.

355	
356	[Definition] Aggregate Core Component
357 358 359	A Collection of <i>Core Components</i> that convey a distinct business meaning. An <i>Aggregate Core Component</i> will consist of two or more <i>Basic Core Components</i> , or at least one <i>Basic Core Component</i> plus one or more <i>Aggregate Core Components</i>
360	
361	[Example] – Aggregate Core Component
362	Aggregate: Financial Account. Details
363 364	Definition: A service through a bank or other organisation through which funds are held on behalf of a client or goods or services are supplied on credit.
365	Basic Core Components:
366	Financial Account. Identifier
367	Financial Account. Name
368	Financial Account. Country. Code
369	Financial Account Product. Type. Identifier
370	Financial Account Nickname. Name

371 The simple diagram in Figure 4-1 shows the relationships between these three

372 categories.

373 Figure 4-1. Core Component Overview

375 A specific relationship exists between Core Components and Business Information

376 Entities. Core Components and Business Information Entities are complementary in

377 many respects. *Core Components* are intended to be the linchpin for creating

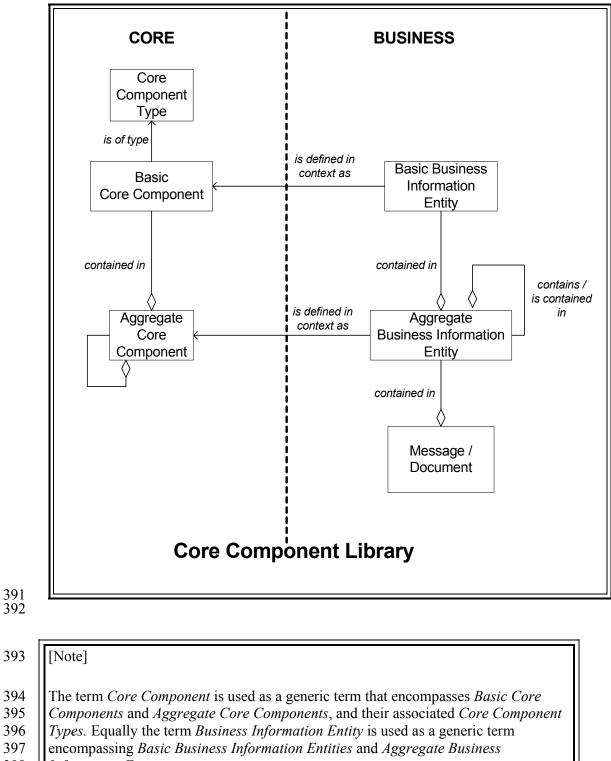

378 interoperable business process models and business documents using a *Controlled*

379 Vocabulary.

380	[Definition] Basic Business Information Entity
381 382	A Core Component used in a specific business context. A Basic Business Information Entity is derived from a Basic Core Component.
383	
384	[Definition] Aggregate Business Information Entity
385 386	A collection of related pieces of business information that together convey a distinct business meaning in a specified business context.
387 388	The features of the relationship between <i>Core Components</i> and <i>Business Information Entities</i> are described in Figure 4-2.

389 Figure 4-2. Relationships between Core Components and Business Information

390 *Entities*

398 *Information Entities.*

399 5 Working Process and Methodology

- 400 This chapter identifies aspects of Core Component working processes and
- 401 methodologies for use. It includes an overview of the discovery and use
- 402 characteristics of *Core Components*. In addition, it includes detailed recommendations
- 403 for conducting discovery, storage, approval, and application of context.

404 **5.1 Overview**

- 405 The analysis of business processes builds a picture of requirements, identifying the
- 406 business collaboration, i.e. timing and purpose of each process step. Detailed
- 407 examination of the business processes at this level reveals the individual pieces of
- 408 business information that are used and at what stage they are exchanged.

409 **5.1.1 Discovery**

- 410 A business process should be modelled using a standard approach. UN/CEFACT
- 411 requires the UN/EDIFACT Modelling Methodology (UMM) as the approach.² One of
- 412 the results is a model (e.g. a class diagram) that shows the business information and
- 413 its inter-relationships. *Business Information Entities* can be identified from the class
- 414 diagram.
- 415 For example, if a domain team has modelled the publication of catalogue data to
- 416 trading partners, the result will be a *Business Information Entity* representing the
- 417 distributed catalogue data that is made up of a set of smaller *Business Information*
- 418 *Entities* that are its component parts. Thus, the description of an item is identified as a
- 419 Business Information Entity for this business process.
- 420 Ultimately, *Business Information Entities* must be based on a basic library of clearly
- 421 defined semantic constructs to help ensure that they will inter-operate. This library
- 422 must include a set of globally agreed semantic definitions such as those, which will be
- 423 contained in the UN/CEFACT Core Components Library.
- 424 A Business Information Entity is a Core Component used in a specific business
- 425 context and given its own unique name. As Basic Core Components are single pieces
- 426 of business information, when they are used directly in specific business contexts, the
- 427 structure (components) does not change.

² The UN/CEFACT Modelling Methodology (UMM) is a methodology for business process and information modelling that is based on the Unified Modelling Language.

428	[Example]
429	An invoicing business process uses a piece of information such as VAT Amount. VAT
430	Amount is a Basic Business Information Entity that is based on the Basic Core
431	Component of Tax. Amount. The invoicing business process is using Tax. Amount in a
432	specific business context where the Business Process Context = Purchasing, and the
433	Geopolitical Context = EU. Therefore the application of context adds a specialised
434	definition, but in all other respects the Basic Business Information Entity is the same
435	as the associated Core Component of Tax. Amount, i.e. it has the same structure and
436	data type.

438	Just as each Business Information Entity must ultimately be based on Basic Core
439	Components, each Aggregate Business Information Entity must ultimately be based on
440	an existing Aggregate Core Component. The underlying Aggregate Core Component
441	identifies the generic, standard definition of business information that is being used in
442	the Aggregate Business Information Entity. The Aggregate Business Information
443	Entity inherits the generic description, which is then modified and enhanced to be
444	specific to the business process in which the Aggregate Business Information Entity is
445	used. An Aggregate Business Information Entity is thus directly tied to a specific
446	business process, or to a Business Context. (See Section 5.6 for a fuller understanding
447	of context.)

448 An important aspect of information interoperability is that each Business Information

- 449 Entity inherits a Core Component structure and associated semantic definitions
- 450 derived from the *Core Component Library*.
- 451 The following section describes the procedures by which the UN/CEFACT ebXML
- 452 compliant library may be developed and maintained.

453 **5.1.2** How to use UN/CEFACT Core Components

454 This section, 5.1.2, provides a procedure for the technical user who wants to

455 understand how to use *Core Components*. It assumes the user is dealing with an

456 established set of *Core Components*, context categories and metadata/storage. The

457 established set of *Core Components* being used should be based on those discovered,

458 harmonised, and published by recognised standards groups. It is further assumed that

459 the recognised standards group(s) and other business association group(s) have also

460 made available sets of *Business Information Entities* for use in a published set of

461 business processes.

462 5.1.2.1 Core Components and Semantic Interoperability

463 Today, the e-business community generally agrees on the definition of a standard

464 message structure expressed as an UN/EDIFACT *Message Implementation Guide*

465 466		an XML schema, or similar syntax specific representation. UN/CEFACT will standards based representations of these artefacts for implementation. ³
467 468 469 470 471 472	associate schema. XML scl interoper	the <i>Core Components</i> concept, defining and storing <i>Core Components</i> and ed context mechanisms occur prior to the creation of a MIG or a XML In this manner, the focus of the user changes from examining the MIG or hema, and moves to an examination of the semantic models. Accordingly, rability between syntaxes no longer depends on analysing specific instances, rally occurs during the business process model definition phase.
473	5.1.2.2	Overall Discovery and Document Creation
474 475 476 477 478	starts wir ultimatel	discovery and document creation can be thought of as a series of steps that th determining the availability of existing business process definitions and y results in standard business documents. Figure 5-1 illustrates this process. steps to be followed are further described below.
479 480 481	Step 1:	Search the registry/repository— A search should be made in the registry on all available published business processes in the repository to find an inter- operable business process that meets the business requirement.
482 483 484	Step 1a:	If no existing business process is found to be appropriate, then the new business process should be modelled using <i>UN/CEFACT Modelling Methodology</i> and submitted to the registry.
485 486	Step 1b:	Conduct a thorough analysis of the business information requirements by following the <i>Core Component Discovery Steps</i> (Section 5.2.2)
487 488 489	Step 2:	Identify relevant context categories - Access the registry interface and identify the relevant context categories of the selected business process by determining the following context categories (See Section 6.2.2):
490 491		• <i>Business Process Context</i> – Identify the role played by the user and their trading partners.
492 493		• <i>Product Classification Context</i> – Determine the goods or services concerned in the collaboration.
494 495		• <i>Industry Classification Context</i> – Determine the relevant trading partner industries.
496 497 498		• <i>Geopolitical Context</i> – Determine where the business process is to be conducted. Determine if the business process crosses international boundaries.
499 500		• <i>Official Constraints Context</i> – Determine any legal restrictions or requirements on this business process.

³ The term XML schema includes XML Schema as defined in World Wide Web Consortium Extensible Markup Language Version 1.0 and XML Document Type Definitions.

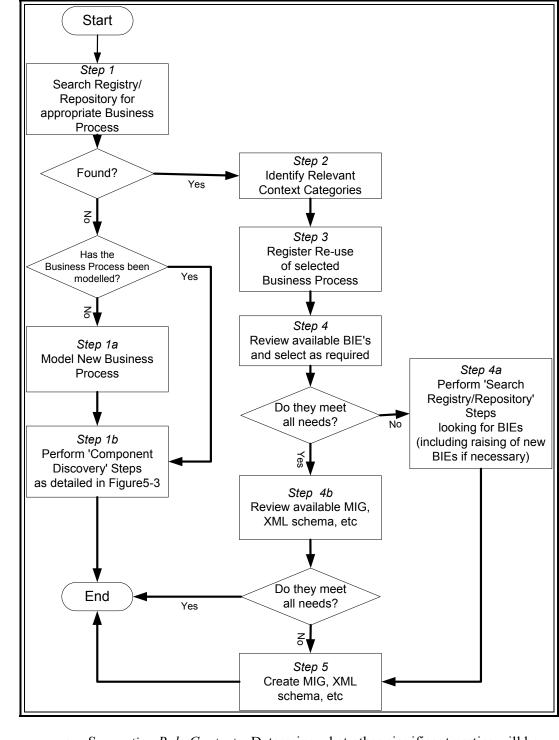

504

505

506

• *Business Process Role Context* – Identify the roles played by the user and their trading partners. These can be derived from the business process.

503 Figure 5-1. Steps from Business Process Discovery to Core Component Discovery

UN/CEFACT Core Components Technical Specification V1.8

507 508	•	<i>System Capabilities Context</i> – Determine any major restrictions derived from legacy systems. Identify the type of system.
509 510 511 512 513 514		The registry will provide a list of pre-defined <i>Business Information Entities</i> that are available to the selected business process, and which meet the context criteria specified. These will come with identified relationships to the <i>Core Components</i> that they are based on, and the context rules/values that fully qualify them. The registry should also return partial matches with an indication of how closely they match the specified context.
515 516 517	Step 3:	Register re-use of selected <i>Business Process</i> in the set of contexts in which it is being used. Registration of each re-use ensures the gradual development of a library of re-uses that will be available to the widening user base.
518 519 520	Step 4:	Review the available <i>Business Information Entities</i> and select the appropriate subset for use that meets the needs of the business process requirement that is being developed.
521 522 523 524 525 526 527	Step 4a:	If the <i>Business Information Entities</i> available for the specific business process do not address all of the data requirements, the repository of all <i>Business Information Entities</i> should be searched to see if the appropriate <i>Business Information Entities</i> already exist. The procedure for this is described under Search Repository (Section 5.2), which includes the steps to raise any new <i>Business Information Entities</i> , required because no appropriate <i>Business Information Entities</i> can be found.
528 529 530 531 532	Step 4b:	If all required <i>Business Information Entities</i> are already available, review the available MIG, XML schema, etc and select the appropriate one(s) for use that meet the technical implementation/solution requirements identified. If no appropriate technical implementation/solution is already available, continue with Step 5 to create new ones.
533 534 535 536 537	Step 5:	Create MIG, XML schema, etc. – The resulting semantic model (the set of <i>Business Information Entities</i>) is manually or programmatically rendered into a syntax-specific message description. The resulting MIG, XML schema is submitted to the repository where it is associated with the <i>Business Information Entities</i> it represents.

538	
539	When selecting a business process and defining the required messages, searches may
540	be made against potential trading partners' data requirements and processes. The
541	context rules and <i>Business Information Entities</i> represent useful metadata in
542	determining the best possible match between the user and their partners. The fact that
543	the rules can be made available in processable formats means that the comparison
544	itself could be automated and made available as a feature of the repository
545	implementation.

546 **5.2 Core Components Discovery**

547 The steps in *Core Component* discovery are preparation and search. In order to

548 properly define the UN/CEFACT Core Component Library, domain or project groups

549 must follow the prescribed preparation and search steps as outlined in the following

subsections. See *Part 2—Core Components Primer* for a detailed end-to-end example

551 of discovering Core Components.

552 **5.2.1 Core Component Discovery – Preparation Steps**

These steps identify pieces of business information such as *Basic* and *Aggregate Business Information Entities*. An analysis of *Business Information Entities* from a variety of similar business processes leads to the underlying core structures and semantics of the *Core Components*. Figure 5-2 graphically portrays the prescribed preparation steps that are described below.

558	Step 1.	Select the Business Process that provides the widest range of business
559	_	information content within the domain being addressed. (e.g. Make a
560		Payment, Place an Order, Issue an Invoice)

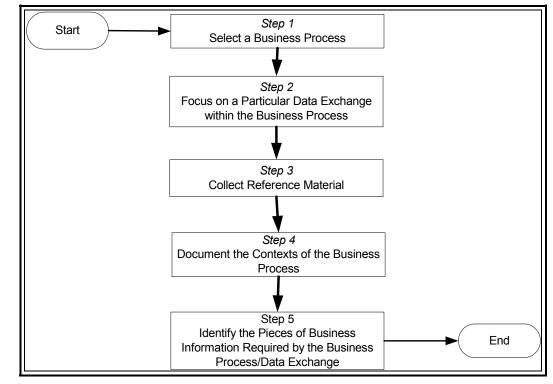

- 561 Step 2. Focus on a particular data exchange within the *Business Process* that
 562 contains key business information (e.g. *Payment Order, Purchase Order,*563 *Invoice*).
- 564Step 3.Collect all the business information and associated details that are relevant to565the chosen business exchange for the previously identified business process.566Use a cross section of Message Implementation Guides, RosettaNet Partner567Interface Process (PIP), Business Process Information Models (BPIMs) or568similar domain-specific artefacts as sources of information about the569business exchange.
- Step 4. Document the context(s) of the business process being analysed. Identify
 what is applicable for each category of context, i.e. whether it is *none*, *in all contexts*, or *one or multiple specific context value(s)*. (See Section 5.6 for a
 more detailed explanation of how to determine context). The context
 categories are:
- Business Process Context

UN/CEFACT Core Components Technical Specification V1.8

- Supporting Role Context
- System Capabilities Context

583 Figure 5-2 Preparation Steps

584

586

587 588

```
• If starting from a model (UN/CEFACT recommends UMM models of business processes), identify the objects (Aggregate Business Information Entities) that are needed.
```

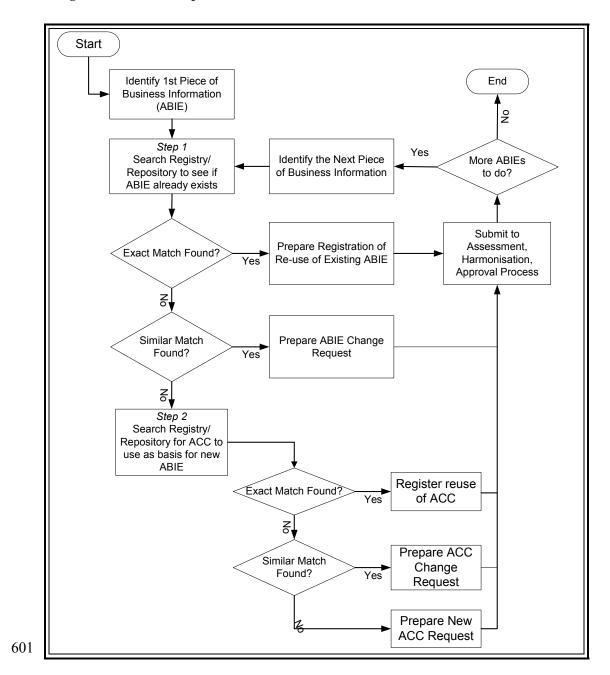

```
    If not starting from a model, collect the pieces of information into object-
like groups (Aggregate Business Information Entities). It is important to
recognise and avoid pieces of information that are purely used for legacy
system or syntax purposes.
```

593	• For each Aggregate Business Information Entity, capture its semantic	
594	definition, any Business Terms by which it is commonly known, and other	
595	information identified in the previous steps.	

596 **5.2.2** Core Components Discovery – Search Registry/Repository

597 Having discovered a number of *Aggregate Business Information Entities* in the

- 598 preparation Step 5 identified in Section 5.2.1 above, repeat the following steps for
- each Aggregate Business Information Entities as shown in Figure 5-3.

600 Figure 5-3 Search Steps

602 603 604 605	Step 1 We recommend starting with <i>Aggregate Business Information Entities</i> at the highest level of aggregation. Search the Catalogue of <i>Aggregate Business Information Entities</i> for an existing <i>Aggregate Business Information Entity</i> that has the same definition.
606 607 608	• If there is an <i>Aggregate Business Information Entity</i> with a definition that meets the business need, register the re-use including business context and any business terms. (Go to next <i>Aggregate Business Information Entity</i>)
609 610 611 612 613 614 615 616 617	• If there is an <i>Aggregate Business Information Entity</i> with a definition that potentially could be modified to meet the business need, prepare an <i>Aggregate Business Information Entity</i> change request for submission to the harmonisation and approval process. Proposed changes need to be assessed to ensure that any adaptation is sensible, reasonable and applied in the most appropriate way. This, together with registration of re-uses, will ensure the availability of a real and usable pool of material to a widening user base. Include re-use, business context and any business terms. (Go to next <i>Aggregate Business Information Entity</i>)
 618 619 620 621 622 	[Note] Proposed changes need to be assessed to ensure that any adaptation is sensible, reasonable and applied in the most appropriate way. This, together with registration of re-uses, will ensure the availability of a real and usable pool of material to a widening user base.
623 624	• If there is not an <i>Aggregate Business Information Entity</i> with a suitable definition, go to Step 2.
625 626 627 628	Step 2 Search the <i>Catalogue of Core Components</i> for an existing <i>Aggregate Core</i> <i>Component</i> that has the appropriate generic definition and structure from which the new required <i>Aggregate Business Information Entity</i> can be formed.
629 630 631 632 633	• If there is an existing <i>Aggregate Core Component</i> with a definition and structure that meets the business needs, register the re-use of the <i>Aggregate Core Component</i> as an <i>Aggregate Business Information Entity</i> including the definition and name created according to the naming convention. (Go to next <i>Aggregate Business Information Entity</i>)
634 635 636 637 638 639 640	• If there is an <i>Aggregate Core Component</i> with a definition and structure that potentially could be modified to meet the business need, prepare an <i>Aggregate Core Component</i> change request for submission to the harmonisation and approval process. Include the re-use of the <i>Aggregate Core Component</i> as an <i>Aggregate Business Information Entity</i> , including the definition and name created according to the naming convention. (Go to next <i>Aggregate Business Information Entity</i>)

If there is not an *Aggregate Core Component* with a suitable definition and structure, prepare a new *Aggregate Core Component* request for submission to the harmonisation and approval process. Include the re-use of the *Aggregate Core Component* as an *Aggregate Business Information Entity*, including the definition and name created according to the naming convention. (Go to next *Aggregate Business Information Entity*)

647 **5.2.3** Core Component Discovery – Basic Business Information Entities

648 This procedure is exactly the same as that described in Section 5.2.2, except that the

649 reader should read *Basic Business Information Entity* for *Aggregate Business*

650 Information Entity and Basic Core Component for Aggregate Core Component.

651 **5.3 Preparation for Submission**

- Following the search of the *Core Component Library*, there may be a need to preparesubmissions for the harmonisation and approval process. (See Section 5.4)
- Preparation of submissions will be carried out by the business domain or
 project group making the discovery.
- Harmonisation and approval will be conducted by appropriate Assessment, Harmonisation and Approval teams to be set up as part of the UN/CEFACT electronic business standards forum.
- The different types of submissions that may be required are detailed below.
- 660 The following submissions are simple documented requests, following procedures to 661 be established by the Assessment, Harmonisation and Approval teams.
- To register a Re-use of an existing *Aggregate Business Information Entity*
- To make a Change Request for an existing *Aggregate Business Information Entity*
- To make a Change Request for an existing *Aggregate Core Component*

The following submissions require more significant preparation, as part of the *Core Component* working methodology, to be carried out by the business domain or project
 group conducting the discovery and analysis.

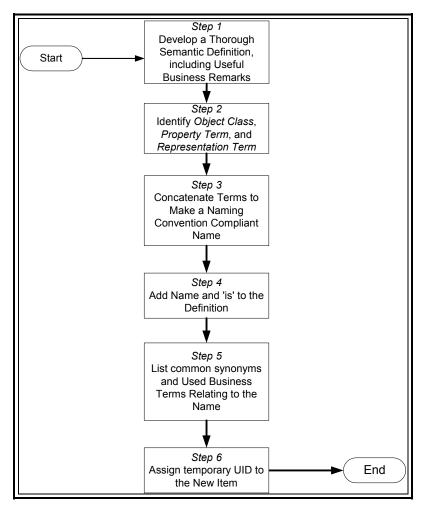

- Preparation for Requesting a new *Basic Core Component*
- Preparation for Requesting a new Aggregate Core Component
- Preparation for Requesting a new Aggregate Business Information Entity
 which re-uses an existing Aggregate Core Component

- Each of these needs to initially follow the same steps in applying the *Naming*
- 674 *Convention* (Section 6.1.3) to arrive at the name of the new item.

675 **5.3.1** Applying the Naming Convention to a New Item

- 676 For all new items, the *Naming Convention* and associated rules that are defined in
- 677 Section 6.1.3 must be applied. Figure 5-4 shows the steps that must be taken, each of
- 678 which is described in the accompanying text.

679 Figure 5-4 Applying the Naming Convention

680

683

684

- 681 Step 1. Develop a thorough semantic definition and include any useful business
 682 comments as remarks. Semantic definitions should:
 - use words different to those being defined *provided* that no ambiguity is thereby introduced,
- 685 be globally applicable,
- be generic (i.e. able to cover the same business concept for different products/services),

688	• be applicable across multiple industries or domains, and					
689	• be simple and clear to enable unambiguous translation to other languages					
690 691	Step 2. Follow the <i>Naming Convention for Core Components or Business</i> <i>Information Entities</i> (Section 6.1.3) to identify as appropriate:					
692	• Object Class					
693	• Property Term					
694	<i>Representation Term</i>					
695	• Qualifier Term(s)					
696	Step 3. Concatenate the terms to create a <i>Naming Convention</i> compliant name.					
697	[Note]					
698 699 700	9 business terms used for that concept. However, rigor of the <i>Naming Convention</i>					
701 702 703	Step 4. Check the quality of the definition by adding the words "[Dictionary Name] is" to the front of the definition, where [Dictionary Name] is the agreed name.					
704 705 706	Step 5. List common synonyms or <i>Business Term(s)</i> that are used within the domain to identify the piece of business information (e.g. <i>Account Number, Account Identifier</i>).					
707	[Note]					
708 709 710 711 712	Some <i>Business Terms</i> are used for several different pieces of business information. It is perfectly acceptable to have the same business term listed as a synonym for two or more pieces of business information. For example, as shown in Figure 5-5, <i>Account Number</i> is a synonym for <i>Financial Account Identifier</i> and for <i>Sales Account Identifier</i> .					
713 714	Step 6. Assign a temporary UID to the new item in the form of a 6 digit alphanumeric string, chosen at the discretion of the user.					

715	Figure 5-5	Core Component	Catalogue Extract
-----	------------	-----------------------	-------------------

	Definition	Remarks	Business Terms	ССТ	Dictionary Entry Name			
Temp UID					Name	Object Class	Property Term	Represent ation Term
C00010	A Financial Account is a service through a bank or other organisation through	Not a general ledger.	Account	u/a	Financial Account. Details	Financial Account	Details	
	which funds are held on behalf of a client or goods or services are supplied on credit				Same	Busine	ss Term	
F00012	A Sales Account is a relationship between a vendor and a customer.	Usually includes a contract specifying the terms of	Account	n/a	Sales Account. Details	Sales Account	Details	

717 **5.3.2** Preparation for Submitting New Aggregate Core Components

718 The development of a new aggregate requires adherence to the *Naming Convention*

rules for naming and definition. Once named, the new aggregate's constituent parts

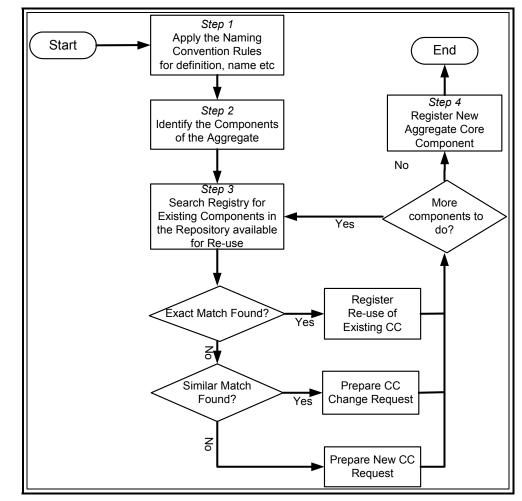

need to be individually examined. The following diagram and text describes the

721 procedure that is to be followed.

722	Step 1.	Apply the Naming Convention rules to arrive at the name of the new
723		Aggregate Core Component

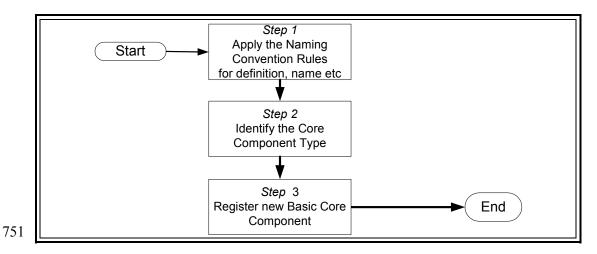

- 724 Step 2. Identify all of the components within the new *Aggregate Core Component*.
- Repeat the following step for each constituent component identified in step 2:
- Step 3. Search the Registry for an existing *Core Component* that has the appropriate generic definition and structure.
- If there is an existing *Core Component* with a definition and structure that
 meets the requirement, register this re-use of the *Core Component* including the context in which it is used.
- If there is an existing *Core Component* with a definition and structure that
 potentially could be modified to meet the requirement, prepare a *Core Component* change request for submission to the harmonisation and
 approval process, including the re-use of the *Core Component* and the
 context in which it is used.
- If there is not an existing *Core Component* with a suitable definition and structure, prepare a new *Core Component* request for submission to the harmonisation and approval process, including the re-use of the *Core Component* and the context.

- 740 When all the constituent components identified in step 2 have been checked as
- 741 described in Step 3, then:
- 742 Step 4. Register new Aggregate Core Component.
- 743 Prepare the new Aggregate Core Component request for submission to the
- harmonisation and approval process.
- 745 Figure 5-6 Preparation for requesting a new Aggregate Core Component

747 5.3.3 Preparation Steps for Requesting a New Basic Core Component

As shown in Figure 5-7, there are three steps necessary to prepare for requesting a new *Basic Core Component*. These three steps are:

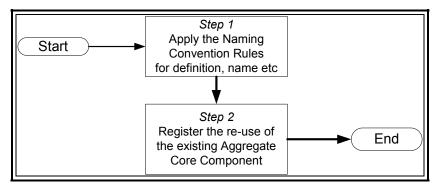

750 Figure 5-7 Preparation Steps for Requesting a New Core Component.

- Step 1. Apply the *Naming Convention* and *Rules* to arrive at the name of the new
 Basic Core Component
- Step 2. Select the appropriate *Core Component Type*. (See Section 6.1.1 for an
- r55 explanation and listing of *Core Component Types*).
- 756 Step 3. Register the new Basic Core Component

757 5.3.4 Preparation for Requesting a New Aggregate Business 758 Information Entity which re-uses an Existing Aggregate Core 759 Component

- As shown in Figure 5-8, there are two steps necessary to prepare for requesting a new
- 761 Aggregate Business Information Entity that re-uses an existing Aggregate Core
- 762 *Component*. These two steps are:

763 Figure 5-8 Preparation Steps for Requesting a New ABIE using Existing ACC

764

Step 1. Apply the *Naming Convention* and *Rules* to arrive at the name of the new
 Aggregate Business Information Entity.

767 Step 2. Register the re-use of the existing *Aggregate Core Component* by this new
 768 *Aggregate Business Information Entity.*

769 **5.4 Harmonisation**

770 771 772 773 774 775	The purpose of harmonisation is to take a set of proposed <i>Core Components</i> or <i>Business Information Entities</i> from different domains, identify differences and similarities between the various submissions, and produce a single, complete cross-domain set. Harmonisation is a critical step in the overall <i>Core Component</i> procedures. The following describes the recommended areas that harmonisation procedures should cover.
776 777 778	• Evaluate each submitted <i>Core Component</i> for consistent application of the Discovery methodology. Resolve any questions or issues by discussion with the submitting groups.
779 780	• Compare the definition and structure of each submitted <i>Core Component</i> with what already exists in the <i>Core Component Library</i> .
781 782 783 784 785 786	- If the submitted <i>Core Component</i> is the same or similar, compare the properties of each to identify any differences. If the submitted <i>Core Component</i> has properties missing in the existing one, enforce a harmonised form that contains the properties of each. If the submitted <i>Core Component</i> is a subset of the existing <i>Core Component</i> definition, then recommend the use of the existing one.
787 788	- If the definition of the <i>Core Component</i> does not match any existing ones, then proceed.
789 790	• Publish the results of harmonisation to the submitting groups for review and finalisation.

791	[Note]
792 793 794 795 796	When submissions are received from different domains simultaneously, they are each processed in their own right against the full cross-domain library. The submissions are not compared against each other before comparison with existing library entries. In other words, all submissions are processed separately and serially against the full cross-domain library.

797 Once the submitted material has passed the harmonisation procedure, it may now be798 submitted for technical assessment and approval.

799 **5.5 Technical Assessment and Approval**

800 Technical assessment must be done in close coordination with the discovery teams

and the harmonisation process in order to minimise domain re-working after technical

802 assessment and harmonisation review. This section, 5.5, defines a recommended

UN/CEFACT Core Components Technical Specification V1.8

- 803 process for conducting technical assessment and approval of all newly submitted and
- 804 changed Core Components. A technical assessment and approval process for Business
- 805 Information Entities should also be developed and applied.
- 806 Technical assessment procedures define the processing that shall be followed by the
- 807 joint development groups, the harmonisation group, submission entry points, the
- technical assessment group, and the secretariat as related to the review of *Core*
- 809 *Components*. The result of this process is the final publication of approved *Core*
- 810 Components.
- 811 These procedures were developed in order to facilitate the process of reviewing and
- approving submissions to the *Core Component* library. In order to minimise the
- 813 requirements for technical assessment and harmonisation, and to expedite the review
- and approval process, *Core Component* development groups should work with the
- technical assessment group, and the harmonisation group during the early
- 816 development stages of component discovery.
- 817 In outline, the procedures cover:
- 818 1) Submission of *Core Component* work that is ready to be reviewed to a designated
 819 secretariat.
- 820 2) Recording of all *Core Component* submissions and distribution to theharmonisation group members.
- 822 3) Review procedures and criteria followed by the harmonisation group.
- 823 4) Return of harmonised *Core Component* submissions for technical assessment.
- 824 5) Review procedures and criteria followed by the technical assessment group.
- 825 6) Registration of the approved *Core Component*(s) in the appropriate *Core*826 *Component Registry*.

827 **5.6 Context in the Discovery Process**

- 828 Information that is needed by a business process is used in a context that is defined by
- how and where the business process can be used. The initial analysis will be
- 830 performed on a set of Business Information Entities, i.e. both Basic and Aggregate
- 831 Business Information Entities, and not on a set of Core Components (See Figure 5-1).
- 832 The analysis that produces *Core Components* is, among other things, a process of
- 833 identifying the various context categories and values, to determine those properties
- that exist in all possible contexts.
- 835 The guidelines presented here facilitate the analysis of *Business Information Entities*
- to determine core business semantics, or provide a mechanism to describe *Business*
- 837 *Information Entities* when they are published in a repository.

- 838 When doing analysis, there is a key question: "Is a particular property of a *Business*
- 839 *Information Entity* derived from its contextual business use, or is it a core property of the component?"
- 841 The answer to this question can be found by looking at as many different instances of
- 842 that *Business Information Entity* as possible. If there is a single semantic property of
- that *Business Information Entity* that is found in every example available for analysis,
- then it can be assumed that the property in question is in fact a core semantic, and is
- not derived from the contextual business use.
- 846 If there are any instances of the *Business Information Entity* in which the property in
- question is not present, then this raises the issue of identity: Is the *Business*
- 848 Information Entity which lacks that property really the same Business Information
- 849 *Entity*, just used in a different context?
- 850 If the answer to this question is *yes*, then that property is not part of the *Core*
- 851 *Component*, but is derived contextually, and the property should be removed from the
- 852 Basic Core Component or Aggregate Core Component being discovered. If the
- answer is *no*, then it is possible that a second, different *Core Component* has been
- 854 discovered.

855 **5.6.1 Context Categories**

856	Context categories are introduced here and are followed by a brief description. After
857	which the various guidelines used to determine context are introduced:

858 859 860 861 862	• Business Process Context: This is the classification of the business process, business collaboration, or business transaction as described in the <i>Catalogue of Common Business Processes</i> . It is the primary context category, and provides many useful distinctions in the analysis of <i>Core Components</i> .
863 864 865	• <i>Product Classification Context:</i> There are many types of information that are specific to products or services being traded or referred to in a business process.
866 867 868	• <i>Industry Classification Context:</i> Traditionally, business vocabularies are divided up into industry verticals. This <i>Context Category</i> specifies a particular industry vertical.
869 870	• <i>Geopolitical Context:</i> Specifies the semantic and structural variation. This is often the result of regional or cultural factors.
871 872	• <i>Official Constraints Context:</i> Specifies the legal or contractual influences upon business semantics.
873 874 875	• Business Process Role Context: Every partner in a business process data exchange has a particular role – buyer, seller, etc. These roles are described in the Catalogue of Common Business Processes and in other

Business Libraries (libraries of business process models). Depending on
the business process, the nature of these roles may require that certain
semantics and data be employed in the messages exchanged. In any *Business Process Role Context*, one must either be a sender or receiver of
data in that particular exchange – otherwise, role is described by the *Supporting Role Context*.

- Supporting Role Context: Parties in a business process who are neither senders nor receivers of data in a particular exchange, may place requirements on the data exchanged by partners who are sending or receiving of data in that exchange. These non-sending, non-receiving parties in this exchange play a supporting role, and are described by the Supporting Role Context.
- System Capabilities Context: When a particular semantic or structure is primarily the result of system constraints, or compliance with a standard, then it is attributable to the System Capabilities Context.

891 **5.6.2** Guidelines for Analyzing Business Information Entities in Context

892 Using the criteria given in section 5.6.1 for determining that a particular property of a 893 Business Information Entity is in fact the product of its use in context, the analyst 894 must ascertain and document the applicable context categories. To accomplish this, 895 the analyst should list all the context categories, and assign a value or values to each 896 category for that component. If a context category has no particular value or values, 897 then the analyst should assign a value of In All Contexts (for all contexts except 898 Official Constraints) or None (for Official Constraints). As this analysis is conducted, 899 different context categories might appear to be in competition for application. The 900 analyst must ascertain which context category is responsible. This section provides 901 some guidelines for answering this question in a systematic and consistent fashion, by 902 examining the typical ambiguities that arise.

- 903 It is possible that a particular property of a *Business Information Entity* may be the 904 result of several context factors. These context factors are identified by analysis of 905 differences and similarities across particular contexts. For example, comparing the 906 same Business Information Entity as used in different regions of the world, variation 907 will probably be the result of a geopolitical context or official constraints context (see 908 below). If a single *Business Information Entity* differs between business processes, 909 then the business process context is probably the cause. For each non-core property of 910 every *Business Information Entity* analysed the relevant influences and hence context 911 factors should be identified.
- 912 The following guidelines apply:
- 913 1) Geopolitical Context versus Official Constraints Context
- 914 If a property can be traced to a specific body of law or international treaty then it is
- 915 the result of an official constraint. For example, if a warning about hazardous

UN/CEFACT Core Components Technical Specification V1.8

- goods is required as part of a goods description, and it is required on all uses of that
 goods description within the United States, then both *Geopolitical* and *Official Constraints* are involved. The value of an *Official Constraint Context* should
 always be the body of law or treaty that is being cited. The value of a *Geopolitical Context* always expresses the region or regions that are relevant.
- 921 2) Product Classification Context versus Industry Classification Context
- When a particular variation on a given product or service is specific to a particular
 industry, then the *Industry Classification Context* is adequate to specify the
 context. If all examples of the particular product or service are described by the
 same unique set of properties across industries, then only a *Product Classification Context* is required. In other cases, a value or values should be supplied for both
 context categories.
- 928 3) Business Process Context versus Business Role Context
- Business Role Context is employed when one actor in the business process has an
 information requirement and the other does not. If both actors have the same
 information requirement, then it is a Business Process Context.
- 932 4) *System Capability Context* categories

This context is the result of system or classes of systems that *primarily* influence
data variation. For example, if a specific Enterprise Resource Planning (ERP)
provider's proprietary data formats use a particular field, and no other applications

use that field, then the presence of the data can be attributed to the processing

- 937 capabilities of that specific system.
- 938 The following detailed example illustrates the process of assigning values for all 939 context categories as part of the *Business Information Entity* analysis process:

940	[Example]
941 942 943 944	Case: A buyer address <i>Business Information Entity</i> is taken from a standard that is used across all industry boundaries and in all processes within the United States. The <i>Business Information Entity</i> also contains a child field that holds the <i>State</i> information.
945 946	The following set of values could be ascribed to this child field for this <i>Business Information Entity</i> :
947	Business Process = In All Contexts
948	Product Classification = In All Context
949	Industry Classification = In All Contexts
950	Geopolitical = United States
951	Official Constraint = None
952	Business Process Role = In All Contexts
953	Supporting Role = In All Contexts
954	System Capabilities = In All Contexts
955	These values were selected based on the following analysis:
956 957 958 959 960	The <i>Business Information Entity</i> construct is the same in every business process covered by the standard in question – the address always contains a <i>State</i> field. Therefore, for the range of business processes covered by the <i>Business Information Entity</i> being analysed, – the <i>Business Process Context</i> category is marked <i>In All Contexts</i> .
961 962 963 964	The products that might be described in the same business message do not affect the address. Since the standard from which the <i>Business Information Entity</i> has been extracted is horizontal across industry boundaries, it is equally valid in all <i>Industry Classification Contexts</i> .
965 966 967	As a child element of <i>Buyer Address</i> , it is clear that the <i>State</i> field is intended to hold a value specific to United States geopolitical demarcations. Therefore the <i>Geopolitical Context Category</i> is properly assigned the value <i>United States</i> .
968 969	No specific law can be cited that requires the presence of the State field in the address. Therefore, a value of <i>None</i> is given to the <i>Official Constraint Context Category</i> .
970 971 972 973 974 975	On inspection of <i>Business Process Role</i> , it appears that all addresses in the standard in question are required to provide the <i>State</i> information, regardless of what role they play in the transaction. The fact that a <i>Buyer Role</i> is being analysed has no effect on this field: all types of addresses have the same semantics. Therefore, all roles provide the data equally when giving an address. A value of <i>In All Contexts</i> is applicable here. The same reasoning holds for the <i>Supporting Role Context</i> .
976 977 978 979 980 981	Finally, considering the <i>System Capabilities Context</i> , there are no specific systems that act as the primary reason for the presence or absence of the semantic. Instead, the primary existence of the field can be ascribed to the fact that in common usage, US addresses include the <i>State</i> field. Therefore, we can provide the value <i>In All Contexts</i> here. Note that as wide of a range of values as possible should be provided to ensure completeness.

- 983 If, in the above example, the address was taken from a French standard, it might be
- that some child elements are common across a number of countries in the same
- 985 region, and perhaps even in multiple regions. Providing the value *France* as a
- 986 *Geopolitical Context* here would be incomplete every known valid value should be
- 987 given.

988 6 Technical Details

- 989 This section provides a detailed technical explanation of the *Core Component*,
- 990 Business Process integration, storage and metamodel elements of the UN/CEFACT
- 991 Core Components concept.

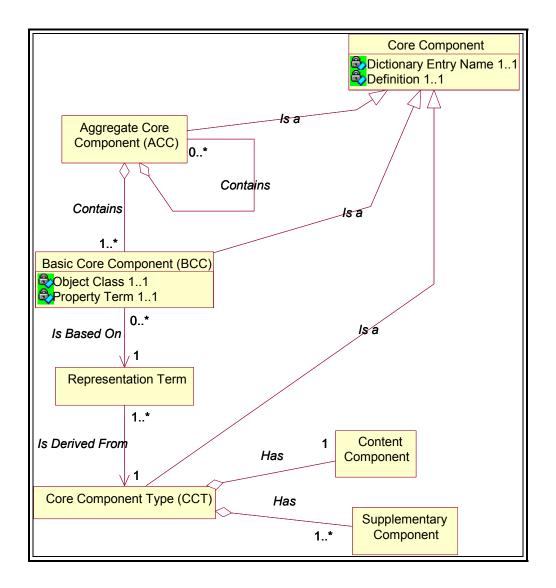

992 6.1 Core Components and Business Information Entities

- 993 This section defines the following:
- 994 Core Component rules
- *995 Naming Conventions*,
- Allowable *Core Component Types*
- 997 Content and Supplementary Component types, and
- 998 *Representation Terms*.
- 999 This section also specifies relationships for *Core Components* and *Business*
- 1000 Information Entities and includes details required for constructing the Core
- 1001 *Components Catalogue* and a larger *Core Component Library*.

1002 6.1.1 Core Components

- 1003 A *Core Component* is a building block for the creation of a semantically correct and
- 1004 meaningful business information exchange 'parcel', containing the information pieces
- needed to describe a specific concept. There are three categories of *Core Components*:
- 1006 Basic Core Component, Core Component Type and Aggregate Core Component.
- 1007 Figure 6-1 illustrates these three categories and their relationships.

1008 Figure 6-1. Core Components Metamodel

- 1009 The following general rules must be followed in discovering and documenting the 1010 three types of *Core Components*:
- 1011[C1]Each Core Component Type, Basic or Aggregate Core Component must have1012its own business semantic definition. The definition shall be developed first1013and the Dictionary Entry Name shall be extracted from it. Remarks can be1014used to further clarify the definition, to provide examples and/or to reference a1015recognised standard.
- 1016[C2]Within an Aggregate Core Component, all embedded entities shall be related1017to the concept of the aggregate.

UN/CEFACT Core Components Technical Specification V1.8

1018	[C3]	There shall be no semantic overlap between the Core Components embedded
1019		within the same Aggregate Core Component.

1020	[C4]	The representation of the information in a Core Component of the Core
1021		Component Type Code should use a standard issued by a recognised standards
1022		body, whenever a standard exists. If international standards are not used a
1023		business driven justification shall be provided.

1024[C5]An Aggregate Core Component must contain at least one Basic Core1025Component.

1026	[Note]
1027 1028 1029 1030 1031	The issue of allowing aggregates without at least one <i>Basic Core Component</i> has been discussed in detail. Modelling has shown that aggregates that contain only other aggregates result in models where the outer bracket has no meaning on its own. The aggregated aggregates in their basic form provide the same benefits as using the basic aggregates on their own.
1032	
1033	[Note]
1034 1035 1036 1037	For the purpose of exchanging information a practical compromise on the level of detail of a <i>Basic Core Component</i> is required. This compromise shall be based on the business need. It is not necessary to have absolute detail, which decomposes a piece of information down to its lowest level.
1038 1039	[C6] The Core Component Type shall be one of the approved Core Component Types
1040	[Note]
1041 1042 1043	Table 8-1 provides a complete list of the currently approved <i>Core Component Types</i> . This Table will subsequently be published separately to facilitate maintenance outside the body of this specification.
1044	[C7] The <i>Content Component</i> shall be one of the approved <i>Content Components</i>

1045[C8]The Supplementary Component shall be one of the approved Supplementary
Components

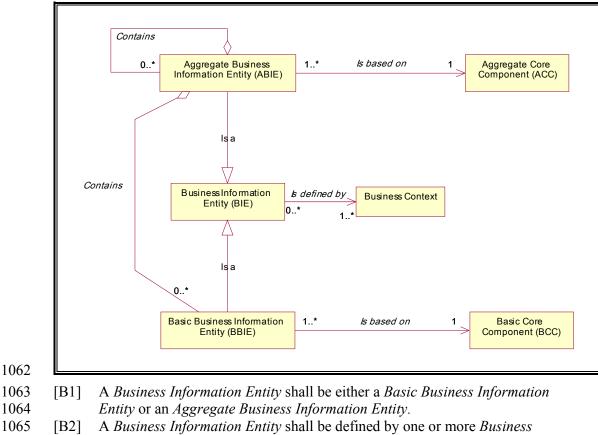

1047	[Note]
1048 1049 1050	Table 8-2 provides a complete list of the currently approved <i>Content Components</i> and <i>Supplementary Components</i> . This Table will subsequently be published separately to facilitate maintenance outside the body of this specification.

1051

1052 6.1.2 Business Information Entities

1053 A Business Information Entity is a piece of business data or a group of pieces of 1054 business data with a unique business semantic definition. A Business Information 1055 Entity can be either a Basic Business Information Entity (BBIE) or an Aggregate 1056 Business Information Entity (ABIE). A Basic Business Information Entity is based on a Basic Core Component (BCC). An Aggregate Business Information Entity is a re-1057 1058 use of an Aggregate Core Component (ACC) in a specified business context. Figure 1059 6-2 describes the Business Information Entity types and shows relationships to the 1060 Core Component counterparts.

1061 Figure 6-2. Business Information Entities Basic Definition Model

1066 *Contexts.*

- 1067 [B3] A Basic Business Information Entity shall be based on a Basic Core
- 1068 *Component*.

- 1069[B4]An Aggregate Business Information Entity shall be based on an Aggregate1070Core Component.
- 1071 [B5] An Aggregate Business Information Entity shall consist of two or more Basic
 1072 Business Information Entities and/or Aggregate Business Information Entities.

1073 6.1.3 Naming Convention

A naming convention is necessary to gain consistency in the naming and defining of
all *Core Components* and *Business Information Entities*. The resulting consistency
facilitates comparison during the discovery and analysis process, and precludes
ambiguity, such as the creation of multiple *Core Components* with different names
that have the same semantic meaning.

1079 The *Naming Convention* is derived from the guidelines and principles described in

1080 document ISO 11179 Part 5 -- Naming and Identification Principles For Data

1081 *Elements*. In certain instances, these guidelines have been adapted to the *Core*

1082 Component environment. In particular, the guidelines have been extended to cover the

1083 naming and defining of *Core Component Types* and *Business Information Entities*.

1084 In order to ensure absolute clarity and understanding of the names and definitions it is

1085 essential to use words from the *Oxford English Dictionary*. A supplementary

1086 Controlled Vocabulary will be developed to define uniquely any words that are

1087 potentially ambiguous. This will ensure that each word within any of the names and

1088 definitions is used in a consistent and unambiguous way. The resultant semantic

1089 integrity will also mean that translation into other languages retains the precise

- 1090 original meaning.
- 1091 6.1.3.1 Core Component Naming Rules
- 1092 The following subsections contain all *Core Component* naming rules.
- 1093 6.1.3.1.1 Core Component Dictionary Information
- 1094 Each *Core Component* contains the following dictionary information that is impacted 1095 by the naming rules in subsequent sub-sections:
- Dictionary Entry Name (Mandatory). This is the unique official name of the Core Component in the dictionary.
- *Definition* (Mandatory). This is the unique semantic business meaning of that *Core Component*.
- Business Term (Optional). This is a synonym term under which the Core
 Component is commonly known and used in the business. A Core
 Component may have several business terms or synonyms.

1102	
1103	[Example]
1104	Dictionary Entry Name – Person. Tax. Identifier
1105	Definition – The registered national tax identification of a person
1106 1107	Business Term – Income tax number, national register number, personal tax register number, social security number, national insurance number
1108	The naming rules are also based on the following concepts as defined in ISO 11179:
1109 1110 1111 1112	• <i>Object Class</i> . This represents the logical data grouping or aggregation (in a logical data model) to which a data element belongs. The <i>Object Class</i> thus is the part of a <i>Core Component's Dictionary Entry Name</i> that represents an activity or object in a specific context.
1113 1114 1115	• <i>Property Term</i> . This represents the distinguishing characteristic or property of the dominant area of interest and shall occur naturally in the definition.
1116 1117	• <i>Representation Term</i> . This defines the type of valid values for an information entity.
1118	6.1.3.1.2 Core Component General Rules
1119	[C9] The dictionary content shall be in <i>English Language</i> following the
1120 1121	primary <i>Oxford Dictionary</i> English spellings to assure unambiguous spelling.
1121	spelling.
 1121 1122 1123 1124 1125 	[Note] There may be restrictions in specific languages, which need to be applied when transforming the <i>Core Component</i> dictionary into other languages. These restrictions shall be formulated as additional rules and added as separate language specific
 1121 1122 1123 1124 1125 1126 	[Note] There may be restrictions in specific languages, which need to be applied when transforming the <i>Core Component</i> dictionary into other languages. These restrictions shall be formulated as additional rules and added as separate language specific annexes to this document.

1134 1135		terms are possible, the definition shall use the preferred term as identified in the ebXML Core Components Glossary of Terms.
1136 1137 1138	[C12]	The definition of a <i>Basic Core Component</i> shall use a structure that is based on the existence of the <i>Object Class</i> , the <i>Property Term</i> , and its <i>Representation Term</i> .
1139 1140 1141	[C13]	Whenever both the definite (i.e. <i>the</i>) and indefinite article (i.e. a) are possible in a definition, preference shall be given to the indefinite article (i.e. a).
1142	[Note]	
1143 1144 1145		eck the quality of the definition, place the <i>Dictionary Entry Name</i> followed by <i>is</i> the definition to ensure that it is not simply a repetition of the <i>Dictionary Entry</i>
1146	6.1.3.	1.4 Core Component Rules for Dictionary Entry Names
1147	[C14]	The Dictionary Entry Name shall be unique.
1148 1149	[C15]	The <i>Dictionary Entry Name</i> shall be extracted from the <i>Core Component</i> definition.
1150 1151	[C16]	The <i>Dictionary Entry Name</i> shall be concise and shall not contain consecutive redundant words.
1152 1153	[C17]	The <i>Dictionary Entry Name</i> and all its components shall be in singular form unless the concept itself is plural.
1154	[Exam	ple]
1155 1156		ngular <i>Good</i> does not exist, whereas <i>Goods</i> is a plural noun whose concept es one or multiple (plural) items
1157 1158	[C18]	The <i>Dictionary Entry Name</i> shall not use non-letter characters unless required by language rules.
1159 1160 1161	[C19]	The <i>Dictionary Entry Name</i> shall only contain verbs, nouns and adjectives (i.e. no words like <i>and</i> , <i>of</i> , <i>the</i> , etc.). This rule shall be applied to the English language, and may be applied to other languages as appropriate.
1162 1163	[C20]	Abbreviations and acronyms that are part of the <i>Dictionary Entry Name</i> shall be expanded or explained in the definition.
	UN/CI	EFACT Core Components Technical Specification V1.8 Page 43 of 97

1164	[C21]	The Dictionary Entry Name of a Basic Core Component shall consist of the
1165		name of an <i>Object Class</i> , the name of a <i>Property Term</i> and the name of a
1166		Representation Term.

1167	[Example]
1168	Tax. Description. Text
1169 1170 1171 1172 1173	[C22] The components of a Dictionary Entry Name shall be separated by dots. The space character shall separate words in multi-word Object Classes and/or multiword Property Terms. Every word shall start with a capital letter. To allow spell checking of the Directory Entry Names' words, the dots after Object Class and Property Terms shall be followed by a space character.
1174	[Note]
1175 1176	The use of CamelCase for <i>Dictionary Entry Names</i> has been considered, but has been rejected for following reasons:
1177	◆ Use of CamelCase will not allow the use of spell checkers
1178 1179 1180	• Strict use of CamelCase makes it impossible to use separators (".") and therefore doesn't allow an unambiguous identification of the composing parts of the <i>Dictionary Entry Name</i> .
1181 1182	[C23] The name of an <i>Object Class</i> shall be unique throughout the dictionary and may consist of more than one word.
1183 1184 1185 1186	[C24] The name of a <i>Property Term</i> shall occur naturally in the definition and may consist of more than one word. A name of a <i>Property Term</i> shall be unique within the context of an <i>Object Class</i> but may be reused across different <i>Object Classes</i> .
1187	[Example]
1188	Car. Colour. Code and Shirt. Colour. Code may both exist.
1189 1190 1191 1192	[C25] If the name of the Property Term uses the same word as the Representation Term (or an equivalent word), this Property Term shall be removed from Dictionary Entry Name. The Representation Term word in this case only will remain.

1193	[Example]
1194 1195 1196 1197	If the Object Class is Goods, the Property Term is Delivery Date, and Representation Term is Date, the Dictionary Entry Name is Goods. Delivery. Date; the Dictionary Entry Name for an identifier of a party (Party. Identification. Identifier) will be truncated to Party. Identifier.
1198 1199 1200	[C26] The name of the <i>Representation Term</i> shall be one of the terms specified in the <i>List of Representation Terms</i> as included in this document (See section 6.1.3.3).
1201 1202	[C27] The name of the <i>Representation Term</i> shall not be truncated in the <i>Dictionary Entry Name</i> .
1203 1204	[C28] The <i>Dictionary Entry Name</i> of a <i>Core Component Type</i> shall consist of a meaningful type name followed by a dot, a space character, and the term <i>Type</i> .
1205	[Example]
1206	Amount. Type; Date Time. Type
1207 1208 1209	[C29] The Dictionary Entry Name of an Aggregate Core Component shall consist of a meaningful Object Class followed by a dot, a space character, and the term Details. The Object Class may consist of more than one word.
1210	[Example]
1211	Postal Address. Details; Party. Details
1212	6.1.3.1.5 Rules for Core Component Business Terms
1213 1214 1215 1216	<i>Core Component Business Terms</i> are those terms that are commonly used for day-to- day information exchanges within a given domain. As such, no specific naming rules apply to <i>Business Terms</i> . Interoperability of <i>Business Terms</i> will be given by linking them to <i>Core Component</i> dictionary entries.
1217	6.1.3.2 Rules for Business Information Entities
1218	The following subsections contain the naming rules for Business Information Entities.
1219	6.1.3.2.1 Business Information Entity Dictionary Information
1220	Each Business Information Entity contains the following dictionary information that is

1221 impacted by the naming rules:

UN/CEFACT Core Components Technical Specification V1.8

1222 1223	• Dictionary Entry Name (Man the Business Information Entry	ndatory). This is the unique official name of <i>ity</i> in the dictionary.
1224 1225	• Definition (Mandatory). This that Business Information End	is the unique semantic business meaning of <i>ity</i> .
1226 1227		nis is a synonym term under which the s commonly known and used in the business
1228 1229		iness Information Entity may have several
1230 1231	The <i>Business Information Entity</i> naming concepts as defined in ISO 11179:	rules are also based on the following
1232 1233 1234 1235	logical data model) to which	the logical data grouping or aggregation (in a a data element belongs. The <i>Object Class</i> Information Entity's Dictionary Entry Name object in a specific context.
1236 1237 1238		ts the distinguishing characteristic or of interest and shall occur naturally in the
1239 1240	• <i>Representation Term</i> . This durinformation entity.	efines the type of valid values for an
1241 1242 1243 1244	Business Information Entity f	ords which help define and differentiate a rom its associated core component and other . <i>Qualifier Terms</i> may be derived from ntext.
1245	6.1.3.2.2 Business Information Entity	General Rules
1246 1247		English Language following the primary ngs to assure unambiguous spelling.
1248	6.1.3.2.3 Business Information Entity	Rules for Definitions
1249		with the requirements of ISO 11179-4
1250 1251	translatable to other languages.	nderstandable meaning, which should also be
1252		bunt the fact that the users of the <i>Business</i>
1253 1254		e not necessarily native English speakers. It ences, using normal words. Wherever
1255	synonym terms are possible, the	lefinition shall use the preferred term as
1256	identified in the Business Informa	ttion Entity Glossary of Terms.

1257 1258 1259	[B9]	The definition of a <i>Basic Business Information Entity</i> shall use a structure that is based on the existence of the <i>Object Class</i> , the <i>Property Term</i> , and its <i>Representation Term</i> , and enhanced by business related <i>Qualifier Terms</i> .
1260 1261 1262	[B10]	Whenever both the definite (i.e. <i>the</i>) and indefinite article (i.e. a) are possible in a definition, preference shall be given to the indefinite article (i.e. a).
1263	6.1.3.2	2.4 Rules for Business Information Entity Dictionary Entry Names
1264	[B11]	The Dictionary Entry Name shall be unique.
1265 1266	[B12]	The <i>Dictionary Entry Name</i> shall be extracted from the <i>Business Information Entity</i> definition.
1267 1268	[B13]	The <i>Dictionary Entry Name</i> shall be concise and shall not contain consecutive redundant words.
1269 1270	[B14]	The <i>Dictionary Entry Name</i> and all its components shall be in singular form unless the concept itself is plural.
1271 1272	[B15]	The <i>Dictionary Entry Name</i> shall not use non-letter characters unless required by language rules.
1273 1274 1275	[B16]	The <i>Dictionary Entry Name</i> shall only contain verbs, nouns and adjectives (i.e. no words like <i>and, of, the</i> , etc.). This rule shall be applied to the English language, and may be applied to other languages as appropriate.
1276 1277	[B17]	Abbreviations and acronyms that are part of the <i>Dictionary Entry Name</i> shall be expanded or explained in the definition.
1278 1279 1280	[B18]	The Dictionary Entry Name of a Basic Business Information Entity shall consist of the names of the Object Class, Property Term, and Representation Term of its associated Core Component, and additional Qualifier Term(s).
1281	[B19]	Qualifier Terms shall be applied to the Object Class and/or the Property Term.
1282	[B20]	Qualifier Terms shall not be applied to the Representation Term.
1283 1284 1285 1286 1287 1288 1289	[B21]	The components of a <i>Dictionary Entry Name</i> shall be separated by dots. The space character shall separate words in multi-word <i>Object Classes</i> and/or multiword <i>Property Terms</i> , including their <i>Qualifier Terms</i> . Every word shall start with a capital letter. <i>Qualifier Terms</i> shall not be separated from their associated <i>Object Class</i> or <i>Property Term</i> . To allow spell checking of the words in the <i>Dictionary Entry Name</i> , a space character shall follow the dots after <i>Object Class</i> and <i>Property Term(s)</i> .

1290	[B22] Qualifier Terms shall precede the associated Object Class or Property Term.
1291	The order of qualifiers shall not be used to differentiate Dictionary Entry
1292	Names.

1293	[Example]		
1294 1295 1296	In the Business Information Entity entitled Cost. Budget Period Total. Amount, the component Budget Period is a Qualifier Term for the Property Term of Total. This is derived from the Core Component of Cost. Total. Amount.		
1297 1298 1299		The name of a qualified <i>Object Class</i> refers to an activity or object within a <i>Business Context</i> . It shall be unique throughout the dictionary and may consist of more than one word.	
1300 1301 1302		If the name of the <i>Property Term</i> uses the same word as the <i>Representation Term</i> (or an equivalent word), and the Property Term is not qualified, the <i>Property Term</i> shall be removed from <i>Dictionary Entry Name</i> .	
1303 1304 1305 1306		The Dictionary Entry Name of an Aggregate Business Information Entity shall consist of the name of the Object Class of its associated Aggregate Core Component and additional Qualifier Term(s) to represent its specific Business Context, followed by a dot, a space character, and the term Details.	
1307	6.1.3.2	2.5 Rules for Business Information Entity Business Terms	
1308 1309 1310 1311	for day naming	<i>Information Entity Business Terms</i> are those terms that are commonly used -to-day information exchanges within a given domain. As such, no specific grules apply to <i>Business Terms</i> . Interoperability of <i>Business Terms</i> will be by linking them to the <i>Business Information Entity</i> dictionary entries.	
1312	6.1.3.3	B List of Representation Terms	
1313 1314 1315 1316 1317 1318	form of instanc [Name]	<i>presentation Term</i> is the part of a <i>Core Component</i> name that describes the f valid values in which the business information is expressed in a data item. For e all basic <i>Core Components</i> representing a monetary amount shall be named <i>J. Amount</i> where <i>[Name]</i> represents a specialisation of the generic amount and <i>t</i> is the <i>Representation Term</i> . Table 6-1 lists the permissible <i>Representation</i>	
1319	[C30]	The Representation Term shall be one out of the list of permissible	

1319[C30]The Representation Te1320Representation Terms

1321 Table 6-1 Permissible Representation Terms

Representation Term	Definition	Links to Core Component Type		
Amount	A number of monetary units specified in a currency where the unit of currency is explicit or implied.	Amount. Type		
Code	ode A character string (letters, figures or symbols) that for brevity and / or language independence may be used to represent or replace a definitive value or text of an attribute. Codes usually are maintained in code lists per attribute type (e.g. colour).			
Date	A day within a particular calendar year (ISO 8601).	Date Time. Type		
Date Time	A particular point in the progression of time (ISO 8601).	Date Time. Type		
Graphic	A diagram, graph, mathematical curves, or similar representation	Graphic. Type		
Identifier	A character string used to establish the identity of, and distinguish uniquely, one instance of an object within an identification scheme from all other objects within the same scheme.			
	[Note: Type shall not be used when a person or an object is identified by its name. In this case the <i>Representation Term</i> "Name" shall be used.]			
Indicator	A list of two, and only two, values that indicate a condition such as on/off; true/false etc. (synonym: "Boolean").	Indicator. Type		
Measure	A numeric value determined by measuring an object. Measures are specified with a unit of measure. The applicable unit of measure is taken from UN/ECE Rec. 20.	Measure. Type		
Name	A word or phrase that constitutes the distinctive designation of a person, place, thing or concept.	Text. Type		
		Numeric. Type		
Picture A visual representation of a person, object, or Picture scene		Picture. Type		
Quantity	A number of non-monetary units. It is associated with the indication of objects. Quantities need to be specified with a unit of quantity.	Quantity. Type		
Rate	A quantity or amount measured with respect to another measured quantity or amount, or a fixed	Numeric. Type		

Representation Term		Links to Core Component Type
	or appropriate charge, cost or value e.g. US Dollars per hour, US Dollars per Euro, kilometre per litre, etc.	
Text	A character string generally in the form of words of a language.	Text. Type
Time	The time within a (not specified) day (ISO 8601).	Date Time. Type
Value	Numeric information that is assigned or is determined by calculation, counting or sequencing. It does not require a unit of quantity or a unit of measure	Numeric. Type

1322 In addition to permissible representation terms for *Core Components*, there are also

- 1323 permissible representation terms for Aggregate Core Components and Core
- 1324 *Component Types*. Table 6-2 contains the permissible representation terms that apply
- 1325 to Aggregate Core Components or Core Component Types.

1000	[021]	
1326	C31	The Representation Term for Aggregate Core Components or Core

- 1327 *Component Types* shall be one of the list of permissible *Aggregate Core*
- 1328 *components* or *Core Component Type Representation Terms*

1329 Table 6-2 Permissible Representation Terms for Aggregate Core Components or 1330 Core Component Types

Representation Term	Definition	Links to Core Component Type
Details	The expression of the aggregation of <i>Core</i> <i>Components</i> to indicate higher levelled information entities	Not Applicable
Туре	The expression of the aggregation of <i>Core</i> <i>Components</i> to indicate the aggregation of lower levelled information entities to become <i>Core</i> <i>Component Types</i> . All <i>Core Component Types</i> shall use this <i>Representation Term</i>	Not Applicable
Content	The actual content of an information entity. <i>Content</i> is the first information entity in a <i>Core</i> <i>Component Type</i>	Used with the Content Components of Core Component Types

1331 **6.1.4 Catalogue of Core Components**

- 1332 As originally articulated in the ebXML architecture concept and perpetuated in the
- 1333 developing UN/CEFACT architecture concept, all Core Components will be recorded
- in an ebXML compliant registry and stored in a related repository. However, small

- and medium enterprise (SME) organisations may not be able to readily access such
- 1336 architecture. As such, it is important that the full range of UN/CEFACT Core
- 1337 *Components* be published in a freely available catalogue. This catalogue must convey
- 1338 the full details of each *Core Component* consistent with how those components are
- 1339 stored as UML objects in the repository. Table 6-3 identifies a proper format for the
- 1340 catalogue and contains representative entries from the existing UN/CEFACT Core
- 1341 Components Catalogue.

UID	Dictionary Entry Name	CCT Used	Basic or Aggregate	Definition	Remarks	Object Class	Property Term	Representation Term	Business Terms	<i>Core</i> <i>Component</i> Children
000024	Address. Type. Code	Code. Type	Basic	The type of the address.	For example a business address or a home address. Not the Role of the address.	Address	Туре	Code		
000147	Base Charge Price. Quantity	Quantity. Type	Basic	The base quantity of the charge/price unit amount.	For example, for a charge of \$5/day for 10 days, the charge base quantity is 1 day.	Base Charge Price	Quantity*	Quantity		
000139	Base. Currency. Code	Code. Type	Basic	The currency that is on the 'one unit' side of the rate of exchange.	The base currency amount divided by the currency exchange rate gives the second currency amount.	Base	Currency	Code		
000012	Birth. Date	Date Time. Type	Basic	The date on which a person was born.	Applies only to parties being natural persons.	Birth	Date*	Date		

1342 Table 6-3. Core Component Catalogue

1343 The catalogue is intended to be part of a larger *Core Component Library*. The *Core*

1344 *Component Library* will consist of the following parts:

• Core Component Types

- 1346 • Core Component Catalogue, including Basic Core Components, Basic 1347 Business Information Entities, and Aggregate Core Components
- 1348 • Catalogue of Aggregate Business Information Entities

1349 6.1.5 Catalogue of Business Information Entities

- 1350 For the same reasons that a *Core Components Catalogue* is necessary, a *Catalogue of*
- 1351 Business Information Entities is also required. Predefined BIEs are not provided.
- 1352 Rather, the working registries and the groups defining business messages will be

1353 responsible for developing a Catalogue of Business Information Entities.

6.2 Context 1354

1355 This section fully describes applicable rules and applications for the use of context in

1356 Core Component discovery, analysis, and use to include context categories and their

1357 values, and the Constraint Language.

1358 6.2.1 Overview of Context Specification

1359 Whenever business collaboration takes place between specific trading partners, data is 1360 exchanged in the form of business messages. That data exists in a particular business

1361

context. In its simplest form, this is the idea of *context* as used in ebXML. The context 1362 in which the business collaboration takes place can be specified by a set of categories

1363 and their associated values.

1364 The Core Components have no context independent of their use. The Context

1365 mechanism provides a full semantic qualification for the *Core Component* used in a

1366 business process. Figure 6-3 shows how the constraint language applies Business

1367 Context categories and specific business context(s) to Core Components to create

1368 Business Information Entities. The Business Information Entity resulting from this

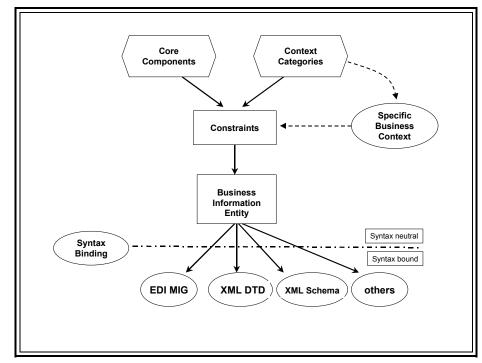

1369 process can be manifested as a model, which in turn can be used as the basis of a

1370 syntax-bound business message description (an EDI message implementation guide,

1371 an XML schema, etc.)

1372 The following sections address the context categories, and the constraint language

1373 more closely.

1374 Figure 6-3. Operation of The Context Mechanism

1376 6.2.1.1 Context Categories

1377 *Context Categories* exist to allow users to uniquely identify and distinguish between

1378 different business contexts. Eight context categories have been identified (Table 6-4).

1379 Each of the identified categories, unless otherwise stated, uses a standard

1380 classification to provide values for the category. Constraint rules, and therefore

1381 Business Information Entities, are tied to a particular set of standard classifications for

1382 identifying and distinguishing contexts.

1383 6.2.1.2 Constraint Language

A Constraint Language is used to express the relationship between specific Business
 Contexts and how semantics are applied to the Core Components to produce Business

- 1386 *Information Entities*. The scope of this language covers two functional parts:
- Assembly of a large aggregate (the Document);

Refinement of the assembly as appropriate. Refinement is both the addition of semantics specific to the business process, and the restriction and extension of the semantic model.

- 1391 This separation is a convenience for implementation (it simplifies the creation of
- 1392 processing tools) and creation of *standard* assemblies that can then be refined by
- 1393 specific users (a process that resembles how EDI standards and message
- 1394 implementation guides function today).

1395 Both *Constraint Language* parts allow, for example, simple commands indicating

- 1396 how Core Components will be used, how they will be named for these specific uses,
- and how to refine the cardinality (if necessary). Further, conditional relationships can
- 1398 be expressed. Specific context values or sets of values can be tied to the actions
- 1399 performed on Core Components to produce Business Information Entities.

1400	[Example]
1401 1402 1403 1404	If the <i>Geopolitical Process Context</i> has a value of <i>Anywhere in the European Union</i> , and the specific <i>Business Context Value</i> indicates that the business process occurs in France, then the context-appropriate <i>Business Information Entity</i> can be assembled by modifying the correct <i>Core Component</i> .
1405 1406 1407 1408 1409	The constraint language would say—If the <i>Geopolitical Process Context</i> equals the <i>European Union</i> , then take the core <i>NameAddress</i> component and rules to provide the correct names, cardinality, and arrangement to the fields. To do business in France, the specific context value for that process will trigger this rule, giving a set of appropriate business semantics (<i>Business Information Entities</i>).

1410 6.2.1.3 Syntax Binding

1411 The Business Information Entity is a model that has no relationship to a specific

1412 syntax. It is intended that any given *Business Information Entity* can be expressed in

any number of syntaxes. This process is called *syntax binding*, and is independent of

(has no relationship to) a specific syntax. It may be possible to express *syntax binding*in an algorithm.

- 1416 The Business Information Entity in its standard form is a model that has no specific
- 1417 relationship to any given syntax. A given *Business Information Entity* can
- subsequently be expressed in any of a number of syntaxes through a binding process.
- 1419 The Syntax Binding process does not alter the semantics of the Business Information
- 1420 Entity, but simply instantiates the Business Information Entity for use in syntax
- 1421 specific documents.
- [B26] Syntax binding shall not change the semantics of a Business InformationEntity.

1424 6.2.2 Approved Context Categories

- 1425 Table 6-4 contains the eight approved *Context Categories*.
- 1426[C32]When describing a specific Business Context, a set of values will be assigned1427to the business situation being formally described.
- 1428 [C33] Applied *Business Context* will be from the list of approved context categories.

Context Category	Description
Business Process	The business process as described using
	the ebXML Catalogue of Common
	Business Processes as extended by the
	user.
Product Classification	Factors influencing semantics that are the
	result of the goods or services being
	exchanged, handled, or paid for, etc. (e.g.
	the buying of consulting services as
	opposed to materials)
Industry Classification	Semantic influences related to the
	industry or industries of the trading
	partners (e.g., product identification
	schemes used in different industries).
Geopolitical	Geographical factors that influence
	business semantics (e.g., the structure of
	an address).
Official Constraints	Legal and governmental influences on
	semantics (e.g. hazardous materials
	information required by law when
	shipping goods).
Business Process Role	The actors conducting a particular
	business process, as identified in the
	Catalogue of Common Business
	Processes.
Supporting Role	Semantic influences related to non-
	partner roles (e.g., data required by a
	third-party shipper in an order response
	going from seller to buyer.)
System Capabilities	This context category exists to capture
	the limitations of systems (e.g. an
	existing back office can only support an
	address in a certain form).

1429 Table 6-4. Approved Context Categories

1430 6.2.2.1 Business Process Context

In describing a business situation, generally the most important aspect of that situation
is the business activity being conducted. *Business Process Context* provides a way to
unambiguously identify the business activity. To ensure consistency with business
process activities, it is important to use a common point of reference. The definitive
point of reference for international standards is the UN/CEFACT *Catalogue of Common Business Processes*.

[C34] Assigned *Business Process Contexts* shall be from the standard hierarchical classification: provided as part of the UN/CEFACT *Catalogue of Common Business Processes*.

1440 1441 1442	[C35]	<i>Business Process Context</i> values may be expressed as a single business process at any level, or may be expressed as a set of business processes at any level.
1//3	[C36]	Business Process Context values may be taken from extensions to the husiness

1443[C36] Business Process Context values may be taken from extensions to the business1444processes described in the Catalogue of Common Business Processes as1445provided for in that document.

[C37] When business process extensions are used, they shall include full information
for each value sufficient to unambiguously identify which extension is
providing the value used.

1449 6.2.2.2 Product Classification Context

1450 The *Product Classification Context* describes those aspects of a business situation 1451 related to the goods or services being exchanged by, or otherwise manipulated, or 1452 concerned, in the business process. Recognised code lists exist that provide 1453 authoritative sources of product classification contexts.

- [C38] A single value or set of values may be used in a *Product Classification Context.*
- [C39] If a hierarchical system of values is used for *Product Classification Context*,
 then these values may be at any level of the hierarchy.
- 1458[C40]If more than one classification system is being employed, an additional value1459specifying which classification scheme has supplied the values used shall be
conveyed.
- 1461[C41]Product classification context code values shall be taken from recognised code1462lists to include:
- Universal Standard Product and Service Specification (UNSPSC)
- 1464- Custodian: Electronic Commerce Code Management Association1465(ECCMA)
- Standard International Trade Classification (SITC Rev .3)
- Custodian: United Nations Statistics Division (UNSD)
- Harmonised Commodity Description and Coding System (HS)
- Custodian: World Trade Organization (WTO)
- Classification Of the purposes of non Profit Institutions serving households (COPI)

1472	- Custodian: UNSD (This provides a mapping between the first three.)
1473	6.2.2.3 Industry Classification Context
1474 1475	The <i>Industry Classification Context</i> provides a description of the industry or sub- industry in which the business process takes place.
1476 1477	[C42] An <i>Industry Classification Context</i> may contain a single value or set of values at any appropriate level of the value hierarchy.
1478	[C43] The <i>Industry Classification Context</i> value hierarchy must be identified.
1479 1480	[C44] <i>Industry Classification Context</i> code values shall be taken from recognised code lists to include:
1481	• International Standard Industrial Classification (ISIC)
1482	- Custodian: UNSD
1483 1484	• Universal Standard Product and Service Specification (UNSPSC) Top- level Segment [digits 1 and 2] used to define industry.
1485	- Custodian: ECCMA
1486	[Note]
1487 1488	There are many other industry classification schemes that may be used for <i>Industry Classification Context</i> .

1489 6.2.2.4 Geopolitical Context

1490	Geopolitical Contexts allow description of those aspects of the business context that
1491	are related to region, nationality, or geographically based cultural factors.

- 1492[C45]Geopolitical Context shall consist of appropriate continent, economic region,1493country, and region identifiers.
- 1494[C46]Geopolitical Regional Classification may associate one or more values with1495any business message or component.

1496 1497	[C47] <i>Geopolitical Regional Classification</i> shall employ the following hierarchical structure:
1498 1499 1500 1501 1502	Global [Continent] [Economic Region] [Country] - ISO 3166.1 [Region] - ISO 3166.2
1503 1504	[C48] At any level of the <i>Geopolitical Regional Classification</i> hierarchy, a value may be a single value, a named aggregate, or cross-border value.
1505 1506	[C49] <i>Geopolitical Regional Classification</i> hierarchy values shall structured as follows:
1507 1508	• Single Value: A single value indicating a single continent, economic region, country, or region, depending on position within the hierarchy.
1509 1510 1511 1512	• Named Aggregate: A related group of values (which may themselves be single values, named aggregates, or cross-border pairs of values), which have been related and assigned a name. A named aggregate contains at least two values.
1513 1514 1515	• Cross-Border: One or more pairs of values, designated <i>To</i> , <i>From</i> , or <i>Bi-directional</i> , indicating the direction of cross-border context. Values may be named aggregates or single values.
1516	[Example]
1517 1518 1519	The following example shows an extract of the basic, single-value hierarchy of recommended values, based on the common ISO 3166.1 <i>Country Codes</i> . (The value at the top of any hierarchy is always understood to be <i>Global</i> .)
1520	Europe
1521	Eastern Europe
1522	AL – ALBANIA
1523	AM – ARMENIA
1524 1525	[C50] Points in the <i>Geopolitical Regional Classification</i> hierarchy shall be specified by the use of the node value, or by the full or partial path.
1526 1527	[C51] The full path of the <i>Geopolitical Regional Classification</i> hierarchy must be used to understand the hierarchy when complex constructs are employed.

1528[C52]A single-point specification is understood to inherit all of the properties of the1529single-value hierarchy except where otherwise specified.

1530 [C53] Geopolitical Values will be taken from ISO 3166.1 and 3166.2 **Official Constraints Context** 1531 6.2.2.5 1532 The Official Constraints Context category describes those aspects of the business 1533 situation that result from legal or regulatory requirements and similar official 1534 categories. This category contains two distinct parts: 1535 • Regulatory and Legislative. These are normally unilateral in nature and 1536 include such things as customs. 1537 Conventions and Treaties. These are normally bi- or multilateral • 1538 agreements and as such are different from regulatory and legislative 1539 constraints. 1540 [C54] The Official Constraints Context will consist of at least two values: Identification of the legal or other classification used to identify the 1541 • 1542 context values Identification of the official constraint itself. These values may represent a 1543 • 1544 hierarchical structure depending on the official constraints system being 1545 referenced. 1546 Because there is no known global classification of all Official Constraints Contexts as 1547 used here, any implementation must provide a set of recognised official constraints 1548 classifications for use within the appropriate Core Components Registry 1549 implementation. 1550 [C55] Individual Core Component implementations shall register used official 1551 constraint classification schemes with the appropriate supporting *Core* 1552 Components Registry implementation. 1553 6.2.2.6 **Business Process Role Context** 1554 The Business Process Role Context describes those aspects of a business situation that 1555 are specific to an actor or actors within the business process. Its values are taken from 1556 the set of *Role* values provided by the *Catalogue of Common Business Processes*. A 1557 Business Process Role Context is specified by using a value or set of values from this 1558 source. 1559 [C56] Business Process Role Context values shall be taken from an approved list 1560 provided by the business process model library being employed. 1561 [C57] The UN/CEFACT Catalogue of Common Business Processes shall be the 1562 definitive source of Business Process Role Context values for all 1563 UN/CEFACT Business Information Entities.

1564 6.2.2.7 Supporting Role Context

1565 The Supporting Role Context identifies those parties that are not active participants in

- 1566 the business process being conducted but who are interested in it. A *Supporting Role*
- 1567 *Context* is specified with a value or set of values from a standard classification.
- [C58] Supporting Role Context values shall be taken from the UN/EDIFACT Code
 List for DE 3035 Party Roles.

1570	[Note]
1571 1572 1573	Users are cautioned that duplication exists in the current version of the required code list. UN/CEFACT will review this code list to clarify duplicates and identify non- <i>Supporting Role Context</i> values.

1574 6.2.2.8 System Capabilities Context

1575 This category identifies a system, a class of systems or standard in the business

1576 situation. The *System Capabilities Context* requires a least one pair of values: an

1577 identification of the classification scheme being used and a value from that scheme. A

1578 valid System Capabilities Context may include more than one such pair of values.

[C59] Systems Capabilities Context values shall consist of pairs of values. Each pair
 shall be comprised of an identification of the referenced classification scheme
 and the value(s) being employed.

1582	[Note]
1583 1584 1585 1586	There is no known classification of all types of information systems and standards. It is recommended that a mechanism for the registration of system and standard names be provided by the ebXML registry, as valid values for the <i>System Capabilities Context</i> .

1587 **6.2.3 Context Values**

1588 A specific business context is formally described using a set of context values. Every 1589 context category must have a valid value, even if this value is *In All Contexts* or *None*.

- 1590 The value *None* is appropriate for *Official Constraints Context* because there will be
- 1591 instances where there are no official constraints.
- 1592[C60]The In All Contexts value shall be a valid value for every context category1593except for Official Constraints Context.
- 1594 [C61] The value *None* shall be a valid value for *Official Constraints Context*.

1595 6.2.4 Core Components Context Constraints Language

1596 The Core Components Context Constraints Language consists of a set of values (See Table 6-5) that allow users to express the relationships between specific business 1597 1598 situations and the specific structure and meaning of business data used in that 1599 situation. The constraints language refers to specific contexts as described in the 1600 Context Categories specification and uses UIDs to refer to Core Components 1601 semantic models. The constraints applied to Core Components in specific business 1602 contexts to generate Business Information Entities are expressed using the constraints 1603 language.

[C62] The Core Components Context Constraints Language shall be used to describe
 the constraints being applied to Core Components to create Business
 Information Entities.

1607 An *Assembly* is the overall expression of a single set of *Assembly Rules*, which groups 1608 a set of unrefined *Business Information Entities* in to a larger structure. When working 1609 with pre-assembled standard document sets, it should not be necessary for users to 1610 create *Assembly* constraints.

1611 [C63] Assembly shall be the top-level construct in any set of Assembly Rules.

1612 The ContextRules construct is the overall expression of a single set of rules that are

1613 used to apply context to *Core Components*. The *ContextRules* add the full semantic

and structural refinement to the *Core Components* to produce *Business Information*

1615 Entities. This mechanism supports specifying cardinality, addition and subtraction of

1616 child core components, renaming of those children, assigning *Business Information*

1617 *Entity* names to the context-specific instances of the *Core Components*, and adding

1618 structure to create Aggregate Business Information Entities.

1619 [C64] A single set of context rules shall be described using the *ContexRules*1620 expression.

Construct	Component Constructs	Description
Assembly		An Assembly contains at least one Assemble, optionally either an @id or an @idref, and optionally one @version Note: An Assembly is the top level construct in a set of Assembly Rules
	Assemble	List of assembled <i>Core Components</i> to be grouped together to form BIEs
	@id	ID of an Assembly
	@idref	Reference to an Assembly id
	@version	Version of the Assembly Rules document.

1621 Table 6-5 Core Components Context Constraints Language

Construct	Component Constructs	Description
Assemble		An Assemble contains at least either a
		CreateBIE or a CreateGroup, optionally
		either an @id or an @idref, and one
		(a)name
	CreateBIE	List of Core Components
	CreateGroup	Create a group of BIEs
	(a)name	Name of the highest-level BIE being
	0	assembled
	@id	ID of an Assemble rule
	@idref	Reference to an Assemble id
CreateGroup		A CreateGroup contains at least one of
-		CreateGroup or CreateBIE or UseBIE or
		Annotation, optionally an @id or an
		@idref, and one @type
	@type	Type of group to be created (the only
		permitted values are 'sequence' and
		'choice')
	@id	ID of a CreateGroup rule
	@idref	Reference to CreateGroup id
	CreateGroup	Create a group of BIEs
	CreateBIE	Create a BIE
	UseBIE	Use the named BIE from among the
		children of the BIE being created.
	Annotation	Insert Annotation
CreateBIE		A CreateBIE rule contains an optional
		Name followed by an optional Type
		followed by a MinOccurs followed by a
		MaxOccurs followed by zero or more
		CreateGroup or Rename, or UseBIE, or
		Condition or Annotation, optionally an
		@id or an @idref, and an optional
		@location
	Туре	Type of BIE to be created – a reference
		to a Core Component
	MinOccurs	Minimum occurrences for the BIE
		created
	MaxOccurs	Maximum occurrences for the BIE
		created. One possible value (other than
		integer) is 'unbounded'.
	@id	Id of the created BIE
	@idref	Reference to the ID of another created
		BIE
	Name	Name of the BIE to be assembled
	@location	Location of the BIE to be assembled
		(i.e. query to the registry)
	Rename	Renames children of the created BIE
	Condition	Condition under which this rule should

UN/CEFACT Core Components Technical Specification V1.8

Construct	Component Constructs	Description
		apply
	Annotation	Insert Annotation
Name		A Name contains only a string of
		characters
Туре		A Type contains only a string of
		characters. It represents a type in the
		output – representation class or Core
		Component, depending on where used.
Rename		A Rename rule contains optionally an
		@id or an @idref, and one @from and
		one @to
	@id	Id of the Rename rule
	@idref	Reference to the ID of another Rename
		rule
	@from	Original name of the child BIE being
		renamed
	@to	New name of the child being renamed
ContextRules		ContextRules contains one or more
		Rules
		Note: A ContextRules is the top level
		construct in a set of Context Rules
	Rule	List of refinement and qualification
		rules to be applied
	@id	Id of the ContextRules rule
	@idref	Reference to the ID of another
		ContextRules rule
	@version	Version of the ContextRules document.
Rule		A Rule contains one or more Taxonomy,
		followed by one or more Condition, one
		@apply, and an optional @order.
	@apply	(See note below)
	Condition	When rule should be run
	@order	Defines order for running rules. Rules
		with lower value for order are run first
	Taxonomy	List of taxonomies used in a Rule that
		employs hierarchical conditions.
Taxonomy		A Taxonomy contains a @context and a
		@ref, and optionally an @id or an
		@idref
	@ref	Pointer to a taxonomy.
	@context	Name of the context category to which
		this Taxonomy applies
	@id	Id of the Taxonomy rule
	@idref	Reference to the ID of another
		Taxonomy rule
Condition		A Condition contains at least one of
		Action or Condition or Occurs, one

UN/CEFACT Core Components Technical Specification V1.8

Construct	Component Constructs	Description
		@test, and optionally an @id or an @idref
	Action	What happens when rule is run
	Condition	A nested condition
	Occurs	Specify number of occurrences
	@id	Id of the Condition rule
	@idref	Reference to the ID of another
	0	Condition rule
	@test	Boolean expression testing whether the rule should be run.
Action		An Action contains at least one of Add or Occurs or Subtract or Condition or Comment or Rename, one @applyTo
		and optionally an @id or an @idref
	@applyTo	Node to apply action to
	Add	Add a component to the content model
	Subtract	Subtract a component from the content model
	Occurs	Constrain or expand the number of occurrences of the component
	Condition	When rule should be run
	Comment	Add a comment
	Rename	Rename a component
	@id	Id of the Condition rule
	@idref	Reference to the ID of another Condition rule
	@applyTo	Name of the component to apply this rule to
Add		Add contains a MinOccurs followed by a MaxOccurs followed by at least one of an optional BIE or an optional Attribute, or a CreateGroup or an Annotation,
		optionally an @id or an @idref, an optional @before or an optional @after
	MinOccurs	Minimum number of times that the new instance must occur
	MaxOccurs	Maximum number of times that the new instance can occur
	@before	Specifies before which component the addition should occur.
	@after	Specifies after which component the subtraction should occur.
	CreateGroup	Create a group of BIEs
	BIE	Adds a new BIE to the content model.
	Attribute	Adds a new non-BIE property to the content model
	Annotation	Insert Annotation

Construct	Component Constructs	Description
	@id	Id of the Add rule
	@idref	Reference to the ID of another Add rule
Subtract		Subtract contains one or more of BIE or Attribute, and optionally an @id or an @idref
	BIE	Removes a BIE from the content model.
	Attribute	Removes a non-BIE property from the content model
	@id	Id of the Subtract rule
	@idref	Reference to the ID of another Subtract rule
Occurs		Occurs contains a MinOccurs, followed by a MaxOccurs, followed by one or more BIEs, and optionally an @id or an @idref
	BIE	Changes an optional BIE to required.
	MinOccurs	Overrides the minimum number of occurrences for this BIE
	MaxOccurs	Overrides the maximum number of occurrences for this BIE
	@id	Id of the Occurs rule
	@idref	Reference to the ID of another Occurs rule
BIE		A BIE contains a Name, followed by an optional Type, followed by zero or more Attribute, followed by zero or more Annotation, and optionally an @id or an @idref
	Name	Name of BIE to be modified
	Туре	Type of BIE – the <i>Core Component</i> - required only if contained in an Add tag
	Attribute	Attribute(s) of this BIE
	Annotation	Insert Annotation
	@id	Id of the BIE rule
	@idref	Reference to the ID of another BIE rule
Attribute		An Attribute contains an optional Name followed by an optional Type, followed by an optional Use, followed by an optional Value, followed by zero or more Annotation, and optionally an @id or an @idref, and an optional @applyTo
	Name	Name of attribute to be modified
	Туре	Type of the attribute (representation class)
	Use	Indicates whether required or optional, and if the latter whether fixed or defaulted

Construct	Component	Description
	Constructs	
	Value	Indicates a fixed or defaulted value, or a
		value to be modified
	@id	Id of the Attribute rule
	@idref	Reference to the ID of another Attribute
		rule
UseBIE		A UseBIE contains zero or more of
		Annotation or CreateGroup or UseBIE,
		and optionally an @id or an @idref
	@name	Name of the BIE being used
	CreateGroup	Create a group of BIEs
	UseBIE	Use the named BIE from among the
		children of the BIE being created.
	Annotation	Insert Annotation
	@id	Id of the UseBIE rule
	@idref	Reference to the ID of another UseBIE
	0	rule
Comment		Ubiquitous. Records comments about
		the rules document at the location it
		appears. It is not intended to be output in
		the resulting semantic model.
MinOccurs		Minimum number of occurrences in the
		output
MinOccurs		Maximum number of occurrences in the
		output
Annotation		An Annotation contains zero or more of
		either Documentation or Appinfo, and
		optionally an @id or an @idref
	Documentation	Used to include documentation
	Appinfo	Used to include application specific
	II -	information
	@id	Id of the Annotation
	@idref	Reference to the ID of another
		Annotation
Documentation		Documentation contains optionally an
		(a) id or an (a) idref
	@id	Id of the Documentation
<u> </u>	(a)idref	Reference to the ID of another
		Annotation
Appinfo		Documentation contains optionally an
¹ Maine		(a)id or an (a)idref
	@id	Id of the Appinfo
	@idref	
	widter	Reference to the ID of another Appinfo

1622

1623	[Note]
1624 1625	Table Key: @ indicates properties of the construct being defined. For example, @id, @idref and @version are properties of Assembly.
1626	6.2.4.1 Assembly Construct
1627 1628 1629	The <i>MinOccurs</i> and <i>MaxOccurs</i> constructs in the <i>CreateBIE</i> construct specify the occurrence that the created <i>Business Information Entity</i> will have in the resulting semantic model.
1630 1631	[C65] A <i>Business Information Entity</i> created with <i>MinOccurs</i> = 1 and <i>MaxOccurs</i> = 1 shall be specified in the resulting semantic model as occurring only once.
1632	[C66] An Assembly may contain more than one assembled top-level semantic model.
1633	6.2.4.2 ContextRule Construct
1634 1635 1636	Several built-in variables are used to access context information. These variables correspond to the identified context categories. All of these variables have string values.
1637 1638	[C67] The <i>Apply</i> attribute of the <i>ContextRule</i> construct type shall be used for determining the behaviour of rules that use hierarchical values.
1639	[C68] Allowed <i>Apply</i> attribute values are:
1640 1641	• <i>exact</i> - match only if the value in the provided context is precisely the same as that specified in the rule
1642 1643	• <i>hierarchical</i> - match if the value provided is the same or a child of that specified in the rule.
1644	[Example]
1645 1646	If the <i>ContextRule</i> specifies the region <i>Europe</i> , the value <i>France</i> would match only if the <i>Apply</i> attribute is set to <i>hierarchical</i> (<i>exact</i> being the default).
1647 1648	[C69] The <i>Attribute</i> construct has four optional children in its content model, of which at least one must be present.
1649	[C70] When the <i>Attribute</i> construct is used to refine an existing <i>Attribute</i> , then a

1650 value must be specified for @applyTo on that *Attribute* construct.

1651[C71]ContextRules must refer to the names of the Core Components, and not the1652names given to the resulting Business Information Entities elsewhere in the1653Rules.

1654	[Example]
1655 1656 1657	Given a source that contains an optional child type named 'X', a rule can be applied to rename 'X' to 'Y', but a rule to make 'Y' required, rather than 'X', would be illegal.

1658 6.2.4.3 Output Constraints

[C72] Semantic models and document definitions produced through the application
 of *Assembly* and *Context Rules* must contain the metadata about the rules and
 context that produced them.

1662 6.2.4.4 Ordering and Application

1663 There is an explicit *Order* property on the *Rule* construct that applies a sequence to 1664 the application of a set of rules. It is an error for two *Rule* constructs to have the same 1665 value for the property *Order*. In a single set of *ContextRules*, users should be careful 1666 not to sequence rules in a way that would preclude their execution—such as adding an 1667 attribute to a business Information Entity that has not been added yet by the rules.

1668[C73]The Order property on the Rule construct will determine the sequence for the
application of the applicable set of rules.

1670 [C74] Two *Rule* constructs must not have the same value for the property *Order*.

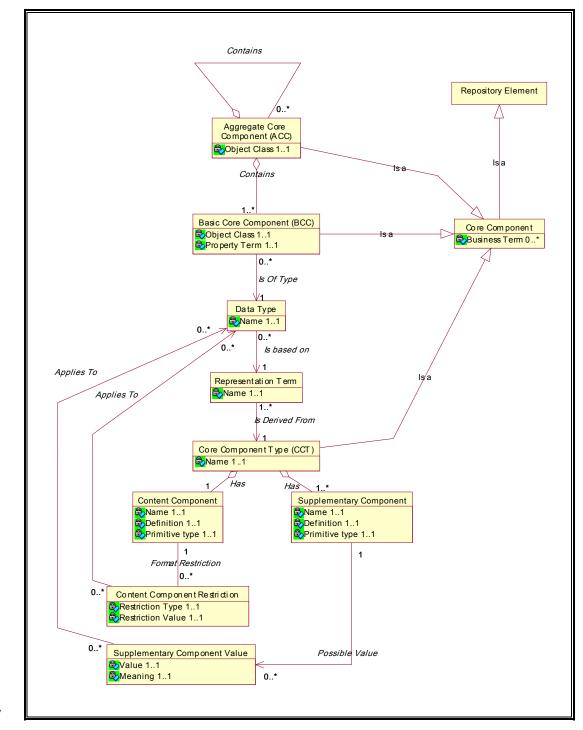

1671 7 Technical Details - Core Component Repository 1672 Storage

1673 Section 6 specifies the basic definitions for Core Components, Business Information 1674 *Entities* and *Context*. This section details exact information required for creation of 1675 Unified Modelling Language objects to store Core Components, Business Information 1676 Entities, Context and relevant associated metadata in the repository. Both parts contain 1677 requirements that must be addressed by developers of *Core Components* and users of 1678 *Core Components.* Further, both parts contain requirements that must be satisfied in the 1679 supported registry and repository suite of technical specifications and any corresponding 1680 overarching information technology framework that uses Core Components as the 1681 linchpin between process modelling and trade.

1682**7.1**Storing Core Components

1683 This section fully describes *Core Component* storage details. Figure 7-1 is the *Unified*

- 1684 *Modelling Language* model of all aspects of *Core Components* and fully describes the
- 1685 types of *Core Components* and their relationships as a requirement of storage.
- 1686

1686 Figure 7-1. Core Components - Full Definition

1687

1688 7.1.1 Stored Core Components

- 1689 [S1] Stored *Core Components* shall always be defined as one of the three recognised
 1690 types—*Basic Core Component, Aggregate Core Component*1691 or *Core Component Type.*
- 1692 [S2] Stored *Core Components* shall include the following attributes:
- Business Term (optional, repetitive): A synonym term under which the Core Component is commonly known and used in a business. A Core Component may have several business terms or synonyms.
- 1696 **7.1.2 Stored Basic Core Components**
- 1697 [S3]Stored Basic Core Components shall always be based on three elements: (1) an1698Object Class, (2) a Property Term and (3) a Data Type.
- 1699 [S4] Stored *Basic Core Components* shall include the following Attributes:
- **Object Class (mandatory):** Basis for the Dictionary Entry Name.
- **Property Term (mandatory):** Basis for the Dictionary Entry Name.
- 1702 7.1.3 Stored Core Component Types
- 1703 [S5] Stored *Core Component Types* shall include one *Content Component* that defines
 1704 the primitive type and one or more *Supplementary Components* that give meaning
 1705 to the *Content Component*.
- 1706 [S6] Stored Core Component Types shall not reflect business meaning.
- 1707 [S7] Stored *Core Component Types* shall include the following attributes:
- Name (mandatory): A meaningful type name, as basis for the *Dictionary Entry Name*.

1710 **7.1.4 Stored Aggregate Core Components**

- 1711 [S8] Stored Aggregate Core Components shall consist of two or more Basic Core
 1712 Components, or at least one Basic Core Component plus one or more Aggregate
 1713 Core Components.
- 1714 [S9] Stored Aggregate Core Components shall identify all relationships with the Basic
 1715 Core Components and Aggregate Core Components from which they are
 1716 constructed.

1717	[S10]	Stored Aggregate Core Components shall include the following Attributes:	
1718		• Object Class (mandatory): Basis for the <i>Dictionary Entry Name</i> .	
1719	7.1.5	Stored Data Types	
1720 1721	[S11]	Stored <i>Data Types</i> shall define the full range of valid values that can be used for a particular <i>Basic Core Component</i> and will include the following attribute:	
1722		• Name (mandatory): Name in the Repository of a <i>Data Type</i> .	
1723 1724	[S12]	Stored <i>Data Types</i> shall be based on a <i>Representation Term</i> derived from a <i>Core Component Type</i> .	
1725 1726 1727 1728	[S13]	Restrictions on Stored <i>Content Components</i> and <i>Supplementary Components</i> shall be identified when the <i>Core Component Type</i> is used as basis for a particular <i>Data Type</i> and when it is necessary to restrict the format of the <i>Content Component</i> and/or to restrict the possible values of a <i>Supplementary Component</i> .	
1729	7.1.6	Stored Representation Term	
1730	[S14]	Stored Representation Terms will include the following attribute:	
1731		• Name (mandatory): Name in the Repository of a <i>Representation Term</i>	
1732	[S15]	Stored Representation Terms shall be derived from a Core Component Type.	
1733	7.1.7	Stored Supplementary Components	
1734 1735 1736	[S16]	Stored <i>Supplementary Components</i> shall be associated with the <i>Content Component</i> in the overarching <i>Core Component Type</i> and shall include the following attributes:	
1737 1738		• Name (mandatory): Name in the Repository of a <i>Supplementary Component</i> of a <i>Core Component Type</i> .	
1739 1740 1741		• Definition (mandatory): A clear, unambiguous and complete explanation of the meaning of a <i>Supplementary Component</i> and its relevance for the related <i>Core Component Type</i> .	
1742 1743		• Primitive type (mandatory) : Primitive type to be used for the representation of the value of a <i>Supplementary Component</i> .	
1744	[Exam	ple]	
1745	Possible values for primitive type are String, Decimal, Integer, Boolean, Date and Binary.		

1746	7.1.8 Stored Supplementary Component Value
1747 1748	[S17] A stored Supplementary Component Value shall define one possible value of a Supplementary Component.
1749 1750	[S18] A stored <i>Supplementary Component Value</i> shall only be stored if all possible values can be defined by an enumeration (e.g. list of quantity units).
1751	[Note]
1752 1753	The list of possible stored <i>Supplementary Component Values</i> can be further restricted when a <i>Core Component Type</i> is used for a particular <i>Basic Component</i> .
1754	[Example]
1755 1756 1757	The Core Component Type Quantity has a Supplementary Component Quantity Unit with possible values like gram and second. A Basic Component like Person. Weight. Quantity will not accept second as quantity unit.
1758	[S19] Stored Supplementary Component Values shall contain the following Attributes:
1759	 Value (mandatory): A possible value of a Supplementary Component.
1760 1761	• Meaning (mandatory): The meaning of the <i>Supplementary Component</i> when it has a particular Value.
1762	7.1.9 Stored Content Components
1763	[S20] Stored Content Components shall contain the following attribute:
1764 1765	• Name (mandatory): Name in the Repository of a <i>Content Component</i> of a <i>Core Component Type</i> .
1766 1767	• Definition (mandatory): A clear, unambiguous and complete explanation of the meaning of a <i>Content Component</i> .
1768 1769 1770	• Primitive type (mandatory) : Primitive type to be used for the expression of the value of a <i>Basic Core Component</i> based on the associated <i>Core Component Type</i> .
1771	7.1.10 Stored Content Component Restrictions
1772 1773	[S21] Stored <i>Content Component Restrictions</i> shall only exist if the values can be defined by a format restriction such as string pattern, minimum or maximum

1774 length, or enumeration.

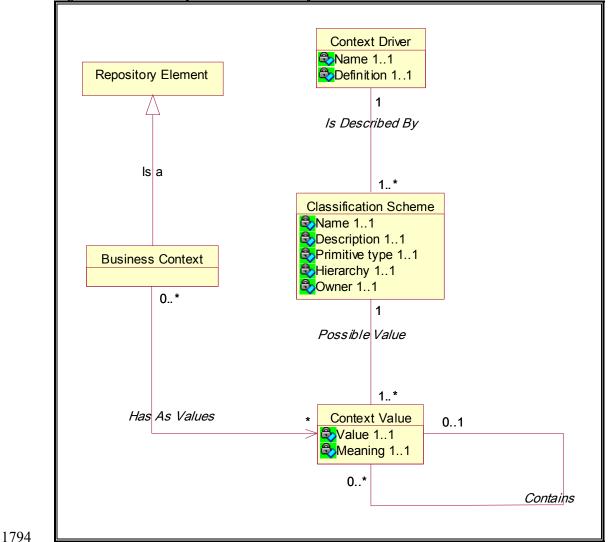

1775 [S22] Stored *Content Component Restrictions* shall contain the following attributes:
1776 • Restriction Type (mandatory): Defines the type of format restriction that 1777 • must be applied to the *Content Component*.
1778 • Restriction Value (mandatory): The actual value of the *Restriction Type* that 1779 applies to a *Content Component*.

1780	[Example]
1781 1782 1783 1784	Possible values include pattern, length, minimum length, maximum length, enumeration, and others to be identified. The restriction values depend on the restriction type (e.g. integer for a length restriction type, list of possible values for an enumeration restriction type.).

1785 7.2 Stored Context

This section fully describes *Context* storage details. Figure 7-2 is the *Unified Modelling Language* model of all aspects of *Context*. It shows that there are a number of *Context Categories* (e.g. Region, Product), which can each be described by one or more
Classification Schemes (e.g. United Nations scheme for products, World Trade
Organization scheme for products). For each Classification Scheme the list of possible
values (and their meaning) is defined. A *Business Context* is then defined as a unique and

1792 meaningful combination of context values.

1793 Figure 7-2 Core Components Context Definition Model

1795 [S23] Stored Business Context shall contain the combination of values for context 1796 categories so as to define a unique and meaningful Business Context.

7.2.1 Context categories 1797

- 1798 Stored Context Categories shall be in conformance with the officially accepted [S24] 1799 categories of Core Component contexts.
- 1800 [S25] Stored *Context Categories* shall contain the following attributes:
- 1801 Name (mandatory): Name in the Repository of a *Context Category*.
- 1802 Definition (mandatory): The meaning of the Context Category. •

1803 7.2.2 Classification Scheme 1804 [S26] A Context Category may be described by one or more Classification Schemes. [S27] Stored *Classification Schemes* shall contain the following attributes: 1805 1806 Name (mandatory): Name under which the *Classification Scheme* is known. • 1807 **Definition (mandatory):** Definition of the *Classification Scheme*. **Primitive type (mandatory):** Primitive type that is used for the representation 1808 • 1809 of a context value in the Classification Scheme. 1810 • Hierarchy (mandatory): Indicator describing whether the Classification Scheme supports a hierarchical description of the context. 1811 1812 Owner (mandatory): Organisation that is responsible for the Classification • Scheme. 1813 7.2.3 Context Value 1814 [S28] Stored *Context Value* shall describe a particular context in a given Context 1815 1816 Category according to a particular Classification Scheme. If the Classification Scheme allows a hierarchy, the value obtained via the association contains 1817 1818 describes this hierarchy. 1819 [S29] Stored *Context Value(s)* shall contain the following attributes: 1820 Value (mandatory): Value describing a particular context. 1821 Meaning (mandatory): Description of the meaning of the corresponding 1822 value. 1823 [Note] 1824 The context value is derived from a business process model which presumably uses values that have their meaning defined somewhere. For example, if the value is taken 1825 1826 from a code list (specified in the *Classification Scheme*), then the meaning of the code 1827 should be provided by the code list specification. As an alternative solution, Meaning could be an optional Uniform Resource Identifier that points to the definition. 1828

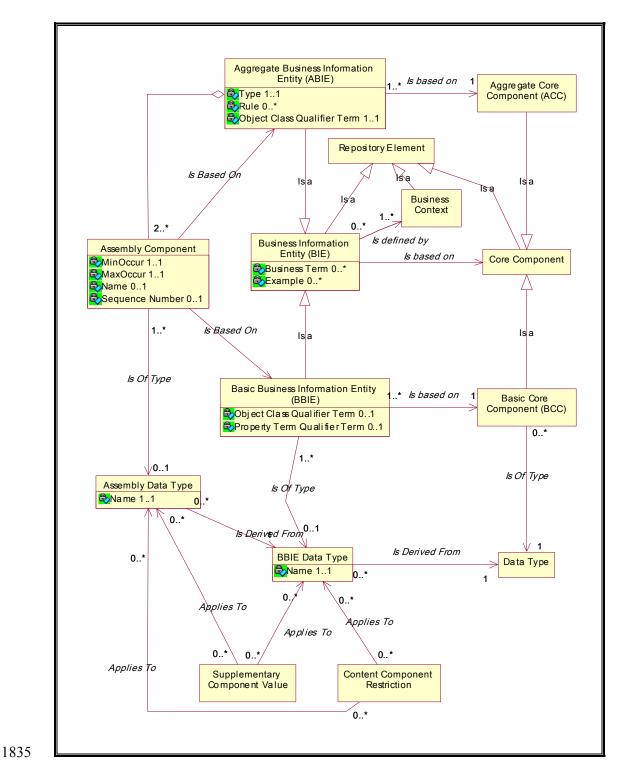

1829 **7.3 Stored Business Information Entities**

1830 This section fully describes *Business Information Entity* storage details. Figure 7-3 is the

1831 Unified Modelling Language model of all aspects of Business Information Entity and

1832 fully describes the types of *Business Information Entities* and their relationships as a

1833 requirement of storage.

1834 Figure 7-3. Business Information Entities – Full Definition

1836 An Aggregate Business Information Entity is either a sequence or a choice and will

- 1837 consist of two or more *Assembly Components*, which are either *Basic Business*
- 1838 Information Entities or Aggregate Business Information Entities. Each Assembly
- 1839 Component has a certain cardinality (i.e. it is mandatory, optional and/or repetitive) and -
- 1840 in case of a sequence a sequence number. When used as an Assembly Component, it is
- 1841 possible to change the name of the composing *Aggregate Business Information Entity* or
- 1842 Basic Business Information Entity and to restrict the data type of a composing Basic
- 1843 Business Information Entity.

1844 **7.3.1 Stored Aggregate Business Information Entities**

- 1845 [S30] Stored Aggregate Business Information Entities shall contain the following attributes:
- Type (mandatory): Indicates whether the composing components of the *Aggregate Business Information Entity* form a sequence (i.e. all composing components may occur when the *Aggregate Business Information Entity* is used) or a choice (i.e. only one of the composing components may occur when the *Aggregate Business Information Entity* is used) or a choice (i.e. only one of the composing components may occur when the *Aggregate Business Information Entity* is used).
- Rule (optional, repetitive): Describes a restriction that relates to various
 Assembly Components of the Aggregate Business Information Entity.
- Object Class Qualifier Term (mandatory): Qualifies the Object Class of the associated Aggregate Core Component.
- 1856 **7.3.2 Stored Assembly Component**
- [S31] A stored Assembly Component shall be either an Aggregate Business Information
 Entity or a Basic Business Information Entity.
- 1859 [S32] Stored *Assembly Components* shall contain the following attributes:
- MinOccur (mandatory): Minimum number of occurrences that a composing Business Information Entity must occur when used in an Aggregate Business Information Entity. If the minimum is zero, the component is optional. If the minimum is one or more, the component is mandatory.
- MaxOccur (mandatory): Maximum number of occurrences that a composing Business Information Entity may occur when used in an Aggregate Business Information Entity. If the maximum is zero, the component is not allowed. If the maximum is more than one, the component is repetitive. The defined maximum must always be greater than or equal to the defined minimum.
- Name (optional): Alternative name to be used for a *Business Information Entity* when used in an *Aggregate Business Information Entity*.
- Sequence Number (optional): Position of the Assembly Component in an Aggregate Business Information Entity of type Sequence.

1873 **7.3.3 Stored Assembly Data Type**

- [S33] Stored Assembly Data Types shall be defined by specifying additional restrictions
 on the Content Component and Supplementary Components of the Basic Business
 Information Entity Data Type from which it is derived.
- 1877 [S34] Stored Assembly Data Types shall contain the following attribute:
- **Name (mandatory)**: Name in the Repository of a *Assembly Data Type*.

1879 **7.3.4 Stored Basic Business Information Entities**

- 1880 [S35] Stored *Basic Business Information Entities* shall contain the following attributes:
- Object Class Qualifier Term (optional): Qualifies the Object Class of the associated Basic Core Component.
- Property Term Qualifier Term (optional): Qualifies the Property Term of the associated Basic Core Component.
- 1885[S36]Stored Basic Business Information Entities shall contain at least one of the
Qualifier Terms specified in Rule S35.

1887 **7.3.5 Stored Basic Business Information Entity Data Types**

- [S37] A *Basic Business Information Entity Data Type* will be defined by specifying
 additional restrictions on the *Content Component* and *Supplementary Components*of the *Data Type* from which it is derived.
- [S38] Stored *Basic Business Information Entity Data Types* shall contain the following attributes:
- Name (mandatory): Name in the Repository of a *Basic Business Information Entity Data Type.*

1895 **7.3.6 Stored Business Information Entities**

- [S39] Stored Business Information Entities shall always be defined as either a Basic
 Business Information Entity or an Aggregate Business Information Entity.
- 1898 [S40] A stored *Business Information Entity* shall contain the following attributes:
- Business Term (optional, repetitive): A synonym term under which the Business Information Entity is commonly known and used in the business. A Business Information Entity may have several business terms or synonyms.

Example (optional, repetitive): Example of a possible value of a *Business Information Entity*

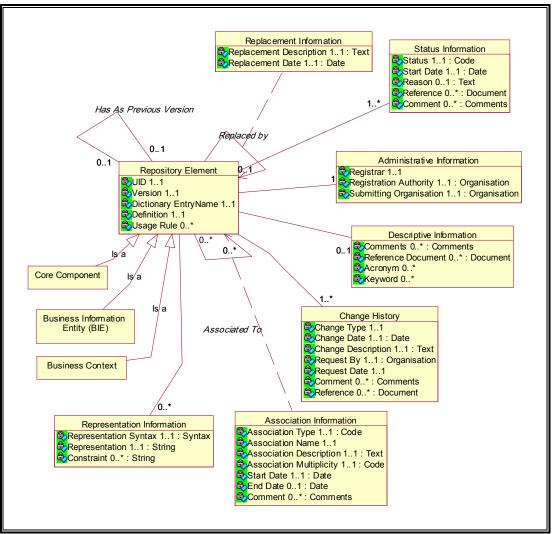

1904 **7.4 Core Component Storage Metadata**

- 1905 Core Components and Business Information Entities are the linchpins for developing
 1906 standardised process models and business documents. Storing these artefacts so that they
 1907 are able to meet this role requires rich metadata storage as well.
- Figure 7-4 focuses on the meta-information that needs to be defined for a *Repository Element* (i.e. all information needed to store for *Core Components* and for *Business*
- *Element* (i.e. all information needed to store for *Core Components* and for *Business*
- 1910 *Information Entities*). To simplify the diagram all information regarding the structure of a

1911 *Core Component* and a *Business Information Entity* has been hidden.

1912	As shown in Figure 7-4, the following metadata categories will be required:
1913	• Version Information: even though at any given point in time only one
1914	version of a <i>Repository Element</i> can be valid, multiple previous versions may
1915	have existed and a future version may be in preparation. The Version
1916	association makes it possible to link the consecutive versions of a <i>Repository</i>
1917	<i>Element.</i> There will not be branches in the versioning; only a linear versioning
1918	will be supported.
1919	• Replacement Information : a <i>Repository Element</i> may be replaced by another
1920	Repository Element at some point in time (e.g. because a duplicate is
1921	discovered). The Replaced by association makes it possible to do this and
1922	Replacement Information makes it possible to document the date of and reason
1923	for replacement.
1924	• Status Information: information about the live status of a <i>Repository Element</i>
1925 1926	• Administrative Information: information about the registration of the <i>Repository Element</i> .
1927 1928	• Descriptive Information : additional descriptive information about a <i>Repository Element</i> , giving further clarification about its meaning.
1929 1930	• Change History : information about all changes that are made to a <i>Repository Element</i> .
1931 1932	• Association Information: a <i>Repository Element</i> may be associated to multiple other <i>Repository Elements</i> .
1933 1934 1935	• Representation Information : information about the physical representation of a <i>Repository Element</i> in a particular syntax (e.g. to document the XML-tag).

1938 7.4.1 General Metadata Storage Rules

- 1939 [S41] Stored *Repository Elements* shall include a universally unique identifier.
- 1940[S42]Stored Repository Elements shall include a version number to keep track of the
evolution over time of a Repository Element.
- 1942 [S43] Stored Repository Elements shall include a Dictionary Entry Name.
- 1943 [S44] Stored *Repository Elements* shall include a Definition.
- 1944[S45]Stored Repository Elements may include one or more Usage Rules, describing1945how and/or when to use the Repository Element.

- 1946[S46]Except for the first version of a *Repository Element*, each stored version shall be1947linked to its previous version.
- 1948[S47]Except for the last version of a *Repository Element*, each stored version shall be1949linked to its next version.
- 1950[S48]Stored Repository Elements shall include the history of the status lifecycle of each
version.

1952 7.4.2 Management Information

- 1953 7.4.2.1 Administrative Information
- 1954 [S49] Stored *Repository Elements* shall contain administrative information and will1955 include the following attributes:
- Registrar (mandatory): Name of the responsible person who has created the *Repository Element* in the repository
- Registration Authority (mandatory): Organisation authorised to register the *Repository Element*.
- Submitting Organisation (mandatory): The organisation that has submitted / requested the *Repository Element*

1962 7.4.2.2 Status Information

- 1963[S50]Stored Repository Elements shall contain status information to include the
following attributes:
- Status (mandatory): Status of the *Repository Element* (i.e. draft, provisionally registered, registered, to be retired, ...)
- Start Date (mandatory): Date on which the status comes into effect
- Reason (optional): Description of why the *Repository Element* status has been changed.
- 1970
 Reference (optional, repetitive): External Document(s) containing relevant information about the status change.
- 1972 Comment (optional, repetitive): Remark about the *Repository Element* status.
- 1974 **7.4.2.3** Change History
- 1975[S51]Stored *Repository Elements* shall include the history of all modifications related to
each version to include the following attributes:

1977 1978	• Change Type (mandatory): Purpose of the Change—such as new element, new version, element modification, status modification, element replacement.
1979	• Change Date (mandatory): Date on which the modification has been made.
1980 1981	• Change Description (mandatory): Description of why and how the <i>Repository Element</i> has been modified.
1982 1983	• Request By (mandatory) : Name of the organisation that has requested the modification of the <i>Repository Element</i>
1984	• Request Date (mandatory) : Date on which the modification was requested.
1985 1986	• Comment (optional, repetitive) : Remark about the <i>Repository Element</i> modification.
1987 1988	• Reference (optional, repetitive) : External Document(s) containing relevant information about the modification.
1989	7.4.2.4 Replacement Information
1990 1991 1992	[S52] For each stored pair of <i>Repository Elements</i> where one <i>Repository Element</i> replaces the other, the stored information shall specify replacement information to include the following attributes:
1993 1994	• Replacement Description (mandatory) : Reason for the <i>Repository Element</i> being replaced
1995 1996	• Replacement Date (mandatory) : Date from which the replacement is effective.
1997 1998	[S53] If another <i>Repository Element</i> has replaced a <i>Repository Element</i> , it shall be linked to the <i>Repository Element</i> by which it has been replaced.
1999 2000	[S54] If a <i>Repository Element</i> replaces one or more other <i>Repository Element</i> , it shall be linked to the <i>Repository Element</i> (s) it replaces
2001	7.4.3 Content Information
2002	7.4.3.1 Descriptive Information
2003 2004	[S55] Stored <i>Repository Elements</i> may optionally include additional descriptive information to include the following attributes:
2005 2006 2007	• Comments (optional, repetitive): Comments is additional information about a <i>Repository Element</i> , which is not part of the definition but that is considered relevant for clarification.

2008 2009 2010	•	Reference Document (optional, repetitive): Reference Document is a reference (e.g. a Uniform Resource Locator) to external documentation that contains relevant additional information about a <i>Repository Element</i> .
2011 2012	•	Acronym (optional, repetitive): Acronym is an abbreviation or code under which the <i>Repository Element</i> is commonly known.
2013 2014	•	Keyword (optional, repetitive): Keyword is one or more significant words used for the search and retrieval of a <i>Repository Element</i> .
2015	7.4.3.2	Representation Information
2016 2017 2018	rep	ored <i>Repository Elements</i> may optionally include information about the presentation of the <i>Repository Element</i> in one or more syntaxes to include the llowing attributes.
2019 2020	•	Representation Syntax (mandatory) : Identification of the representation syntax
2021 2022	•	Representation (mandatory) : Physical representation of the <i>Repository Element</i> (e.g. <i>Extensible Markup Language</i> tag)
2023 2024 2025	•	Constraint (optional, repetitive) : Description of additional constraints that apply to the representation of the <i>Repository Element</i> in the given syntax (e.g. maximum length,)
2026	7.4.3.3	Association Information
2027 2028		ored <i>Repository Elements</i> shall include all associations they have with other ored <i>Repository Elements</i> and shall include the following attributes:
2029	•	Association Name (mandatory): Name of the association
2030 2031	•	Association Description (mandatory): Descriptive text explaining the meaning of the association
2032 2033	•	Association Type (mandatory) : Type of association (e.g. aggregation, specialisation, generalisation, simple association)
2034 2035	•	Association Multiplicity (mandatory): Cardinality of the association (i.e. optional/mandatory and repetition)
2036	•	Start Date (mandatory): Date at which the association becomes valid
2037	•	End Date (optional): Date from which the association is no longer valid
2038 2039	•	Comment (optional, repetitive) : Relevant information about the association (e.g. reason why it has been removed,)

2040 8 Approved Core Component Type, Content, and 2041 Supplementary Components

- 2042 The Following subsections contain tables that convey the currently approved *Core*
- 2043 Component Types (Section 8.1) and the Core Component Type Content and
- 2044 Supplementary Components (Section 8.2).

2045 8.1 Approved Core Component Types

2046 [Note]

2047	The UIDs in Table 8-1 are interim in nature and will be finalised prior to release of this document in specification status.
2048	this document in specification status.

2049 Table 8-1 Core Component Types (CCT)

2	050

UID	CCT Dictionary Entry Name	Definition	Remarks	Object Class	Property Term	CCT Components
000105	Amount. Type	A number of monetary units specified in a currency where the unit of currency is explicit or implied.		Amount	Туре	 Amount. Content (000106) Amount Currency. Identification. Code (000107)
000089	Code. Type	A character string (letters, figures or symbols) that for brevity and/or language independence may be used to represent or replace a definitive value or text of an attribute together with relevant supplementary information.		Code	Туре	 Code. Content (000091) Code List. Identifier (000092) Code List. Agency. Identifier (000093) Code List. Version. Identifier (000099) Code. Name (000100) Language. Code (000075)
000066	Date Time. Type	A particular point in the progression of time together with relevant supplementary information.	Can be used for a date and/or time.	Date Time	Туре	 Date Time. Content (000067) Date Time. Format. Text (000068)
000200	Graphic. Type	A diagram, graph, mathematical curves, or similar representation.		Graphic	Туре	 Graphic. Content Graphic. Format. Text

UID	CCT Dictionary Entry Name	Definition	Remarks	Object Class	Property Term	CCT Components
000101	Identifier. Type	A character string to identify and distinguish uniquely, one instance of an object in an identification scheme from all other objects within the same scheme together with relevant supplementary information.		Identifier	Туре	 Identifier. Content (000102) Identification Scheme. Name (000103) Identification Scheme Agency. Name (000104) Language. Code (000075) Identification Scheme. Data. Uniform Resource Identifier (000209) Identification Scheme. Uniform Resource Identifier (000208)
000180	Indicator. Type	A list of two, and only two, values, which indicate a condition such as on/off; true/false etc. (synonym: "Boolean").		Indicator	Туре	 Indicator. Content (000181) Indicator. Format. Text
000152	Measure. Type	The size, volume, mass, amount or scope derived by performing a physical measure together with relevant supplementary information.		Measure	Туре	 Measure. Content (000153) Measure Unit. Code (000154)
000182	Numeric. Type	A representation of a number.	May or may not be decimal	Numeric	Туре	 Numeric. Content (000183) Numeric. Format. Text
000201	Picture. Type	A visual representation of a person, object, or scene.		Picture	Туре	Picture. ContentPicture. Format. Text
000108	Quantity. Type	A number of non- monetary units together with relevant supplementary information.		Quantity	Туре	 Quantity. Content (000109) Quantity. Unit. Code (000110) Quantity Unit. Code List. Identifier (000111) Quantity Unit. Code List Agency. Identifier (000112)
000090	Text. Type	A character string with or without a specified language.		Text	Туре	 Text. Content (000094) Language. Code (000075)

2052 8.2 Approved Core Component Type Content and Supplementary Components

Table 8-2 presents the currently approved set of *Core Component Type Content* and *Supplementary Components*. The asterisk (*) in the property term column indicates cases where the property term is the same as either the representation term or object class, and is consequently dropped from the dictionary entry name.

Table 8-2. Core Component Type Content and Supplementary Components

UID	Name	Data- type	Definition	Remarks
000106	Amount. Content	decimal	A number of monetary units specified in a currency where the unit of currency is explicit or implied	
000107	Amount Currency. Identification. Code	string	The currency of the amount	Reference ISO 4217.
000091	Code. Content	string	A character string (letters, figures or symbols) that for brevity and/or language independence may be used to represent or replace a definitive value or text of an attribute	
000093	Code List. Agency. Identifier	string	An agency that maintains one or more code lists	
000092	Code List. Identifier	string	The name of a list of codes	Can be used to identify the URL of a source that defines the set of currently approved permitted values
000099	Code List. Version. Identifier	string	The version of the code list	
000100	Code. Name	string	The textual equivalent of the code content	If no code content exists, the code name can be used on its own
000067	Date time. Content	string	The particular point in the progression of time	
000068	Date Time. Format. Text	string	The format of the date/time content	Reference ISO 8601
000202	Graphic. Content	binary	A diagram, graph, mathematical curves, or similar representation	
000203	Graphic. Format. Text	string	The format of the graphic content	
000104	Identification Scheme Agency. Name	string	The agency that maintains the identification scheme	
000103	Identification Scheme. Name	string	The name of the identification scheme	
000209	Identification Scheme. Data. Uniform Resource Identifier	string	The Uniform Resource Identifier that identifies where the Identification Scheme Data is located	
000208	Identification Scheme. Uniform Resource Identifier	string	The Uniform Resource Identifier that identifies where the Identification Scheme is located	
000102	Identifier. Content	string	A character string to identify and distinguish uniquely, one instance of an object in an identification scheme from all other objects within the same scheme	
000181	Indicator. Content	string	The value of the indicator	For example on, off, true, false
000207	Indicator. Format. Text	String	Whether the indicator is numeric, textual or binary	
000075	Language. Code	string	The identifier of the language used in the corresponding text string	Reference ISO 639: 1998
000153	Measure. Content	decimal	The size, volume, mass, amount or scope derived by performing a physical measure	For example, 20 kilograms (20 is the measure content)

UID	Name	Data-	Definition	Remarks
		type		
000154	Measure Unit. Code	string	The type of unit of measure	Reference UN/ECE Recommendation #20 and X12 355. For example, for \$10/100 km use CCT quantity type and for a measured distance of 20 kilometres use CCT measure type
000183	Numeric. Content	As defined by Numeric. Format.	The representation of a number	May be decimal
000204	Numeric. Format. Text	string	Whether the number is an integer, decimal, real number or percentage	
000205	Picture. Content	binary	A visual representation of a person, object, or scene	
000206	Picture. Format. Text	string	The acronym of the coding scheme used to record the picture	
000109	Quantity. Content	decimal	A number of non-monetary units	
000110	Quantity. Unit. Code	string	The unit of the quantity	May use UN/ECE Recommendation #20 and X12 355, but for actual measurements use the CCT measure type. For example, for \$10/100 km use CCT quantity type and for a measured distance of 20 kilometres use CCT measure type
000112	Quantity Unit Code List Agency. Identifier	string	The agency which maintains the quantity unit code list	
000111	Quantity Unit Code List. Identifier	string	The quantity unit code list	
000094	Text. Content	string	A character string generally in the form of words	

2060 9 Definition of Terms

2061 Aggregate Business Information Entity (ABIE) – A collection of related pieces of
 2062 business information that together convey a distinct business meaning in a specified
 2063 business context.

Aggregate Core Component - (ACC) – A collection of Core Components that convey
 a distinct business meaning. An Aggregate Core Component will consist of two or
 more Basic Core Components, or at least one Basic Core Component plus one or
 more Aggregate Core Components.

Assembly Component – An Assembly Component is a Business Information Entity
 that is a component part of an Aggregate Business Information Entity.

2070 *Assembly Data Type -* The formal definition of a set of valid values that can be used

2071 for a particular *Basic Business Information Entity* when used as an assembly

2072 component in a particular Aggregate Business Information Entity.

Basic Business Information Entity (BBIE) – A Core Component used in a specific
 business context. A Basic Business Information Entity is derived from a Basic Core
 Component.

2076 *Basic Business Information Entity Data Type* - The formal definition of a set of 2077 valid values that can be used for a particular *Basic Information Entity*.

- 2078 Basic Core Component (BCC) A Core Component that represents a singular
- 2079 business concept with a unique business semantic definition. A *Basic Core*

2080 Component is constructed by using a Core Component Type. Basic Core Components

2081 are used in developing *Aggregate Core Components*.

2082 *Business Context* – The formal description of a specific business circumstance as 2083 identified by the values of a set of context categories, allowing different business

- 2084 circumstances to be uniquely distinguished.
- Business Information Entity (BIE) A Business Information Entity is a piece of
 business data or a group of pieces of business data with a unique business semantic
 definition. A Business Information Entity can be either a Basic Business Information
- 2088 Entity or an Aggregate Business Information Entity.
- 2089 **Business Term** This is a synonym term under which the Core Component or
- 2090 Business Information Entity is commonly known and used in the business. A Core
- 2091 Component or Business Information Entity may have several business terms or
- synonyms.
- 2093 *Cardinality* The number of elements in a particular set or other grouping.

UN/CEFACT Core Components Technical Specification V1.8

- 2094 *Child Core Component* A *Core Component* that is used in a larger aggregate
 2095 construct.
- 2096 *Classification Scheme* This is an officially supported scheme to describe a given
 2097 *Context Category*.
- 2098 Constraint Language A formal expression of actions occurring in specific contexts
 2099 to assemble, structurally refine, and semantically qualify Core Components. The
 2100 result of applying the constraint language to a set of Core Components in a specific
 2101 context is a set of Business Information Entities.
- 2102 *Content Component* Defines the primitive type used to express the content of a
 2103 *Core Component Type.*
- 2104 *Content Component Restrictions* The formal definition of a format restriction that
 2105 applies to the possible values of a *Content Component*.
- 2106 *Context* Defines the circumstances in which a business process can be used. This is 2107 specified by a set of context categories known as a *Business Context*.
- 2108 *Context Category* A group of one or more related values used to express one
 2109 characteristic of a business circumstance.
- 2110 *Context Information Entity* The influence of a particular context on the restriction
- 2111 on a reusable semantic building block for the exchange of business-related
- 2112 information.
- 2113 Controlled Vocabulary A supplementary vocabulary to define uniquely any words
- 2114 or business terms that are potentially ambiguous. This is to ensure that every word
- 2115 within any of the *Core Component* names and definitions is used in a consistent and
- 2116 unambiguous way and this will also aid accurate language translations.
- 2117 *Core Component (CC)* A building block for the creation of a semantically correct
 2118 and meaningful information exchange 'parcel'. It contains only the information pieces
 2119 necessary to describe a specific concept.
- 2120 *Core Component Administrative Information* Administrative information
- 2121 regarding a Core Component
- 2122 *Core Component Association Information* Information about the association
 2123 between two *Core Components*.
- 2124 *Core Component Catalogue* The temporary collection of all metadata about each
- 2125 Core Component that has been discovered during the development and initial testing
- 2126 of this Core Component Technical Specification, pending the establishment of a
- 2127 permanent Repository.

- 2128 Core Component Change History History of the modifications applied to a Core
 2129 Component version.
- 2130 *Core Component Library* The *Core Component Library* is that part of the
- 2131 Repository (the elusive ARK of ebXML mythology) in which Core Components shall
- 2132 be stored as *Repository Elements*. *The Core Component Library* will contain all the
- 2133 Core Component Types, Basic Core Components, Aggregate Core Components, Basic
- 2134 Business Information Entities and Aggregate Business Information Entities.
- 2135 *Core Component Replacement Information* Information about the replacement of a
 2136 *Core Component* by another.
- 2137 *Core Component Representation Information* Information about the physical representation of a *Core Component* in a particular syntax.
- 2139 *Core Component Status Information* History of the lifecycle of a particular version
 2140 of a *Core Component*.
- 2141 Core Component Type (CCT)- A Core Component that consists of one and only one
- 2142 *Content Component* that carries the actual content plus one or more supplementary
- 2143 components giving an essential extra definition to the content component. Core
- 2144 *Component Types* do not have business meaning.
- 2145 *Data Type* Defines the set of valid values that can be used for a particular *Basic*
- 2146 Core Component. It is defined by specifying restrictions on the Core Component Type
- that forms the basis of the *Representation Term* from which the *Data Type* is derived.
- 2148 *Definition -* This is the unique semantic business meaning of a *Core Component*,
- 2149 Business Information Entity or Business Context.
- 2150 *Dictionary Entry Name* This is the unique official name of a *Core Component*,
- 2151 Business Information Entity or Business Context in the dictionary.
- 2152 *Information Entity* A reusable semantic building block for the exchange of
- 2153 business-related information.
- 2154 *Object Class* The logical data grouping (in a logical data model) to which a data
- 2155 element belongs (ISO11179). The Object Class is the part of a Core Component's
- 2156 *Dictionary Entry Name* that represents an activity or object in a specific context.
- 2157 *Primitive Type* Primitive type used for the representation of the value of a
- Supplementary Component. Possible values are String, Decimal, Integer, Boolean,
 Date.
- Property Term This identifies one of the characteristics belonging to the Object
 Class.

UN/CEFACT Core Components Technical Specification V1.8

- 2162 **Qualifier Term** A word or words which help to define and differentiate a Business
- 2163 Information Entity from its associated Core Component and other Business
- 2164 Information Entities.
- 2165 *Repository Element* The formal definition of all the information that is needed to be
- 2166 recorded in the Repository about a *Core Component* or a *Business Information Entity*.
- 2167 *Representation Term* The type of valid values for a *Basic Core Component*.
- 2168 Supplementary Component –Gives meaning to the Content Component in the Core
 2169 Component Type.
- 2170 Usage Rules Usage Rules describe how and/or when to use the Repository Element.
- 2171 User Community A user community is a group of practitioners, with a publicised
- 2172 contact address, who may define context profiles relevant to their area of business.
- 2173 Users within the community do not create, define or manage their individual context
- 2174 needs but conform to the community's standard. Such a community should liase
- closely with other communities and with general standards-making bodies to avoid
- 2176 overlapping work and to avoid creating multiple *Towers of Babel*. A community may,
- 2177 of course, be as small as two consenting organisations.
- 2178 *XML schema* A generic term used to identify the family of grammar based XML
- 2179 document structure validation languages to include the more formal W3C XML
- 2180 Schema Technical Specification, Document Type Definition, Schematron, Regular
- 2181 Language Description for XML (RELAX), and the OASIS RELAX NG.
