Paul Madsen, NTT

Abstract:

This profile specifies the use of SAML V2.0 attribute queries and assertions to support distributed authorization in support of X.509v3-based authentication.

Status:

This is a **Working Draft** of the Security Services Technical Committee.

Committee members should submit comments and potential errata to the security-services@lists.oasis-open.org list. Others should submit them by filling out the web form located at http://www.oasis-open.org/committees/comments/form.php?wg_abbrev=security. The committee will publish on its web page (<http://www.oasis-open.org/committees/security>) a catalog of any changes made to this document as a result of comments.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights web page for the Security Services TC (<http://www.oasis-open.org/committees/security/ipr.php>).

71 1 Introduction

72 The *SAML V2.0 Attribute Sharing Profile for X.509 Authentication-Based Systems* describes the use of the
73 SAML V2.0 Assertion Query and Request Protocol [SAMLCore] in conjunction with the SAML V2.0 SOAP
74 Binding [SAMLBind] to retrieve the attributes of a principal who has authenticated using an X.509
75 certificate.

76 There are two modes of operation specified in this profile: Basic Mode (section) and Encrypted Mode
77 (section). The Basic Mode profile extends the SAML V2.0 Assertion Query/Request Profile [SAMLProf].
78 The Encrypted Mode profile specifies the use of encryption to protect the privacy of the principal.

79 1.1 Notation

80 This specification uses normative text to describe the use of SAML attribute queries and assertions.

81 The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD
82 NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this specification are to be interpreted as
83 described in [RFC 2119] :

84 ...they MUST only be used where it is actually required for interoperation or to limit behavior
85 which has potential for causing harm (e.g., limiting retransmissions)...

86 These keywords are thus capitalized when used to unambiguously specify requirements over protocol and
87 application features and behavior that affect the interoperability and security of implementations. When
88 these words are not capitalized, they are meant in their natural-language sense.

89 Listings of XML schemas appear like this.

90
91 Example code listings appear like this.

92 Conventional XML namespace prefixes are used throughout the listings in this specification to stand for
93 their respective namespaces as follows, whether or not a namespace declaration is present in the
94 example:

<i>Prefix</i>	<i>XML Namespace</i>	<i>Comments</i>
saml:	urn:oasis:names:tc:SAML:2.0:assertion	This is the SAML V2.0 assertion namespace [SAMLCore].
samlp:	urn:oasis:names:tc:SAML:2.0:protocol	This is the SAML V2.0 protocol namespace [SAMLCore].
md:	urn:oasis:names:tc:SAML:2.0:metadata	This is the SAML V2.0 metadata namespace [SAMLMeta].
query:	urn:oasis:names:tc:SAML:metadata:ext:query	This is the SAML metadata extension query requester namespace [SAMLMeta-Ext].
ds:	http://www.w3.org/2000/09/xmldsig#	This is the XML Signature namespace [XMLSig].
xenc:	http://www.w3.org/2001/04/xmlenc#	This is the XML Encryption namespace [XMLEnc].

95 This specification uses the following typographical conventions in text: <SAMLElement>,
96 <ns:ForeignElement>, Attribute, **Datatype**, OtherKeyword.

97 1.2 Terminology

98 The term *identity provider* as used in this specification refers to an ordinary SAML attribute authority
99 [SAMLGloss]. The term *service provider* refers to a SAML attribute requester. However, as used in this
100 specification, a service provider is not a typical SAML service provider since it performs X.509

101 authentication in lieu of consuming a SAML authentication assertion.

102 The term *X.509 certificate* as used in this specification refers to an X.509 end entity certificate [RFC3280]
103 or a certificate based on an X.509 end entity certificate (such as an X.509 proxy certificate [RFC3820]).

104 **1.3 Outline**

105 The next section describes a typical use case scenario that motivates the Basic Mode profile. Then
106 sections 3 and 4 specify Basic Mode and Encrypted Mode, respectively. Security and privacy issues are
107 discussed in section 5. Finally, in section 6, some guidance for implementers is given.

108 2 Use Cases

109 The following non-normative material describes a typical use case that motivates the Basic Mode profile
110 described in Section 3.

111 2.1.1 Overview

112 A principal attempts to access a secured resource maintained at a service provider. Principal
113 authentication is accomplished by presenting a trusted X.509v3 certificate and by demonstrating proof of
114 possession of the associated private key.

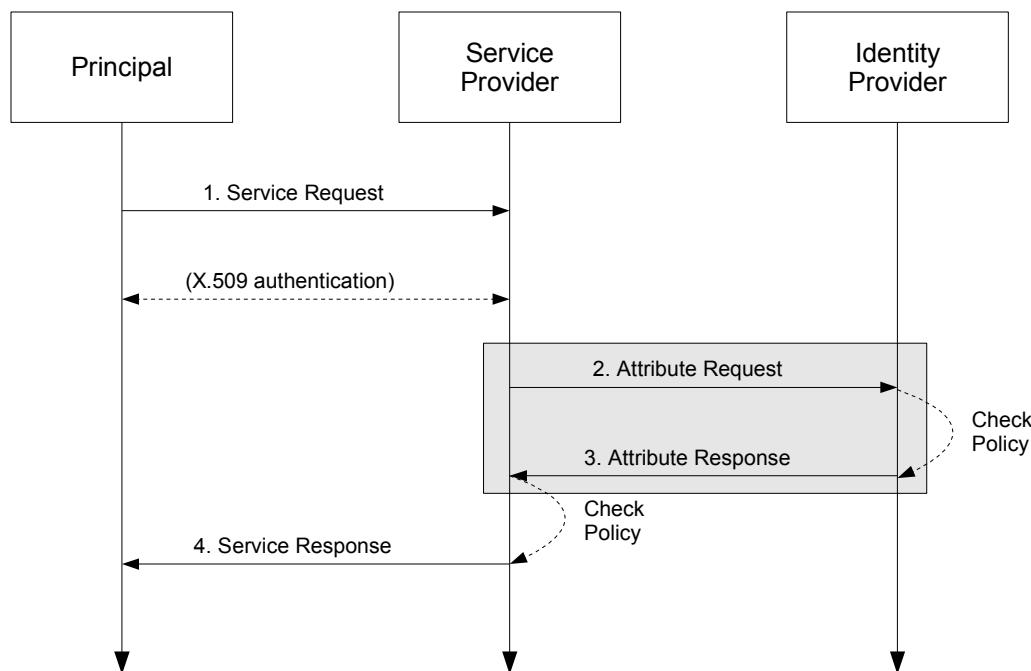

115 After the principal has been authenticated, the service provider requires additional information about the
116 principal in order to determine whether to grant access to the resource. To obtain this information, the
117 service provider uses the Subject Distinguished Name (Subject DN) field of the principal's X.509v3
118 certificate to query an identity provider for the required information about the principal. When the identity
119 provider returns the relevant attributes, the service provider is able to make an informed authorization
120 decision.

121 2.1.2 Sequence

122 The sequence of steps for the full use case is shown below.

123 **Note:** The steps constrained by this profile are highlighted with a gray box. The other
124 steps are shown only for completeness; the profile does not constrain them.

125

126

127

1. Service Request

128 In step 1, the principal requests a secured resource from a service provider who requires that the
129 principal be authenticated. The principal authenticates to the service provider with an X.509v3
130 certificate. Subject confirmation is performed by the service provider as part of this authentication.
131 Presentation of the principal's certificate might occur via TLS with client certificate authentication, but
132 the details of this step are out of scope for this profile.

133

2. Attribute Request

134 In step 2, the service provider sends a SAML V2.0 <AttributeQuery> to the identity provider using
135 a SAML SOAP Binding. The Subject DN from the principal's X.509v3 certificate (presented in step 1
136 above) is used to construct the <Subject> element. Thus, the <Subject> element will contain a
137 <NameID> with the value of the Subject DN from the principal's X.509v3 certificate.

138

139 3. **Attribute** Response

140 In step 3, after verifying that the service provider is a valid requester, the identity provider issues a
141 <Response> message containing appropriate attributes pertaining to the principal. The attributes
142 returned to the service provider are subject to policy at the identity provider.

143 4. Service Response

144 Based on the attributes received from the identity provider in step 3, the service provider returns the
145 requested resource or an error, subject to policy.

146 Of the sequence steps described above, it is steps 2 and 3 that are profiled in Sections 3 and 4 of this
147 specification.

3 Basic Mode

In this mode, a service provider sends a SAML V2.0 `<AttributeQuery>` message directly to an identity provider. This message contains a name identifier assigned to a principal that authenticated to the service provider using an X.509v3 certificate.

If the identity provider receiving the request can:

- recognize the name identifier; and
- fulfill the request, subject to any applicable policies;

the identity provider responds with a successful `<Response>` containing the relevant attributes for the identified principal.

The `<AttributeQuery>`, `<Response>`, and `<Assertion>` elements MAY be signed in this mode.

3.1 Required Information

Identification:

`urn:oasis:names:tc:SAML:profiles:query:attributes:X509-basic`

Contact information: security-services-comment@lists.oasis-open.org

Description: Given below.

Updates: N/A

Extends: Attribute Query/Request Profile (defined in [SAMLProf])

3.2 `<AttributeQuery>` Issued by Service Provider

To initiate the profile, the service provider uses the SAML SOAP Binding (see Section 3.2 of [SAMLBind]) to send a SAML V2.0 `<AttributeQuery>` message to an identity provider. The query MUST conform to the Assertion Query/Request Profile described in Section 6 of [SAMLProf] except as specified below.

3.2.1 `<AttributeQuery>` Usage

The `<AttributeQuery>` element MUST conform to the following rules:

- The `<Subject>` element must contain a `<NameID>` element whose value is the Subject DN from the principal's X.509v3 certificate.
- The `<NameID>` element MUST have a `Format` attribute whose value is `urn:oasis:names:tc:SAML:1.1:nameid-format:X509SubjectName`, as defined in Section 8.3.3 of [SAMLCore].

3.3 `<Response>` Issued by Identity Provider

The identity provider processes the `<AttributeQuery>` element and any enclosed `<Attribute>` elements, as defined in [SAMLCore] and Section 6 of [SAMLProf], and returns a response to the service provider. The response MUST conform to the Assertion Query/Request Profile described in Section 6 of [SAMLProf] except as specified below.

The service provider MUST process the `<Response>` message and any enclosed `<Assertion>` elements as described in [SAMLCore] and in Section 6 of [SAMLProf].

183 3.3.1 <Response> Usage

184 If the request is successful, the <Response> element MUST conform to the following rules:

- 185 • Any <Assertion> element(s) MUST satisfy the following conditions:
- 186 • The <Assertion> element MUST contain at least one <AttributeStatement> element
187 that conveys the attributes of the principal to the service provider.
 - 188 • The <Assertion> element MUST contain an <AudienceRestriction> element that
189 includes the service provider's unique identifier as an <Audience>.
 - 190 • Other conditions (and other <Audience> elements) MAY be included as requested by the
191 service provider or at the discretion of the identity provider.

192 Otherwise, if the identity provider wishes to return an error, it MUST NOT include any assertions in the
193 <Response> message.

194 3.4 Use of Metadata

195 The service provider and identity provider MAY use metadata in support of this profile for locating
196 endpoints, communicating key information, and so on. If SAML V2.0 metadata is used, the
197 <md:AttributeAuthorityDescriptor> element defined by the SAML metadata specification
198 [SAMLMeta] and the **query:AttributeQueryDescriptorType** complex type defined by the SAML metadata
199 extension specification [SAMLMeta-Ext] SHOULD be used with this profile.

200 4 Encrypted Mode

201 In this mode, as in Basic Mode, a service provider sends a SAML V2.0 `<AttributeQuery>` message
202 directly to an identity provider. The Encrypted Mode request differs from that of the Basic Mode in that the
203 query message contains an encrypted name identifier assigned to a principal that authenticated to the
204 service provider using an X.509v3 certificate.

205 If the identity provider receiving the request can:

- 206 • decrypt and recognize the name identifier; and
- 207 • fulfill the request subject to any applicable policies;

208 the identity provider responds with a successful `<Response>` containing the relevant attributes for the
209 identified principal. The returned attributes **MUST** be encrypted as described below.

210 Each of the `<AttributeQuery>`, `<Response>`, and `<Assertion>` elements **MUST** be signed in this
211 mode.

212 4.1 Required Information

213 **Identification:**

214 `urn:oasis:names:tc:SAML:profiles:query:attributes:X509-encrypted`

215 **Contact information:** security-services-comment@lists.oasis-open.org

216 **Description:** Given below.

217 **Updates:** N/A

218 **Extends:** Attribute Query/Request Profile (defined in [SAMLProf])

219 4.2 `<AttributeQuery>` Issued by Service Provider

220 In Encrypted Mode, the service provider sends a SAML V2.0 `<AttributeQuery>` message to an identity
221 provider as described in section 3. In addition to the requirements of Basic Mode, this mode has the
222 following requirements.

223 All requests **MUST** be made over either SSL 3.0 [SSL3] or TLS 1.0 [RFC2246] to maintain confidentiality
224 and message integrity. In addition, the requester **MAY** use SSL/TLS client authentication.

225 4.2.1 `<AttributeQuery>` Usage

226 In addition to the rules defined for Basic Mode in section 3.2.1, the `<AttributeQuery>` element **MUST**
227 conform to the following rules:

- 228 • The `<Subject>` element must contain an `<EncryptedID>` element carrying the encrypted value
229 of the `<NameID>` element (using XML Encryption as defined in [XMLEnc]). See Section 4.2.2 for
230 details on the use of encryption.
- 231 • The `<AttributeQuery>` **MUST** contain a `<ds:Signature>` element carrying the signature of
232 the service provider.

233 4.2.2 Use of Encryption

234 The SAML V2.0 Assertions and Protocols specification [SAMLCore] defines the `<EncryptedID>`
235 element as a means of applying confidentiality to a name identifier.

236 In Encrypted Mode the service provider MUST use the `<EncryptedID>` to carry the Subject DN of the
237 principal in the `<AttributeQuery>`.

238 Exactly one of the following encryption procedures MUST be followed:

239 • The service provider generates a new symmetric key to encrypt the principal's name identifier
240 containing the Subject DN. After performing the encryption, the service provider places the resulting
241 ciphertext in the `<xenc:EncryptedData>` element. The symmetric key MUST be encrypted with
242 the identity provider's public key and the resulting ciphertext placed in the `<xenc:EncryptedKey>`
243 element.

244 This procedure MUST be supported by the service provider.

245 • Optionally, the service provider uses a previously established symmetric key to encrypt the
246 principal's name identifier containing the Subject DN. After performing the encryption, the service
247 provider places the resulting ciphertext in the `<xenc:EncryptedData>` element. In this case, the
248 `<EncryptedID>` element MUST NOT contain an `<xenc:EncryptedKey>` element.

249 An encryption algorithm satisfying FIPS 140-2 Security Requirements [FIPS 140-2] SHALL be used for the
250 encryption operation.

251 **4.2.3 Use of Digital Signatures**

252 The SAML V2.0 assertions and protocols specification [SAMLCore] describes how to use the
253 `<ds:Signature>` element (defined in [XMLSig]) as a means of providing integrity and authenticity for a
254 message.

255 In Encrypted Mode, a service provider MUST sign the `<AttributeQuery>` containing the
256 `<EncryptedID>` to allow the identity provider to authenticate the origin and verify the integrity of the
257 request. A signing algorithm satisfying FIPS 140-2 Security Requirements [FIPS 140-2] SHALL be used
258 for the digital signature operation.

259 **4.3 <Response> Issued by Identity Provider**

260 The identity provider processes the `<AttributeQuery>`, as defined in [SAMLCore] and Section 6 of
261 [SAMLProf], and returns a response to the service provider. In addition to the requirements of Basic
262 Mode, this mode has the following requirements.

263 The responding identity provider MUST authenticate to the requester, both by signing the `<Response>`
264 message and through TLS or SSL server authentication.

265 **4.3.1 <Response> Usage**

266 If the request is successful, the `<Response>` element MUST conform to the following rules:

- 267 • The `<Response>` element MUST contain a `<ds:Signature>` element carrying the signature of
268 the identity provider.
- 269 • It MUST contain at least one `<EncryptedAssertion>` element.
- 270 • The encrypted content of each `<EncryptedAssertion>` element is an `<Assertion>` element
271 that MUST satisfy the following conditions, in addition to the rules of section 3.3.1:
 - 272 • The `<Assertion>` element MUST contain a `<ds:Signature>` element carrying the
273 signature of the identity provider.

274 Otherwise, if the identity provider wishes to return an error, it MUST NOT include any assertions in the
275 `<Response>` message.

276 4.3.2 Use of Encryption

277 The SAML V2.0 assertions and protocols specification [SAMLCore] defines the
278 <EncryptedAssertion> element as a mean of applying confidentiality to the contents of an assertion.

279 In Encrypted mode the identity provider MUST use the <EncryptedAssertion> element to carry the
280 returned attribute values for the principal.

281 Exactly one of the following procedures MUST be followed:

282 • The identity provider generates a new symmetric key to encrypt the <Assertion>. After
283 performing the encryption, the identity provider places the resulting ciphertext in the
284 <xenc:EncryptedData> element. The symmetric key MUST be encrypted with the service
285 provider's public key and the resulting ciphertext placed in the <xenc:EncryptedKey> element.

286 This procedure MUST be supported by the identity provider.

287 • Optionally, and if supported by the service provider, the identity provider uses the symmetric key
288 used by the service provider to encrypt the name identifier. After encrypting the <Assertion>
289 using this key, the identity provider places the resulting ciphertext in the <xenc:EncryptedData>
290 element. In this case, however, the <EncryptedAssertion> element MUST NOT contain an
291 <xenc:EncryptedKey> element.

292 • Optionally, and if supported by the service provider, and if the service provider did not include a
293 symmetric key in the <AttributeQuery> for decryption of the <EncryptedID>, the identity
294 provider uses a previously established symmetric key to encrypt the <Assertion>. If the identity
295 provider reuses a key in this manner, the <EncryptedAssertion> element MUST NOT contain
296 an <xenc:EncryptedKey> element.

297 An encryption algorithm satisfying FIPS 140-2 Security Requirements [FIPS 140-2] SHALL be used for the
298 encryption operation.

299 4.3.3 Use of Digital Signatures

300 The SAML V2.0 assertions and protocols specification [SAMLCore] defines how to use the
301 <ds:Signature> element (defined in [XMLSig]) as a means of providing integrity and authenticity for a
302 message.

303 In Encrypted Mode, the identity provider MUST sign the <Assertion> in order to allow the service
304 provider to verify its integrity. The signature is calculated before the encryption operation. A signing
305 algorithm satisfying the FIPS 140-2 Security Requirements [FIPS 140-2] SHALL be used for the digital
306 signature operation.

307 4.4 Use of Metadata

308 As in Basic Mode, the service provider and identity provider MAY use metadata in support of this profile. If
309 SAML V2.0 metadata is used, in addition to the rules defined in section 3.4, there SHOULD be at least
310 one <md:KeyDescriptor> element with attribute use="encryption" in both the service provider's
311 and the identity provider's metadata.

312 **5 Security and Privacy Considerations**

313 The motivation for this profile is to specify a secure means of obtaining SAML attributes in conjunction
314 with X.509 authentication. As such, security considerations are highly important from the perspective of
315 this profile.

316 **5.1 Background**

317 The SAML Security and Privacy specification [SAMLSecure] provides general background material
318 relevant to all SAML profiles. In addition, section 3.1.2 of the SAML Bindings specification [SAMLBind]
319 provides general security guidelines regardless of binding. Sections 5 and 6 of the SAML Assertions and
320 Protocols specification [SAMLCore] give general syntax and processing guidelines regarding XML
321 Signature and XML Encryption, respectively. Finally, sections 6.3 and 6.4 of the SAML Profiles
322 specification [SAMLProf] give specific security requirements governing queries.

323 **5.2 General Security Requirements**

324 SAML profiles often involve a system entity that relies on an earlier act of user authentication. For
325 example, the SAML Web Browser SSO Profile [SAMLProf] relies on an authentication service that
326 validates a username/password for a user. The authentication service must be securely linked to an
327 identity provider that issues SAML authentication assertions based on that user's act of authentication.
328 Similarly, this profile assumes that the system entity that performs the X.509 authentication is operating in
329 a secure environment that includes the attribute requester.

330 In this profile, an end user presents an X.509 certificate to authenticate at the service provider. The
331 system entity that performs this authentication (i.e., validates the certificate and its trust chain) must be
332 securely linked to the SAML service provider that subsequently initiates this profile. The latter must have
333 a secure means of obtaining the X.509 subject name from the user certificate and issuing a SAML V2.0
334 <AttributeQuery> for that subject to the appropriate asserting party. The mechanism by which these
335 system entities are linked is out of scope for this profile.

336 Local policy settings at the attribute authority will determine whether or not the asserting party is permitted
337 to return attributes for the requested subject.

338 Since this profile extends the SAML V2.0 Assertion Query/Request Profile (section 6 of [SAMLProf]), a
339 Basic Mode requester SHOULD authenticate and ensure message integrity to the responder, and vice
340 versa. In Encrypted Mode, a requester MUST authenticate and ensure message integrity to the
341 responder, and vice versa.

342 Generally speaking, Basic Mode is applicable in point-to-point situations where transport-level security
343 suffices. Thus mutually authenticated SSL/TLS will be the norm. On the other hand, Encrypted Mode
344 may apply in multi-hop scenarios that require end-to-end message-level security. In that case, SSL/TLS is
345 not sufficient to guarantee authenticity and message integrity, and digital signatures are required. To
346 ensure privacy, message-level encryption is also required.

347 **5.3 User Privacy**

348 The identity of the principal for which the assertion was issued SHOULD NOT be human readable (that is,
349 stored in clear text) in log files, cache files or the cache repository (as applicable).

350 **6 Implementation Guidance (Informative)**

351 The following non-normative guidance is provided for implementers.

352 **6.1 Identity Provider Policy**

353 Service providers may explicitly enumerate the required attributes in queries or may issue queries
354 containing no `<saml:Attribute>` elements that essentially request all available attributes. Regardless
355 of any attributes requested in the query (or in metadata, if used), it is the identity provider that determines
356 the actual attributes to be returned to the service provider. Thus an identity provider should institute and
357 enforce policy that strictly limits the attributes released to service providers.

358 **6.2 Caching of Attributes**

359 A capability to cache user attributes that are returned in assertions should be provided. Cache expiration
360 settings should be configurable by administrators.

403 A. Acknowledgments

404 The editors would like to acknowledge the contributions of the OASIS Security Services Technical
405 Committee, whose voting members at the time of publication were:

- 406 • Hal Lockhart, BEA Systems, Inc
- 407 • Steve Anderson, BMC Software
- 408 • Rick Randall, Booz Allen Hamilton
- 409 • Nick Ragouzis, Enosis Group LLC
- 410 • Sharon Boeyen, Entrust
- 411 • Thomas Wisniewski, Entrust
- 412 • Carolina Canales-Valenzuela, Ericsson
- 413 • Dana Kaufman, Forum Systems
- 414 • Ashish Patel, France Telecom
- 415 • Irving Reid, Hewlett-Packard
- 416 • Greg Whitehead, Hewlett-Packard
- 417 • Guy Denton, IBM
- 418 • Heather Hinton, IBM
- 419 • Anthony Nadalin, IBM
- 420 • Eric Tiffany, IEEE
- 421 • Prasanta Behera, Individual
- 422 • Scott Cantor, Internet2
- 423 • Bob Morgan, Internet2
- 424 • Jeff Hodges, NeuStar
- 425 • Frederick Hirsch, Nokia
- 426 • Paul Madsen, NTT USA
- 427 • Ari Kermaier, Oracle
- 428 • Prateek Mishra, Oracle
- 429 • Vamsi Motukuru, Oracle
- 430 • John Hughes, PA Consulting
- 431 • Brian Campbell, Ping Identity
- 432 • Rob Philpott, RSA Security
- 433 • Jahan Moreh, Sigaba
- 434 • Bhavna Bhatnagar, Sun Microsystems
- 435 • Eve Maler, Sun Microsystems
- 436 • David Staggs, Veterans Health Administration

437 The editors also would like to acknowledge the following non-voting SSTC members for their
438 contributions to this or previous versions of this specification:

- 439 • Maryann Hondo, IBM
- 440 • Peter Michalek, Individual
- 441 • Conor P. Cahill, Intel
- 442 • Wendy Gray, JPMorganChase
- 443 • Peter Davis, NeuStar
- 444 • Senthil Sengodan, Nokia
- 445 • Cameron Morris, Novell
- 446 • Darren Platt, Ping Identity
- 447 • Alberto Squassabia, Ping Identity
- 448 • Jim Lien, RSA Security
- 449 • John Linn, RSA Security
- 450 • Ron Monzillo, Sun Microsystems
- 451 • Mike Beach, The Boeing Company

452 Finally, the editors wish to acknowledge the following people for their contributions of material used as
453 input to this specification:

- 454 • Tom Scavo, NCSA/University of Illinois
- 455 • Santosh Chokhani, Orion Security
- 456 • Robert Mingo, SAIC

457 B. Notices

458 OASIS takes no position regarding the validity or scope of any intellectual property or other rights that
459 might be claimed to pertain to the implementation or use of the technology described in this document or
460 the extent to which any license under such rights might or might not be available; neither does it represent
461 that it has made any effort to identify any such rights. Information on OASIS's procedures with respect to
462 rights in OASIS specifications can be found at the OASIS website. Copies of claims of rights made
463 available for publication and any assurances of licenses to be made available, or the result of an attempt
464 made to obtain a general license or permission for the use of such proprietary rights by implementors or
465 users of this specification, can be obtained from the OASIS Executive Director.

466 OASIS invites any interested party to bring to its attention any copyrights, patents or patent applications, or
467 other proprietary rights which may cover technology that may be required to implement this specification.
468 Please address the information to the OASIS Executive Director.

469 **Copyright © OASIS Open 2006. All Rights Reserved.**

470 This document and translations of it may be copied and furnished to others, and derivative works that
471 comment on or otherwise explain it or assist in its implementation may be prepared, copied, published and
472 distributed, in whole or in part, without restriction of any kind, provided that the above copyright notice and
473 this paragraph are included on all such copies and derivative works. However, this document itself may
474 not be modified in any way, such as by removing the copyright notice or references to OASIS, except as
475 needed for the purpose of developing OASIS specifications, in which case the procedures for copyrights
476 defined in the OASIS Intellectual Property Rights document must be followed, or as required to translate it
477 into languages other than English.

478 The limited permissions granted above are perpetual and will not be revoked by OASIS or its successors
479 or assigns.

480 This document and the information contained herein is provided on an "AS IS" basis and OASIS
481 DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY
482 WARRANTY THAT THE USE OF THE INFORMATION HEREIN WILL NOT INFRINGE ANY RIGHTS OR
483 ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.
