SAML Metadata Extension for a Standalone Attribute Requester

Committee Draft 01, 11 April 2005

Document identifier:
sssc-saml-metadata-ext-cd-01

Location:

Editors:
Tom Scavo (trscavo@gmail.com), individual
Scott Cantor (cantor.2@osu.edu), Internet2

Contributors:
Tom Wisniewski, Entrust

Abstract:
This specification defines an extension to the SAML V2.0 metadata specification [SAML2Meta]. The extension defines a role descriptor that describes a standalone SAML V1.x or V2.0 attribute requester, that is, an attribute requester not bound to a SAML single sign-on profile. Readers are advised to familiarize themselves with that specification before reading this one.

Status:
This is a Committee Draft approved by the Security Services Technical Committee on 15 April 2005.

Committee members should submit comments and potential errata to the security-services@lists.oasis-open.org list. Others should submit them by filling out the web form located at http://www.oasis-open.org/committees/comments/form.php?wg_abbrev=security. The committee will publish on its web page (http://www.oasis-open.org/committees/security) a catalog of any changes made to this document as a result of comments.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights web page for the Security Services TC (http://www.oasis-open.org/committees/security/ipr.php).

1 Introduction

This specification defines an extension to the SAML V2.0 metadata specification. The extension defines a role descriptor that describes a standalone SAML attribute requester, that is, an attribute requester not bound to a SAML single sign-on profile. The profile addresses both SAML V1.x and SAML V2.0.

Unless specifically noted, nothing in this document should be taken to conflict with the SAML V2.0 metadata specification [SAML2Meta]. Readers are advised to familiarize themselves with that specification before reading this one.

1.1 Notation

This specification uses normative text to define an extension to the SAML V2.0 metadata specification.

The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this specification are to be interpreted as described in [RFC 2119]:

...they MUST only be used where it is actually required for interoperation or to limit behavior which has potential for causing harm (e.g., limiting retransmissions)...

These keywords are thus capitalized when used to unambiguously specify requirements over protocol and application features and behavior that affect the interoperability and security of implementations. When these words are not capitalized, they are meant in their natural-language sense.

Listings of XML schemas appear like this.

Example code listings appear like this.

Conventional XML namespace prefixes are used throughout the listings in this specification to stand for their respective namespaces as follows, whether or not a namespace declaration is present in the example:

<table>
<thead>
<tr>
<th>Prefix</th>
<th>XML Namespace</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>saml:</td>
<td>urn:oasis:names:tc:SAML:2.0:assertion</td>
<td>This is the SAML V2.0 assertion namespace [SAML2Core].</td>
</tr>
<tr>
<td>md:</td>
<td>urn:oasis:names:tc:SAML:2.0:metadata</td>
<td>This is the SAML V2.0 metadata namespace [SAML2Meta].</td>
</tr>
<tr>
<td>mdext:</td>
<td>urn:oasis:names:tc:SAML:metadata:extension</td>
<td>This is the SAML V2.0 metadata extension namespace, defined by this document and its accompanying schema [MDext-XSD].</td>
</tr>
<tr>
<td>xsd:</td>
<td><a href="http://www.w3.org/2001/XMLSchema">http://www.w3.org/2001/XMLSchema</a></td>
<td>This namespace is defined in the W3C XML Schema specification [Schema1]. In schema listings, this is the default namespace and no prefix is shown.</td>
</tr>
<tr>
<td>xsi:</td>
<td><a href="http://www.w3.org/2001/XMLSchema-instance">http://www.w3.org/2001/XMLSchema-instance</a></td>
<td>This is the XML Schema namespace for schema-related markup that appears in XML instances [Schema1].</td>
</tr>
<tr>
<td>ds:</td>
<td><a href="http://www.w3.org/2000/09/xmldsig#">http://www.w3.org/2000/09/xmldsig#</a></td>
<td>This is the W3C XML Signature specification [XMLSig].</td>
</tr>
</tbody>
</table>

This specification uses the following typographical conventions in text: <SAMLElement>, <ns:ForeignElement>, Attribute, Datatype, OtherKeyword.
1.2 Motivating Use Cases

A primary SAML use case is browser single sign-on, but several non-browser use cases are emerging that incorporate a standalone attribute requester ([SAMLX509], [GridShib], [LionShare]). Such a role is not supported by [SAML2Meta]. This specification defines a new role descriptor type designed to support a typical non-browser scenario.

A SAML metadata extension that supports this use case is described in Section 2. Relevant references are listed in Section 3.
2 Metadata Extension for SAML V2.0

This section defines a new role descriptor type that supports the non-browser use case described in Section 1.

2.1 Namespaces

The SAML V2.0 metadata specification [SAML2Meta] and its accompanying schema [SAML2Meta-xsd] define the following namespace:

```
urn:oasis:names:tc:SAML:2.0:metadata
```

By convention, the namespace prefix `md:` is used to refer to the above namespace.

This specification defines a new namespace:

```
urn:oasis:names:tc:SAML:metadata:extension
```

The prefix `mdext:` is used here and in the accompanying schema [MDext-XSD] to refer to this new namespace. In what follows, any unqualified type is assumed to belong to this new namespace.

2.2 Element `<md:RoleDescriptor>`

The `<md:RoleDescriptor>` element defined in [SAML2Meta] is an abstract extension point that contains descriptive information common across various entity roles. New roles can be defined by extending its abstract `md:RoleDescriptorType` complex type, which is the approach taken here.

2.3 Complex Type `AttributeRequesterDescriptorType`

Complex type `AttributeRequesterDescriptorType` extends complex type `md:RoleDescriptorType` with content specific to attribute requesters, that is, consumers of SAML attributes. The type `AttributeRequesterDescriptorType` contains the following additional attributes and elements:

- `WantAssertionsSigned` [Optional]
  
  Optional attribute that indicates a requirement for assertions received by this service provider to be signed. If omitted, the value is assumed to be `false`. This requirement is in addition to any requirement for signing derived from the use of a particular profile/binding combination.

- `<md:NameIDFormat>` [Zero or More]
  
  Zero or more elements of type `xsd:anyURI` that enumerate the name identifier formats supported by this service provider. See Section 8.3 of [SAML2Core] for some possible values of this element.

- `<md:AttributeConsumingService>` [Zero or More]
  
  Zero or more elements that describe an application or service provided by this service provider that requires or desires the use of SAML attributes. It is RECOMMENDED that deployers provide at least one such element to facilitate configuration of policy by attribute providers.

At most one `<md:AttributeConsumingService>` element can have the attribute `isDefault` set to `true`. When multiple elements are specified and none has the attribute `isDefault` set to `true`, then the first element whose `isDefault` attribute is not set to `false` is to be used as the default. If all elements have their `isDefault` attribute set to `false`, then the first element is considered the default.
Instances of AttributeRequesterDescriptorType are declared using the <md:RoleDescriptor> element with an xsi:type of AttributeRequesterDescriptorType. See the example in Section 2.4.

See [SAML1xMeta] for specifics on the transformation and use of particular elements and attributes for use with SAML V1.x.

The following schema fragment defines the AttributeRequesterDescriptorType complex type:

```xml
<complexType name="AttributeRequesterDescriptorType">
  <complexContent>
    <extension base="md:RoleDescriptorType">
      <sequence>
        <element ref="md:NameIDFormat" minOccurs="0" maxOccurs="unbounded"/>
        <element ref="md:AttributeConsumingService" minOccurs="0" maxOccurs="unbounded"/>
      </sequence>
      <attribute name="WantAssertionsSigned" type="boolean" use="optional"/>
    </extension>
  </complexContent>
</complexType>
```

2.4 Example

Following is a metadata example for a SAML attribute requester that supports both SAML V1.1 and SAML V2.0.

```xml
<md:EntityDescriptor
  xmlns:md="urn:oasis:names:tc:SAML:2.0:metadata"
  xmlns:saml="urn:oasis:names:tc:SAML:2.0:assertion"
  xmlns:ds="http://www.w3.org/2000/09/xmldsig#"
  xmlns:xsd="http://www.w3.org/2001/XMLSchema"
  entityID="https://gs.org/gridshib">
  <!-- insert ds:Signature element here -->
  <md:RoleDescriptor
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xmlns:mdext="urn:oasis:names:tc:SAML:metadata:extension"
    <md:KeyDescriptor use="signing">
      <ds:KeyInfo>
        <ds:KeyName>Requester Key</ds:KeyName>
      </ds:KeyInfo>
    </md:KeyDescriptor>
    <md:NameIDFormat>
      urn:oasis:names:tc:SAML:1.1:nameid-format:X509SubjectName
    </md:NameIDFormat>
    <md:AttributeConsumingService isDefault="true" index="0">
      <md:ServiceName xml:lang="en">
        Shibbolized Grid Service
      </md:ServiceName>
      <md:RequestedAttribute
        NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:uri"
        Name="urn:oid:1.3.6.1.4.1.5923.1.1.1.7"
        FriendlyName="eduPersonEntitlement">
        <saml:AttributeValue xsi:type="xsd:anyURI">
          https://gs.org/gridshib/entitlements/123456789
        </saml:AttributeValue>
      </md:RequestedAttribute>
      <md:RequestedAttribute
        NameFormat="urn:mace:shibboleth:1.0:attributeNamespace:uri"
        Name="urn:mace:dir:attribute-def:eduPersonEntitlement">
        <saml:AttributeValue xsi:type="xsd:anyURI">
          https://gs.org/gridshib/entitlements/123456789
        </saml:AttributeValue>
      </md:RequestedAttribute>
    </md:AttributeConsumingService>
  </md:RoleDescriptor>
</md:EntityDescriptor>
```
<saml:AttributeValue>
