SAML V2.0 X.500/LDAP Attribute Profile

Committee Draft 01, 19 December 2006

Document identifier:
ssct-saml-attribute-x500-cd-01

Location:

Technical Committee:
OASIS Security Services TC

Chair(s):
Hal Lockhart, BEA Systems, Inc.
Prateek Mishra, Oracle Corporation

Editors:
Scott Cantor, Internet2

Related Work:
This specification supercedes the X.500/LDAP Attribute Profile in the original SAML 2.0 Profiles specification [SAML2Prof].

Abstract:
This profile is a replacement for the X.500/LDAP Attribute Profile found in the original SAML 2.0 Profiles specification [SAML2Prof]. The original profile results in well-formed but schema-invalid XML and cannot be corrected without a normative change.

Status
This document was last revised or approved by the SSTC on the above date. The level of approval is also listed above.

Technical Committee members should send comments on this specification to the Technical Committee’s email list. Others should send comments to the Technical Committee by using the “Send A Comment” button on the Technical Committee’s web page at http://www.oasis-open.org/committees/security

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights web page for the Security Services TC (http://www.oasis-open.org/committees/security/ipr.php).

1 Introduction

This profile supersedes the profile originally presented in the SAML 2.0 Profiles specification [SAML2Prof] and corrects a normative error in the use of XML extension attributes.

1.1 Notation

This specification uses normative text.

The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this specification are to be interpreted as described in [RFC2119]:

…they MUST only be used where it is actually required for interoperation or to limit behavior which has potential for causing harm (e.g., limiting retransmissions)...

These keywords are thus capitalized when used to unambiguously specify requirements over protocol and application features and behavior that affect the interoperability and security of implementations. When these words are not capitalized, they are meant in their natural-language sense.

Listings of XML schemas appear like this.

Example code listings appear like this.

Conventional XML namespace prefixes are used throughout the listings in this specification to stand for their respective namespaces as follows, whether or not a namespace declaration is present in the example:

<table>
<thead>
<tr>
<th>Prefix</th>
<th>XML Namespace</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>saml:</td>
<td>urn:oasis:names:tc:SAML:2.0:assertion</td>
<td>This is the SAML V2.0 assertion namespace defined in the SAML V2.0 core specification [SAML2Core].</td>
</tr>
<tr>
<td>x500:</td>
<td>urn:oasis:names:tc:SAML:2.0:profiles:attribute:X500</td>
<td>This is the namespace defined by this document and its accompanying schema [SAMLX500-xsd].</td>
</tr>
<tr>
<td>xsd:</td>
<td><a href="http://www.w3.org/2001/XMLSchema">http://www.w3.org/2001/XMLSchema</a></td>
<td>This namespace is defined in the W3C XML Schema specification [Schema1]. In schema listings, this is the default namespace and no prefix is shown.</td>
</tr>
<tr>
<td>xsi:</td>
<td><a href="http://www.w3.org/2001/XMLSchema-instance">http://www.w3.org/2001/XMLSchema-instance</a></td>
<td>This is the XML Schema namespace for schema-related markup that appears in XML instances [Schema1].</td>
</tr>
</tbody>
</table>

This specification uses the following typographical conventions in text: <SAMLElement>, <ns:ForeignElement>, Attribute, Datatype, OtherCode.
2 SAML 2.0 X.500/LDAP Attribute Profile

2.1 Required Information

Identification: urn:oasis:names:tc:SAML:2.0:profiles:attribute:X500 (this is also the target namespace assigned in the corresponding X.500/LDAP profile schema document [SAMLX500-xsd])

Contact information: security-services-comment@lists.oasis-open.org

Description: Given below.

Updates: Supersedes the erroneous profile in the SAML 2.0 Profiles specification [SAML2Prof].

2.2 Profile Overview

Directories based on the ITU-T X.500 specifications [X.500] and the related IETF Lightweight Directory Access Protocol specifications [LDAP] are widely deployed. Directory schema is used to model information to be stored in these directories. In particular, in X.500, attribute type definitions are used to specify the syntax and other features of attributes, the basic information storage unit in a directory (this document refers to these as “directory attributes”).

Directory attribute types are defined in schema in the X.500 and LDAP specifications themselves, schema in other public documents (such as the Internet2/Educause EduPerson schema [eduPerson], or the inetOrgperson schema [RFC2798]), and schema defined for private purposes. In any of these cases, it is useful for deployers to take advantage of these directory attribute types in the context of SAML attribute statements, without having to manually create SAML-specific attribute definitions for them, and to do this in an interoperable fashion.

The X.500/LDAP attribute profile defines a common convention for the naming and representation of such attributes when expressed as SAML attributes.

2.3 SAML Attribute Naming

The NameFormat XML attribute in <Attribute> elements MUST be urn:oasis:names:tc:SAML:2.0:attrname-format:uri.

To construct attribute names, the URN oid namespace described in IETF RFC 3061 [RFC3061] is used. In this approach the Name XML attribute is based on the OBJECT IDENTIFIER assigned to the directory attribute type.

Example:

\texttt{urn:oid:2.5.4.3}

Since X.500 procedures require that every attribute type be identified with a unique OBJECT IDENTIFIER, this naming scheme ensures that the derived SAML attribute names are unambiguous.

For purposes of human readability, there may also be a requirement for some applications to carry an optional string name together with the OID URN. The optional XML attribute FriendlyName (defined in [SAML2Core]) MAY be used for this purpose. If the definition of the directory attribute type includes one or more descriptors (short names) for the attribute type, the FriendlyName value, if present, SHOULD be one of the defined descriptors.
2.3.1 Attribute Name Comparison

Two <Attribute> elements refer to the same SAML attribute if and only if their Name XML attribute values are equal in the sense of [RFC3061]. The FriendlyName attribute plays no role in the comparison.

2.4 Profile-Specific XML Attributes

To represent the encoding rules in use for a particular attribute's values, the <Attribute> element MUST contain an XML attribute named Encoding defined in the XML namespace urn:oasis:names:tc:SAML:2.0:profiles:attribute:X500. The value of the attribute is determined by the particular encoding rules in use.

2.5 SAML Attribute Values

Directory attribute type definitions for use in native X.500 directories specify the syntax of the attribute using ASN.1 [ASN.1]. For use in LDAP, directory attribute definitions additionally include an LDAP syntax which specifies how attribute or assertion values conforming to the syntax are to be represented when transferred in the LDAP protocol (known as an LDAP-specific encoding). The LDAP-specific encoding commonly produces Unicode characters in UTF-8 form. This SAML attribute profile specifies the form of SAML attribute values only for those directory attributes which have LDAP syntaxes. Future extensions to this profile may define attribute value formats for directory attributes whose syntaxes specify other encodings.

For any directory attribute with a syntax whose LDAP-specific encoding exclusively produces UTF-8 character strings as values, the SAML attribute value is encoded as simply the UTF-8 string itself, as the content of the <AttributeValue> element, with no additional whitespace. In such cases, the xsi:type XML attribute MUST be set to xsd:string. The profile-specific Encoding XML attribute is provided in the <Attribute> element, with a value of LDAP.

A list of some LDAP attribute syntaxes to which this applies is:

<table>
<thead>
<tr>
<th>Attribute Type Description</th>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute Type Description</td>
<td>1.3.6.1.4.1.1466.115.121.1.3</td>
</tr>
<tr>
<td>Bit String</td>
<td>1.3.6.1.4.1.1466.115.121.1.6</td>
</tr>
<tr>

<td>1.3.6.1.4.1.1466.115.121.1.30</td>
</tr>
<tr>
<td>Matching Rule Use Description</td>
<td>1.3.6.1.4.1.1466.115.121.1.31</td>
</tr>
<tr>
<td>Name And Optional UID</td>
<td>1.3.6.1.4.1.1466.115.121.1.34</td>
</tr>
<tr>
<td>Name Form Description</td>
<td>1.3.6.1.4.1.1466.115.121.1.35</td>
</tr>
<tr>
<td>Numeric String</td>
<td>1.3.6.1.4.1.1466.115.121.1.36</td>
</tr>
<tr>
<td>Object Class Description</td>
<td>1.3.6.1.4.1.1466.115.121.1.37</td>
</tr>
<tr>
<td>Octet String</td>
<td>1.3.6.1.4.1.1466.115.121.1.40</td>
</tr>
<tr>
<td>OID</td>
<td>1.3.6.1.4.1.1466.115.121.1.38</td>
</tr>
<tr>
<td>Other Mailbox</td>
<td>1.3.6.1.4.1.1466.115.121.1.39</td>
</tr>
<tr>
<td>Postal Address</td>
<td>1.3.6.1.4.1.1466.115.121.1.41</td>
</tr>
<tr>
<td>Presentation Address</td>
<td>1.3.6.1.4.1.1466.115.121.1.43</td>
</tr>
<tr>
<td>Printable String</td>
<td>1.3.6.1.4.1.1466.115.121.1.44</td>
</tr>
</tbody>
</table>
For all other LDAP syntaxes, the attribute value is encoded, as the content of the `<AttributeValue>` element, by base64-encoding [RFC2045] the encompassing ASN.1 OCTET STRING-encoded LDAP attribute value. The xsi:type XML attribute MUST be set to xsd:base64Binary. The profile-specific Encoding XML attribute is provided in the `<Attribute>` element, with a value of LDAP.

When comparing SAML attribute values for equality, the matching rules specified for the corresponding directory attribute type MUST be observed (case sensitivity, for example).

### 2.6 Profile-Specific Schema

The following schema listing shows how the profile-specific Encoding XML attribute is defined [SAMLX500-xsd]:

```xml
<schema
    targetNamespace="urn:oasis:names:tc:SAML:2.0:profiles:attribute:X500"
    xmlns="http://www.w3.org/2001/XMLSchema"
    elementFormDefault="unqualified"
    attributeFormDefault="unqualified"
    blockDefault="substitution"
    version="2.0">
  <annotation>
    <documentation>
      Document identifier: saml-schema-x500-2.0
      Location: http://docs.oasis-open.org/security/saml/v2.0/
      Revision history:
      V2.0 (March, 2005):
      Custom schema for X.500 attribute profile, first published in SAML 2.0.
    </documentation>
  </annotation>
  <attribute name="Encoding" type="string"/>
</schema>
```

Note that this is the original schema included in the SAML 2.0 Profiles specification [SAML2Prof].

### 2.7 Examples

The following is an example of a mapping of the "givenName" directory attribute, representing the SAML assertion subject's first name. It's OBJECT IDENTIFIER is 2.5.4.42 and its LDAP syntax is Directory String.

```xml
<saml:Attribute
    xmlns:x500="urn:oasis:names:tc:SAML:2.0:profiles:attribute:X500"
    NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:uri"
    Name="urn:oid:2.5.4.42" FriendlyName="givenName" x500:Encoding="LDAP">
  <saml:AttributeValue xsi:type="xsd:string">Steven</saml:AttributeValue>
</saml:Attribute>
```
