

SAMLv2.0 HTTP POST “SimpleSign” Binding

Committee Draft 01, 1 March 2007

Document identifier:

sstc-saml-binding-simplesign-cd-01

Location:

http://www.oasis-open.org/committees/documents.php?wg_abbrev=security

Technical Committee:

OASIS Security Services TC

Chairs:

Hal Lockhart, BEA Systems, Inc.
Prateek Mishra, Oracle Corporation

Editors:

Jeff Hodges, NeuStar
Scott Cantor, Internet2

Abstract:

This specification defines a SAML HTTP protocol binding, specifically using the HTTP POST method, and not using XML Digital Signature for SAML message data origination authentication. Rather, a “sign the BLOB” technique is employed wherein a conveyed SAML message is treated as a simple octet string if it is signed. Conveyed SAML assertions may be individually signed using XMLdsig. Security is optional in this binding.

Status:

This is a **Committee Draft** approved by the Security Services Technical Committee on 30 January 2007.

Committee members should submit comments and potential errata to the security-services@lists.oasis-open.org list. Others should submit them by filling out the web form located at http://www.oasis-open.org/committees/comments/form.php?wg_abbrev=security.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights web page for the Security Services TC (<http://www.oasis-open.org/committees/security/ipr.php>).

56 1 Introduction

57 This specification defines a SAML HTTP protocol binding, specifically using the HTTP POST method, and
58 which specifically does not use XML Digital Signature[XMLSig] for SAML message data origination
59 authentication. Rather, a “sign the BLOB” technique is employed wherein a conveyed SAML message,
60 along with any content (e.g. SAML assertion(s)), is treated as a simple octet string if it is signed.
61 Additionally, it is out of the scope of this specification whether or not conveyed SAML assertions are
62 authenticated via XML Digital Signature. Security is optional in this binding.

63 The next subsection gives a general overview of SAML Protocol Binding concepts, followed by notation
64 and namespace declarations. The binding itself is defined in Section 2.

65 1.1 Protocol Binding Concepts

66 Mappings of SAML request-response message exchanges onto standard messaging or communication
67 protocols are called SAML *protocol bindings* (or just *bindings*). An instance of mapping SAML request-
68 response message exchanges into a specific communication protocol <FOO> is termed a <FOO> *binding*
69 *for SAML* or a *SAML <FOO> binding*.

70 For example, a SAML SOAP binding describes how SAML request and response message exchanges
71 are mapped into SOAP message exchanges.

72 The intent of this specification is to specify the given binding in sufficient detail to ensure that
73 independently implemented SAML-conforming software can interoperate when using standard messaging
74 or communication protocols.

75 Unless otherwise specified, this binding should be understood to support the transmission of any SAML
76 protocol message derived from the **samlp:RequestAbstractType** and **samlp:StatusResponseType**
77 types. Further, when this binding refers to "SAML requests and responses", it should be understood to
78 mean any protocol messages derived from those types.

79 For other terms and concepts that are specific to SAML, refer to the SAML glossary [SAMLGloss].

80 1.2 Notation

81 The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD
82 NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this specification are to be interpreted as
83 described in IETF RFC 2119 [RFC2119].

84 `Listings of productions or other normative code appear like this.`

85

86 `Example code listings appear like this.`

87 **Note:** Notes like this are sometimes used to highlight non-normative commentary.

88 Conventional XML namespace prefixes are used throughout this specification to stand for their respective
89 namespaces as follows, whether or not a namespace declaration is present in the example:

Prefix	XML Namespace	Comments
saml:	urn:oasis:names:tc:SAML:2.0:assertion	This is the SAML V2.0 assertion namespace [SAMLCore].
samlp:	urn:oasis:names:tc:SAML:2.0:protocol	This is the SAML V2.0 protocol namespace [SAMLCore].

Prefix	XML Namespace	Comments
SOAP-ENV:	http://schemas.xmlsoap.org/soap/envelope	This namespace is defined in SOAP V1.1 [SOAP11].

90

91 This specification uses the following typographical conventions in text: `<ns:Element>`, `XMLAttribute`,
92 **Datatype**, `OtherKeyword`. In some cases, angle brackets are used to indicate non-terminals, rather than
93 XML elements; the intent will be clear from the context.

94 2 HTTP POST Binding-SimpleSign

95 The HTTP POST binding, defined in [SAMLBind], defines a mechanism by which SAML protocol
96 messages may be transmitted within the base64-encoded content of an HTML form control. When using
97 that binding, SAML protocol messages and/or SAML assertions are signed using [XMLSig], which is an
98 XML-aware, XML-based, invasive digital signature paradigm necessitating canonicalization of the
99 signature target.

100 This document specifies an alternative HTTP POST-based binding where the conveyed SAML protocol
101 messages – including their content, i.e. any conveyed SAML assertions – are signed as simple “BLOBs”
102 (“Binary Large Objects”, aka binary octet strings).

103 Note that this binding defines the conveyance of an individual SAML request or response message via
104 HTTP POST. Thus this binding MAY be composed with the HTTP Redirect binding (see Section 3.4 of
105 [SAMLBind]) or the HTTP Artifact binding (see Section 3.6 of [SAMLBind]) to transmit request and
106 response messages in an overall SAML protocol exchange, the definition of which is termed a “SAML
107 Profile” [SAMLProf], using two different bindings.

108 2.1 Required Information

109 **Identification:** urn:oasis:names:tc:SAML:2.0:bindings:HTTP-POST-SimpleSign

110 **Contact information:** security-services-comment@lists.oasis-open.org

111 **Description:** Given below.

112 **Updates:** None. Rather, it provides an alternative to the HTTP POST Binding defined in [SAMLBind]

113 2.2 Overview

114 The HTTP POST-SimpleSign binding is intended for cases in which the SAML requester or responder
115 need to communicate using an HTTP user agent (as defined in HTTP 1.1 [RFC2616] as an intermediary,
116 and when data origination authentication and integrity protection of the SAML message is not required, or
117 when a lighter-weight signature mechanism (as compared to [XMLSig] is appropriate. This may be
118 necessary, for example, if the communicating parties do not share a direct path of communication. It may
119 also be needed if the responder requires an interaction with the user agent in order to fulfill the request,
120 such as when the user agent must authenticate to it.

121 Note that some HTTP user agents may have the capacity to play a more active role in the protocol
122 exchange and may support other bindings that use HTTP, such as the SOAP and Reverse SOAP
123 bindings. This binding does not require such capabilities—it assumes nothing apart from the capabilities
124 of a common web browser.

125 2.3 Relay State

126 RelayState data MAY be included with a SAML protocol message transmitted with this binding. The value
127 MUST NOT exceed 80 bytes in length and SHOULD be integrity protected by the entity creating the
128 message, either via a digital signature (see section 2.5) or by some independent means.

129 If a SAML request message is accompanied by RelayState data, then the SAML responder MUST return
130 its SAML protocol response message using a binding that also supports a RelayState mechanism, and it
131 MUST place the exact data it received with the request into the corresponding RelayState parameter in
132 the response message.

133 If no such value is included with a SAML request message, or if the SAML response message is being
134 generated without a corresponding request, then the SAML responder MAY include RelayState data to be
135 interpreted by the recipient based on the use of a profile or prior agreement between the parties.

136 2.4 Message Encoding and Conveyance

137 This section describes how to encode a SAML protocol message, and thus any SAML assertion(s) it may
138 contain, into HTML FORM “control(s)” [HTML401] (Section 17), thus enabling the SAML protocol
139 message to be conveyed via the HTTP POST method.

140 A SAML protocol message is form-encoded by:

- 141 1. Applying the base-64 encoding rules to the XML representation of the message. The resulting
142 base64-encoded value MAY be line-wrapped at a reasonable length in accordance with common
143 practice.
- 144 2. Encoding the result from the prior step into a “form data set”, in the same fashion as is specified for
145 “successful controls” in [HTML401] (Section 17.13.3), as a form “control value”. The HTML
146 document also MUST adhere to the XHTML specification, [XHTML].
 - 147 a. If the SAML protocol message is a SAML request, then the form “control name” used to convey
148 the SAML protocol message itself MUST be *SAMLRequest*.
 - 149 b. If the SAML protocol message is a SAML response, then the form “control name” used to
150 convey the SAML protocol message itself MUST be *SAMLResponse*.
 - 151 c. Any additional form controls or presentation, other than those noted below for including a
152 signature, MAY be included but MUST NOT be required in order for the recipient to nominally
153 process the SAML protocol message itself.

154 SAML protocol messages, and any SAML assertions contained within the SAML protocol messages,
155 MAY be signed using [XMLSig], and if so, any such signatures MUST remain intact. Additionally, SAML
156 protocol messages MAY be signed using the technique given below in section 2.5. This technique is
157 referred to as the “SimpleSign technique”. The SimpleSign signature value is conveyed in a form control
158 value named *Signature*, and the signature algorithm is conveyed in a form control value named
159 *SigAlg*. These form control values are included in the form data set constructed in step 2 above.

160 If the SAML protocol message is signed using SimpleSign, the *Destination* XML attribute in the root
161 SAML element of the SAML protocol message MUST contain the URL to which the sender has instructed
162 the user agent to deliver the message. The recipient MUST then verify that the value matches the location
163 at which the SAML protocol message has been received. Also, the signer’s certificate or other keying
164 information MAY be included in a form control named *KeyInfo*. This form control, if present, MUST
165 contain a base-64 encoded `<ds:KeyInfo>` element [XMLSig] (base-64 encoding is done as in step 1,
166 above).

167 If a “RelayState” value is to accompany the SAML protocol message, it MUST be in a form control named
168 *RelayState*, and included in the form data set constructed in step 2 above, and also included in any
169 signed content if the message is signed.

170 The *action* attribute of the form MUST be the recipient’s HTTP endpoint for the protocol or profile using
171 this binding to which the SAML protocol message is to be delivered. The *method* attribute MUST be
172 “POST”. The *enctype* attribute specifies the form content type and MUST be `application/x-www-`
173 `form-urlencoded`.

174 All of the above form attributes and form controls, to which values are assigned per the above discussion,
175 comprise the form data set. The form data set is then encoded into an HTTP response *message-body*
176 as a `<FORM>` element. The HTTP response message is then sent to the user agent.

177 Any technique supported by the user agent MAY be used to cause the submission of the form (to cause it
178 to be conveyed to the SAML protocol message recipient), and any form content necessary to support this

179 MAY be included, such as submit controls and client-side scripting commands. However, the recipient
180 MUST be able to process the message without regard for the mechanism by which the form submission is
181 initiated.

182 Note that any form control values included MUST be transformed so as to be safe to include in the
183 XHTML document. This includes transforming characters such as quotes into HTML entities, etc.
184 [HTML401][XHTML]

185 2.5 SimpleSign Signature

186 To construct a signature of a SAML message conveyed by this binding:

- 187 1. The signature algorithm used MUST be identified by a URI, specified according to [XMLSig] or
188 whatever specification governs the algorithm. The following signature algorithms (see [XMLSig])
189 and their URI representations MUST be supported with this encoding mechanism:
 - 190 • DSAwithSHA1 – <http://www.w3.org/2000/09/xmldsig#dsa-sha1>
 - 191 • RSAwithSHA1 – <http://www.w3.org/2000/09/xmldsig#rsa-sha1>
- 193 2. A string consisting of the concatenation of the raw, unencoded XML making up the SAML protocol
194 message (NOT the base64-encoded version), the `RelayState` value (if present), and the
195 `SigAlg` value, is constructed in one of the following ways (each individually ordered as shown):

```
196 SAMLRequest=value&RelayState=value&SigAlg=value  
197  
198 SAMLResponse=value&RelayState=value&SigAlg=value  
199
```

- 201 3. The resultant octet string is fed into the signature algorithm.
- 202 4. The value yielded by the signature algorithm is base64 encoded (see [RFC2045]), and used as the
203 value for the `Signature` form control as discussed in section 2.4, above.

204 Note that this is subtly different from the signature approach defined by the HTTP-Redirect binding
205 [SAMLBind]. Experimentation shows that many web browsers alter linefeeds when submitting form
206 controls that span multiple lines. Since base64-encoded data often wraps, it is not possible to guarantee
207 that the values submitted will match what the original signer produced, resulting in verification failures.
208 Using the raw XML content as a component of the octet string addresses this issue.

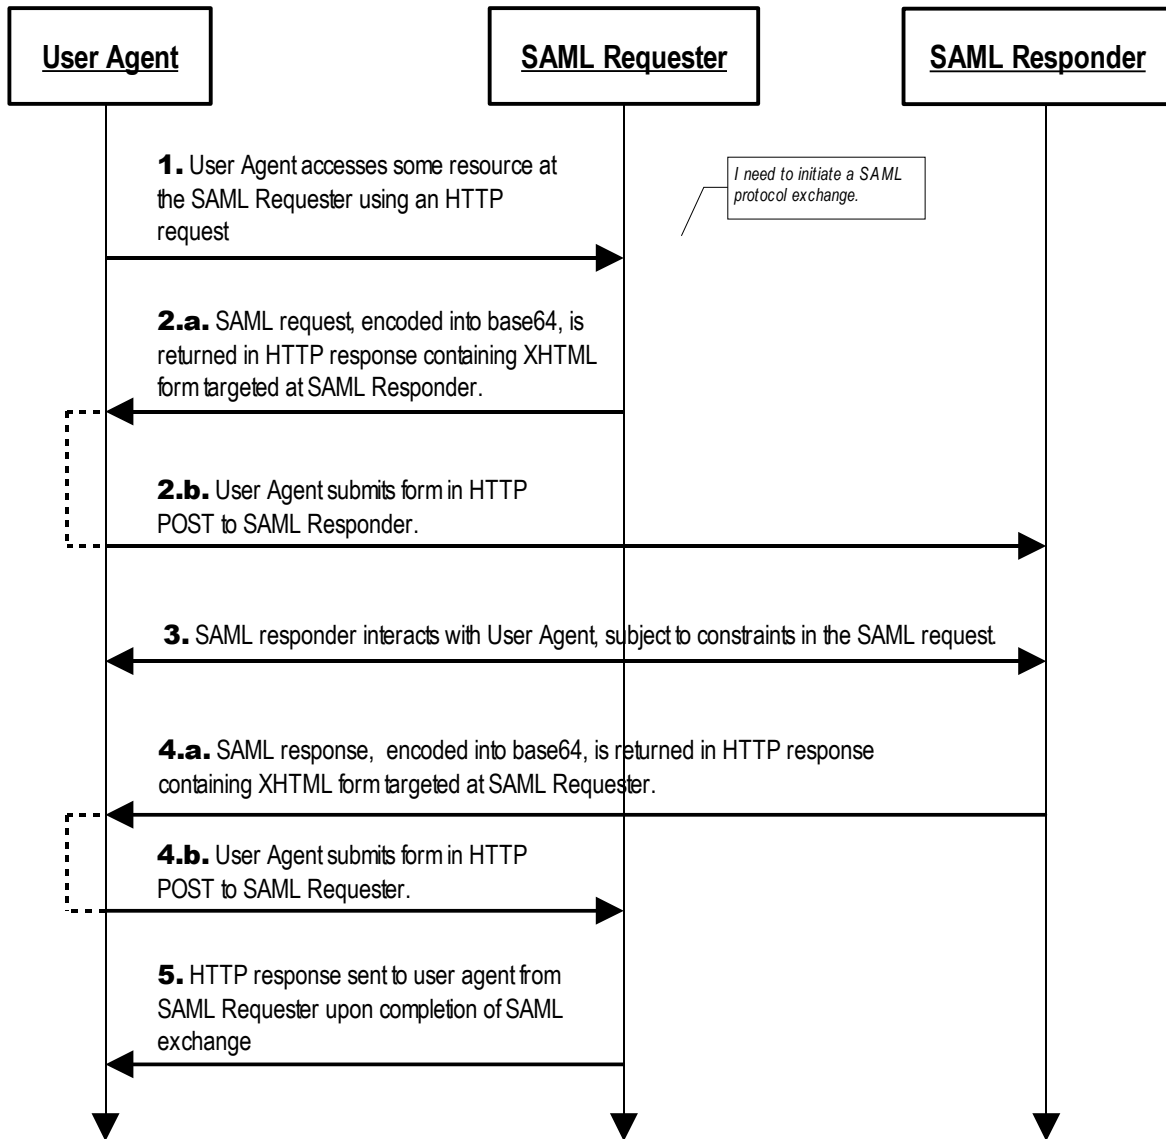

209 The original XML MUST be concatenated with the other information as shown above without regard for
210 any embedded whitespace, even if the result spans multiple lines. The specific whitespace characters
211 present will be safely encoded in base64 and then recovered by the relying party for use in verifying the
212 signature.

213 2.6 SimpleSign Signature Verification

214 To verify a received SAML protocol message, which was signed using SimpleSign and conveyed by this
215 binding, the receiver MUST extract the form control values for the `RelayState` (if present), `SigAlg`, and
216 `SAMLRequest` (or `SAMLResponse`) values (as appropriate) from the received HTTP message. Then the
217 receiver reconstructs the string as described in section 2.5 step 2, above. The signature value conveyed
218 in the `Signature` control value is then checked against this string per the signature algorithm given by
219 the `SigAlg` control value, and using (as appropriate, see [XMLSig]) the keying material obtained via the
220 `<ds:KeyInfo>` conveyed in the `KeyInfo` control value (if present). Error handling and generated
221 messages as a result of the signature not verifying are implementation-dependent.

222 **2.7 Message Exchange**

223 The system model used for SAML conversations via this binding is a request-response model. However,
224 a SAML request message is sent to the user agent via an HTTP response message, and subsequently
225 delivered to the SAML responder via an HTTP request message issued by the user agent. Any HTTP
226 interactions before, between, and after the foregoing exchanges take place is unspecified. Both the SAML
227 requester and responder are assumed to be HTTP responders. See the following diagram illustrating the
228 messages exchanged. Note that although the diagram illustrates both the SAML request and the SAML
229 response being conveyed via the HTTP POST-SimpleSign binding, one or the other of the SAML request
230 or the SAML response could be conveyed via a different SAML HTTP-based binding.

- 232 1. Initially, the user agent makes an arbitrary HTTP request to a system entity. In the course of
233 processing the request, the system entity decides to initiate a SAML protocol exchange.
- 234 2. (a) The system entity acting as a SAML requester responds to an HTTP request from the user
235 agent by returning a SAML request. The request is returned in an XHTML document containing the
236 form and content defined in Section 2.4, above. (b) The user agent delivers the SAML request by
237 issuing an HTTP POST request to the SAML responder.
- 238 3. In general, the SAML responder MAY respond to the SAML request by immediately returning a
239 SAML response or it MAY return arbitrary content to facilitate subsequent interaction with the user
240 agent necessary to fulfill the request. Specific protocols and profiles may include mechanisms to
241 indicate the requester's level of willingness to permit this kind of interaction (for example, the
242 `IsPassive` attribute in `<samlp:AuthnRequest>` [SAMLCore]).
- 243 4. Eventually the responder SHOULD (a) return a SAML response to the user agent to be (b) returned
244 to the SAML requester. The SAML response is returned in the same fashion as described for the
245 SAML request in step 2, if this or a similar binding is employed for this step. Otherwise, details may
246 vary.

247 5. Upon receiving the SAML response, the SAML requester returns an arbitrary HTTP response to the
248 user agent.

249 2.7.1 HTTP and Caching Considerations

250 HTTP proxies and the user agent intermediary should not cache SAML protocol messages. To ensure
251 this, the following rules SHOULD be followed.

252 When returning SAML protocol messages using HTTP 1.1, HTTP responders SHOULD:

- 253 • Include a `Cache-Control` header field set to "no-cache, no-store".
- 254 • Include a `Pragma` header field set to "no-cache".

255 There are no other restrictions on the use of HTTP headers.

256 2.7.2 Security Considerations

257 The presence of the user agent intermediary means that the requester and responder cannot rely on the
258 transport layer for endpoint-to-endpoint (i.e. SAML Requester to/from SAML Responder) authentication,
259 integrity or confidentiality protection. This binding defines the SimpleSign approach as a means for
260 signing the conveyed SAML protocol messages and optional `RelayState` in order to provide endpoint-
261 to-endpoint integrity protection and data origin authentication.

262 This binding SHOULD NOT be used if the content of the request or response should not be exposed to
263 the user agent intermediary. Otherwise, confidentiality of both SAML requests and SAML responses is
264 OPTIONAL and depends on the environment of use. If on-the-wire confidentiality is necessary, SSL 3.0
265 [SSL3] or TLS 1.0 [RFC2246] SHOULD be used to protect the overall HTTP messages, and the conveyed
266 SAML protocol messages, in transit between the user agent and the SAML requester and responder.

267 In general, this binding relies on message-level authentication and integrity protection via signing and
268 does not support confidentiality of messages from the user agent intermediary.

269 **NOTE:** Cryptographically-based security is entirely OPTIONAL in this binding. If no
270 security mechanisms are employed, then there is essentially no runtime assurance as to
271 the identity of any of the communicating entities.

272 If the SAML protocol messages are signed (using the SimpleSign approach or [XMLSig]) then the
273 `Destination` XML attribute in the root SAML element of the SAML protocol message MUST contain the
274 URL to which the sender has instructed the user agent to deliver the message. The recipient MUST then
275 verify that the value matches the location at which the message has been received.

276 Note also that the SimpleSign technique, if employed, binds the `RelayState` value (if present) to the SAML
277 protocol message, unlike the [XMLSig]-based technique of the HTTP POST binding [SAMLBind]. Thus, if
278 a SAML protocol message is not signed using SimpleSign, but is signed using the [XMLSig]-based
279 technique, then the caveats with respect to any conveyed `RelayState` value, presented in section 3.5.5.2
280 of [SAMLBind], should be taken into account.

281 2.8 Error Reporting

282 A SAML responder that refuses to perform a message exchange with the SAML requester SHOULD
283 return a response message with a second-level `<samlp:StatusCode>` value of
284 `urn:oasis:names:tc:SAML:2.0:status:RequestDenied`.

285 HTTP interactions during the message exchange MUST NOT use HTTP error status codes to indicate
286 failures in SAML processing, since the user agent is not a full party to the SAML protocol exchange.

287 For more information about SAML status codes, see the SAML assertions and protocols specification

289 2.9 Metadata Considerations

290 Support for the HTTP POST-SimpleSign binding SHOULD be reflected by indicating URL endpoints at
 291 which requests and responses for a particular protocol or profile should be sent. Either a single endpoint
 292 or distinct request and response endpoints MAY be supplied [SAMLMeta]. The identification URI given in
 293 section 2.1 is used as the value for the `Binding` attribute of any endpoint elements.

294 2.10 Note to Implementors

295 SAML protocol message recipients can distinguish between HTTP-SAML messages constructed via this
 296 specification's HTTP POST-SimpleSign binding and ones constructed via the HTTP POST binding
 297 [SAMLBind] by examining received HTTP messages for an XHTML form field with a name attribute value
 298 of `Signature`. If this is present, then the message MUST be processed in accordance with this
 299 specification. If not present, then the HTTP message MAY be processed in accordance with the HTTP
 300 POST binding specification.

301 2.11 Example

302 In this example, a `<LogoutRequest>` and `<LogoutResponse>` message pair is exchanged using the
 303 HTTP POST-SimpleSign binding. The messages are signed as described in section 2.5, above. If the
 304 messages were unsigned, they would be the same as shown below, except that the hidden form controls
 305 named `Signature` and `SigAlg` would be missing.

306 First, here are the actual SAML protocol messages being exchanged:

```
307 <samlp:LogoutRequest xmlns:samlp="urn:oasis:names:tc:SAML:2.0:protocol"
308 xmlns="urn:oasis:names:tc:SAML:2.0:assertion"
309 ID="d2b7c388cec36fa7c39c28fd298644a8" IssueInstant="2004-01-
310 21T19:00:49Z" Version="2.0">
311 <Issuer>https://IdentityProvider.com/SAML</Issuer>
312 <NameID Format="urn:oasis:names:tc:SAML:2.0:nameid-
313 format:persistent">005a06e0-ad82-110d-a556-004005b13a2b</NameID>
314 <samlp:SessionIndex>1</samlp:SessionIndex>
315 </samlp:LogoutRequest>
```

```
317 <samlp:LogoutResponse xmlns:samlp="urn:oasis:names:tc:SAML:2.0:protocol"
318 xmlns="urn:oasis:names:tc:SAML:2.0:assertion"
319 ID="b0730d21b628110d8b7e004005b13a2b"
320 InResponseTo="d2b7c388cec36fa7c39c28fd298644a8"
321 IssueInstant="2004-01-21T19:00:49Z" Version="2.0">
322 <Issuer>https://ServiceProvider.com/SAML</Issuer>
323 <samlp:Status>
324 <samlp:StatusCode
325 Value="urn:oasis:names:tc:SAML:2.0:status:Success"/>
326 </samlp:Status>
327 </samlp:LogoutResponse>
```

329 The initial HTTP request from the user agent in step 1 is not defined by this binding. To initiate the logout
 330 protocol exchange, the SAML requester returns the following HTTP response, containing a SAML request
 331 message. The `SAMLRequest` parameter value is actually derived from the request message above.

```
332 HTTP/1.1 200 OK
333 Date: 21 Jan 2004 07:00:49 GMT
334 Content-Type: text/html; charset=iso-8859-1
335
336 <?xml version="1.0" encoding="UTF-8"?>
```

```

Appendix B. Notices

517 Copyright © OASIS Open 2007. All Rights Reserved.

518 All capitalized terms in the following text have the meanings assigned to them in the OASIS Intellectual
519 Property Rights Policy (the "OASIS IPR Policy"). The full Policy may be found at the OASIS website.

520 This document and translations of it may be copied and furnished to others, and derivative works that
521 comment on or otherwise explain it or assist in its implementation may be prepared, copied, published,
522 and distributed, in whole or in part, without restriction of any kind, provided that the above copyright notice
523 and this section are included on all such copies and derivative works. However, this document itself may
524 not be modified in any way, including by removing the copyright notice or references to OASIS, except as
525 needed for the purpose of developing any document or deliverable produced by an OASIS Technical
526 Committee (in which case the rules applicable to copyrights, as set forth in the OASIS IPR Policy, must
527 be followed) or as required to translate it into languages other than English.

528 The limited permissions granted above are perpetual and will not be revoked by OASIS or its successors
529 or assigns.

530 This document and the information contained herein is provided on an "AS IS" basis and OASIS
531 DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY
532 WARRANTY THAT THE USE OF THE INFORMATION HEREIN WILL NOT INFRINGE ANY
533 OWNERSHIP RIGHTS OR ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A
534 PARTICULAR PURPOSE.

535 OASIS requests that any OASIS Party or any other party that believes it has patent claims that would
536 necessarily be infringed by implementations of this OASIS Committee Specification or OASIS Standard,
537 to notify OASIS TC Administrator and provide an indication of its willingness to grant patent licenses to
538 such patent claims in a manner consistent with the IPR Mode of the OASIS Technical Committee that
539 produced this specification.

540 OASIS invites any party to contact the OASIS TC Administrator if it is aware of a claim of ownership of
541 any patent claims that would necessarily be infringed by implementations of this specification by a patent
542 holder that is not willing to provide a license to such patent claims in a manner consistent with the IPR
543 Mode of the OASIS Technical Committee that produced this specification. OASIS may include such
544 claims on its website, but disclaims any obligation to do so.

545 OASIS takes no position regarding the validity or scope of any intellectual property or other rights that
546 might be claimed to pertain to the implementation or use of the technology described in this document or
547 the extent to which any license under such rights might or might not be available; neither does it represent
548 that it has made any effort to identify any such rights. Information on OASIS' procedures with respect to
549 rights in any document or deliverable produced by an OASIS Technical Committee can be found on the
550 OASIS website. Copies of claims of rights made available for publication and any assurances of licenses
551 to be made available, or the result of an attempt made to obtain a general license or permission for the
552 use of such proprietary rights by implementers or users of this OASIS Committee Specification or OASIS
553 Standard, can be obtained from the OASIS TC Administrator. OASIS makes no representation that any
554 information or list of intellectual property rights will at any time be complete, or that any claims in such list
555 are, in fact, Essential Claims.
