

# Web Services Business Process Execution Language (WS-BPEL)

Dieter König, IBM  
[dieterkoenig@de.ibm.com](mailto:dieterkoenig@de.ibm.com)

Second Annual OASIS Adoption Forum  
London, October 17, 2005

# Outline

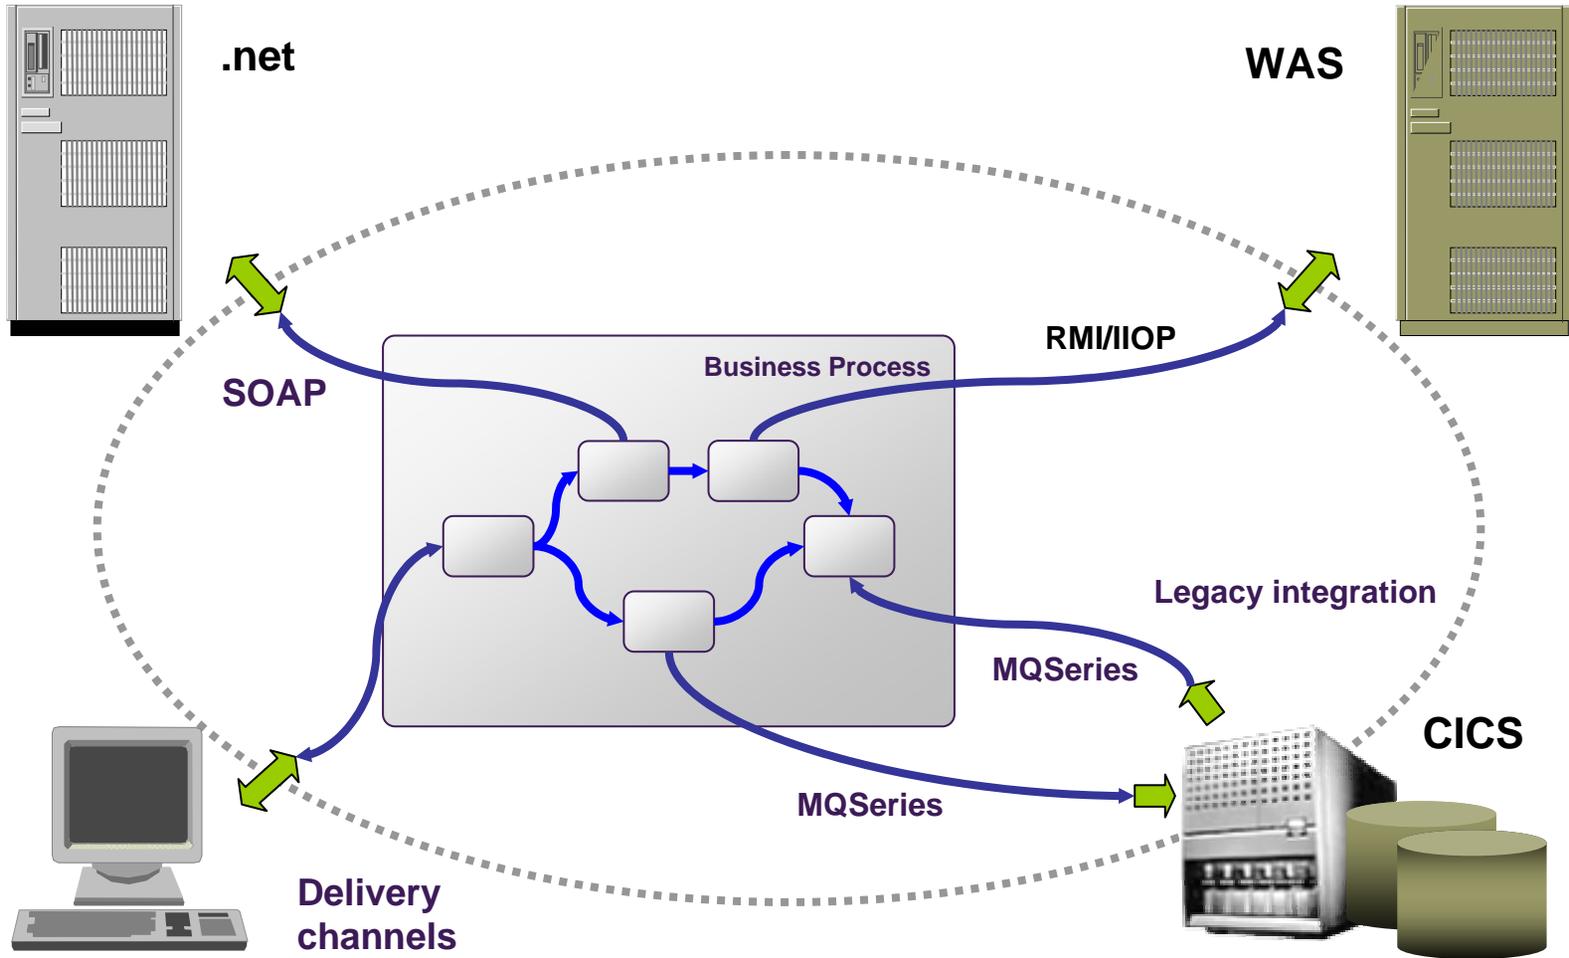

- Motivation
- OASIS and WS-BPEL
- Main Concepts
- Examples
- Status and support

# Motivation

- Application integration is a key problem facing businesses
  - Intra enterprise integration (Enterprise Application Integration)
  - Integrating with partners (Business Process Integration)
- Web services → move towards service-oriented computing
  - Applications are viewed as “services”
  - Loosely coupled, dynamic interactions
  - Heterogeneous platforms
  - No single party has complete control
- Service composition
  - How do you compose services in this domain?

# Application Integration

# Two-level Programming Model

- Programming in the large
  - Non-programmers implementing flows
    - Flow logic deals with combining functions in order to solve a more complex problem (such as processing an order)
- Programming in the small
  - Programmers implementing functions
    - Function logic deals with a discrete fine-grained task (such as retrieving an order document or updating a customer record)

# Process Usage Patterns

- Aiming for a single approach for both ...
  - Executable processes
    - Contain the partner's business logic behind an external protocol
  - Abstract processes
    - Define the publicly visible behavior of some or all of the services an executable process offers
    - Define a process template embodying domain-specific best practices

# Process Model Requirements

- Portability and Interoperability
- Flexible Integration
  - Rich, and easily adaptable to changes in the services it is interacting with
- Recursive, type-based composition, enables ...
  - third-party composition of existing services
  - providing different views on a composition to different parties
  - inter-workflow interaction
  - increased scalability and reuse
- Separation and composability of concerns
  - Decoupled from the supporting mechanisms (quality of service, messaging frameworks)
- Stateful conversations and lifecycle management
  - Can carry multiple stateful long-running conversations
- Recoverability
  - Business processes, and in particular long running ones, need a way to build-in fault handling and compensation mechanisms to handle and recover from errors

# WS-BPEL

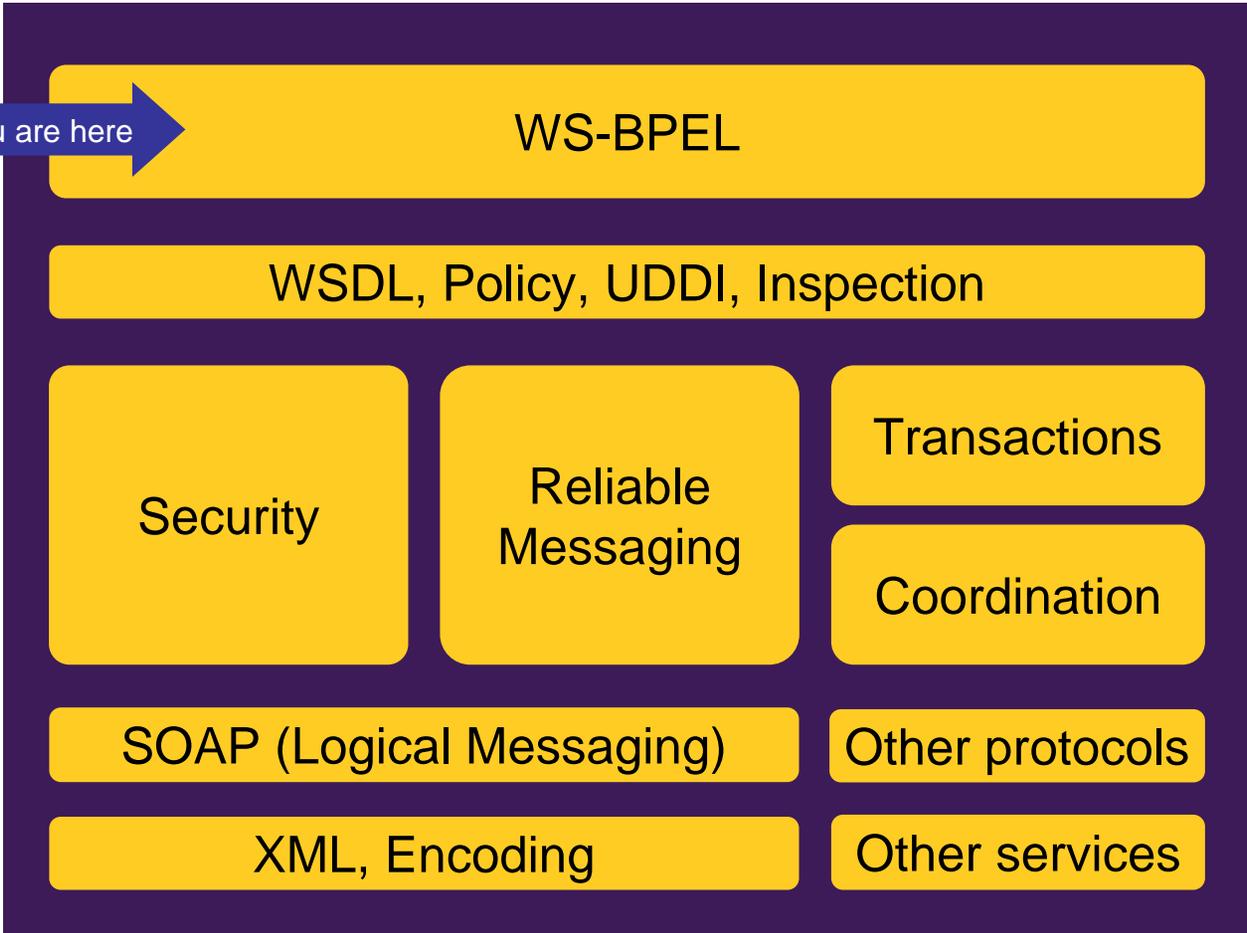

- WS-BPEL enables ...
  - Defining business processes as coordinated sets of Web service interactions, recursively into new aggregated Web services
  - Defining both abstract and executable processes
    - Abstract processes for e-commerce specifications
    - Executable processes provide a model to integrating enterprise applications
  - Creating compositions of Web services
    - Composition based on abstract descriptions
- WS-BPEL provides portable, interoperable process models
- WS-BPEL comes from ...
  - Strong roots in traditional flow models
  - Plus many concepts from structured programming languages
  - All laid on top of WSDL and core XML specifications
  - Merges WSFL and XLANG concepts

# WS-BPEL Specifications

- BPEL4WS 1.0 (7/2002)
  - Original proposal from BEA, IBM, Microsoft
  - Combined ideas from IBM's WSFL and Microsoft's XLANG
- BPEL4WS 1.1 (5/2003)
  - Revised proposal submitted to OASIS
  - With additional contributions from SAP and Siebel
- WS-BPEL 2.0 Committee Draft Specifications
  - Currently in OASIS undergoing standardization

# WS-BPEL in the WS-\* Stack

Business Processes

Description

Quality Of Service

Transport and Encoding

# Outline

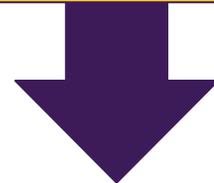

- Motivation
- OASIS and WS-BPEL
- Main Concepts
- Examples
- Status and support

# Getting the Players Together

(\*)

BPEL4WS 1.1

(\*) BPEL4WS 1.1 authors

# OASIS Technical Committee

- Over 250 committee members, incl. observers
  - 44 Active voting members, attending weekly calls
- Work on WS-BPEL (TC Charter)
  - Standardize it 😊
  - Focus on
    - Common concepts for a business process execution language for usage patterns including both the process interface descriptions and executable process models
  - Explicitly **do not** address
    - Bindings to specific hardware/software platforms and other mechanisms required for a complete runtime environment for process implementation

# OASIS Technical Committee

- Issues Process
  - List of all issues available at [http://www.choreology.com/external/WS\\_BPEL\\_issues\\_list.html](http://www.choreology.com/external/WS_BPEL_issues_list.html)
  - Issue discussion
    - Weekly calls
    - Quarterly face to face meetings
- Status
  - Deadlines (need 2/3 majority to override)
    - No new feature issues since Aug 15, 2004
    - No new feature issue resolution proposals since April 1, 2005
    - Feature issues that are not resolved are marked as revisitable
  - Latest approved committee draft: September 2005

# WS-BPEL Design Goals

- Business processes defined using an **XML-based language**
- **Web services** are the model for process decomposition and assembly
- **The same orchestration concepts** are used for both the **external** (abstract) and **internal** (executable) views of a business process
- Both **hierarchical and graph-like** control regimes are used, reducing the fragmentation of the process modeling space
- An **identification mechanism for process instances** is provided at the application message level
- The **basic lifecycle mechanism** is in implicit creation and termination of process instances.
- A long-running transaction model is defined to support **failure recovery** for parts of long-running business processes
- Language built on **compatible Web services standards in a composable and modular manner**

# Outline

- Motivation
- OASIS and WS-BPEL
- Main Concepts
- Examples
- Status and support

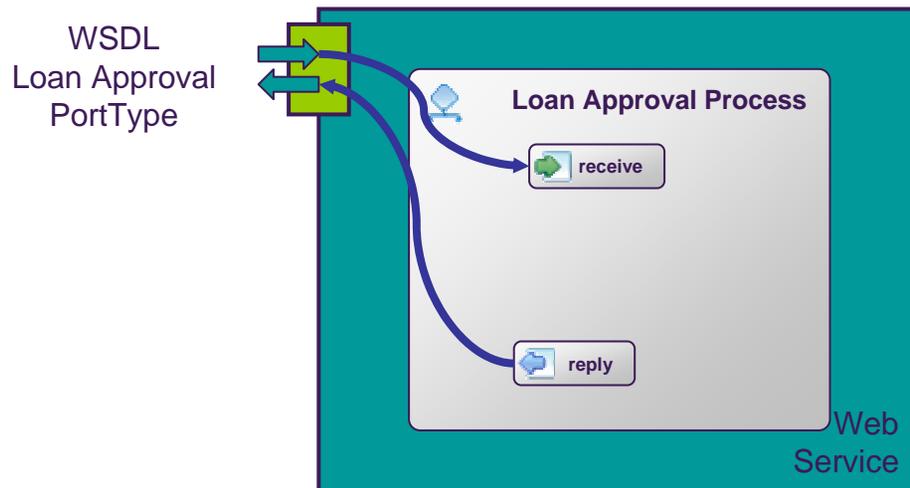

# WS-BPEL Language Structure

- Process
- Partner links
- Data handling
- Properties and correlation
- Basic and structured activities
- Scopes

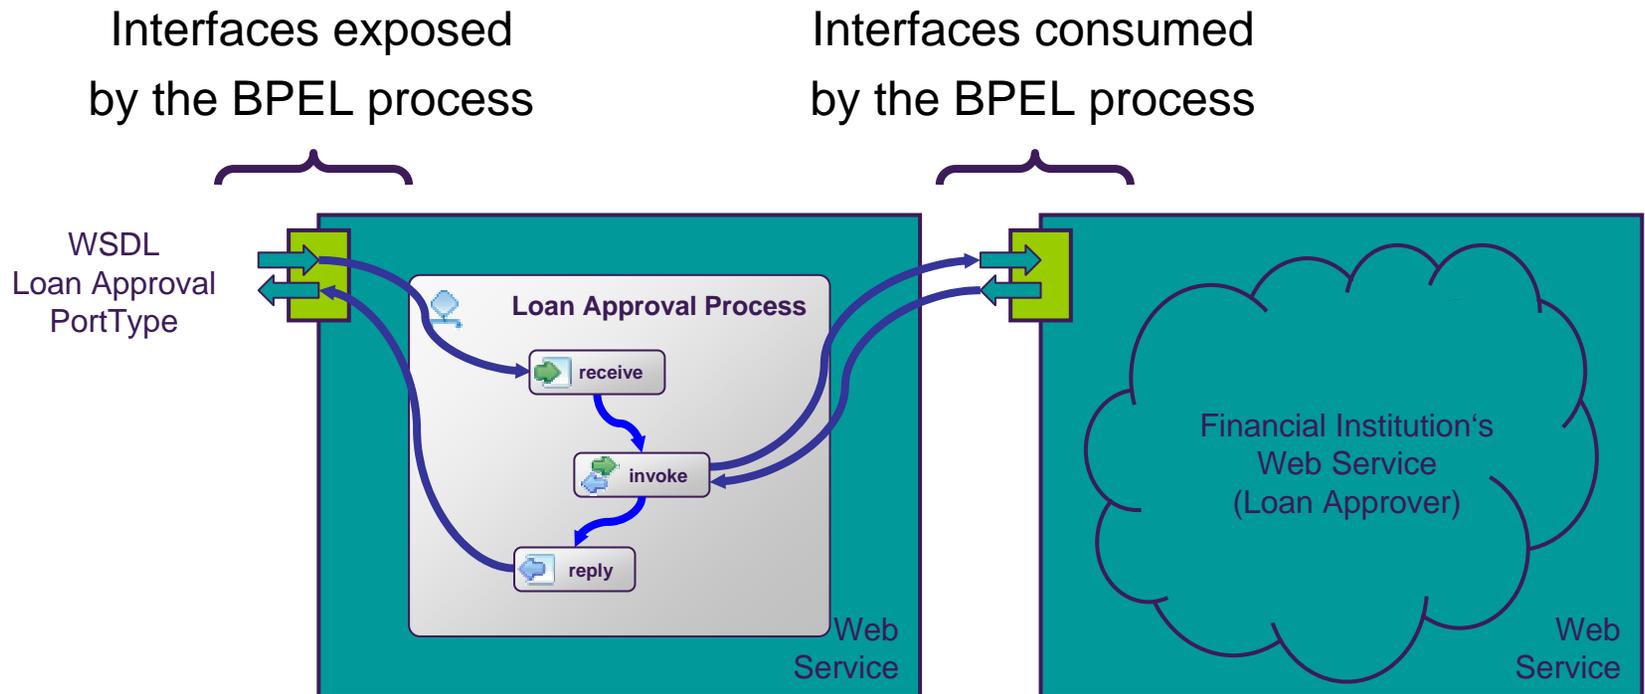

# BPEL and WSDL

- BPEL processes are exposed as WSDL services
  - Message exchanges map to WSDL operations
  - WSDL can be derived from partner definitions and the role played by the process in interactions with partners

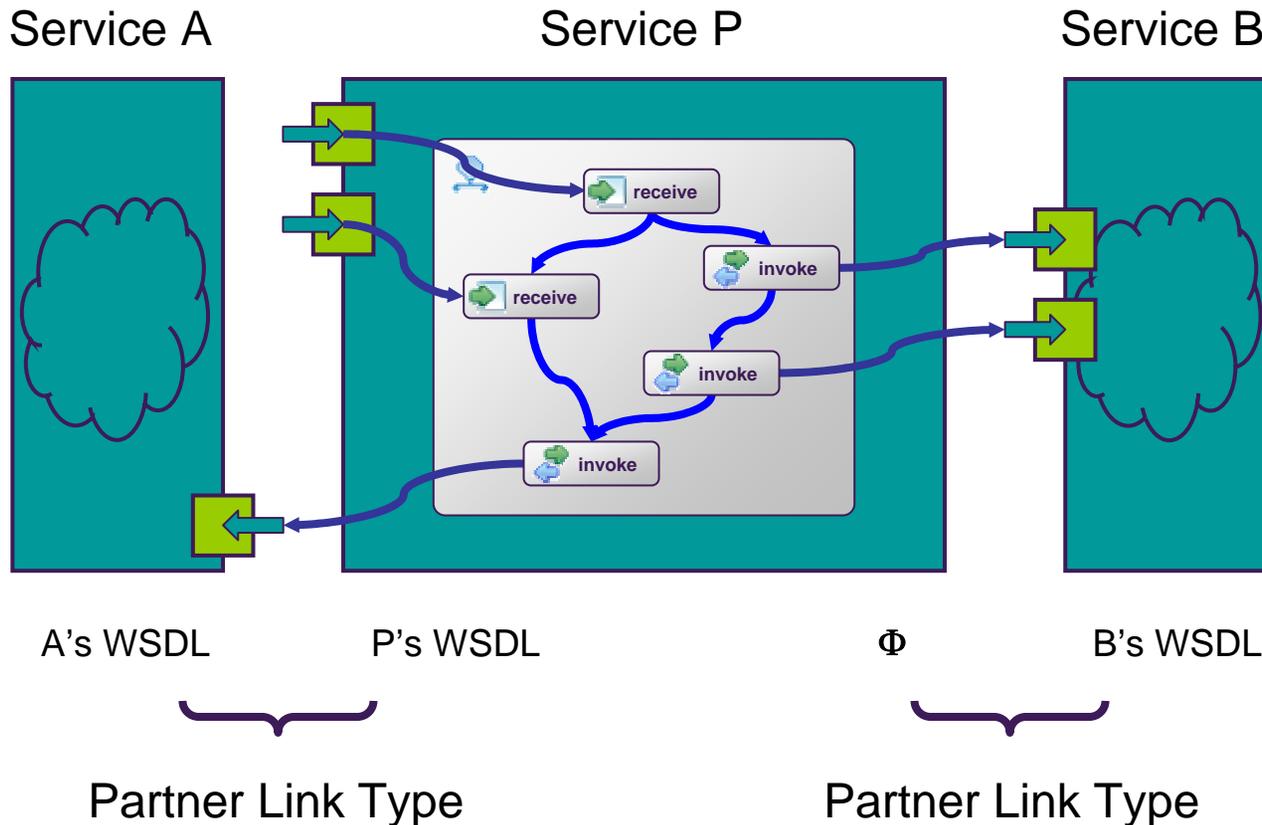

# Recursive Composition

- BPEL processes interact with WSDL services exposed by business partners

# Composition of Web Services

# Partner Links

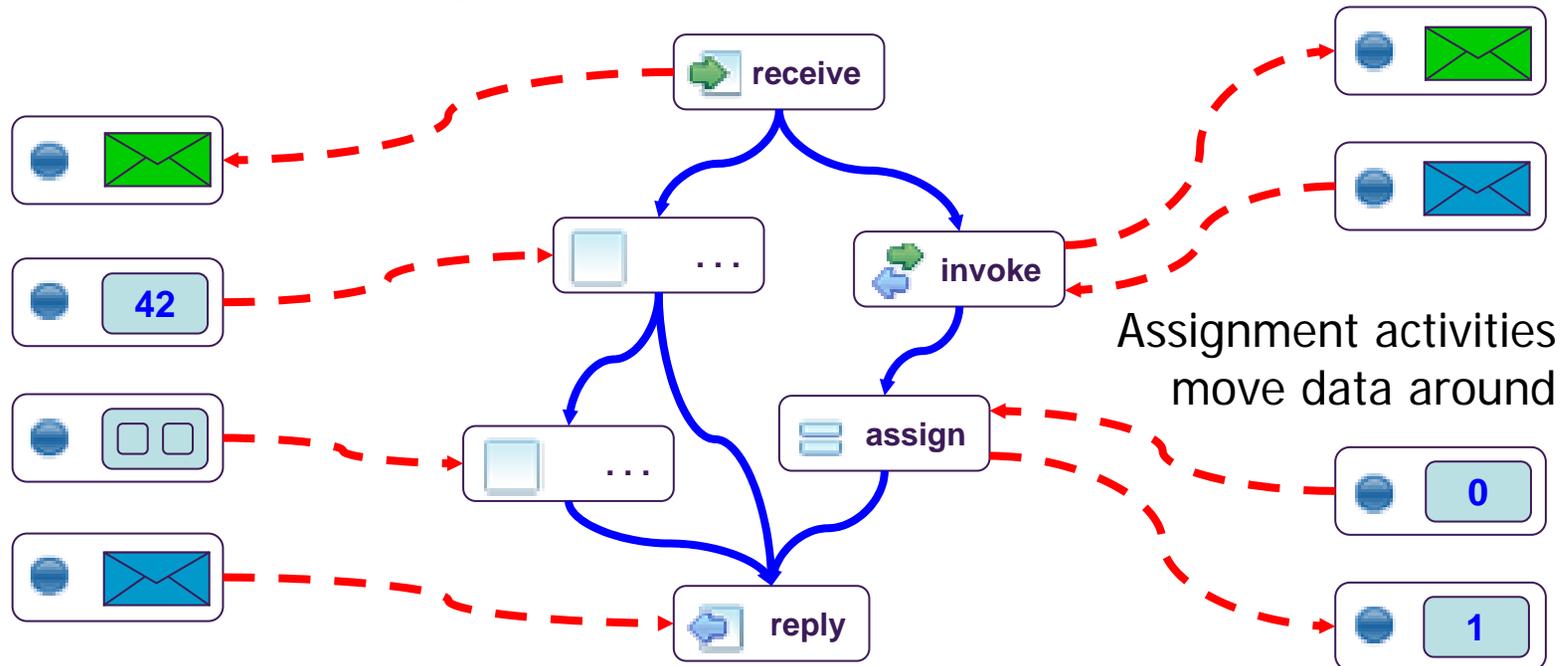

- Partner link: instance of typed connector
  - Partner link type specifies required and/or provided portTypes
  - Channel along which a peer-to-peer conversation with a partner takes place

# BPEL Data Model: Variables

Scoped variables typed as  
WSDL messages or  
XML Schema elements/types

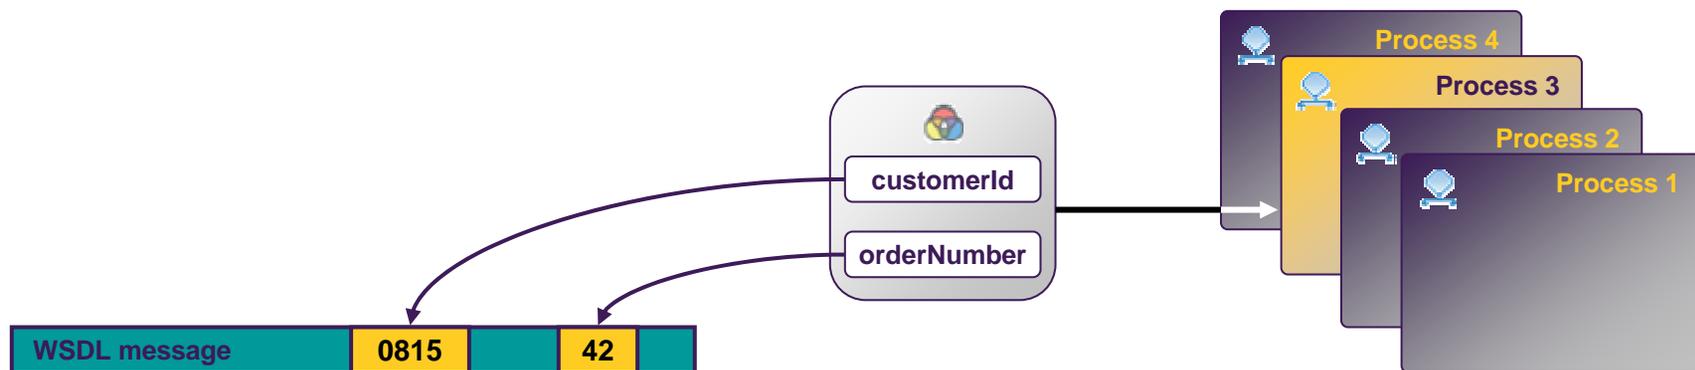

Activities' input and output  
kept in scoped variables

Assignment activities  
move data around

# Properties and Correlation

- Messages in long-running conversations are correlated to the correct process instance
  - Typed properties defined in WSDL are named and mapped (aliased) to parts of several WSDL messages used by the process

# Basic Activities

 <b>receive</b>	Do a blocking wait for a matching message to arrive	 <b>throw</b>	Generate a fault from inside the business process
 <b>reply</b>	Send a message in reply to a formerly received message	 <b>rethrow</b>	Forward a fault from inside a fault handler
 <b>invoke</b>	Invoke a one-way or request-response operation	 <b>exit</b>	Immediately terminate execution of a business process instance
 <b>assign</b>	Update the values of variables or partner links with new data	 <b>wait</b>	Wait for a given time period or until a certain time has passed
 <b>validate</b>	Validate XML data stored in variables	 <b>compensate</b>	Invoke compensation on an inner scope that has already completed
 <b>empty</b>	A “no-op” instruction for a business process		

# Structured Activities

**flow**

Contained activities are executed in parallel, partially ordered through control links

**pick**

Block and wait for a suitable message to arrive (or time out)

**if then else**

Select exactly one branch of activity from a set of choices

**forEach**

Contained activity is performed sequentially or in parallel, controlled by a specified counter variable

**while**

Contained activity is repeated while a predicate holds

**sequence**

Contained activities are performed sequentially in lexical order

**repeatUntil**

Contained activity is repeated until a predicate holds

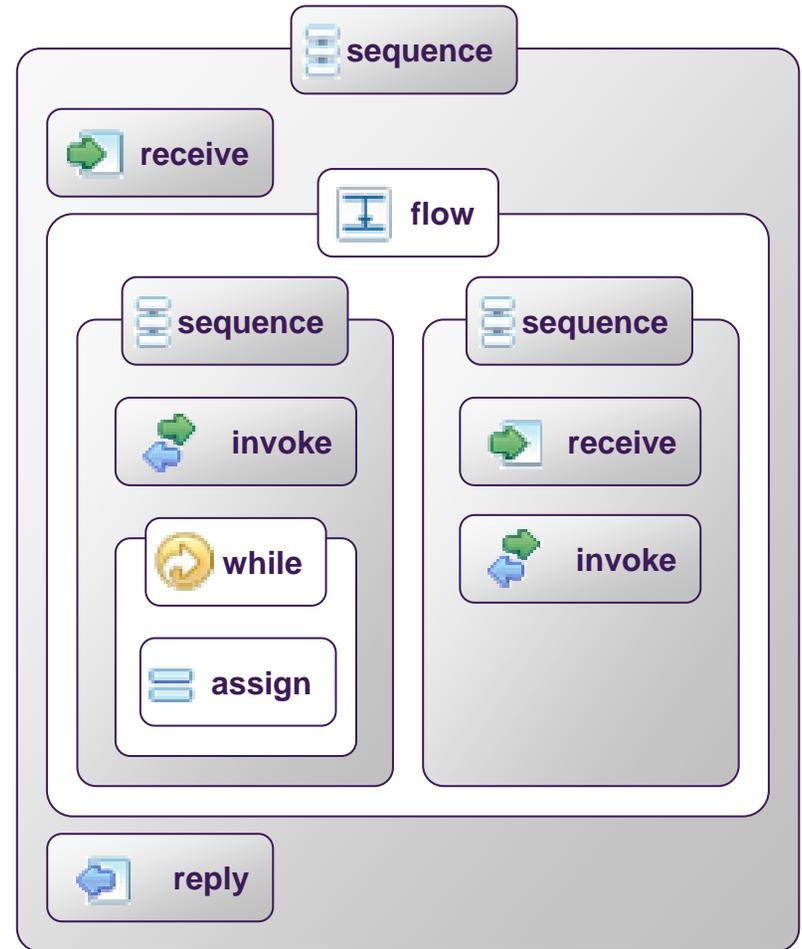

**scope**

Associate contained activity with its own local variables, fault handlers, compensation handler, and event handlers

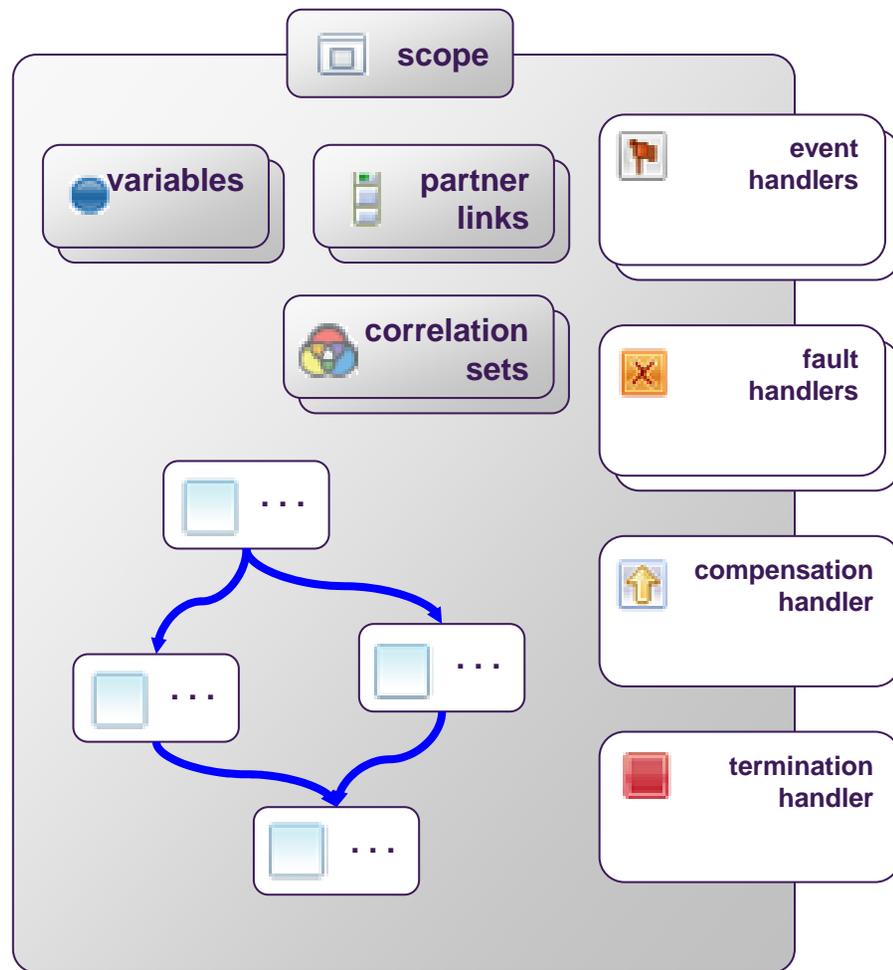

# Nesting Structured Activities

```
<sequence>
  <receive .../>
  <flow>
    <sequence>
      <invoke .../>
      <while ... >
        <assign>...</assign>
      </while>
    </sequence>
    <sequence>
      <receive .../>
      <invoke ... >
    </sequence>
  </flow>
  <reply>
</sequence>
```

# Scopes and Handlers

- Scope
  - Set of activities (basic or structured)
  - Local variables
  - Local correlation sets
  - Local partner links
- Handlers
  - Event handlers
    - Message events or timer events (deadline or duration)
  - Fault handlers
    - Dealing with different exceptional situations (internal faults)
  - Compensation handler
    - Undoing persisted effects of already completed activities
  - Termination handler
    - Dealing with forced scope termination (external faults)

# Process Instance Lifecycle

- Business processes defined in BPEL represent stateful Web services
  - When a process is started, a new instance is created
  - The creation and destruction of BPEL process instances is by design implicit

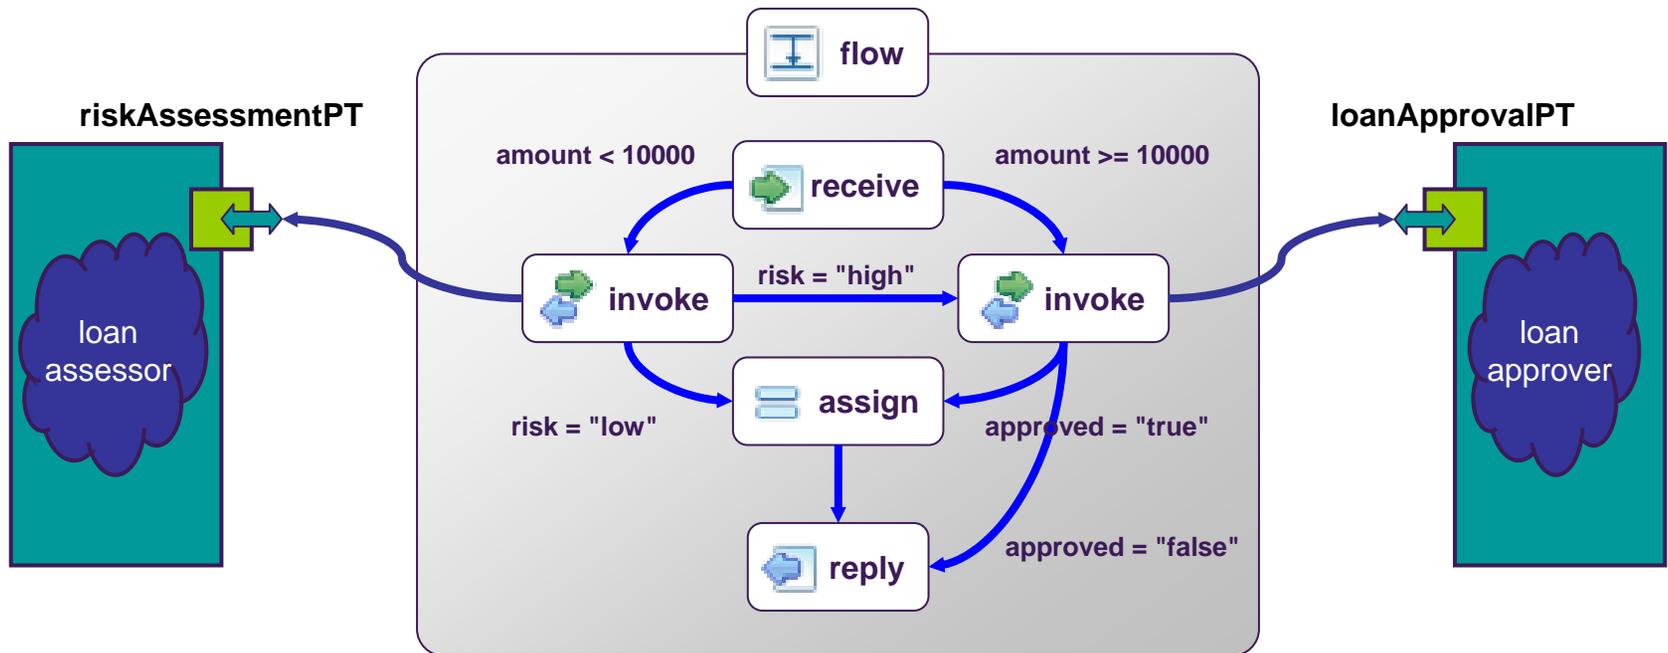

# Outline

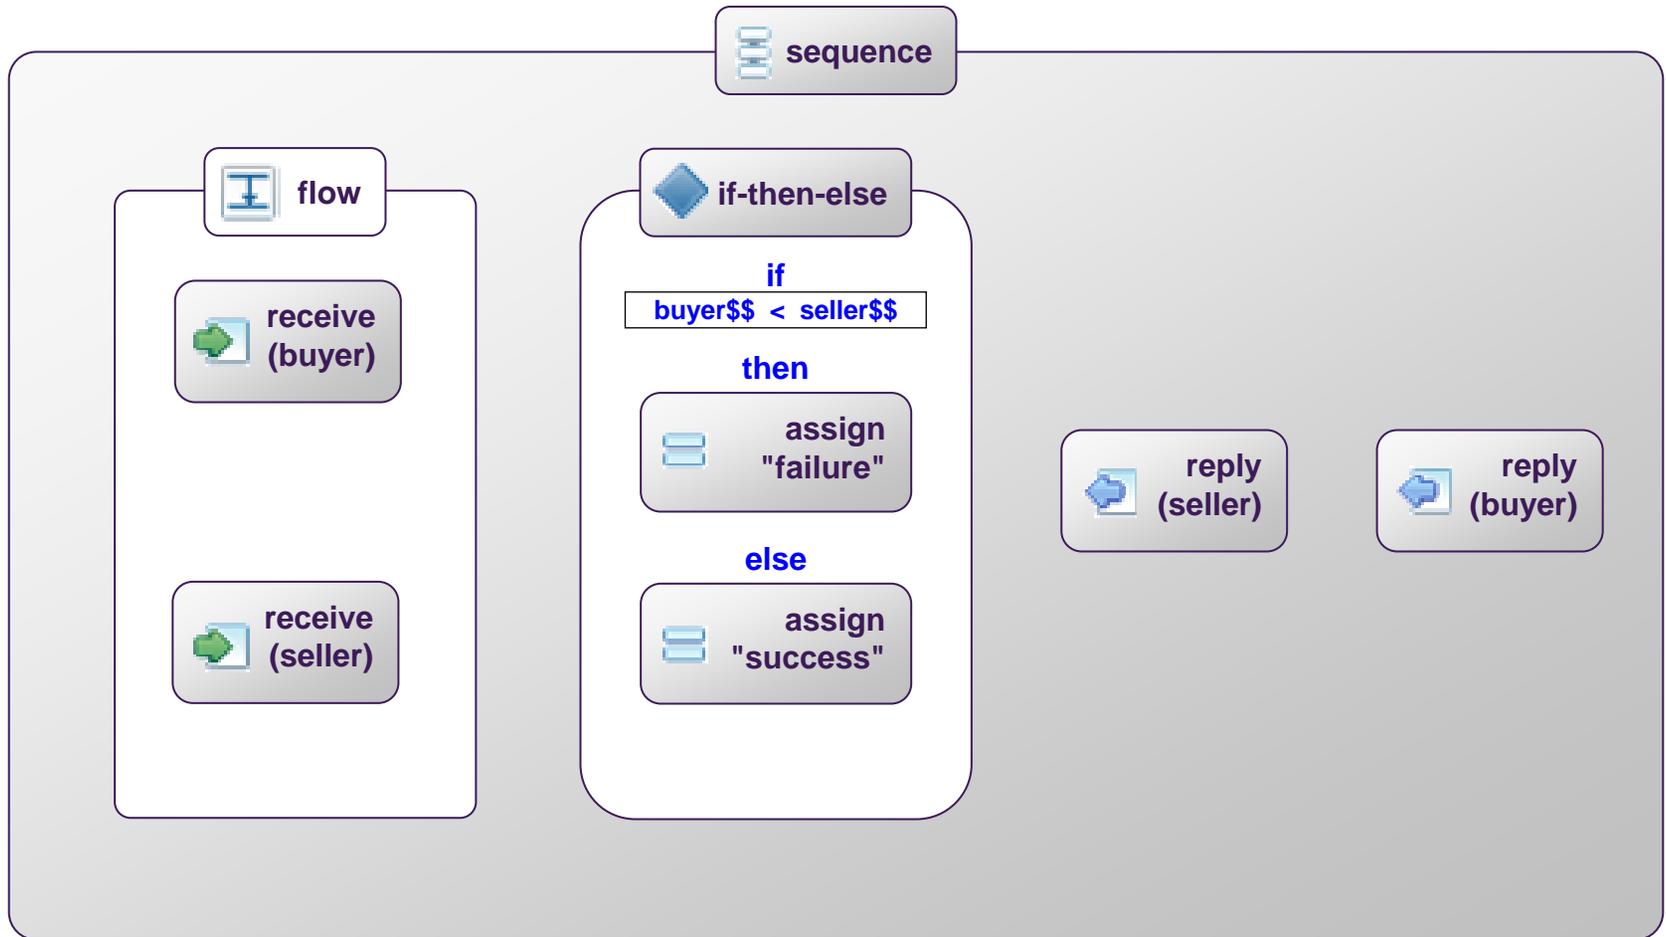

- Motivation
- OASIS and WS-BPEL
- Main Concepts
- Examples
- Status and support

# Graph-Oriented Authoring Style

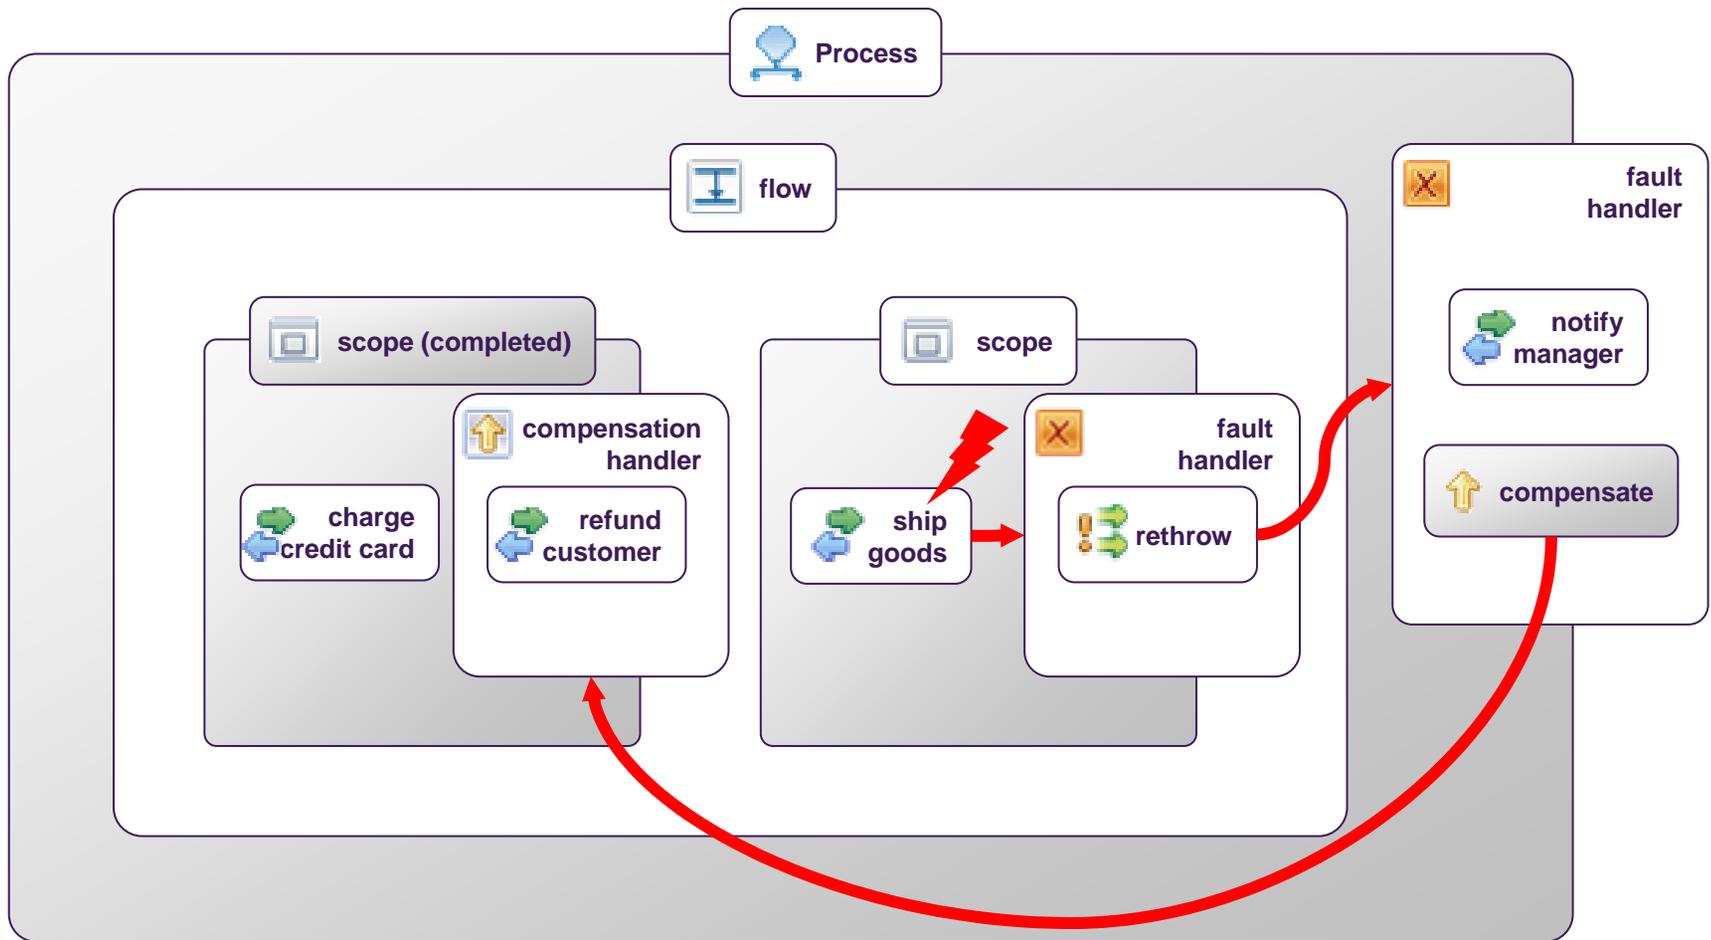

1. A customer asks for a loan, providing name and amount info
2. Two services are involved:
  - a) A risk assessor which can approve the loan if the risk is low
  - b) A loan approver which checks the name and approves/disapproves the loan
3. The reply is returned to the customer

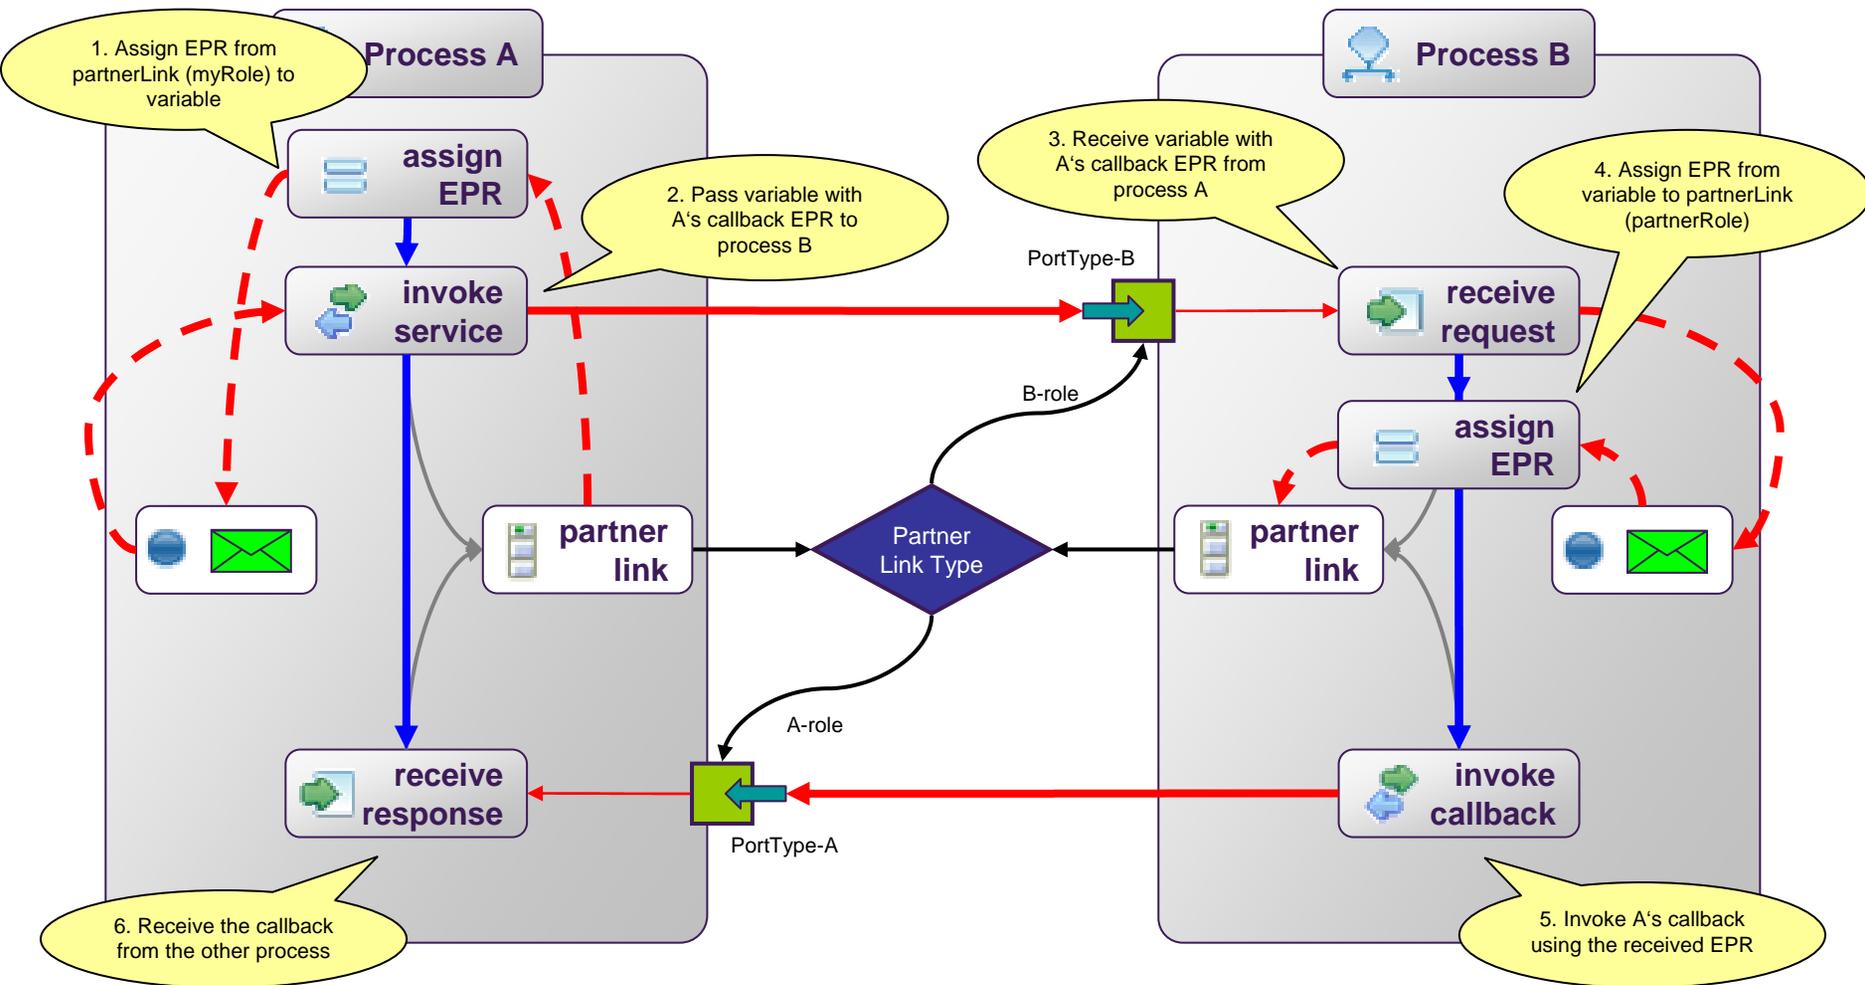

# Structured Authoring Style

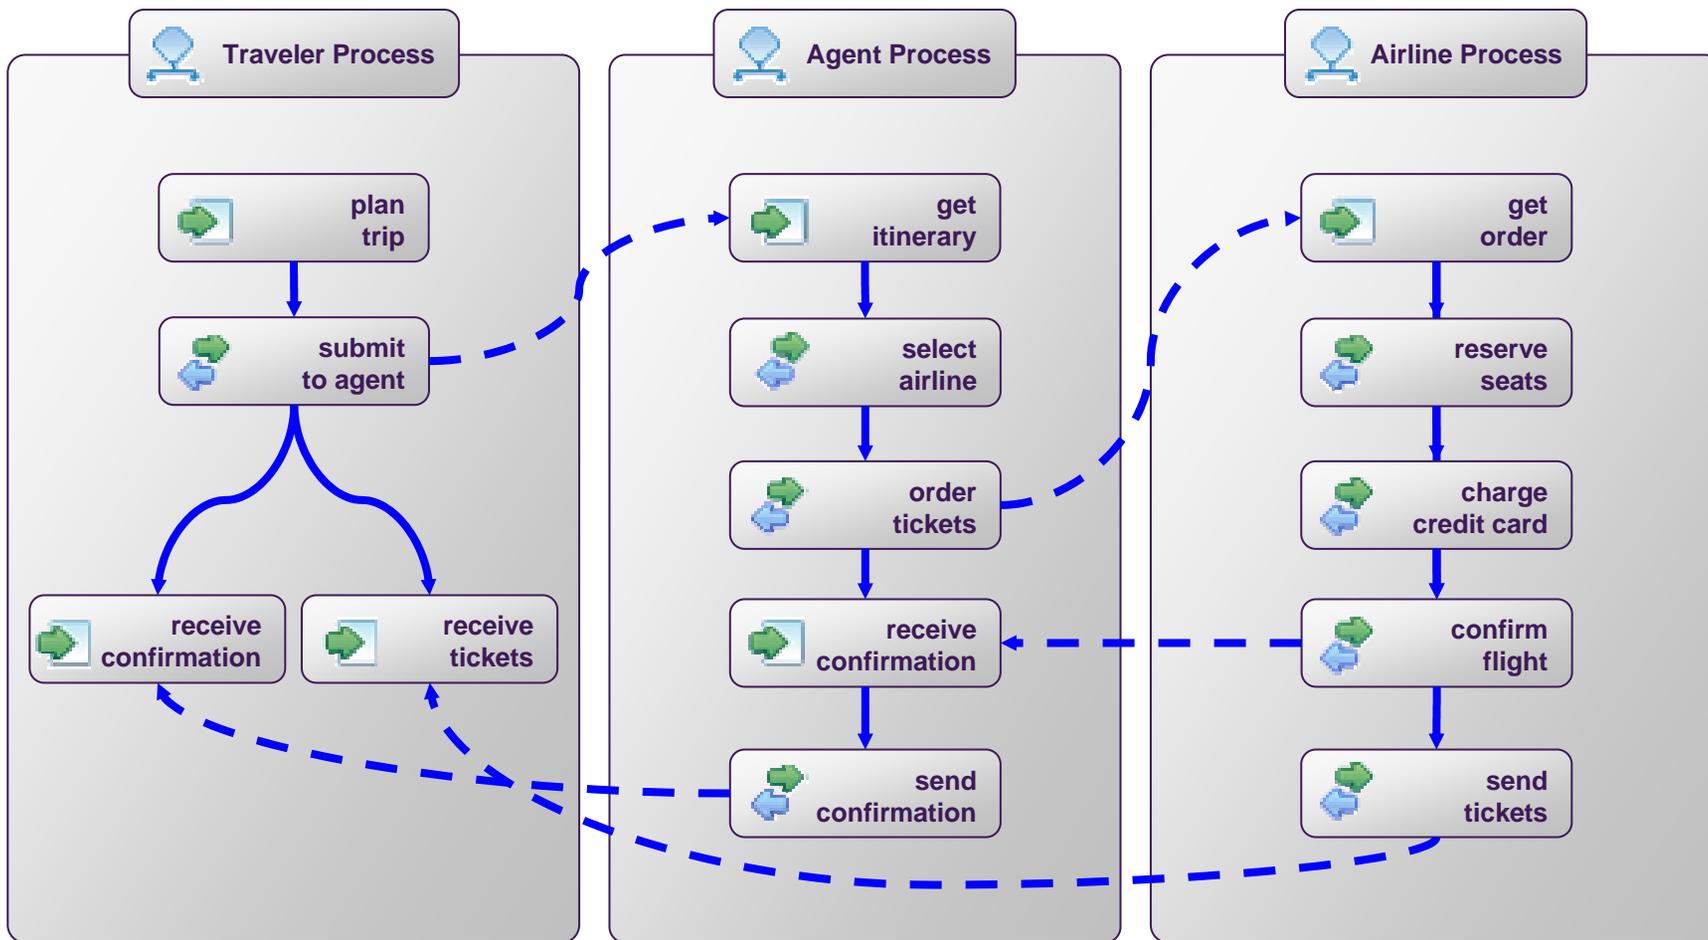

# Fault Handling and Compensation

# BPEL Partner Link Assignment

# Executable Processes View

# Outline

- Motivation
- OASIS and WS-BPEL
- Main Concepts
- Examples
- Status and support

# WS-BPEL

- Portable, interoperable process model for long running business processes
- Flexible integration of Web services
  - WSDL abstract interfaces alone used to define composition
    - Enables two levels of adaptive behavior
      - Abstract partners can be bound to actual services at runtime
      - The process can choose a protocol for communicating with the service at runtime
  - Services whose data definitions do not match can be composed
    - Data transformations can be inlined in process definition

# WS-BPEL Adoption: Products

- Active Endpoints ActiveWebflow Server
- ActiveBPEL Engine (open source)
- bexee BPEL Execution Engine (open source)
- Cape Clear Orchestrator
- FiveSight PXE
- IBM WebSphere Business Integration – Server Foundation 5.1
- IBM WebSphere Process Server 6.0
- OpenLink Virtuoso Universal Server
- OpenStorm ChoreoServer
- Oracle BPEL Process Manager
- Parasoft BPEL Maestro
- SeeBeyond eInsight BPM
- Twister (open source)

# WS-BPEL Application Areas

- Business Process Design
- Autonomic Computing
- Grid Computing
- Semantic Web

# What's new since BPEL4WS 1.1?

- Activities: if-then-else, repeatUntil, validate, forEach
- Extension activity
- Completion condition in forEach activity
- Variable initialization
- XPath access to variable data  
`$variable[.part]/location`
- XML schema variables for WS-I compliant doc/lit-style WS interactions
- Locally declared messageExchange for correlating receive and reply activities
- Abstract processes – common base and profiles

# WS-BPEL 2.0 To-Do List

- Important open issues
  - Miscellaneous specification clarifications
  - Abstract processes
    - Common base (syntax)
    - Profiles (semantics)
      - Externally observable behavior (as in BPEL4WS 1.1)
      - Templating

# Next Steps & Future Direction

- Human user interactions – BPEL4People (as known from existing workflow engines)  
<http://www-128.ibm.com/developerworks/webservices/library/specification/ws-bpel4people/>
- Subprocesses
  - Based on a coordination protocol
- Transaction semantics
- Currency with related standards
  - WSDL 2.0, XQuery, etc.
