30

This version of the errata is a working draft of the committee. As such, it may change prior to incorporation into a future OASIS Standard. Please send comments to the editors. If you are on the wss@lists.oasis-open.org list for committee members, send comments there. If you are not on that list, subscribe to the wss-comment@lists.oasis-open.org list and send comments there. To subscribe, send an email message to wss-comment-request@lists.oasis-open.org with the word "subscribe" as the body of the message. For patent disclosure information that may be essential to the implementation of this specification, and any offers of licensing terms, refer to the Intellectual Property Rights section of the OASIS Web Services Security Technical Committee (WSS TC) web page at <http://www.oasis-open.org/committees/wss/ipr.php>. General OASIS IPR information can be found at <http://www.oasis-open.org/who/intellectualproperty.shtml>.

46 1 Issues Addressed

47 The following issues have been addressed in this document:

48

ISSUE	DESCRIPTION
259	Editorial comments on Username Token profile - post v1 review period.

49 2 Typographical Errors

50

51 None

52

3 Normative Errors

53

3.1 Section 2.2 Namespaces

54

Add the following after line 81

55

URI fragments defined in WSS: Username Token Profile 1.0 are relative to a base URI of

56

`http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-username-`

57

`token-profile-1.0`

58

3.2 Section 3.1 Usernames and Passwords

59

Delete the following line (89):

60

Passwords of type `wsse:PasswordText` and `wsse:PasswordDigest` are not limited to

61

and replace it with:

62

Passwords of type `PasswordText` and `PasswordDigest` are not limited to

63

64

Delete the following lines (91-93):

65

Having a type of `wsse:PasswordText`, `wsse:PasswordDigest` merely implies that the information held in the password is "in the clear"...

66

and replace it with:

67

Having a type of `PasswordText` merely implies that the information held in the password is "in the clear" ...

68

69

70

71

Delete the following line (98):

72

Passwords of type `wsse:PasswordText` and `wsse:PasswordDigest` are defined as being

73

and replace it with:

74

Passwords of type `PasswordDigest` are defined as being

75

76

Delete the following line (101-102):

77

the digest offers no real additional security over use of `wsse:PasswordText` and

78

`wsse:PasswordDigest`.

79

and replace it with:

80

the digest offers no real additional security over use of `PasswordText`.

81

82

Delete the following line (132):

83

Note that `wsse:PasswordDigest` can only be used if the plain text password (or password

84

password

85

and replace it with:

86

Note that `PasswordDigest` can only be used if the plain text password (or password

87

88

Delete the following line(235):

89

"ValueType attribute is not required. If specified, the value of `<wsse:UsernameToken>` MUST"

90

MUST"

91

and replace it with:

92

"ValueType attribute is not required. If specified, the value of `#UsernameToken` MUST"

93

3.3 Section 3.2 Token Reference

94

Delete the following line(235):

95

`ValueType` attribute is not required. If specified, the value of `<wsse:UsernameToken>`

96

MUST

97

and replace it with:

98
99

ValueType attribute is not required. If specified, the value of #UsernameToken MUST

100 3.4 Section 3.4 Key Derivation (new)

101 Add the following as new section after line 257:

102 The password associated with a username may be used to derive a shared secret key for
103 the purposes of integrity or confidentiality protecting message contents. This section
104 defines schema extensions and a procedure for deriving such keys. This procedure
105 MUST be employed when keys are to be derived from passwords in order to insure
106 interoperability.

107 It must be noted that passwords are subject to several kinds of attack, which in turn will
108 lead to the exposure of any derived keys. This key derivation procedure is intended to
109 minimize the risk of attacks on the keys, to the extent possible, but it is ultimately limited
110 by the insecurity of a password that it is possible for a human being to remember and
111 type on a standard keyboard. This is discussed in more detail in the security
112 considerations section of this document.

113 Two additional elements are required to enable derivation of a key from a password.
114 They are <wsse:Salt> and <wsse:Iteration>. These values are not secret and
115 MUST be conveyed in the Username token when key derivation is used. When key
116 derivation is used the password MUST NOT be included in the Username token. The
117 receiver will use its knowledge of the password to derive the same key as the sender.

118 The following illustrates the syntax of the <wsse:Salt> and <wsse:Iteration>
119 elements.

```
120 <wsse:UsernameToken wsse:Id="..." >  
121   <wsse:Username>...</wsse:Username>  
122   <wsse:Salt>...</wsse:Salt>  
123   <wsse:Iteration>...</wsse:Iteration>  
124 </wsse:UsernameToken>
```

125 The following describes these elements.

126 /wsse:UsernameToken/wsse:Salt

127 This element is combined with the password as described below. Its value is a 128 bit
128 number expressed in hexadecimal. It MUST be present when key derivation is used.

129 /wsse:UsernameToken/wsse:Iteration

130 This element indicates the number of times the hashing operation is repeated when
131 deriving the key. It is expressed as a decimal value. If it is not present, a value of 1000
132 is used for the iteration count.

133 A key derived from a password may be used either in the calculation of a Message
134 Authentication Code (MAC) or as a symmetric key for encryption. When used in a MAC,
135 the key length will always be 160 bits. When used for encryption, an encryption algorithm
136 MUST NOT be used which requires a key of length greater than 160 bits. A sufficient
137 number of the high order bits of the key will be used for encryption. Unneeded low order
138 bits will be discarded. For example, if the AES-128 algorithm is used, the high order 128
139 bits will be used and the low order 32 bits will be discarded from the derived 160 bit
140 value.

141 The <wsse:Salt> element is constructed as follows. The high order 8 bits of the Salt
142 will have the value of 01 if the key is to be used in a MAC and 02 if the key is to be used
143 for encryption. The remaining 120 low order bits of the Salt should be a random value.

144 The key is derived as follows. The password and Salt are concatenated in that order.
145 Only the actual octets of the password are used, it is not padded or zero terminated. This
146 value is hashed using the SHA1 algorithm. The result of this operation is also hashed
147 using SHA1. This process is repeated until the total number of hash operations equals
148 the Iteration count.

149 In other words: $K1 = \text{SHA1}(\text{password} + \text{Salt})$

150 $K2 = \text{SHA1}(K1)$

151 ...

152
$$K_n = \text{SHA1} (K_{n-1}$$

153 Where + means concatenation and n is the iteration count.
154 The resulting 160 bit value is used in a MAC function or truncated to the
155 appropriate length for encryption.

156 **3.5 Section 4 Security Coniderations**

157 Add after line 282:
158 The security of keys derived from passwords is limited by the attacks available against
159 passwords themselves, such as guessing and brute force. Because of the limited size of
160 password that human beings can remember and limited number of octet values
161 represented by keys that can easily be typed, a typical password represents the
162 equivalent of an entropy source of a maximum of only about 50 bits. For this reason a
163 maximum key size of only 160 bits is supported. Longer keys would simply increase
164 processing without adding to security.
165 The key derivation algorithm specified here is based on one described in RFC 2898. It is
166 referred to in that document as PBKDF1. It is used instead of PBKDF2, because it is
167 simpler and keys longer than 160 bits are not required as discussed previously.
168 The purpose of the salt is to prevent the bulk pre-computation of key values to be tested
169 against distinct passwords. The Salt value is defined so that MAC and encryption keys
170 are guaranteed to have distinct values even when derived from the same password. This
171 prevents certain cryptanalytic attacks.
172 The iteration count is intended to increase the work factor of a guessing or brute force
173 attack, at a minor cost to normal key derivation. An iteration count of at least 1000 (the
174 default) SHOULD always be used.

175 **4 Non-Normative Errors**

176 None

177

5 Clarifications

178

179

The following table lists the full URI for each URI fragment referred to in the specification.

URI Fragment	Full URI
#PasswordDigest	http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-username-token-profile-1.0#PasswordDigest
#PasswordText	http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-username-token-profile-1.0#PasswordText
#UsernameToken	http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-username-token-profile-1.0#UsernameToken

Appendix B: Notices

185 OASIS takes no position regarding the validity or scope of any intellectual property or other rights
186 that might be claimed to pertain to the implementation or use of the technology described in this
187 document or the extent to which any license under such rights might or might not be available;
188 neither does it represent that it has made any effort to identify any such rights. Information on
189 OASIS's procedures with respect to rights in OASIS specifications can be found at the OASIS
190 website. Copies of claims of rights made available for publication and any assurances of licenses
191 to be made available, or the result of an attempt made to obtain a general license or permission
192 for the use of such proprietary rights by implementers or users of this specification, can be
193 obtained from the OASIS Executive Director.

194 OASIS invites any interested party to bring to its attention any copyrights, patents or patent
195 applications, or other proprietary rights which may cover technology that may be required to
196 implement this specification. Please address the information to the OASIS Executive Director.
