**Related Work:**

This specification replaces or supercedes:

- Extensible Resource Identifier (XRI) Resolution Version 2.0, Committee Draft 01, March 2005
- Extensible Resource Identifier (XRI) Version 1.0, Committee Draft 01, January 2004

This specification is related to:

- Extensible Resource Identifier (XRI) Syntax Version 2.0, Committee Specification, December 2005
- Extensible Resource Identifier (XRI) Metadata Version 1.0, Committee Draft 01, March 2005

## Declared XML Namespace(s)

xri://\$res  
xri://\$xrds  
xri://\$xrd  
xri://\$xrd\*(\$v\*2.0)  
xri://\$res\*auth  
xri://\$res\*auth\*(\$v\*2.0)  
xri://\$res\*proxy  
xri://\$res\*proxy\*(\$v\*2.0)

## Abstract:

This document defines a simple generic format for resource description (XRDS documents), a protocol for obtaining XRDS documents from HTTP(S) URIs, and generic and trusted protocols for resolving Extensible Resource Identifiers (XRI) using XRDS documents and HTTP(S) URIs. These protocols are intended for use with both HTTP(S) URIs as defined in **[RFC2616]** and with XRI as defined by *Extensible Resource Identifier (XRI) Syntax Version 2.0* **[XRISyntax]** or higher. For a dictionary of XRI defined to provide standardized identifier metadata, see *Extensible Resource Identifier (XRI) Metadata Version 2.0* **[XRIMetadata]**. For a basic introduction to XRI, see the *XRI 2.0 FAQ* **[XRIFAQ]**.

## Status:

This document was last revised or approved by the XRI Technical Committee on the above date. The level of approval is also listed above. Check the “Latest Version” or “Latest Approved Version” location noted above for possible later revisions of this document.

Technical Committee members should send comments on this specification to the Technical Committee’s email list. Others should send comments to the Technical Committee by using the “Send A Comment” button on the Technical Committee’s web page at <http://www.oasis-open.org/committees/xri>.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Technical Committee web page (<http://www.oasis-open.org/committees/xri/ipr.php>).

The non-normative errata page for this specification is located at <http://www.oasis-open.org/committees/xri>.

# 1 Introduction

Extensible Resource Identifier (XRI) provides a uniform syntax for abstract structured identifiers as defined in **[XRISyntax]**. Because XRI may be used across a wide variety of communities and applications (as Web addresses, database keys, filenames, object IDs, XML IDs, tags, etc.), no single resolution mechanism may prove appropriate for all XRI. However, in the interest of promoting interoperability, this specification defines a simple generic resource description format called XRDS (Extensible Resource Descriptor Sequence), a standard protocol for requesting XRDS documents using HTTP(S) URIs, and standard protocol for resolving XRI using XRDS documents and HTTP(S) URIs. Both generic and trusted versions of the XRI resolution protocol are defined (the latter using HTTPS **[RFC2818]** and/or signed SAML assertions **[SAML]**). In addition, an HTTP(S) proxy resolution service is specified both to provide network-based resolution services and for backwards compatibility with existing HTTP(S) infrastructure.

## 1.1 Overview of XRI Resolution Architecture

Resolution is the function of dereferencing an identifier to a set of metadata describing the identified resource. For example, in DNS, a domain name is typically resolved using the UDP protocol into a set of resource records describing a host. If the resolver does not have the answer cached, it will start by querying one of the well-known DNS root nameservers for the fully qualified domain name. Since domain names work from right to left, and the root nameservers know only about top level domains, they will return the NS (name server) records for the top-level domain. The resolver will then repeat the same query to those name servers and “walk down the tree” until the domain name is fully resolved or an error is encountered.

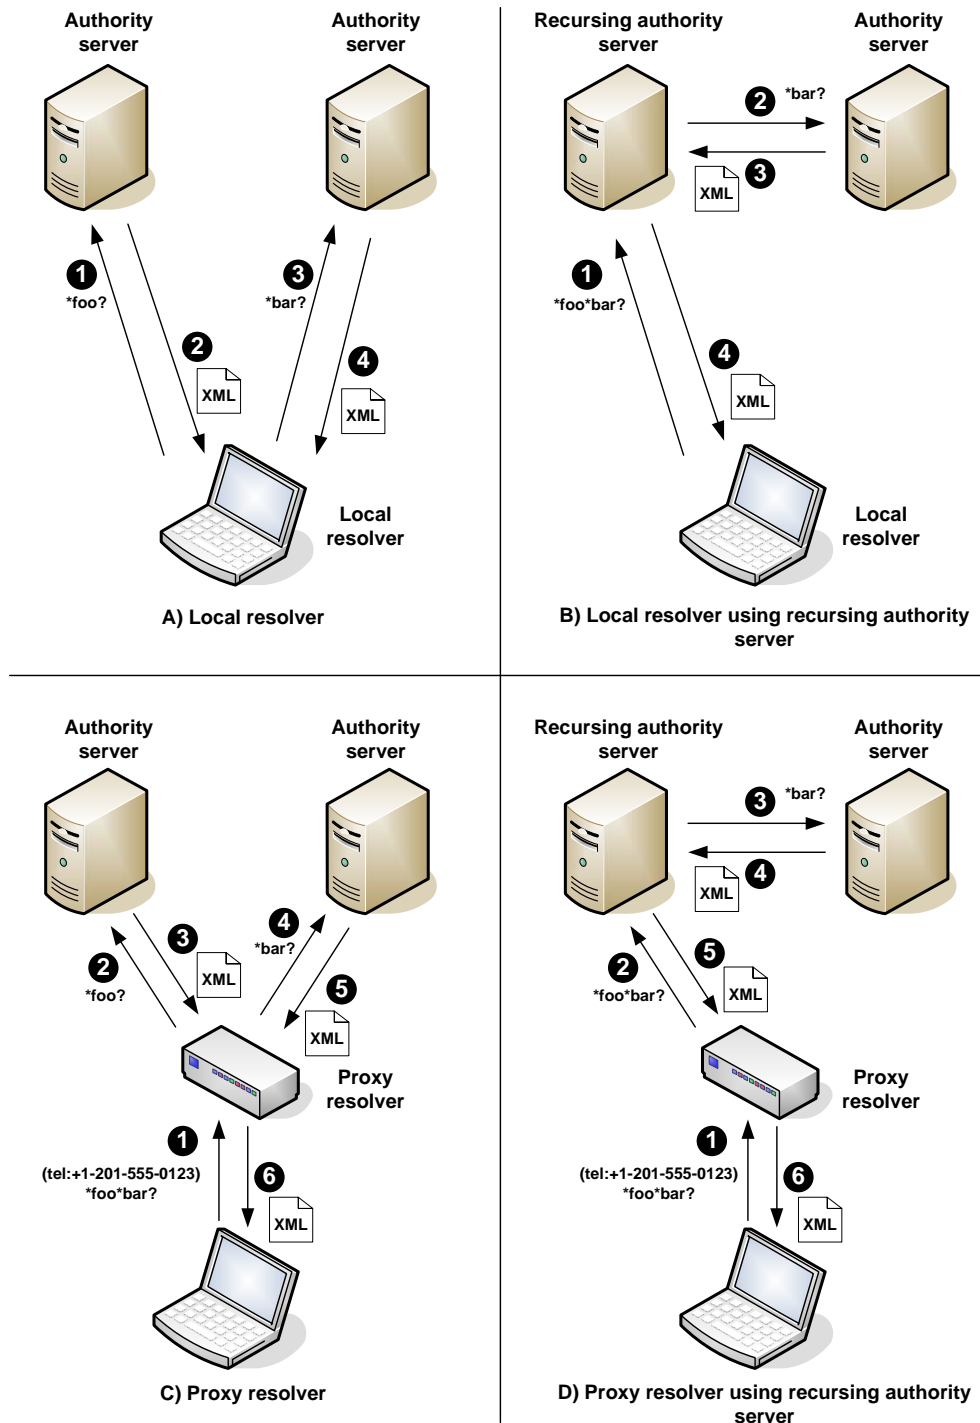

A simple *non-recursing resolver* will rely on a *recursing nameserver* to do this work. For example, it will send a query for the fully qualified domain name `docs.oasis-open.org` to a local nameserver. If the nameserver doesn't have the answer cached, it will resolve the domain name and return the results back to the resolver (and cache the results for subsequent queries).

XRI resolution follows this same architecture except at a higher level of abstraction, i.e., rather than using UDP to resolve a domain name into a text-based resource descriptor, it uses HTTP(S) to resolve an XRI into an XML-based resource descriptor called an *XRDS document*. Table 1 provides a high-level comparison between DNS and XRI resolution architectures.

Resolution Component	DNS Architecture	XRI Architecture
Identifier	domain name	XRI (authority + path + query)
Resource record format	text (resource record)	XML (XRDS document)
Attribute identifier	string	anyURI
Network endpoint identifier	IP address	URI
Synonyms	CNAME	LocalID, EquivID, CanonicalID, CanonicalEquivID
Primary resolution protocol	UDP	HTTP(S)
Trusted resolution options	DNSSEC	HTTPS and/or SAML
Resolution client	resolver	resolver
Resolution server	authoritative nameserver	authority server
Recursing resolution	recursing nameserver	recursing authority server or proxy resolver

Table 1: Comparing DNS and XRI resolution architecture.

31 As Table 1 notes, XRI resolution architecture supports both recursing authority servers and *proxy*  
 32 *resolvers*. A proxy resolver is simply an HTTP(S) interface to a local XRI resolver (one  
 33 implemented using a platform-specific API). Proxy resolvers enable applications—even those that  
 34 only understand HTTP URIs—to easily access the functions of an XRI resolver remotely.  
 35 Figure 1 shows four scenarios of how these components might interact to resolve  
 36 `xri://(tel:+1-201-555-0123)*foo*bar` (unlike DNS, this works from left-to-right).

37  
 38 *Figure 1: Four typical scenarios for XRI authority resolution.*

39 Each of these scenarios may involve two phases of XRI resolution:

- 40 • *Phase 1: Authority resolution.* This is the phase required to resolve the authority component  
41 of an XRI into an XRDS document describing the target authority. Authority resolution works  
42 iteratively from left-to-right across each subsegment in the authority component of the XRI. In  
43 XRIs, subsegments are delimited using either a specified set of symbol characters or  
44 parentheses. For example, in the XRI `xri://(tel:+1-201-555-0123)*foo*bar`, the  
45 authority subsegments are `(tel:+1-201-555-0123)` (the community root authority, in this  
46 case a URI expressed as an cross-reference delimited with parentheses), `*foo`, (the first  
47 resolvable subsegment), and `*bar`, (the second resolvable subsegment). Note that a  
48 resolver must be preconfigured (or have its own way of discovering) the community root  
49 authority starting point, so the community root subsegment is not resolved except in one  
50 special case (see section 9.1.6).
- 51 • *Phase 2: Optional service endpoint selection.* Once authority resolution is complete, there is  
52 an optional second phase of XRI resolution to select a specific type of metadata from the final  
53 XRDS document retrieved called a *service endpoint* (SEP). Service endpoints are descriptors  
54 of concrete URIs at which network services are available for the target resource. Additional  
55 XRI resolution parameters as well as the path component of an XRI may be used as service  
56 endpoint selection criteria.

57 It is worth highlighting several other key differences between DNS and XRI resolution:

- 58 • *HTTP.* As a resolution protocol, HTTP not only makes it easy to deploy XRI resolution  
59 services (including proxy resolution services), but also allows them to employ both HTTP  
60 security standards (e.g., HTTPS) and XML-based security standards (e.g., SAML). Although  
61 less efficient than UDP, HTTP(S) is suitable for the higher level of abstraction represented by  
62 XRIs and can take advantage of the full caching capabilities of modern web infrastructure.
- 63 • *XRDS documents.* This simple, extensible XML resource description format makes it easy to  
64 describe the capabilities of any XRI-, IRI-, or URI-identified resource in a manner that can be  
65 consumed by any XML-aware application (or even by non-XRI aware browsers via a proxy  
66 resolver).
- 67 • *Service endpoint descriptors.* DNS can use NAPTR records to do string transformations into  
68 URIs representing network endpoints. XRDS documents have *service endpoint descriptors*—  
69 elements that describe the set of URIs at which a particular type of service is available. Each  
70 service endpoint may present a different type of data or metadata representing or describing  
71 the identified resource. Thus XRI resolution can serve as a lightweight, interoperable  
72 discovery mechanism for resource attributes available via HTTP(S), LDAP, UDDI, SAML,  
73 WS-Trust, or other directory or discovery protocols.
- 74 • *Synonyms.* DNS uses the CNAME attribute to establish equivalence between domain names.  
75 XRDS architecture supports four synonym elements (LocalID, EquivID, CanonicalID, and  
76 CanonicalEquivID) to provide robust support for mapping XRIs, IRIs, or URIs to other XRIs,  
77 IRIs, or URIs that identify the same target resource. This is particularly useful for discovering  
78 and mapping to persistent identifiers as often required by trust infrastructures.
- 79 • *Redirects and Refs.* XRDS architecture also includes two mechanisms for distributed XRDS  
80 document management. The *Redirect* element allows an identifier authority to manage  
81 multiple XRDS documents describing a target resource from different network locations. The  
82 *Ref* element allows one identifier authority to delegate all or part of an XRDS document to a  
83 different identifier authority.

## 84 1.2 Structure of this Specification

85 This specification is structured into the following sections:

- 86 • *Conformance* (section 2) specifies the conformance targets and conformance claims for this  
87 specification.
- 88 • *Namespaces* (section 3) specifies the XRI and XML namespaces and media types used for  
89 the XRI resolution protocol.

90 The next three sections cover XRDS documents and the requirements for XRDS clients and  
91 servers:

- 92 • *XRDS Documents* (section 4) specifies a simple, flexible XML-based container for XRI  
93 resolution metadata, service endpoints, and/or other metadata describing a resource.
- 94 • *XRDS Synonyms* (section 5) specifies usage of the four XRDS synonym elements.
- 95 • *Discovering an XRDS Document from an HTTP(S) URI* (section 6) specifies a protocol for  
96 obtaining an XRDS description of a resource by starting from an HTTP(S) URI identifying the  
97 resource.

98 The remaining sections cover XRI resolution and the requirements for XRI authority servers, local  
99 resolvers, and proxy resolvers:

- 100 • *XRI Resolution Flow* (section 7) provides a top-level flowchart of the XRI resolution function  
101 together with a list of other supporting flowcharts used throughout the specification.
- 102 • *Inputs and Outputs* (section 8) specifies the input parameters, output formats, and associated  
103 processing rules.
- 104 • *Generic Authority Resolution* (section 9) specifies a simple resolution protocol for the  
105 authority component of an XRI using HTTP/HTTPS as a transport.
- 106 • *Trusted Authority Resolution* (section 10) specifies three extensions to generic authority  
107 resolution for creating a chain of trust between the participating identifier authorities using  
108 HTTPS connections, SAML assertions, or both.
- 109 • *Proxy Resolution* (section 11) specifies an HTTP(S) interface for an XRI resolver plus a  
110 format for expressing an XRI as an HTTP(S) URI to provide backwards compatibility with  
111 existing HTTP(S) infrastructure.
- 112 • *Redirect and Ref Processing* (section 12) specifies how a resolver follows a reference from  
113 one XRDS document to another to enable federation of XRDS documents across multiple  
114 network locations (Redirects) or identifier authorities (Refs).
- 115 • *Service Endpoint Selection* (section 13) specifies an optional second phase of resolution for  
116 selecting a set of service endpoints from an XRDS document.
- 117 • *Synonym Verification* (section 14) specifies how a resolver can verify that one XRI, IRI, or  
118 HTTP(S) URI is an authorized synonym for another.
- 119 • *Status Codes and Error Processing* (section 15) specifies status reporting and error handling.
- 120 • *Use of HTTP(S)* (section 16) specifies how the XRDS and XRI resolution protocols leverage  
121 features of the HTTP(S) protocol.
- 122 • *Extensibility and Versioning* (section 17) describes how the XRI resolution protocol can be  
123 easily extended and how new versions will be identified and accommodated.
- 124 • *Security and Data Protection* (section 18) summarizes key security and privacy  
125 considerations for XRI resolution infrastructure.

## 126 1.3 Terminology and Notation

127 The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”,  
128 “SHOULD NOT”, “RECOMMENDED”, “NOT RECOMMENDED”, “MAY”, and “OPTIONAL” in this  
129 document are to be interpreted as described in [RFC2119]. When these words are not capitalized  
130 in this document, they are meant in their natural language sense.

131 This specification uses the Augmented Backus-Naur Form (ABNF) syntax notation defined in  
132 [RFC4234].

133 Other terms used in this document and not defined herein are defined in the glossary in Appendix  
134 C of [XRISyntax].

135 Formatting conventions used in this document:

136 Examples look like this.

137 ABNF productions look like this.

138 In running text, XML elements, attributes, and values look like this.

## 139 1.4 Examples

140 The specification includes short examples as necessary to clarify interpretation. However, to  
141 minimize non-normative material, it does not include extensive examples of XRI resolution  
142 requests and responses. Many such examples are available via open source implementations,  
143 operating XRI registry and resolution services, and public websites about XRI. For a list of such  
144 resources, see the Wikipedia page on XRI [WikipediaXRI].

## 218 2 Conformance

219 This section specifies the conformance targets of this specification and the requirements that  
220 apply to each of them.

### 221 2.1 Conformance Targets

222 The conformance targets of this specification are:

- 223 1. *XRDS clients*, which provide a limited subset of the functionality of XRI resolvers.
- 224 2. *XRDS servers*, which provide a limited subset of the functionality of XRI authority servers.
- 225 3. *XRI local resolvers*, which may implement any combination of the generic, HTTPS, or  
226 SAML resolution protocols.
- 227 4. *XRI proxy resolvers*, which may implement any combination of the generic, HTTPS, or  
228 SAML resolution protocols.
- 229 5. *XRI authority servers*, which may implement any combination of the generic, HTTPS, or  
230 SAML resolution protocols.

231 Note that a single implementation may serve any combination of these functions. For example, an  
232 XRI authority server may also function as an XRDS client and server and an XRI local and proxy  
233 resolver.

### 234 2.2 Conformance Claims

235 A claim of conformance with this specification MUST meet the following requirements:

- 236 1. It MUST state which conformance targets it implements.
- 237 2. If the conformance target is an XRI local resolver, XRI proxy resolver, or XRI authority  
238 server, it MUST state which resolution protocols are supported, i.e., generic, HTTPS,  
239 and/or SAML.

### 240 2.3 XRDS Clients

241 An implementation conforms to this specification as an XRDS client if it meets the following  
242 conditions:

- 243 1. It MAY implement parsing of XRDS Documents as specified in section 4.
- 244 2. It MUST implement the client requirements of the XRDS request protocol specified in  
245 section 6.

### 246 2.4 XRDS Servers

247 An implementation conforms to this specification as an XRDS server if it meets the following  
248 conditions:

- 249 1. It MUST produce valid XRDS Documents as specified in section 4.
- 250 2. It MUST implement the server requirements of the XRDS request protocol specified in  
251 section 6.

## 252 **2.5 XRI Local Resolvers**

### 253 **2.5.1 Generic**

254 An implementation conforms to this specification as a generic local resolver if it meets the  
255 following conditions:

- 256 1. It parses XRDS documents as specified in section 4.
- 257 2. It processes resolution inputs and outputs as specified in section 8.
- 258 3. It implements the resolver requirements of the generic resolution protocol specified in  
259 section 9.
- 260 4. It implements the Redirect and Ref processing rules specified in section 12.
- 261 5. It implements the Service Endpoint Selection processing rules specified in section 13.
- 262 6. It implements the Synonym Verification processing rules specified in section 14.
- 263 7. It implements the Status Code and Error Processing rules specified in section 15.
- 264 8. It follows the HTTP(S) usage recommendations specified in section 16.

### 265 **2.5.2 HTTPS**

266 An implementation conforms to this specification as an HTTPS local resolver if it meets all the  
267 requirements of a generic local resolver plus the following conditions:

- 268 1. It implements the resolver requirements of the HTTPS trusted resolution protocol  
269 specified in section 10.1.

### 270 **2.5.3 SAML**

271 An implementation conforms to this specification as a SAML local resolver if it meets all the  
272 requirements of a generic local resolver plus the following conditions:

- 273 1. It implements the resolver requirements of the SAML trusted resolution protocol specified  
274 in section 10.2.
- 275 2. It SHOULD also meet the requirements of an HTTPS local resolver. This is STRONGLY  
276 RECOMMENDED for confidentiality of SAML interactions.

## 277 **2.6 XRI Proxy Resolvers**

### 278 **2.6.1 Generic**

279 An implementation conforms to this specification as a generic proxy resolver if it meets all the  
280 requirements of a generic local resolver plus the following conditions:

- 281 1. It implements the requirements for a proxy resolver specified in section 11.

### 282 **2.6.2 HTTPS**

283 An implementation conforms to this specification as a HTTPS proxy resolver if it meets all the  
284 requirements of a HTTPS local resolver plus the following conditions:

- 285 1. It implements the requirements for a HTTPS proxy resolver specified in section 11.

### 286 **2.6.3 SAML**

287 An implementation conforms to this specification as a SAML proxy resolver if it meets all the  
288 requirements of a SAML local resolver plus the following conditions:

- 289 1. It implements the requirements for a proxy resolver specified in section 11.

290 2. It SHOULD also meet the requirements of an HTTPS proxy resolver. This is STRONGLY  
291 RECOMMENDED for confidentiality of SAML interactions.

## 292 **2.7 XRI Authority Servers**

### 293 **2.7.1 Generic**

294 An implementation conforms to this specification as a generic authority server if it meets the  
295 following conditions:

- 296 1. It produces XRDS documents as specified in section 4.
- 297 2. It assigns XRDS synonyms as specified in section 5.
- 298 3. It processes resolution inputs and outputs as specified in section 8.
- 299 4. It implements the server requirements of the generic resolution protocol specified in  
300 section 9.
- 301 5. It implements the Status Code and Error Processing rules specified in section 15.
- 302 6. It follows the HTTP(S) usage recommendations specified in section 16.

### 303 **2.7.2 HTTPS**

304 An implementation conforms to this specification as an HTTPS authority server if it meets all the  
305 requirements of a generic authority server plus the following conditions:

- 306 1. It implements the server requirements of the HTTPS trusted resolution protocol specified  
307 in section 10.1.

### 308 **2.7.3 SAML**

309 An implementation conforms to this specification as an SAML authority server if it meets all the  
310 requirements of a generic authority server plus the following conditions:

- 311 1. It implements the server requirements of the SAML trusted resolution protocol specified  
312 in section 10.2.
- 313 2. It SHOULD also meet the requirements of an HTTPS authority server. This is  
314 STRONGLY RECOMMENDED for confidentiality of SAML interactions.

## 315 **2.8 Extensions**

316 The protocols and XML documents defined in this specification MAY be extended. To maintain  
317 interoperability, extensions MUST use the extensibility architecture specified in section 17.  
318 Extensions MUST NOT be implemented in a manner that would cause them to be non-  
319 interoperable with implementations that do not implement the extensions.

## 320 **2.9 Language**

321 This specification's normative language is English. Translation into other languages is  
322 encouraged.

---

## 323 3 Namespaces

### 324 3.1 XRI Namespaces for XRI Resolution

325 As defined in section 2.2.1.2 of **[XRISyntax]**, the GCS symbol \$ is reserved for specified  
326 identifiers, i.e., those assigned and defined by XRI TC specifications, other OASIS specifications,  
327 or other standards bodies. (See also **[XRIMetadata]**.) This section specifies the \$ namespaces  
328 reserved for XRI resolution.

#### 329 3.1.1 XRIs Reserved for XRI Resolution

330 The XRIs in Table 2 are assigned by this specification for the purposes of XRI resolution and  
331 resource description.

XRI (in URI-Normal Form)	Usage	See Section
xri://\$res	Namespace for XRI resolution service types	3.1.2
xri://\$xrds	Namespace for the generic XRDS (Extensible Resource Descriptor Sequence) schema (not versioned)	3.2
xri://\$xrd	Namespace for the XRD (Extensible Resource Descriptor) schema (versioned)	3.2
xri://\$xrd*(\$v*2.0)	Version 2.0 of above (using an XRI version identifier as defined in <b>[XRIMetadata]</b> )	3.2

332 *Table 2: XRIs reserved for XRI resolution.*

#### 333 3.1.2 XRIs Assigned to XRI Resolution Service Types

334 The XRIs in Table 3 are assigned to the XRI resolution service types defined in this specification.

XRI	Usage	See Section
xri://\$res*auth	Authority resolution service	9
xri://\$res*auth*(\$v*2.0)	Version 2.0 of above	9
xri://\$res*proxy	HTTP(S) proxy resolution service	11
xri://\$res*proxy*(\$v*2.0)	Version 2.0 of above	11

335 *Table 3: XRIs assigned to identify XRI resolution service types.*

336 Using the standard XRI extensibility mechanisms described in **[XRISyntax]**, the \$res  
337 namespace may be extended by other authorities besides the XRI Technical Committee. See  
338 **[XRIMetadata]** for more information about extending \$ namespaces.

339 **3.2 XML Namespaces for XRI Resolution**

340 Throughout this document, the following XML namespace prefixes have the meanings defined in  
 341 Table 4 whether or not they are explicitly declared in the example or text.

Prefix	XML Namespace	Reference
xs	http://www.w3.org/2001/XMLSchema	[XMLSchema]
saml	urn:oasis:names:tc:SAML:2.0:assertion	[SAML]
ds	http://www.w3.org/2000/09/xmldsig#	[XMLDSig]
xrds	xri://\$xrds	Section 3.1.1 of this document
xrd	xri://\$xrd*(\$v*2.0)	Section 3.1.1 of this document

342 *Table 4: XML namespace prefixes used in this specification.*

343 **3.3 Media Types for XRI Resolution**

344 Because XRI resolution architecture is based on HTTP, it makes use of standard media types as  
 345 defined by [RFC2046], particularly in HTTP Accept headers as specified in [RFC2616]. Table 5  
 346 specifies the media types used for XRI resolution. Note that in XRI authority resolution, these  
 347 media types MUST be passed as HTTP Accept header values. By contrast, in XRI proxy  
 348 resolution these media types MUST be passed as query parameters in an HTTP(S) URI as  
 349 specified in section 11.

Media Type	Usage	Reference
application/xrds+xml	Content type for returning the full XRDS document describing a resolution chain	Appendix D
application/xrd+xml	Content type for returning only the final XRD element in a resolution chain	Appendix E
text/uri-list	Content type for returning a list of URIs output from the service endpoint selection process defined in section 12	Section 5 of [RFC2483]

350 *Table 5: Media types defined or used in this specification.*

351 To provide full control of XRI resolution, the media types specified in Table 5 accept the media  
 352 type parameters defined in Table 6. All are Boolean flags. Note that when these media type  
 353 parameters are appended to a media type in the XRI proxy resolver interface, the semicolon  
 354 character used to concatenate them MUST be percent-encoded as specified in section 11.4.

<b>Media Type Parameter</b>	<b>Default Value</b>	<b>Usage</b>	<b>See Section</b>
https	FALSE	Specifies use of HTTPS trusted resolution	10.1
saml	FALSE	Specifies use of SAML trusted resolution	10.2
refs	TRUE	Specifies whether Refs should be followed during resolution (by default they are followed)	12.4
sep	FALSE	Specifies whether service endpoint selection should be performed	13
nodefault_t	TRUE	Specifies whether a default match on a Type service endpoint selection element is allowed	13.3
nodefault_p	TRUE	Specifies whether a default match on a Path service endpoint selection element is allowed	13.3
nodefault_m	TRUE	Specifies whether a default match on a MediaType service endpoint selection element is allowed	13.3
uric	FALSE	Specifies whether a resolver should automatically construct service endpoint URIs	13.7.1
cid	TRUE	Specifies whether automatic canonical ID verification should be performed	14.3

356 *Table 6: Parameters for the media types defined in Table 5.*

357 When used as logical XRI resolution input parameters, these media type parameters will be  
 358 referred to as *subparameters*.

---

## 359 4 XRDS Documents

360 XRI resolution provides resource description metadata using a simple, extensible XML format  
361 called an XRDS (Extensible Resource Descriptor Sequence) document. An XRDS document  
362 contains one or more XRD (Extensible Resource Descriptor) elements. While this specification  
363 defines only the XRD elements necessary to support XRI resolution, XRD elements can easily be  
364 extended to publish any form of metadata about the resources they describe.

### 365 4.1 XRDS and XRD Namespaces

366 An XRDS document is intended to serve exclusively as an XML container document for XML  
367 schemas from other XML namespaces. Therefore it has only a single root element `xrds:XRDS` in  
368 its own XML namespace identified by the XRI `xri://$xrds`. It also has two attributes,  
369 `redirect` and `ref`, that are used to identify the resource described by the XRDS document.  
370 Both are of type `anyURI`. Use of these attributes is defined in section 12.5. A link to the formal  
371 RelaxNG schema definition of an XRDS document is provided in Appendix B.

372 The elements in the XRD schema are intended for generic resource description, including the  
373 metadata necessary for XRI resolution. Since the XRD schema has simple semantics that may  
374 evolve over time, the version defined in this specification uses the XML namespace  
375 `xri://$xrd*($v*2.0)`. This namespace is versioned using XRI version metadata as defined  
376 in [XRIMetadata].

377 The attributes defined in both the XRDS and XRD schemas are not namespace qualified. In order  
378 to prevent conflicts, attributes defined in extensions MUST be namespace qualified.

379 This namespace architecture enables the XRDS namespace to remain constant while allowing  
380 the XRD namespace (and the namespaces of other XML elements that may be included in an  
381 XRDS document) to be versioned over time. See section 17.2 for more about versioning of the  
382 XRD schema.

### 383 4.2 XRD Elements and Attributes

384 The following example XRDS instance document illustrates the elements and attributes defined in  
385 the XRD schema. Note that because it is provided by the community root authority  
386 (`tel:+1-201-555-0123`), it includes only one XRD describing the subsegment `*foo`.  
387 Examples in later sections show multiple XRDs.

```

389 <XRDS xmlns="xri://$xrds" ref="xri://(tel:+1-201-555-0123)*foo">
390   <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">
391     <Query>*foo</Query>
392     <Status code="100"/>
393     <ServerStatus code="100"/>
394     <Expires>2005-05-30T09:30:10Z</Expires>
395     <ProviderID>xri://(tel:+1-201-555-0123)</ProviderID>
396     <LocalID>*baz</LocalID>
397     <EquivID>https://example.com/example/resource/</EquivID>
398     <CanonicalID>xri://(tel:+1-201-555-0123)!1234</CanonicalID>
399     <CanonicalEquivID>
400       xri://=!4a76!c2f7!9033.78bd
401     </CanonicalEquivID>
402     <Service>
403       <ProviderID>
404         xri://(tel:+1-201-555-0123)!1234
405       </ProviderID>
406       <Type>xri://$res*auth*($v*2.0)</Type>
407       <MediaType>application/xrds+xml</MediaType>
408       <URI priority="10">http://resolve.example.com</URI>
409       <URI priority="15">http://resolve2.example.com</URI>
410       <URI>https://resolve.example.com</URI>
411     </Service>
412     <Service>
413       <ProviderID>
414         xri://(tel:+1-201-555-0123)!1234
415       </ProviderID>
416       <Type>xri://$res*auth*($v*2.0)</Type>
417       <MediaType>application/xrds+xml;https=true</MediaType>
418       <URI>https://resolve.example.com</URI>
419     </Service>
420     <Service>
421       <Type match="null" />
422       <Path select="true">/media/pictures</Path>
423       <MediaType select="true">image/jpeg</MediaType>
424       <URI append="path" >http://pictures.example.com</URI>
425     </Service>
426     <Service>
427       <Type match="null" />
428       <Path select="true">/media/videos</Path>
429       <MediaType select="true">video/mpeg</MediaType>
430       <URI append="path" >http://videos.example.com</URI>
431     </Service>
432     <Service>
433       <ProviderID> xri://!!1000!1234.5678</ProviderID>
434       <Type match="null" />
435       <Path match="default" />
436       <URI>http://example.com/local</URI>
437     </Service>
438     <Service>
439       <Type>http://example.com/some/service/v3.1</Type>
440       <URI>http://example.com/some/service/endpoint</URI>
441       <LocalID>https://example.com/example/resource/</LocalID>
442     </Service>
443   </XRD>
444 </XRDS>

```

445 A link to the normative RelaxNG schema definition of the XRD schema is provided in Appendix B.  
446 Additional normative requirements that cannot be captured in XML schema notation are specified  
447 in the following sections. In the case of any conflict, the normative text in this section shall prevail.

## 448 4.2.1 Management Elements

449 The first set of elements are used to manage XRDs, particularly from the perspective of caching,  
450 error handling, and delegation. Note that to prevent processing conflicts, the XRD schema  
451 permits a choice of either `xrd:XRD/xrd:Redirect` elements or `xrd:XRD/xrd:Ref` elements  
452 but not both.

### 453 **xrd:XRD**

454 Container element for all other XRD elements. Implicitly includes an OPTIONAL `xml:id`  
455 attribute of type `xs:ID`. This attribute is REQUIRED in trusted resolution to uniquely  
456 identify this element within the containing `xrds:XRDS` document. It also includes an  
457 OPTIONAL `idref` attribute of type `xs:idref`. This attribute is REQUIRED in trusted  
458 resolution when an XRD element in a nested `xrd:XRDS` document must reference a  
459 previously included XRD instance. See sections 4.3.1 and 12.5. Lastly, it includes a  
460 `version` attribute that is OPTIONAL for uses outside of XRI resolution but REQUIRED  
461 for XRI resolution as defined in section 4.3.2

### 462 **xrd:XRD/xrd:Query**

463 0 or 1 per `xrd:XRD` element. Expresses the XRI, IRI, or URI reference in URI-normal  
464 form whose resolution results in this `xrd:XRD` element. See section 5.1.

### 465 **xrd:XRD/xrd:Status**

466 0 or 1 per `xrd:XRD` element. RECOMMENDED for all XRDs. REQUIRED if the resolver  
467 must report certain error conditions. Contains a REQUIRED attribute `code` of type  
468 `xs:int` that provides a numeric status code. Contains enumerated attributes `cid` and  
469 `ceid` that are OPTIONAL except when REQUIRED to report the results of CanonicalID  
470 verification as defined in section 14.3.4. The contents of the element are a human-  
471 readable message string describing the status of the response as determined by the  
472 resolver. For XRI resolution, values of the Status element and `code` attribute are defined  
473 in section 15.

### 474 **xrd:XRD:xrdServerStatus**

475 0 or 1 per `xrd:XRD` element. Identical to `xrd:XRD/xrd:Status` except this element is  
476 used by an XRI authority server to report the status of a resolution request to an XRI  
477 resolver, and it does not include the `cid` and `ceid` attributes. See section 15.1.

### 478 **xrd:XRD/xrd:Expires**

479 0 or 1 per `xrd:XRD` element. The date/time, in the form of `xs:dateTime`, after which  
480 this XRD cannot be relied upon. To promote interoperability, this date/time value  
481 SHOULD use the UTC "Z" time zone and SHOULD NOT use fractional seconds. A  
482 resolver MUST NOT use an XRD after the time stated here. A resolver MAY discard this  
483 XRD before the time indicated in this result. If the HTTP transport caching semantics  
484 specify an expiry time earlier than the time expressed in this attribute, then a resolver  
485 MUST NOT use this XRD after the expiry time declared in the HTTP headers per section  
486 13.2 of [RFC2616]. See section 16.2.1.

### 487 **xrd:XRD/xrd:Redirect**

488 0 or more per `xrd:XRD` element. Type `xs:anyURI`. MUST contain an absolute HTTP(S)  
489 URI. Accepts the optional global `priority` attribute (section 4.3.3). Choice between this  
490 or the `xrd:XRD/xrd:Ref` element below. MUST be processed by a resolver to locate  
491 another XRDS document authorized to describe the target resource as defined in section  
492 12. Includes an optional `append` attribute that governs construction of the final redirect  
493 URI as defined in section 13.7.

494 **xrd:XRD/xrd:Ref**  
495 0 or more more per `xrd:XRD` element. Type `xs:anyURI`. MUST contain an absolute  
496 XRI. Accepts the optional global `priority` attribute (section 4.3.3). Choice between this  
497 or the `xrd:XRD/xrd:Redirect` element above. MUST be processed by a resolver  
498 (depending on the value of the `refs` subparameter) to locate another XRDS document  
499 authorized to describe the target resource as defined in section 12.

## 500 4.2.2 Trust Elements

501 The second set of elements are for applications where trust must be established in the identifier  
502 authority providing the XRD. These elements are OPTIONAL for generic authority resolution  
503 (section 9), but may be REQUIRED for specific types of trusted authority resolution (section 10)  
504 and CanonicalID verification (section 14.3).

### 505 **xrd:XRD/xrd:ProviderID**

506 0 or 1 per `xrd:XRD` element. A unique identifier of type `xs:anyURI` for the parent  
507 authority providing this XRD. The value of this element MUST be a persistent identifier.  
508 There MUST be negligible probability that the value of this element will be assigned as an  
509 identifier to any other authority. For purposes of CanonicalID verification (section 14.3), it  
510 is RECOMMENDED to use a fully persistent XRI as defined in [XRISyntax]. If a URN  
511 [RFC2141] or other persistent identifier is used, it is RECOMMENDED to express it as an  
512 XRI cross-reference as defined in [XRISyntax]. Note that for XRI authority resolution, the  
513 authority identified by this element is the parent authority (the provider of the current  
514 XRD), not the child authority (the target of the current XRD). The latter is identified by the  
515 `xrd:XRD/xrd:Service/xrd:ProviderID` element inside a authority resolution  
516 service endpoint (see below).

### 517 **xrd:XRD/saml:Assertion**

518 0 or 1 per `xrd:XRD` element. A SAML assertion from the provider of the current XRD  
519 that asserts that the information contained in the current XRD is authoritative. Because  
520 the assertion is digitally signed and the digital signature encompasses the containing  
521 `xrd:XRD` element, it also provides a mechanism for the recipient to detect unauthorized  
522 changes since the last time the XRD was published.

523 Note that while a `saml:Issuer` element is required within a `saml:Assertion` element,  
524 this specification makes no requirement as to the value of the `saml:Issuer` element. It  
525 is up to the XRI community root authority to place restrictions, if any, on the  
526 `saml:Issuer` element. A suitable approach is to use an XRI in URI-normal form that  
527 identifies the community root authority. See section 9.1.3.

## 528 4.2.3 Synonym Elements

529 In XRDS architecture, an identifier is a *synonym* of the query identifier (the identifier resolved to  
530 obtain the XRDS document) if it is not character-for-character equivalent but identifies the same  
531 target resource (the resource to which the identifier was assigned by the identifier authority). The  
532 normative rules for synonym usage are specified in section 5.

### 533 **xrd:XRD/xrd:LocalID**

534 0 or more per `xrd:XRD` element. Type `xs:anyURI`. Accepts the optional global  
535 `xrd:priority` attribute (section 4.3.3). Asserts an interchangeable synonym for the  
536 value of the `xrd:Query` element. See section 5.2.1 for detailed requirements.

537 **xrd:XRD/xrd:EquiVID**

538 0 or more per `xrd:XRD` element. Type `xs:anyURI`. Accepts the optional global  
539 `priority` attribute (section 4.3.3). Asserts an absolute identifier for the target resource  
540 that is not equivalent to the CanonicalID or CanonicalEquiVID (see below). See section  
541 5.2.2 for detailed requirements.

542 **xrd:XRD/xrd:CanonicalID**

543 0 or 1 per `xrd:XRD` element. Type `xs:anyURI`. Asserts the canonical identifier assigned  
544 to the target resource by the authority providing the XRD. See section 5.2.3 for detailed  
545 requirements.

546 **xrd:XRD/xrd:CanonicalEquiVID**

547 0 or 1 per `xrd:XRD` element. Type `xs:anyURI`. Asserts the canonical identifier for the  
548 target resource assigned by *any* identifier authority. See section 5.2.4 for detailed  
549 requirements.

550 **4.2.4 Service Endpoint Descriptor Elements**

551 The next set of elements is used to describe service endpoints—the set of network endpoints  
552 advertised in an XRD for performing delegated resolution, obtaining further metadata, or  
553 interacting directly with the target resource. Again, because there can be more than one instance  
554 of a service endpoint that satisfies a service endpoint selection query, or more than one instance  
555 of these elements inside a service descriptor, these elements all accept the global `priority`  
556 attribute (see section 4.3.3).

557 **IMPORTANT:** Establishing unambiguous priority is especially important for service endpoints  
558 because they are used to control the direction of authority resolution, the order of Redirect and  
559 Ref processing, and the prioritization of the final service endpoint URIs selected (if any). See  
560 section 4.3.3 for rules and recommendations about usage of the `priority` attribute.

561 Note that to prevent processing conflicts, the XRD schema permits only one of these element  
562 types in a service endpoint: `xrd:URI`, `xrd:Redirect`, or `xrd:Ref`.

563 **xrd:XRD/xrd:Service**

564 0 or more per `xrd:XRD` element. The container element for service endpoint metadata.  
565 Referred to by the abbreviation *SEP*.

566 **xrd:XRD/xrd:Service/xrd:LocalID**

567 0 or more per `xrd:XRD/xrd:Service` element. Identical to the  
568 `xrd:XRD/xrd:LocalID` element defined above except this synonym is asserted by the  
569 provider of the service and not the parent authority for the XRD. **MAY** be used to provide  
570 one or more identifiers by which the target resource **SHOULD** be identified in the context  
571 of the service endpoint. See section 5.2.1 for detailed requirements.

572 **xrd:XRD/xrd:Service/xrd:URI**

573 0 more per `xrd:XRD/xrd:Service` element. Type `xs:anyURI`. Choice between this or  
574 the `xrd:XRD/xrd:Service/xrd:Redirect` or `xrd:XRD/xrd:Service/xrd:Ref`  
575 elements. If present, it indicates a transport-level URI for accessing the capability  
576 described by the parent `Service` element. For the service types defined for XRI resolution  
577 in section 3.1.2, this URI **MUST** be an HTTP or HTTPS URI. Other services may use  
578 other transport protocols. Includes an optional `append` attribute that governs construction  
579 of the final service endpoint URI as defined in section 13.7.

580 **xrd:XRD/xrd:Service/xrd:Redirect**  
581 0 more per `xrd:XRD/xrd:Service` element. Choice between this or the  
582 `xrd:XRD/xrd:Service/xrd:URI` or `xrd:XRD/xrd:Service/xrd:Ref` elements.  
583 Identical to the `xrd:XRD/xrd:Redirect` element defined above except processed only  
584 in the context of service endpoint selection. See section 12.

585 **xrd:XRD/xrd:Service/xrd:Ref**  
586 0 more per `xrd:XRD/xrd:Service` element. Choice between this or the  
587 `xrd:XRD/xrd:Service/xrd:URI` or `xrd:XRD/xrd:Service/xrd:Redirect`  
588 elements. Identical to the `xrd:XRD/xrd:Ref` element defined above except processed  
589 only in the context of service endpoint selection. See section 12.

## 590 4.2.5 Service Endpoint Trust Elements

591 Similar to the XRD trust elements defined above, these elements enable trust to be established in  
592 the provider of the service endpoint. These elements are OPTIONAL for generic authority  
593 resolution (section 9), but REQUIRED for SAML trusted authority resolution (section 10.2).

594 **xrd:XRD/xrd:Service/xrd:ProviderID**  
595 0 or 1 per `xrd:XRD/xrd:Service` element. Identical to the  
596 `xrd:XRD/xrd:ProviderID` above, except this identifies the provider of the *described*  
597 *service endpoint* instead of the provider of the XRD. For an XRI authority resolution  
598 service endpoint, it identifies the *child authority* who will perform resolution of subsequent  
599 XRI subsegments. In SAML trusted resolution, when a resolution request is made to the  
600 child authority at this service endpoint, the contents of the `xrd:XRD/xrd:ProviderID`  
601 element in the response MUST match the content of this element for correlation as  
602 defined in section 10.2.5. The same usage MAY apply to other services not defined in  
603 this specification. Authors of other specifications employing XRD service endpoints  
604 SHOULD define the scope and usage of this element, particularly for trust verification.

605 **xrd:XRD/xrd:Service/ds:KeyInfo**  
606 0 or 1 per `xrd:XRD/xrd:Service` element. This element provides the digital signature  
607 metadata necessary to validate interaction with the resource identified by the  
608 `xrd:XRD/xrd:Service/xrd:ProviderID` (above). In XRI resolution, this element  
609 comprises the key distribution method for SAML trusted authority resolution as defined in  
610 section 10.2.5. The same usage MAY apply to other services not defined in this  
611 specification.

## 612 4.2.6 Service Endpoint Selection Elements

613 The final set of service endpoint descriptor elements is used in XRI resolution for service endpoint  
614 selection. They include two global attributes used for this purpose: `match` and `select`. See  
615 sections 13.3.2 and 13.4.2.

616 **xrd:XRD/xrd:Service/xrd:Type**  
617 0 or more per `xrd:XRD/xrd:Service` element. A unique identifier of type `xs:anyURI`  
618 that identifies the type of capability available at this service endpoint. See section 3.1.2  
619 for the resolution service types defined in this specification. If a service endpoint does not  
620 include at least one `xrd:Type` element, the service type is effectively described by the  
621 type of URI specified in the `xrd:XRD/xrd:Service/xrd:URI` element, i.e., an HTTP  
622 URI specifies an HTTP service. See section 13.3.6 for Type element matching rules.

623 **xrd:XRD/xrd:Service/xrd:Path**  
624 0 or more per `xrd:XRD/xrd:Service` element. Of type `xs:string`. Contains a string  
625 meeting the `xri-path` production defined in section 2.2.3 of [XRISyntax]. See section  
626 13.3.7 for Path element matching rules.

627 **xrd:XRD/xrd:Service/xrd:MediaType**  
628 0 or more per `xrd:XRD/xrd:Service` element. Of type `xs:string`. The media type of  
629 content available at this service endpoint. The value of this element MUST be of the form  
630 of a media type defined in [RFC2046]. See section 3.3 for the media types used in XRI  
631 resolution. See section 13.3.8 for MediaType element matching rules.

632 The XRD schema (Appendix B) allows other elements and attributes from other namespaces to  
633 be added throughout. As described in section 17.1.1, these points of extensibility can be used to  
634 deploy new XRI resolution schemes, new service description schemes, or other metadata about  
635 the described resource.

## 636 4.3 XRD Attribute Processing Rules

### 637 4.3.1 ID Attribute

638 For uses such as SAML trusted resolution (section 10.2) that require unique identification of  
639 multiple XRD elements within an XRDS document, the XRD element uses the implicit `xml:id`  
640 attribute as defined by the W3C XML ID specification [XMLID]. Note that this attribute is NOT  
641 explicitly declared in either the RelaxNG schema in Appendix B or the XML Schema in Appendix  
642 C since it is inherently included by the extensibility design of both schemas.

643 If present, the value of this attribute MUST be unique for all elements in the containing XML  
644 document. Because an XRI resolver may need to assemble multiple XRDs received from different  
645 authority servers into one XRDS document, there MUST be negligible probability that the value of  
646 the `xrd:XRD/@xml:id` attribute is not globally unique. For this reason the value of this attribute  
647 SHOULD be a UUID as defined by [UUID] prefixed by a single underscore character (“\_”) in  
648 order to make it a legal *NCName* as required by [XMLID]. However, the value of this attribute  
649 MAY be generated by any algorithm that fulfills the same requirements of global uniqueness and  
650 *NCName* conformance.

651 Note that when an XRI resolver is assembling multiple XRDs into a single XRDS document, their  
652 XML document order MUST match the order in which they were resolved (see section 9.1.2).  
653 Also, if Redirect or Ref processing requires the same XRD to be included in an XRDS document  
654 twice (via a nested XRDS document), that XRD MUST reference the previous instance using the  
655 `xrd:XRD/@idref` attribute as defined in section 12.5.

### 656 4.3.2 Version Attribute

657 Unlike the XRDS element, which is not intended to be versioned, the `xrd:XRD` element has the  
658 optional attribute `xrd:XRD/@version`. Use of this attribute is REQUIRED for XRI resolution.  
659 The value of this attribute MUST be the exact numeric version value of the XRI Resolution  
660 specification to which the containing XRD element conforms. See sections 3.1.1 and 17.2.1.

661 General rules about versioning of the XRI resolution protocol are defined in section 17.2. Specific  
662 rules for processing the XRD version attribute are specified in section 17.2.4.

### 663 4.3.3 Priority Attribute

664 Certain XRD elements involved in the XRI resolution process (`xrd:Redirect`, `xrd:Ref`,  
665 `xrd:Service`, and `xrd:URI`) may be present multiple times in an XRDS document to enable  
666 delegation, provide redundancy, expose differing capabilities, or other purposes. In this case XRD  
667 authors SHOULD use the global `priority` attribute to prioritize selection of these element

668 instances. Like the priority attribute of DNS records, this attribute accepts a non-negative integer  
669 value.

670 Following are the normative processing rules that apply whenever there is more than one  
671 instance of the same type of element selected in an XRD (if there is only one instance selected,  
672 the `priority` attribute is ignored.)

- 673 1. The consuming application SHOULD select the element instance with the lowest numeric  
674 value of the `priority` attribute. For example, an element with `priority` attribute value  
675 of “10” should be selected before an element with a `priority` attribute value of “11”,  
676 and an element with `priority` attribute value of “11” should be selected before an  
677 element with a `priority` attribute value of “25”. Zero is the highest `priority` attribute  
678 value. Null is the lowest `priority` attribute value—it is the equivalent of a value of  
679 infinity. It is RECOMMENDED to use a large finite value (100 or more) rather than a null  
680 value.
- 681 2. If an element has no `priority` attribute, its `priority` attribute value is considered to  
682 be null, i.e., the lowest possible priority value. Rather than omitting a `priority` attribute,  
683 it is RECOMMENDED that XRI authorities follow the standard practice in DNS and set  
684 the default `priority` attribute value to “10”.
- 685 3. If two or more instances of the same element type have identical `priority` attribute  
686 values (including the null value), the consuming application SHOULD select one of the  
687 instances at random. This consuming application SHOULD NOT simply choose the first  
688 instance that appears in XML document order.

689 **IMPORTANT:** It is vital that implementers observe the preceding rule in order to support  
690 intentional redundancy or load balancing semantics. At the same time, it is vital that XRDS  
691 authors understand that this rule can result in non-deterministic behavior if two or more of the  
692 same type of synonym elements or service endpoint elements are included with the same priority  
693 in an XRD but are NOT intended for redundancy or load balancing.

- 694 4. An element selected according to these rules is referred to in this specification as *the*  
695 *highest priority element*. If this element is subsequently disqualified from the set of  
696 qualified elements, the next element selected according to these rules is referred to as  
697 *the next highest priority element*. If a resolution operation specifying selection of the  
698 highest priority element fails, the resolver SHOULD attempt to select the next highest  
699 priority element unless otherwise specified. This process SHOULD be continued for all  
700 other instances of the qualified elements until success is achieved or all instances are  
701 exhausted.

## 702 4.4 XRI and IRI Encoding Requirements

703 The W3C XML 1.0 specification [XML] requires values of XML elements of type `xs:anyURI` to  
704 be valid IRIs. Thus all XRIs used as the values of XRD elements of this type MUST be in at least  
705 IRI-normal form as defined in section 2.3 of [XRIyntax].

706 A further restriction applies to XRIs or IRIs used in XRI resolution because it relies on HTTP(S) as  
707 a transport protocol. Therefore when an XRI or IRI is used as the value of an `xrd:Query`,  
708 `xrd:LocalID`, `xrd:EquivID`, `xrd:CanonicalID`, `xrd:CanonicalEquivID`,  
709 `xrd:Redirect`, `xrd:Ref`, `xrd:Type`, or `xrd:Path` element, it MUST be in URI-normal form  
710 as defined in section 2.3 of [XRIyntax].

711 Note: XRIs composed entirely of valid URI characters and which do not use XRI parenthetical  
712 cross-reference syntax do not require escaping in the transformation to URI-normal form.  
713 However, XRIs that use characters valid only in IRIs or that use XRI parenthetical cross-reference  
714 syntax may require percent encoding in the transformation to URI-normal form as explained in  
715 section 2.3 of [XRIyntax].

## 716 5 XRD Synonym Elements

717 XRDS architecture includes support for *synonyms*—XRI, IRIs, or URIs that are not character-for-  
718 character equivalent, but which identify the same target resource (in the same context, or across  
719 different contexts). Table 7 lists the four synonym elements supported in XRDs.

XRD Synonym Element	Cardinality	Resolution Scope	Assigning Authority	Resolves to different XRD?
LocalID	Zero-or-more	Local	MUST be the parent authority	MUST NOT
EquivID	Zero-or-more	Global	Any authority	SHOULD
CanonicalID	Zero-or-one	Global	MUST be the parent authority	MUST NOT
CanonicalEquivID	Zero-or-one	Global	Any authority	SHOULD

720 Table 7: The four XRD synonym elements.

721 This section specifies the normative rules for usage of each XRD synonym element.

### 722 5.1 Query Identifiers

723 Each XRI synonym element asserts a synonym for the *query identifier*. This is the identifier  
724 resolved to obtain the XRDS document containing the XRD asserting the synonym. A *fully-*  
725 *qualified query identifier* may be either:

- 726 1. A valid absolute HTTP(S) URI that does not contain an XRI.
- 727 2. A valid absolute XRI, either in a standard XRI form as defined in **[XRISyntax]**, or  
728 encoded in an HTTP(S) URI (called an *HXRI*) as specified in section 11.2.

#### 729 5.1.1 HTTP(S) URI Query Identifiers

730 If the fully-qualified query identifier is an absolute HTTP(S) URI, the XRDS document to which it  
731 resolves (via the protocol specified in section 6) MUST contain a single XRD. This XRD MAY  
732 include an `xrd:Query` element; if present, the value MUST be equivalent to the original HTTP(S)  
733 URI query identifier.

734 In this single XRD, all synonym elements in Table 7 assert synonyms for the original HTTP(S)  
735 URI.

#### 736 5.1.2 XRI Query Identifiers

737 If the fully-qualified query identifier is an absolute XRI, the XRDS document to which it resolves  
738 (via the protocol specified in section 9.1.2) MAY contain multiple XRDs, each XRD corresponding  
739 to one subsegment of the authority component of the XRI. Each XRD SHOULD include an  
740 `xrd:Query` element that echos back the XRI subsegment described by this XRD. This is called  
741 the *local query identifier*, because it represents just one subsegment of the fully-qualified query  
742 identifier.

743 At any point in the XRI resolution chain, the combination of the community root authority XRI  
744 (section 9.1.3) plus all local query identifiers resolved in all XRDs up to that point is called the  
745 *current fully-qualified query identifier*. When the resolution chain is complete, the current fully-  
746 qualified query identifier is equal to the starting fully-qualified query identifier.

747 In each XRD in the resolution chain, the LocalID element asserts a synonym for the local query  
748 identifier, and the EquivID, CanonicalID, and CanonicalEquivID elements assert a synonym for  
749 the current fully-qualified query identifier.

## 750 5.2 Synonym Elements

### 751 5.2.1 LocalID

752 In an XRD, a synonym for the local query identifier is asserted using the `xrd:LocalID` element.  
753 LocalIDs may be used at both the XRD level (as a child of the root `xrd:XRD` element) and at the  
754 service endpoint (SEP) level (as a child of the root `xrd:XRD/xrd:Service` element).

755 At the XRD level, the value of the `xrd:XRD/xrd:LocalID` element asserts a synonym that is  
756 interchangeable with the contents of the `xrd:Query` element in the XRD. This means that  
757 resolution of a LocalID in the context of the same parent authority using the same resolution  
758 query parameters as the current query MUST result in an equivalent XRD as defined in section  
759 5.4. It also means an XRI resolver MAY use a LocalID as an alternate key for the XRD in its  
760 cache (see section 16.4.2).

761 If the parent authority has assigned a persistent local identifier to the resource described by an  
762 XRD, it SHOULD return this persistent identifier as an `xrd:XRD/xrd:LocalID` value in any  
763 resolution response for a reassignable local identifier for the same resource. The reverse MAY  
764 also be true, however parent authorities MAY adopt privacy or other policies that restrict the  
765 reassignable synonyms returned for any particular resolution request.

766 At the SEP level, the `xrd:XRD/xrd:Service/xrd:LocalID` element MAY be used to express  
767 either a local or global identifier for the target resource in the context of the specific service being  
768 described. If present, consuming applications SHOULD use the value of the highest priority  
769 instance of the `xrd:XRD/xrd:Service/xrd:LocalID` element to identify the target resource  
770 in the context of this service endpoint. If not present, consuming applications SHOULD select a  
771 synonym as defined in section 5.6.

772 SPECIAL SECURITY CONSIDERATIONS: A parent authority SHOULD NOT permit a child  
773 authority to edit a LocalID value in an XRD without authenticating the child authority and verifying  
774 that the child authority is authorized to use this LocalID value either at the XRD level and/or the  
775 SEP level.

### 776 5.2.2 EquivID

777 In an XRD, any synonym for the current fully-qualified query identifier *except* a CanonicalID or a  
778 CanonicalEquivID (see below) is asserted using the `xrd:EquivID` element. Unlike a LocalID, an  
779 EquivID is NOT REQUIRED to be issued by the parent authority.

780 An EquivID MUST be an absolute identifier. For durability of the reference, it is RECOMMENDED  
781 to use a persistent identifier such as a persistent XRI [XRISyntax] or a URN [RFC2141].

782 An EquivID element is OPTIONAL in an XRD except in two cases:

- 783 1. When it is REQUIRED as a backpointer to verify another EquivID element in a different  
784 XRD as specified in section 14.2.
- 785 2. When it is REQUIRED as a backpointer to verify a CanonicalEquivID element as  
786 specified in section 14.3.3.

787 SPECIAL SECURITY CONSIDERATIONS: An EquivID synonym SHOULD NOT be trusted  
788 unless it is verified. This function is not performed automatically by XRI resolvers but may be  
789 easily performed by consuming applications using one additional XRI resolution call as specified  
790 in section 14.2. A parent authority SHOULD NOT permit a child authority to edit the EquivID value  
791 in an XRD without authenticating the child authority and verifying that the child authority is

792 authorized to use this EquivID value. A parent authority SHOULD NOT assert an EquivID  
793 element if the identifier authority to whom it points is not authorized to make a CanonicalEquivID  
794 assertion.

### 795 5.2.3 CanonicalID

796 The purpose of the `xrd:CanonicalID` element is to assert the canonical identifier assigned by  
797 the parent authority to the target resource described by an XRD. It plays a special role in XRD  
798 synonym architecture because it is the ultimate test of XRD equivalence as defined in section 5.4.  
799 A CanonicalID MUST meet all the requirements of an EquivID plus the following:

- 800 1. It MUST be an identifier for which the parent authority is the final authority. This means  
801 that resolution of a CanonicalID using the same resolution query parameters as the  
802 current query MUST result in an equivalent XRD as defined in section 5.4.
- 803 2. If the CanonicalID is any XRI except a community root authority XRI (section 9.1.3), it  
804 MUST consist of the parent authority's CanonicalID plus one additional subsegment. (In  
805 XRI resolution the parent authority's CanonicalID is always in the immediately preceding  
806 XRD in the same XRDS document, not in a nested XRDS document produced as a result  
807 of Redirect and Ref processing as defined in section 12.5.) For example, if the  
808 CanonicalID asserted for a target resource is `@!1!2!3`, then the CanonicalID for the  
809 parent authority must be `@!1!2`. See section 14.3.2 for details.
- 810 3. Once assigned, a parent authority SHOULD NEVER: a) change or reassign a  
811 CanonicalID value, or b) stop asserting a CanonicalID element in an XRD in which it has  
812 been asserted. For this reason, it is STRONGLY RECOMMENDED to use a persistent  
813 identifier such as a persistent XRI [XRISyntax] or a URN [RFC2141].

814 As a best practice, a parent authority SHOULD ALWAYS publish a CanonicalID element in an  
815 XRD, even if its value is equivalent to the current fully-qualified query identifier. This practice:

- 816 • Makes it unambiguous to consuming applications which absolute synonym they should use to  
817 identify the target resource in the context of the parent authority.
- 818 • Enables child authorities to issue their own verifiable CanonicalIDs.
- 819 • Enables verification of a CanonicalEquivID if asserted (below).

820 SPECIAL SECURITY CONSIDERATIONS: A CanonicalID synonym SHOULD NOT be trusted  
821 unless it is verified. CanonicalID verification is performed automatically during resolution by an  
822 XRI resolver unless this function is explicitly turned off; see section 14. A parent authority  
823 SHOULD NOT permit a child authority to edit the CanonicalID value in an XRD without  
824 authenticating the child authority and verifying that the child authority is authorized to use this  
825 CanonicalID value.

### 826 5.2.4 CanonicalEquivID

827 The purpose of the `xrd:CanonicalEquivID` element is to assert a canonical synonym for the  
828 fully-qualified query identifier for which the parent authority MAY NOT be authoritative. A  
829 CanonicalEquivID MUST meet all the requirements of an EquivID plus the following:

- 830 1. In order for the value of the `xrd:CanonicalEquivID` element to be verified: a) the  
831 XRD in which it appears MUST include a CanonicalID that can be verified as specified in  
832 section 14.2, and b) the XRD to which it resolves MUST meet the rules specified in  
833 section 14.3.3. In particular, those rules require that the CanonicalID of that XRD match  
834 the asserted CanonicalEquivID.
- 835 2. For the same reasons as with a CanonicalID, it is STRONGLY RECOMMENDED to use  
836 a persistent identifier such as a persistent XRI [XRISyntax] or a URN [RFC2141].

837 3. Although the CanonicalEquivID associated with a CanonicalID MAY change over time, at  
838 any one point in time, every XRD from the same parent authority that asserts the same  
839 CanonicalID value MUST assert the same CanonicalEquivID value if the XRD includes a  
840 CanonicalEquivID element.

841 As a best practice, a parent authority SHOULD publish a CanonicalEquivID in an XRD if  
842 consuming applications SHOULD be able to persistently identify the target resource using this  
843 identifier in other contexts. Also, a CanonicalEquivID value SHOULD change very infrequently, if  
844 at all.

845 SPECIAL SECURITY CONSIDERATIONS: A CanonicalEquivID synonym SHOULD NOT be  
846 trusted unless it is verified. Verification of the value of the CanonicalEquivID element in the final  
847 XRD in an XRDS document is performed automatically during resolution by an XRI resolver  
848 unless this function is explicitly turned off; see section 14. A parent authority SHOULD NOT  
849 permit a child authority to edit the CanonicalEquivID value in an XRD without authenticating the  
850 child authority and verifying that the child authority is authorized to use this CanonicalEquivID  
851 value.

## 852 5.3 Redirect and Ref Elements

853 While similar in some ways to synonym elements, the `xrd:Redirect` and `xrd:Ref` elements  
854 MUST NOT be used to assert a synonym. Instead their purpose is to assert that a different XRDS  
855 document is authorized to serve as an equally valid descriptor of the target resource. These  
856 elements enable separation of synonym assertion semantics vs. distributed XRDS document  
857 authorization semantics.

858 In the same way as a LocalID, both a Redirect and a Ref may be used in an XRD at either the  
859 XRD level (as a child of the root `xrd:XRDS` element) and at the SEP level (as a child of the root  
860 `xrd:XRDS/xrd:Service` element). The complete rules for Redirect and Ref processing in XRI  
861 resolution are specified in section 12.

862 If two independent resources are later merged into the same resource, e.g., two businesses are  
863 merged into one, the use of an EquivID, CanonicalID, or CanonicalEquivID element SHOULD be  
864 combined with the use of a Redirect or Ref element to provide the semantics of BOTH identifier  
865 synonymity and XRDS authorization.

866 SPECIAL SECURITY CONSIDERATIONS: A parent authority SHOULD NOT permit a child  
867 authority to edit a Redirect or Ref value in an XRD without authenticating the child authority and  
868 verifying that the child authority is authorized to use this Redirect or Ref value at either the XRD  
869 level and/or the SEP level.

## 870 5.4 XRD Equivalence

871 LocalID and CanonicalID synonyms are required to resolve to an XRD that is equivalent to the  
872 XRD in which the synonym is asserted. Two XRDs MUST be considered equivalent if they meet  
873 the following rules:

- 874 1. Both XRDs contain a CanonicalID element.
- 875 2. The values of these CanonicalID elements are equivalent according to the equivalence  
876 rules of the applicable identifier scheme. Note that these identifiers MUST be in URI-  
877 normal form as specified in section 4.4. In addition, if the CanonicalID values are  
878 HTTP(S) URIs, fragments MUST be considered significant in comparison.

879 In addition, while not strictly required for XRD equivalence, section 5.2.4 REQUIRES that two  
880 equivalent XRDs issued at the same point in time assert the same CanonicalEquivID value if they  
881 both contain a CanonicalEquivID element. It is RECOMMENDED that all other elements in the  
882 XRD that are not relative to a specific resolution request also be equivalent.

## 883 5.5 Synonym Verification

884 For security purposes, it is STRONGLY RECOMMENDED that a consuming application not rely  
885 on EquivID, CanonicalID, or CanonicalEquivID synonyms unless they are verified as specified in  
886 section 14.

## 887 5.6 Synonym Selection

888 It is out of the scope of this specification to specify policies consuming applications should use to  
889 select their desired synonym(s) to identify a target resource. However, the following are  
890 RECOMMENDED best practices:

- 891 • Only select a verified synonym (see above).
- 892 • Select a persistent synonym, particularly if a long term or immutable reference is required. If  
893 a persistent synonym is present, other reassignable synonyms (including the current fully-  
894 qualified query identifier) SHOULD be treated only as temporary identifiers.
- 895 • Select a CanonicalID if present, verified, and persistent. This identifier SHOULD be used  
896 whenever referencing the target resource in the context of the parent authority issuing the  
897 CanonicalID.
- 898 • If possible, *also* select a CanonicalEquivID if present, verified, and persistent. This identifier  
899 SHOULD be used as a reference to the target resource in any context other than that of the  
900 parent authority.
- 901 • When selecting a synonym to use in the context of a specific service endpoint, follow the  
902 recommendations for use of the `xrd:XRD/xrd:Service/xrd:LocalID` element as  
903 specified in section 5.2.1.

---

## 904 6 Discovering an XRDS Document from an 905 HTTP(S) URI

906 A resource described by an XRDS document and potentially identified by one or more XRI may  
907 also be identified with one or more HTTP(S) URIs. For backwards compatibility with HTTP(S)  
908 infrastructure, this section defines two protocols, originally specified in [Yadis], for discovering an  
909 XRDS document starting with an HTTP(S) URI.

### 910 6.1 Overview

911 There are two protocols for discovery of an XRDS document from an HTTP(S) URI:

- 912 1. *HEAD protocol*: using an HTTP(S) HEAD request to obtain a header with XRDS  
913 document location information as specified in section 6.2.
- 914 2. *GET protocol*: using an HTTP(S) GET request with content negotiation as specified in  
915 section 6.3.

916 An XRDS server **MUST** support the GET protocol and **MAY** support the HEAD protocol. An  
917 XRDS client **MAY** attempt the HEAD protocol but **MUST** attempt the GET protocol if the HEAD  
918 protocol fails.

### 919 6.2 HEAD Protocol

920 Under this protocol the XRDS client **MUST** begin by issuing an HTTP(S) HEAD request. This  
921 request **SHOULD** include an Accept header specifying the content type  
922 `application/xrds+xml`.

923 The response from the XRDS server **MUST** be HTTP(S) response-headers only, which **MAY**  
924 include one or both of the following:

- 925 1. An `X-XRDS-Location` response-header.
- 926 2. A content type response-header specifying the content type `application/xrds+xml`.

927 If the response includes the first option above, the value of the `X-XRDS-Location` response-  
928 header **MUST** be an HTTP(S) URI which gives the location of an XRDS document describing the  
929 target resource. The XRDS client **MUST** then request this document as specified in section 6.3.

930 If the response includes the second option above, the XRDS client **MUST** request the XRDS  
931 document from the original HTTP(S) URI as specified in section 6.3.

932 If the response includes both options above, the value of the `X-XRDS-Location` element in the  
933 HTTP(S) response-header **MUST** take precedence.

934 If response includes neither of the two options above, this protocol fails and the XRDS client  
935 **MUST** fall back to using the protocol specified in section 6.3.

936 In all cases the HTTP(S) status messages and error codes defined in [RFC2616] apply.

### 937 6.3 GET Protocol

938 Under this protocol the XRDS client **MUST** begin by issuing an HTTP(S) GET request. This  
939 request **SHOULD** include an Accept header specifying the content type  
940 `application/xrds+xml`.

941 The XRDS server response **MUST** be one of four options:

- 942 1. HTTP(S) response-headers only as defined in section 6.2.

- 943 2. HTTP(S) response-headers as defined in section 6.2 together with a document, which  
944 MAY be either document type specified in options 3 or 4 below.
- 945 3. A valid HTML document with a <head> element that includes a <meta> element with an  
946 http-equiv attribute equal to X-XRDS-Location.
- 947 4. A valid XRDS document (content type application/xrds+xml).

948 If the response is only HTTP(S) response headers as defined in section 6.2, or if in addition to  
949 these response headers it includes any document other than the two document types defined in  
950 the third and fourth options above, the protocol MUST proceed as defined in section 6.2, *except*  
951 *that there is no fallback to this section if that protocol fails.*

952 If the response is only an HTML document as defined in the third option above, the value of the  
953 <meta> element with an http-equiv attribute equal to X-XRDS-Location MUST be an  
954 HTTP(S) URI which gives the location of an XRDS document describing the target resource. If  
955 this HTTP(S) URI is identical to the starting HTTP(S) URI, this is a loop and the protocol fails.  
956 Otherwise, the XRDS client MUST request the XRDS document from this URI using an HTTP(S)  
957 GET. This request SHOULD include an Accept header specifying the content type  
958 application/xrds+xml.

959 If the response includes both an HTTP(S) response header and the HTML document defined in  
960 the third option above, the value of the X-XRDS-Location element in the HTTP(S) response-  
961 header MUST take precedence.

962 If the response includes an XRDS document as specified in the fourth option above, the protocol  
963 has completed successfully.

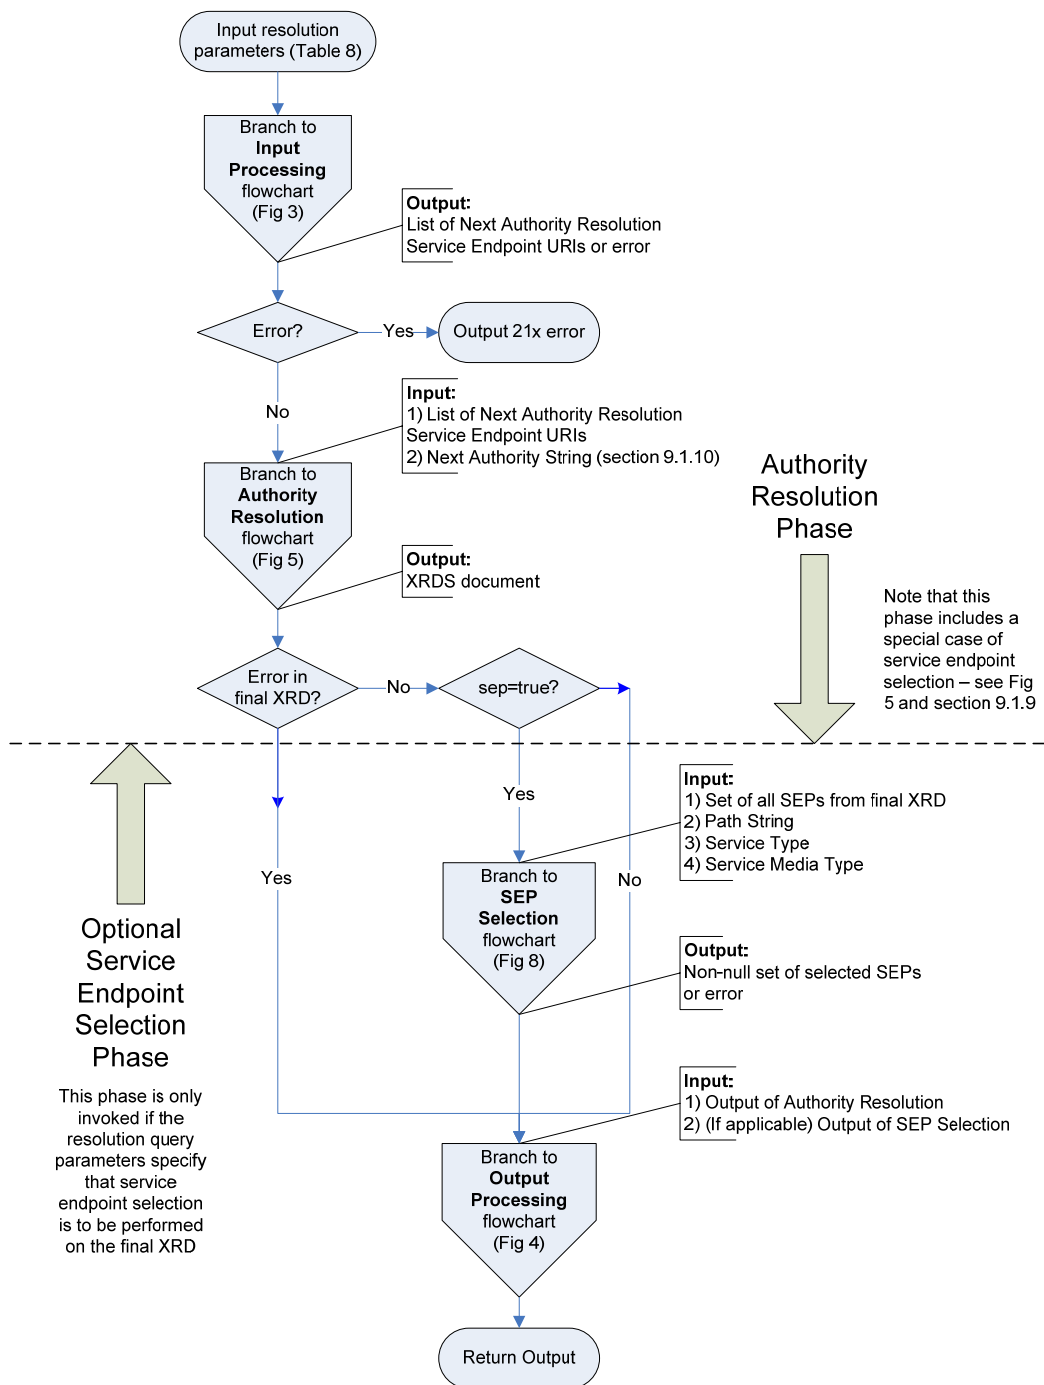

964 In all cases the HTTP(S) status messages and error codes defined in **[RFC2616]** apply.

965 Note: If the XRDS server supports content negotiation, the response SHOULD include a Vary:  
966 header to allow caches to properly interpret future requests. This header SHOULD be present  
967 even in the case where the HTML page is returned (instead of an XRDS document).

968

## 7 XRI Resolution Flow

969 Logically, XRI resolution is a function invoked by an application to dereference an XRI into a  
970 descriptor of the target resource (or in some cases to a representation of the resource itself).  
971 Figure 2 is a top-level flowchart of this function highlighting the two major phases: *authority*  
972 *resolution* followed by *optional service endpoint selection*.

973

974 *Figure 2: Top-level flowchart of XRI resolution phases.*

975 Branches of this top-level flowchart are used throughout the specification to provide a logical  
976 overview of key components of XRI resolution. The branch flowcharts include:

- 977 • Figure 3: Input processing (section 8.1).
- 978 • Figure 4: Output processing (section 8.2).
- 979 • **Figure 5: Authority resolution (section 9).**
- 980 • Figure 6: XRDS requests (section 9.1.3).
- 981 • **Figure 7: Redirect and Ref processing (section 12).**
- 982 • **Figure 8: Service endpoint selection (section 13).**
- 983 • Figure 9: Service endpoint selection logic (section 13.2).

984 **IMPORTANT:** In all cases the flowcharts are informative and the specification text is normative.  
985 However, the flowcharts are recommended as an aid in reading the specification. In particular,  
986 those highlighted in **bold** above illustrate the recursive calls for authority resolution and service  
987 endpoint selection used during Redirect and Ref processing (section 12). Implementers should  
988 pay special attention to these calls and the guidance in section 12.6, *Recursion and Backtracking*.

## 989 8 Inputs and Outputs

990 This section defines the logical inputs and outputs of XRI resolution together with their processing  
991 rules. It does not specify a binding to a particular local resolver interface. A binding to an HTTP  
992 interface for XRI proxy resolvers is specified in section 11. For purposes of illustration, a binding  
993 to a non-normative, language-neutral API is suggested in Appendix F.

### 994 8.1 Inputs

995 Table 8 summarizes the logical input parameters to XRI resolution and whether they are  
996 applicable in the authority resolution phase or the service endpoint selection phase. In this  
997 specification, references to these parameters use the logical names in the first column. Local  
998 APIs MAY use different names for these parameters and MAY define additional parameters.

Logical Input Parameter Name	Type	Required/Optional	Default	Resolution Phase	Section
QXRI (query XRI) including Authority String, Path String, and Query String	xs:anyURI	Required	N/A	Authority Resolution (except Path String which is used in Service Endpoint Selection)	8.1.1
Resolution Output Format	xs:string (media type)	Optional	Null	Authority Resolution	8.1.2
Service Type	xs:anyURI	Optional	Null	Service Endpoint Selection	8.1.3
Service Media Type	xs:string (media type)	Optional	Null	Service Endpoint Selection	8.1.4

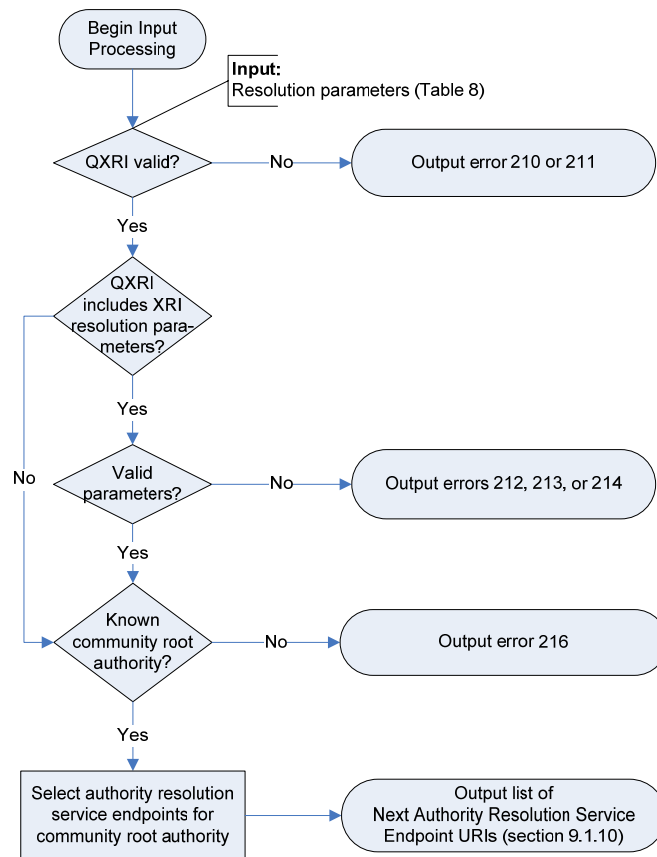

999 *Table 8: Input parameters for XRI resolution.*

1000 The following general rules apply to all input parameters as well as to all XRD elements  
1001 throughout this specification:

- 1002 1. The presence of an input parameter, subparameter, or XRD element with an empty value  
1003 MUST be treated as equivalent to the absence of that input parameter, subparameter, or  
1004 XRD element. (Note that this rule does not apply to XRD attributes.)
- 1005 2. From a programmatic standpoint, both conditions above MUST be considered as  
1006 equivalent to setting the value of that parameter, subparameter, or element to null.
- 1007 3. In an XRD element, an attribute with an empty value is an error and MUST NOT be  
1008 interpreted as the default value or any other value of that attribute.
- 1009 4. As required by [XMLSchema2], for all Boolean subparameters: a) the string values `true`  
1010 and `false` MUST be considered case-insensitive (lowercase is RECOMMENDED), b)  
1011 the values `true` and `1` MUST be considered equivalent, b) the values `false` and `0`  
1012 MUST be considered equivalent.

1013 Figure 3 is a flowchart (non-normative) illustrating the processing of input parameters.

1014

1015 *Figure 3: Input processing flowchart.*

1016 The following sections specify additional validation and usage requirements that apply to  
1017 particular input parameters.

1018 **8.1.1 QXRI (Authority String, Path String, and Query String)**

1019 The QXRI (query XRI) is the only REQUIRED input parameter. Per **[XRISyntax]**, a QXRI consists  
 1020 of three logical subparameters as defined in Table 9.

Logical Parameter Name	Type	Required/Optional	Value
Authority String	xs:string	Required	Contents of the authority component of the QXRI, NOT including the XRI scheme name or leading double forward slashes (“//”) or a terminating single forward slash (“/”).
Path String	xs:string	Optional	Contents of the path component of the QXRI, NOT including the leading single forward slash (“/”) or terminating delimiter (such as “/”, “?”, “#”, whitespace, or CRLF). If the path component is absent or empty, the value is null.
Query String	xs:string	Optional	Contents of the query component of the QXRI, NOT including leading question mark (“?”) or terminating delimiter (such as “#”, white space, or CRLF). If the query component is absent or empty, the value is null.

1021 *Table 9: Subparameters of the QXRI input parameter.*

1022 The fourth possible component of a QXRI—a fragment—is by definition resolved locally relative  
 1023 to the target resource identified by the combination of the Authority, Path, and Query  
 1024 components, and as such does not play a role in XRI resolution.

1025 Following are the constraints on the value of the QXRI parameter.

- 1026 1. It MUST be a valid absolute XRI according to the ABNF defined in **[XRISyntax]**. To  
 1027 resolve a relative XRI reference, it must be converted into an absolute XRI using the  
 1028 procedure defined in section 2.4 of **[XRISyntax]**.
- 1029 2. For authority or proxy resolution as defined in this specification, the QXRI MUST be in  
 1030 URI-normal form as defined in section 2.3.1 of **[XRISyntax]**. A local resolver API MAY  
 1031 support the input of other XRI forms but SHOULD document the normal form(s) it  
 1032 supports and its normalization policies.
- 1033 3. When a QXRI is included as part of an HXRI (section 11.2) for XRI proxy resolution, the  
 1034 QXRI MUST be normalized as specified in section 11.2, and all HXRI query parameters  
 1035 MUST follow the encoding rules specified in sections 11.3 and 11.4.

1036 **8.1.2 Resolution Output Format**

1037 The Resolution Output Format is an OPTIONAL parameter that, together with its subparameters,  
 1038 is used to specify:

- 1039 • The media type for the resolution response.
- 1040 • Whether generic or trusted resolution must be used by the resolver.
- 1041 • Whether Refs should be followed during resolution.
- 1042 • Whether CanonicalID verification should not be performed during resolution.
- 1043 • Whether service endpoint selection should be performed on the final XRD.

- 1044 • Whether default matches should be ignored during service endpoint selection.
- 1045 • Whether URIs should automatically be constructed in the final XRD.

1046 Following are the normative requirements for the use of this parameter.

- 1047 1. The Resolution Output Format MUST be one of the values specified in Table 5 and MAY  
1048 include any of the subparameters specified in Table 6.
- 1049 2. If the value of the `https` subparameter is TRUE, the resolver MUST use the HTTPS  
1050 trusted authority resolution protocol specified in section 10.1 (or return an error indicating  
1051 this is not supported).
- 1052 3. If the value of the `saml` subparameter is TRUE, the resolver MUST use the SAML trusted  
1053 authority resolution protocol specified in section 10.2 (or return an error indicating this is  
1054 not supported).
- 1055 4. If the value of both the `https` and `saml` subparameters are TRUE, the resolver MUST  
1056 use the HTTPS+SAML trusted authority resolution protocol specified in section 10.3 (or  
1057 return an error indicating this is not supported).
- 1058 5. If the value of the `cid` subparameter is TRUE or null, or if the parameter is absent, the  
1059 resolver MUST perform CanonicalID verification as specified in section 14.3. If the value  
1060 of the `cid` subparameter is FALSE, the resolver MUST NOT perform CanonicalID  
1061 verification.
- 1062 6. If the value of the `refs` subparameter is TRUE or null, or if the parameter is absent, the  
1063 resolver MUST perform Ref processing as specified in section 12. If the value of the  
1064 `refs` subparameter is FALSE, the resolver MUST NOT perform Ref processing and  
1065 must return an error if a Ref is encountered as specified in section 12.
- 1066 7. If the value of the `sep` subparameter is TRUE, the resolver MUST perform service  
1067 endpoint selection on the final XRD (even if the values of all service endpoint selection  
1068 parameters are null). If the value of the `sep` subparameter is FALSE or null, or if the  
1069 parameter is absent, the resolver MUST NOT perform service endpoint selection on the  
1070 final XRD unless it is required to produce a URI List or HTTP(S) redirect. See section 8.2.
- 1071 8. If the value of the `nodefault_t`, `nodefault_p`, or `nodefault_m` subparameter is  
1072 TRUE, the resolver MUST ignore default matches on the corresponding service endpoint  
1073 selection element categories as specified in section 13.3.2.
- 1074 9. If the value of the `uric` subparameter is TRUE, the resolver MUST perform service  
1075 endpoint URI construction as specified in section 13.7.1. If the value of the `uric`  
1076 subparameter is FALSE or null, or if the parameter is absent, the resolver MUST NOT  
1077 perform service endpoint URI construction.

1078 Future versions of this specification, or other specifications for XRI resolution, MAY use other  
1079 values for Resolution Output Format or its subparameters.

### 1080 8.1.3 Service Type

1081 The Service Type is an OPTIONAL value of type `xs:anyURI` used to request a specific type of  
1082 service in the service endpoint selection phase (section 11). The value of this parameter MUST  
1083 be a valid absolute XRI, IRI, or URI in URI-normal form as defined by **[XRISyntax]**. (Note that  
1084 URI-normal form is required so this parameter may be passed to a proxy resolver in a QXRI  
1085 query parameter as defined in section 11.) The Service Type values defined for XRI resolution  
1086 services are specified in section 3.1.2. The rules for matching the value of the Service Type  
1087 parameter to the value of the `xrd:XRD/xrd:Service/xrd:Type` element are specified in  
1088 section 13.3.6.

1089 **8.1.4 Service Media Type**

1090 The Service Media Type is an OPTIONAL string used to request a specific media type in the  
1091 service endpoint selection phase (section 11). The value of this parameter MUST be a valid  
1092 media type as defined by [RFC2046]. The Service Media Type values defined for XRI resolution  
1093 services are specified in section 3.3. The rules for matching the value of the Service Media Type  
1094 parameter to the value of the `xrd:XRD/xrd:Service/xrd:MediaType` element are specified  
1095 in section 13.3.8.

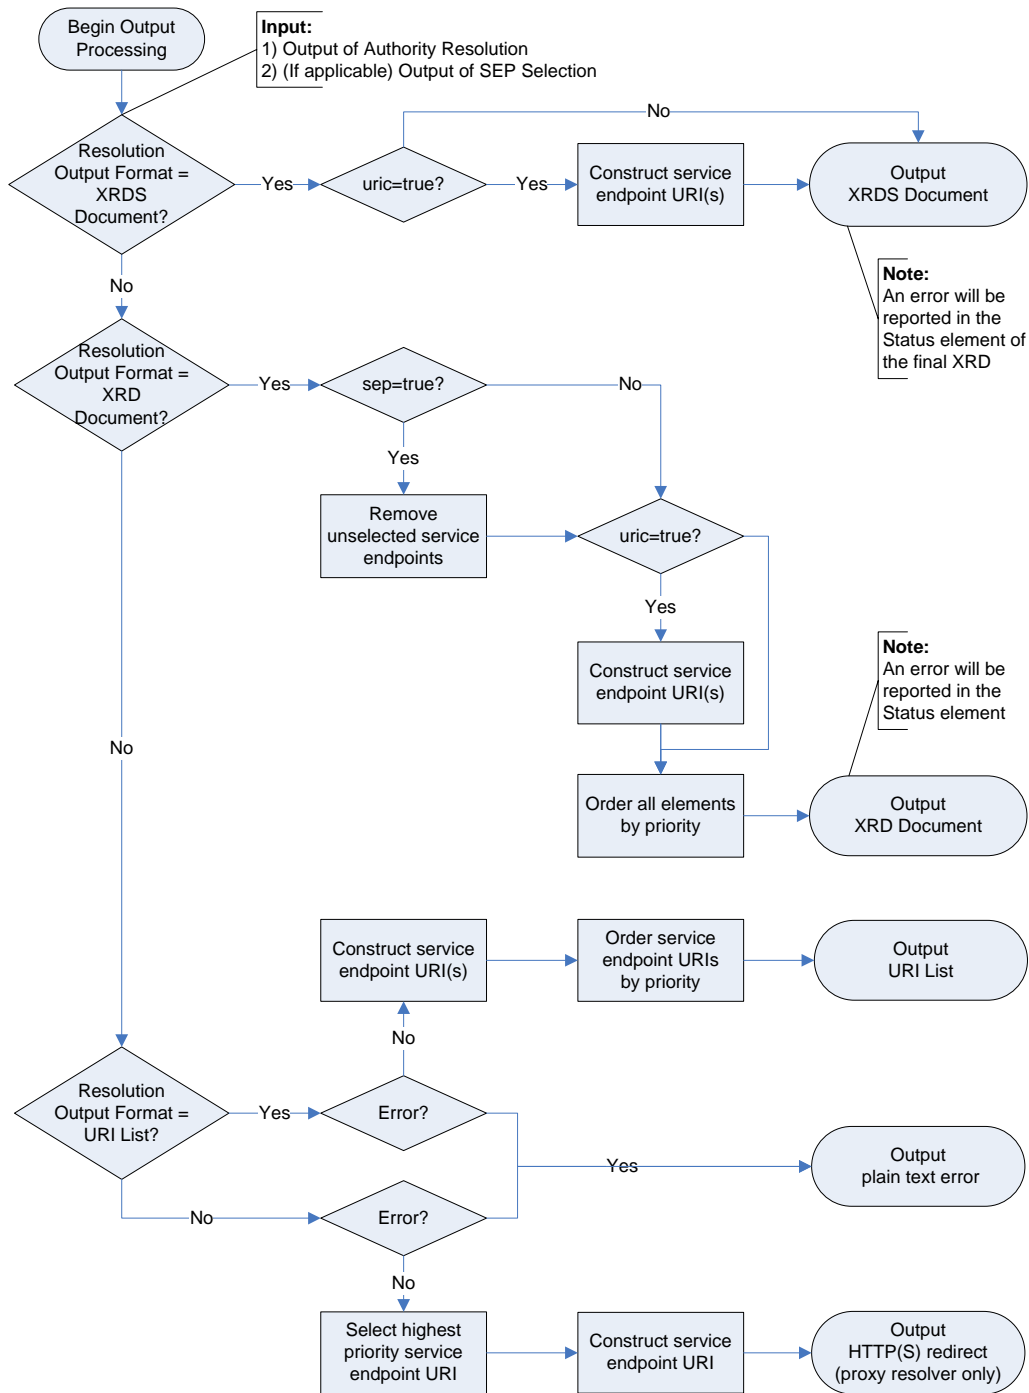

1096 **8.2 Outputs**

1097 Table 10 summarizes the logical outputs of XRI resolution. Note that these are defined in terms of  
1098 media types returned by authority servers and proxy resolvers. A local resolver API MAY  
1099 implement other representations of these media types.

Logical Output Format Name	Media Type Value (when requesting XRI authority resolution only)	Media Type Value (when requesting service endpoint selection)
XRDS Document	application/xrds+xml	application/xrds+xml;sep=true
XRD Element	application/xrd+xml	application/xrd+xml;sep=true
URI List	N/A	text/uri-list
HTTP(S) Redirect	N/A	<i>null</i>

1100 *Table 10: Outputs of XRI resolution.*

1101 Figure 4 is a flowchart illustrating the process of producing these output formats once the auth-  
 1102 ority resolution and optional service endpoint selection phases are complete. Note that in the first  
 1103 two output options, errors are reported directly in the XRDS, so no special error format is needed.

1104  
 1105 *Figure 4: Output processing flowchart.*

1106 The following sections provide additional construction and validation requirements.

## 1107 8.2.1 XRDS Document

1108 If the value of the Resolution Output Format parameter is `application/xrds+xml`, the  
1109 following rules apply.

- 1110 1. The output MUST be a valid XRDS document according to the schema defined in  
1111 Appendix B.
- 1112 2. The XRDS document MUST contain an ordered list of `xrd:XRD` elements—one for each  
1113 authority subsegment successfully resolved by the resolver client. This list MUST appear  
1114 in the same order as the corresponding subsegments in the Authority String.
- 1115 3. Each of the contained XRD elements must be a valid XRD element according to the  
1116 schema defined in Appendix B.
- 1117 4. The XRD elements MUST conform to the additional requirements in section 4.
- 1118 5. If the value of the `saml` subparameter of the Resolution Output Format is TRUE, the  
1119 XRD elements MUST conform to the additional requirements in section 10.2.
- 1120 6. If Redirect or Ref processing is necessary during the authority resolution or service  
1121 endpoint selection process, it MUST result in a valid nested XRDS document as defined  
1122 in section 12.
- 1123 7. If the value of the `sep` subparameter is TRUE, service endpoint selection MUST be  
1124 performed as defined in section 13, even if the values of all three service endpoint  
1125 selection input parameters (Service Type, Path String, and Service Media Type) are null.

1126 **IMPORTANT:** No filtering of the final XRD is performed when returning an XRDS document.  
1127 Filtering is only performed when the requested Resolution Output Format is an XRD element –  
1128 see the next section.

- 1129 8. If the value of the `cid` subparameter is TRUE, synonym verification MUST be reported  
1130 using the `xrd:Status` element of each XRD in the XRDS document as defined in  
1131 section 14.
- 1132 9. If the output is an error, this error MUST be returned using the `xrd:Status` element of  
1133 the final XRD in the XRDS document as defined in section 15.

## 1134 8.2.2 XRD Element

1135 If the value of the Resolution Output Format parameter is `application/xrd+xml`, the following  
1136 rules apply.

- 1137 1. The output MUST be a valid XRD element according to the schema defined in Appendix  
1138 B.
- 1139 2. The XRD elements MUST conform to the additional requirements in section 4.
- 1140 3. If the value of the `saml` subparameter of the Resolution Output Format is TRUE, the  
1141 XRD element MUST conform to the additional requirements in section 10.2.
- 1142 4. If the value of the `sep` subparameter is FALSE or null, or if this parameter is absent, the  
1143 XRD MUST be the final XRD in the XRDS document produced as a result of authority  
1144 resolution. Service endpoint selection or any other filtering of the XRD element MUST  
1145 NOT be performed.
- 1146 5. If the value of the `sep` subparameter is TRUE, service endpoint selection MUST be  
1147 performed as defined in section 13, even if the values of all service endpoint selection  
1148 input parameters are null.
- 1149 6. If service endpoint selection is performed, the only `xrd:Service` elements in the XRD  
1150 element MUST be those selected according to the rules specified in section 13. If no  
1151 service endpoints were selected by those rules, no `xrd:Service` elements will be

1152 present. In addition, all elements within the XRD element that are subject to the global  
1153 `priority` attribute (even if the attribute is absent or null) MUST be returned in order of  
1154 highest to lowest priority as defined in section 4.3.3.

1155 **IMPORTANT:** Any other filtering of the XRD element MUST NOT be performed. Note that this  
1156 means that if the XRD element includes a SAML signature element as defined in section 10.2,  
1157 this element is still returned inside the XRD element even though it may not be able to be verified  
1158 by a consuming application.

- 1159 7. If the value of the `cid` subparameter is TRUE, synonym verification MUST be reported  
1160 using the `xrd:Status` element of each XRD in the XRDS document as defined in  
1161 section 14.
- 1162 8. If the output is an error, this error MUST be returned using the `xrd:Status` element as  
1163 defined in section 15.

### 1164 8.2.3 URI List

1165 If the value of the Resolution Output Format parameter is `text/uri-list`, the following rules  
1166 apply.

- 1167 1. For this output, service endpoint selection is REQUIRED, even if the values of all service  
1168 endpoint selection input parameters are null.
- 1169 2. If authority resolution and service endpoint selection are both successful, the output  
1170 MUST be a valid URI List as defined by section 5 of [RFC2483].
- 1171 3. If, after applying the service endpoint selection rules, more than one service endpoint is  
1172 selected, the highest priority `xrd:XRD/xrd:Service` element MUST be selected as  
1173 defined in section 4.3.3.
- 1174 4. If the final selected `xrd:XRD/xrd:Service` element contains a  
1175 `xrd:XRD/xrd:Service/xrd:Redirect` or `xrd:XRD/xrd:Service/xrd:Ref`  
1176 element, Redirect and Ref processing MUST be performed as described in section 12.  
1177 This rule applies iteratively to each new XRDS document resolved.
- 1178 5. From the final selected `xrd:XRD/xrd:Service` element, the service endpoint URI(s)  
1179 MUST be constructed as defined in section 13.7.1.
- 1180 6. The URIs MUST be returned in order of highest to lowest priority of the source `xrd:URI`  
1181 elements within the selected `xrd:Service` element as defined in section 4.3.3. When  
1182 two or more of the source `xrd:URI` elements have equal priority, their constructed URIs  
1183 SHOULD be returned in random order.

1184 **IMPORTANT:** Any other filtering of the URI list MUST NOT be performed.

- 1185 7. If the output is an error, it MUST be returned with the content type `text/plain` as  
1186 defined in section 15.

### 1187 8.2.4 HTTP(S) Redirect

1188 In XRI proxy resolution, the Resolution Output Format parameter may be null. In this case the  
1189 output of a proxy resolver is an HTTP(S) redirect as defined in section 11.7.

---

## 1190 9 Generic Authority Resolution Service

1191 As discussed in section 1.1 and illustrated in Figure 2, authority resolution is the first phase of XRI  
1192 resolution. This phase applies only to resolving the subsegments in the Authority String of the  
1193 QXRI. The Authority String may identify either an *XRI authority* or an *IRI authority* as described in  
1194 section 2.2.1 of [XRISyntax].

1195 XRI authorities and IRI authorities have different syntactic structures, partially due to the higher  
1196 level of abstraction represented by XRI authorities. For this reason, XRI authorities are resolved  
1197 to XRDS documents one subsegment at a time as specified in section 9.1. IRI authorities, since  
1198 they are based on DNS names or IP addresses, are resolved into an XRDS document through a  
1199 special HTTP(S) request using the entire IRI authority component as specified in section 9.1.11.

### 1200 9.1 XRI Authority Resolution

#### 1201 9.1.1 Service Type and Service Media Type

1202 The protocol defined in this section is identified by the values in Table 11.

Service Type	Service Media Type	Subparameters
xri://\$res*auth*(\$v*2.0)	application/xrds+xml	OPTIONAL (see important note below)

1203 Table 11: Service Type and Service Media Type values for generic authority resolution.

1204 A generic authority resolution service endpoint advertised in an XRDS document MUST use the  
1205 Service Type identifier and MAY use the Service Media Type identifier defined in Table 11.

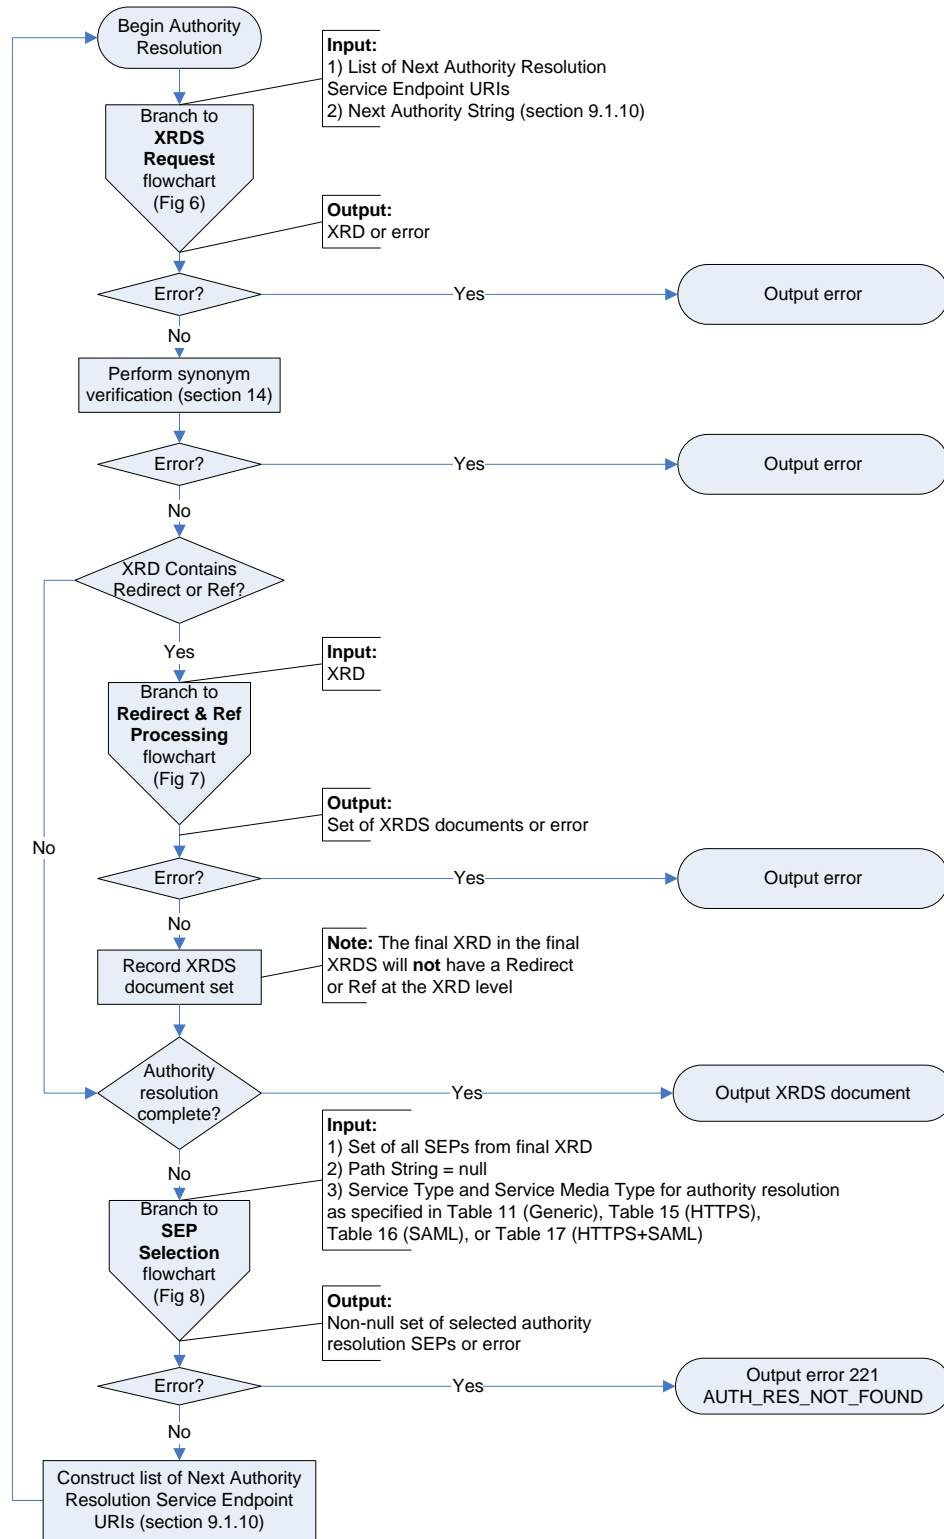

1206 BACKWARDS COMPATIBILITY NOTE: Earlier drafts of this specification used a subparameter  
1207 called `trust`. This has been deprecated in favor of new subparameters for each trusted  
1208 resolution option, i.e., `https=true` and `saml=true`. However, implementations SHOULD  
1209 consider the following values equivalent both for the purpose of service endpoint selection within  
1210 XRDS documents and as HTTP(S) Accept header values in XRI authority resolution requests:

```
1211 application/xrds+xml  
1212 application/xrds+xml;trust=none  
1213 application/xrds+xml;https=false  
1214 application/xrds+xml;saml=false  
1215 application/xrds+xml;https=false;saml=false  
1216 application/xrds+xml;saml=false;https=false
```

1217 **9.1.2 Protocol**

1218 Figure 5 (non-normative) illustrates the overall logical flow of generic authority resolution.

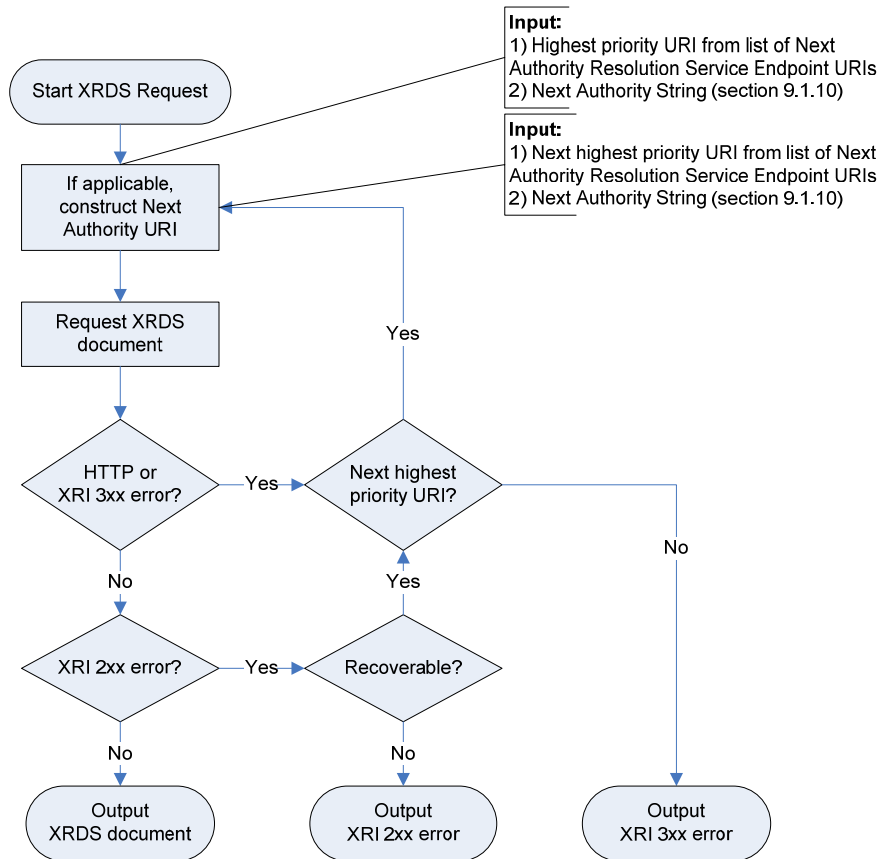

1219

1220 Figure 5: Authority resolution flowchart.

- 1221 Following are the normative requirements for behavior of an XRI resolver and an XRI authority  
1222 server when performing generic XRI authority resolution:
- 1223 1. Each request for an XRDS document using HTTP(S) MUST conform to the requirements  
1224 in section 9.1.3.
  - 1225 2. For errors in XRDS document resolution requests, a resolver MUST implement failover  
1226 handling as specified in section 9.1.4.
  - 1227 3. The resolver MUST be preconfigured with or have a means of obtaining the XRDS  
1228 document describing the community root authority for the XRI to be resolved as defined  
1229 in section 9.1.5.
  - 1230 4. The resolver MAY obtain the XRDS document describing the community root authority by  
1231 requesting a self-describing XRDS document as defined in section 9.1.6.
  - 1232 5. Resolution of each subsegment in the Authority String after the community root  
1233 subsegment MUST proceed in subsegment order (left-to-right) using fully qualified  
1234 subsegment values as defined in section 9.1.7.
  - 1235 6. Subsegments that use XRI parenthetical cross-reference syntax MUST be resolved as  
1236 defined in section 9.1.8.
  - 1237 7. For each iteration of the authority resolution process, the next authority resolution service  
1238 endpoint MUST be selected as specified in section 9.1.9.
  - 1239 8. For each iteration of the authority resolution process, an HTTP(S) URI called the Next  
1240 Authority URI MUST be constructed according to the algorithm specified in section  
1241 9.1.10.
  - 1242 9. A resolver MAY request that a recursing authority server perform resolution of multiple  
1243 subsegments as defined in section 9.1.11.
  - 1244 10. For each iteration of the authority resolution process, a resolver MUST perform Redirect  
1245 and Ref processing as specified in section 12. Note that if Redirect and Ref processing is  
1246 successful, it will result in a nested XRDS document as specified in section 12.5.

1247 **9.1.3 Requesting an XRDS Document using HTTP(S)**

1248 Figure 6 (non-normative) illustrates the logical flow for requesting an XRDS document.

1249  
1250 *Figure 6: XRDS request flowchart.*

1251 Following are the normative requirements for an XRI resolver and an XRI authority server when  
1252 requesting an XRDS document:

- 1253 1. Each resolution request **MUST** be an HTTP(S) GET to the Next Authority URI and **MUST**  
1254 contain an Accept header with the media type identifier defined in Table 11. Note that in  
1255 XRI authority resolution, this Accept header is **NOT** interpreted as an XRI resolution input  
1256 parameter, but simply as the media type being requested from the server. This differs  
1257 from XRI proxy resolution, where the Accept header **MAY** be used to specify the Service  
1258 Media Type resolution parameter. See section 11.5.
- 1259 2. The ultimate HTTP(S) response from an authority server to a successful resolution  
1260 request **MUST** contain either: a) a 2XX response with a valid XRDS document containing  
1261 an XRD element for each authority subsegment resolved, or b) a 304 response signifying  
1262 that the cached version on the resolver is still valid (depending on the client's HTTP(S)  
1263 request). There is no restriction on intermediate redirects (i.e., 3XX result codes) or other  
1264 result codes (e.g., a 100 HTTP response) that eventually result in a 2XX or 304 response  
1265 through normal operation of [RFC2616].
- 1266 3. The HTTP(S) response from an authority server **MUST** return the media type requested  
1267 by the resolver. The response **SHOULD NOT** include any subparameters supplied by the  
1268 resolver in the request. If the resolver receives such parameters in the response, the  
1269 resolver **MUST** ignore them and do its own independent verification that the response  
1270 fulfills the requested parameters.

- 1271 4. Any ultimate response besides an HTTP 2XX or 304 SHOULD be considered an error in  
1272 the resolution process. In this case, the resolver MUST implement failover handling as  
1273 specified in section 9.1.4.
- 1274 5. If all authority resolution service endpoints fail, the resolver SHOULD return the  
1275 appropriate error code and context message as specified in section 15. In recursing  
1276 resolution, such an error MUST be returned by the recursing authority server to the  
1277 resolver as specified in section 15.4.
- 1278 6. All other uses of HTTP(S) in this protocol MUST comply with the requirements in section  
1279 16. In particular, HTTP caching semantics SHOULD be leveraged to the greatest extent  
1280 possible to maintain the efficiency and scalability of the HTTP-based resolution system.  
1281 The recommended use of HTTP caching headers is described in more detail in section  
1282 16.2.1.

### 1283 9.1.4 Failover Handling

1284 XRI infrastructure has the same requirements as DNS infrastructure for stability, redundancy, and  
1285 network performance. This means XRI authority and proxy resolution services are subject to the  
1286 same requirements as DNS nameservers. For example:

- 1287 • Critical authority or proxy resolution servers SHOULD be operated from a minimum of two  
1288 physically separate network locations to prevent a single point of failure.
- 1289 • Authority or proxy resolution servers handling heavy loads SHOULD operate from multiple  
1290 servers and take advantage of load balancing technologies.

1291 However, such capabilities are effective only if resolvers or other client applications implement  
1292 proper failover handling. Because XRI resolution takes place at a layer above DNS resolution,  
1293 resolvers have two ways to discover additional network endpoints at which authority or proxy  
1294 resolution services are available.

- 1295 • *DNS round robin/failover*: The domain name of an authority resolution service endpoint URI  
1296 may be associated with more than one IP address.
- 1297 • *XRI round robin/failover*: The XRDS document describing an XRI authority may publish  
1298 multiple URI elements for its authority resolution service endpoint, or multiple authority  
1299 resolution service endpoints, or both.

1300 To take advantage of both these options, the following rules apply to failover handling:

- 1301 1. A resolver SHOULD first try an alternate IP address for the current authority resolution  
1302 service endpoint if the endpoint uses DNS round robin.
- 1303 2. If all alternate IP addresses fail, a resolver MUST try the next highest priority authority  
1304 resolution URI in the current authority resolution service endpoint, if available.
- 1305 3. If all URIs in the current authority resolution service endpoint fail, a resolver MUST try the  
1306 next highest priority authority resolution service endpoint, if available, until all authority  
1307 resolution service endpoints are exhausted.
- 1308 4. A resolver SHOULD only return an error if all network endpoints associated with the  
1309 authority resolution service fail to respond.

1310 **IMPORTANT:** These rules also apply to any client of an XRI proxy resolver. Failure to observe  
1311 this warning means the proxy resolver can become a point of failure.

1312 One final consideration: DNS caching mechanisms should respect the TTL (Time To Live)  
1313 settings in DNS records. However, different software languages and frameworks handle DNS  
1314 caching differently. It is RECOMMENDED to check the default settings to ensure that a library or  
1315 application is not caching DNS results indefinitely.

## 1316 9.1.5 Community Root Authorities

1317 Identifier management policies are defined on a community-by-community basis. For XRI  
1318 identifier authorities, the resolution community is specified by the first (leftmost) subsegment of  
1319 the authority component of the XRI. This is referred to as the *community root authority*, and it  
1320 represents the authority server(s) that answer resolution queries at this root. When a resolution  
1321 community chooses to create a new community root authority, it SHOULD define policies for  
1322 assigning and managing identifiers under this authority. Furthermore, it SHOULD define what  
1323 resolution protocol(s) may be used for these identifiers.

1324 For an XRI authority, the community root may be either a global context symbol (GCS) character  
1325 or top-level cross-reference as specified in section 2.2.1.1 of **[XRISyntax]**. In either case, the  
1326 corresponding root XRDS document (or its equivalent) specifies the top-level authority resolution  
1327 service endpoints for that community.

1328 The community root authority SHOULD publish a self-describing XRDS document as defined in  
1329 section 9.1.6. This XRDS document SHOULD be available at the HTTP(S) URI(s) that serve as  
1330 the community's root authority resolution service endpoints. This community root XRDS  
1331 document, or its location, must be known *a priori* and is part of the configuration of an XRI  
1332 resolver, similar to the specification of root DNS servers for a DNS resolver. Note that it is not  
1333 strictly necessary to publish this information in an XRDS document—it may be supplied in any  
1334 format that enables configuration of the XRI resolvers in the community. However, publishing a  
1335 self-describing XRDS document at a known location simplifies this process and enables dynamic  
1336 configuration of community resolvers.

1337 As a best practice, it is RECOMMENDED that community root XRDS document contain:

- 1338 • The root HTTPS resolution service endpoint(s) if HTTPS trusted resolution is supported.
- 1339 • A valid self-signed SAML assertion accessible via HTTPS or other secure means if SAML  
1340 trusted resolution is supported.
- 1341 • Both of the above if HTTPS+SAML trusted resolution is supported.
- 1342 • The service endpoints and supported media types of the community's XRI proxy resolver(s) if  
1343 proxy resolution is supported.

1344 For a list of public community root authorities and the locations of their community root XRDS  
1345 documents, see the Wikipedia entry on XRI **[WikipediaXRI]**.

## 1346 9.1.6 Self-Describing XRDS Documents

1347 An identifier authority MAY publish a self-describing XRDS document, i.e., one produced by the  
1348 same identifier authority that it describes. A resolver MAY request a self-describing XRDS  
1349 document from a target identifier authority using either of two methods:

- 1350 1. If the resolver knows an HTTP(S) URI for the target authority's XRI authority resolution  
1351 service endpoint, it may use the resolution protocol specified in section 6 to request an  
1352 XRDS document directly from this HTTP(S) URI. This HTTP(S) URI may be known a  
1353 priori (as is often the case with community root authorities, above), or it may be  
1354 discovered from other identifier authorities via the resolution protocols defined in this  
1355 specification.
- 1356 2. If the resolver knows: a) an XRI of the target authority as a community root authority, and  
1357 b) an HTTP(S) URI for a proxy resolver configured for this community root authority, it  
1358 may use the proxy resolution protocol specified in section 11 to query the proxy resolver  
1359 for the community root authority XRI. This query MUST include only a single subsegment  
1360 identifying the community root authority and MUST NOT include any additional  
1361 subsegments.

1362 If an identifier authority had an authority resolution service endpoint at  
1363 `http://example.com/auth-res-service/`, an example of the first method would be to

1364 issue an HTTP(S) GET request to that URI with an Accept header specifying the content type  
1365 application/xrds+xml. See section 6.3 for more details.

1366 If an identifier authority with the community root authority identifier `xri://(example)` was  
1367 registered with the XRI proxy resolver `http://xri.example.com/`, an example of the second  
1368 method would be to issue an HTTP(S) GET request to the following URI:

1369 `http://xri.example.com/(example)?_xrd_r=application/xrds+xml`

1370 Note that a proxy resolver may use the first method to publish its own self-describing XRDS  
1371 document at the HTTP(S) URI(s) for its proxy resolution service.

1372 **IMPORTANT:** A self-describing XRDS document **MUST** only be issued by an identifier authority  
1373 when describing itself. It **MUST NOT** be included in an XRDS document when describing a  
1374 different identifier authority. In the latter case the self-describing XRDS document for the  
1375 community root authority is implicit.

### 1376 9.1.7 Qualified Subsegments

1377 A qualified subsegment is defined by the productions whose names start with `xri-subseg` in  
1378 section 2.2.3 of **[XRISyntax]** including the leading syntactic delimiter (“\*” or “!”). A qualified  
1379 subsegment **MUST** include the leading syntactic delimiter even if it was optionally omitted in the  
1380 original XRI (see section 2.2.3 of **[XRISyntax]**).

1381 If the first subsegment of an XRI authority is a GCS character and the following subsegment does  
1382 not begin with a “\*” (indicating a reassignable subsegment) or a “!” (indicating a persistent  
1383 subsegment), then a “\*” is implied and **MUST** be added when constructing the qualified  
1384 subsegment as specified in section 9.1.7. Table 12 and Table 13 illustrate the differences  
1385 between parsing a reassignable subsegment following a GCS character and parsing a cross-  
1386 reference, respectively.

1387

<b>XRI</b>	<code>xri://@example*internal/foo</code>
<b>XRI Authority</b>	<code>@example*internal</code>
<b>Community Root Authority</b>	<code>@</code>
<b>First Qualified Subsegment Resolved</b>	<code>*example</code>

1388 *Table 12: Parsing the first subsegment of an XRI that begins with a global context symbol.*

<b>XRI</b>	<code>xri://(http://www.example.com)*internal/foo</code>
<b>XRI Authority</b>	<code>(http://www.example.com)*internal</code>
<b>Community Root Authority</b>	<code>(http://www.example.com)</code>
<b>First Qualified Subsegment Resolved</b>	<code>*internal</code>

1389 *Table 13: Parsing the first subsegment of an XRI that begins with a cross-reference.*

## 1390 9.1.8 Cross-References

1391 Any subsegment within an XRI authority component may be a cross-reference (see section 2.2.2  
1392 of **[XRISyntax]**). Cross-references are resolved identically to any other subsegment because the  
1393 cross-reference is considered opaque, i.e., the value of the cross-reference (including the  
1394 parentheses) is the literal value of the subsegment for the purpose of resolution.

1395 Table 14 provides several examples of resolving cross-references. In these examples,  
1396 subsegment !b resolves to a Next Authority Resolution Service Endpoint URI of  
1397 `http://example.com/xri/` and recursing authority resolution is not being requested.  
1398

Example XRI	Next Authority URI after resolving
	<code>xri://!a!b</code>
<code>xri://!a!b!(@!1!2!3)*e/f</code>	<code>http://example.com/xri/!(@!1!2!3)</code>
<code>xri://!a!b*(mailto:jd@example.com)*e/f</code>	<code>http://example.com/xri/*(mailto:jd@example.com)</code>
<code>xri://!a!b*(\$v/2.0)*e/f</code>	<code>http://example.com/xri/*(\$v*2.0)</code>
<code>xri://!a!b*(c*d)*e/f</code>	<code>http://example.com/xri/*(c*d)</code>
<code>xri://!a!b*(foo/bar)*e/f</code>	<code>http://example.com/xri/*(foo%2Fbar)</code>

1399 Table 14: Examples of the Next Authority URIs constructed using different types of cross-references.

## 1400 9.1.9 Selection of the Next Authority Resolution Service Endpoint

1401 For each iteration of authority resolution, the resolver MUST select the next authority resolution  
1402 service endpoint from the current XRD as specified in section 13. For generic authority resolution,  
1403 this selection process MUST use the parameters specified in Table 11. For trusted authority  
1404 resolution, this selection process MUST use the parameters specified in Table 15, Table 16, or  
1405 Table 17. In all cases, an explicit match on the `xrd:XRD/xrd:Service/xrd:Type` element is  
1406 REQUIRED, so during authority resolution, a resolver MUST set the `nodefault` parameter to a  
1407 value of `nodefault=type` in order to override selection of a default service endpoint as  
1408 specified in section 13.3.2.

## 1409 9.1.10 Construction of the Next Authority URI

1410 Once the next authority resolution service endpoint is selected, the resolver MUST construct a  
1411 URI for the next HTTP(S) request, called the *Next Authority URI*, by concatenating two strings as  
1412 specified in this section.

1413 The first string is called the *Next Authority Resolution Service Endpoint URI*. To construct it, the  
1414 resolver MUST:

- 1415 1. Select the highest priority URI of the highest priority authority resolution service endpoint  
1416 selected in section 9.1.9.
- 1417 2. Apply the service endpoint URI construction algorithm based the value of the `append`  
1418 attribute as defined in section 13.7.
- 1419 3. Append a forward slash (“/”) if the URI does not already end in a forward slash.

1420 The second string is called the *Next Authority String* and it consists of either:

- 1421 • The next fully qualified subsegment to be resolved (see section 9.1.7), or
- 1422 • In the case of recursing resolution, the next fully qualified subsegment to be resolved plus  
1423 any additional subsegments for which recursing resolution is requested (see section 9.1.11).

1424 The final step is to append the Next Authority String to the path component of the Next Authority  
1425 Resolution Service Endpoint URI. The resulting URI is called the *Next Authority URI*.

1426 Construction of the Next Authority URI is more formally described in this pseudocode for  
1427 resolving a “next-auth-string” via a “next-auth-res-sep-uri”:

```
1428     if (path portion of next-auth-res-sep-uri does not end in "/"):
1429         append "/" to path portion of next-auth-res-sep-uri
1430
1431     if (next-auth-string is not preceded with "*" or "!" delimiter):
1432         prepend "*" to next-auth-string
1433
1434     append uri-escape(next-auth-string) to path of next-auth-res-sep-uri
```

## 1435 9.1.11 Recursing Authority Resolution

1436 If an authority server offers recursing resolution, an XRI resolver MAY request resolution of  
1437 multiple authority subsegments in one transaction. If a resolver makes such a request, the  
1438 responding authority server MAY perform the additional recursing resolution steps requested. In  
1439 this case the recursing authority server acts as a resolver to the other authority resolution service  
1440 endpoints that need to be queried. Alternatively, the recursing authority server may retrieve XRDs  
1441 from its local cache until it reaches a subsegment whose XRD is not locally cached, or it may  
1442 simply recurse only as far as it is authoritative.

1443 If an authority server performs any recursing resolution, it MUST return an ordered list of  
1444 `xrd:XRDS` elements (and nested `xrd:XRDS` elements if Redirects or Refs are followed as  
1445 specified in section 12) in an `xrd:XRDS` document for all subsegments resolved as defined in  
1446 section 8.2.1.

1447 A recursing authority server MAY resolve fewer subsegments than requested by the resolver. The  
1448 recursing authority server is under no obligation to resolve more than the first subsegment (for  
1449 which it is, by definition, authoritative).

1450 If the recursing authority server does not resolve the entire set of subsegments requested, the  
1451 resolver MUST continue the authority resolution process itself. At any stage, however, the  
1452 resolver MAY request recursing resolution of any or all of the remaining authority subsegments.

## 1453 9.2 IRI Authority Resolution

1454 From the standpoint of generic authority resolution, an IRI authority component represents either  
1455 a DNS name or an IP address at which an XRDS document describing the authority may be  
1456 retrieved using HTTP(S). Thus IRI authority resolution simply involves making an HTTP(S) GET  
1457 request to a URI constructed from the IRI authority component. The resulting XRDS document  
1458 can then be consumed in the same manner as one obtained using XRI authority resolution.

1459 While the use of IRI authorities provides backwards compatibility with the large installed base of  
1460 DNS- and IP-identifiable resources, IRI authorities do not support the additional layer of  
1461 abstraction, delegation, and extensibility offered by XRI authority syntax. Therefore IRI authorities  
1462 are NOT RECOMMENDED for new deployments of XRI identifiers.

1463 This section defines IRI authority resolution as a simple extension to the XRI authority resolution  
1464 protocol defined in the preceding section.

### 1465 9.2.1 Service Type and Media Type

1466 Because IRI authority resolution takes place at a level “below” XRI authority resolution, it cannot  
1467 be described in an XRD, and thus there is no corresponding resolution service type. IRI authority  
1468 resolution uses the same media type as generic XRI authority resolution.

## 1469 9.2.2 Protocol

1470 Following are the normative requirements for IRI authority resolution that differ from generic XRI  
1471 authority resolution:

- 1472 1. The Next Authority URI (section 9.1.10) is constructed by extracting the entire IRI  
1473 authority component and prepending the string `http://`. See the exception in section  
1474 9.2.3.
- 1475 2. The HTTP GET request MUST include an HTTP Accept header containing only the  
1476 following:

1477 `Accept: application/xrds+xml`

- 1478 3. The HTTP GET request MUST have a `Host:` header (as defined in section 14.23 of  
1479 **[RFC2616]**) containing the value of the IRI authority component. For example:

1480 `Host: example.com`

- 1481 4. An HTTP server acting as an IRI authority SHOULD respond with an XRDS document  
1482 containing the XRD describing that authority.
- 1483 5. The responding server MUST use the value of the `Host:` header to populate the  
1484 `xrd:XRD/xrd:Query` element in the resulting XRD.

1485 Note that because IRI authority resolution is required to process the entire IRI authority  
1486 component in a single step, recursing authority resolution does not apply.

## 1487 9.2.3 Optional Use of HTTPS

1488 Section 10 of this specification defines trusted resolution only for XRI authorities. Trusted  
1489 resolution is not defined for IRI Authorities. If, however, an IRI authority is known to respond to  
1490 HTTPS requests (by some means outside the scope of this specification), then the resolver MAY  
1491 use HTTPS as the access protocol for retrieving the authority's XRD. If the resolver is satisfied,  
1492 via transport level security mechanisms, that the response is from the expected IRI authority, the  
1493 resolver MAY consider this an HTTPS trusted resolution response as defined in section 10.1.

---

## 1494 10 Trusted Authority Resolution Service

1495 This section defines three options for performing trusted XRI authority resolution as an extension  
1496 of the generic authority resolution protocol defined in section 9.1—one using HTTPS, one using  
1497 SAML assertions, and one using both.

### 1498 10.1 HTTPS

1499 HTTPS authority resolution is a simple extension to generic authority resolution in which all  
1500 communication with authority resolution service endpoints is carried out over HTTPS. This  
1501 provides transport-level security and server authentication, however it does not provide message-  
1502 level security or a means for a responder to provide different responses for different requestors.

#### 1503 10.1.1 Service Type and Service Media Type

1504 The protocol defined in this section is identified by the values in Table 15.

Service Type	Service Media Type	Subparameters
xri://\$res*auth*(\$v*2.0)	application/xrds+xml	https=true

1505 *Table 15: Service Type and Service Media Type values for HTTPS trusted authority resolution.*

1506 An HTTPS trusted resolution service endpoint advertised in an XRDS document **MUST** use the  
1507 Service Type identifier and Service Media Type identifier (including the `https=true` parameter)  
1508 defined in Table 15. In addition, the identifier authority **MUST** use an HTTPS URI as the value of  
1509 the `xrd:URI` element(s) for this service endpoint.

#### 1510 10.1.2 Protocol

1511 Following are the normative requirements for HTTPS trusted authority resolution that differ from  
1512 generic authority resolution (section 9.1):

- 1513 1. All authority resolution service endpoints **MUST** be selected using the values defined in  
1514 Table 15.
- 1515 2. All authority resolution requests, including the starting request to a community root  
1516 authority, **MUST** use the HTTPS protocol as defined in **[RFC2818]**. This includes all  
1517 intermediate redirects, as well as all authority resolution requests resulting from Redirect  
1518 and Ref processing as defined in section 12. A successful HTTPS response **MUST** be  
1519 received from each authority in the resolution chain or the output **MUST** be error.
- 1520 3. All authority resolution requests **MUST** contain an HTTPS Accept header with the media  
1521 type identifier defined in Table 15 (including the `https=true` subparameter).
- 1522 4. If the resolver finds that an authority in the resolution chain does not support HTTPS at  
1523 any of its authority resolution service endpoints, the resolver **MUST** return a 23x error as  
1524 defined in section 15.

## 1525 10.2 SAML

1526 In SAML trusted resolution, the resolver uses the Resolution Output Format subparameter  
1527 `saml=true` and the authority server responds with an XRDS document containing an XRD with  
1528 an additional element—a digitally signed SAML **[SAML]** assertion that asserts the validity of the  
1529 containing XRD. SAML trusted resolution provides message integrity but does not provide  
1530 confidentiality. For this reason is is **RECOMMENDED** to combine SAML trusted resolution with

1531 HTTPS trusted resolution as defined in section 10.3. Message confidentiality may also be  
1532 achieved with other security protocols used in conjunction with this specification. SAML trusted  
1533 resolution also does not provide a means for an authority to provide different responses for  
1534 different requestors; client authentication is explicitly out-of-scope for version 2.0 of XRI  
1535 resolution.

## 1536 10.2.1 Service Type and Service Media Type

1537 The protocol defined in this section is identified by the values in Table 16.

Service Type	Service Media Type	Subparameters
xri://\$res*auth*(\$v*2.0)	application/xrds+xml	saml=true

1538 *Table 16: Service Type and Service Media Type values for SAML trusted authority resolution.*

1539 A SAML trusted resolution service endpoint advertised in an XRDS document MUST use the  
1540 Service Type identifier and Service Media Type identifier defined in Table 16 (including the  
1541 `saml=true` subparameter). In addition, for transport security the identifier authority SHOULD  
1542 offer at least one HTTPS URI as the value of the `xrd:URI` element(s) for this service endpoint.

## 1543 10.2.2 Protocol

### 1544 10.2.2.1 Client Requirements

1545 For a resolver, trusted resolution is identical to the generic resolution protocol (section 9.1) with  
1546 the addition of the following requirements:

- 1547 1. All authority resolution service endpoints MUST be selected using the values defined in  
1548 Table 16. A resolver SHOULD NOT request SAML trusted resolution service from an  
1549 authority unless the authority advertises a resolution service endpoint matching these  
1550 values.
- 1551 2. Authority resolution requests MAY use either the HTTP or HTTPS protocol. The latter is  
1552 RECOMMENDED for confidentiality.
- 1553 3. All authority resolution requests MUST contain an HTTP(S) Accept header with the  
1554 media type identifier defined in Table 16 (including the `saml=true` subparameter). This  
1555 is the media type of the requested response.

1556 **IMPORTANT:** Clients willing to accept either generic or trusted responses MAY use a  
1557 combination of media type identifiers in the Accept header as described in section 14.1 of  
1558 [RFC2616]. Media type identifiers SHOULD be ordered according to the client's preference for  
1559 the media type of the response. If a client performing generic authority resolution receives an  
1560 XRD containing SAML elements, it MAY choose not to validate the signature or perform any  
1561 processing of these elements.

- 1562 4. A resolver MAY request recursing authority resolution of multiple subsegments as  
1563 defined in section 10.2.3.
- 1564 5. The resolver MUST individually validate each XRD it receives in the resolution chain  
1565 according to the rules defined in section 10.2.4. When `xrd:XRD` elements come both  
1566 from freshly-retrieved XRDS documents and from a local cache, a resolver MUST ensure  
1567 that these requirements are satisfied each time a resolution request is performed.

### 1568 **10.2.2.2 Server Requirements**

1569 For an authority server, trusted resolution is identical to the generic resolution protocol (section  
1570 9.1) with the addition of the following requirements:

- 1571 1. The HTTP(S) response to a trusted resolution request MUST include a content type of  
1572 `application/xrds+xml;saml=true`.
- 1573 2. The XRDS document returned by the resolution service MUST contain a  
1574 `saml:Assertion` element as an immediate child of the `xrd:XRDS` element that is valid  
1575 per the processing rules described by [SAML].
- 1576 3. The `saml:Assertion` element MUST contain a valid enveloped digital signature as  
1577 defined by [XMLDSig] and as constrained by section 5.4 of [SAML].
- 1578 4. The signature MUST apply to the `xrd:XRDS` element that contains the signed SAML  
1579 assertion. Specifically, the signature MUST contain a single  
1580 `ds:SignedInfo/ds:Reference` element, and the `URI` attribute of this reference  
1581 MUST refer to the `xrd:XRDS` element that is the immediate parent of the signed SAML  
1582 assertion. The URI reference MUST NOT be empty and it MUST refer to the identifier  
1583 contained in the `xrd:XRDS/@xml:id` attribute.
- 1584 5. [SAML] specifies that the digital signature enveloped by the SAML assertion MAY contain  
1585 a `ds:KeyInfo` element. If this element is included, it MUST describe the key used to  
1586 verify the digital signature element. However, because the signing key is known in  
1587 advance by the resolution client, the `ds:KeyInfo` element SHOULD be omitted from the  
1588 `ds:Signature` element of the SAML assertion.
- 1589 6. The `xrd:XRDS/xrd:Query` element MUST be present, and the value of this field MUST  
1590 match the XRI authority subsegment requested by the client.
- 1591 7. The `xrd:XRDS/xrd:ProviderID` element MUST be present and its value MUST match  
1592 the value of the `xrd:XRDS/xrd:Service/xrd:ProviderID` element in an XRD  
1593 advertising availability of trusted resolution service from this authority as required in  
1594 section 10.2.5.
- 1595 8. The `xrd:XRDS/saml:Assertion/saml:Subject/saml:NameID` element MUST be  
1596 present and equal to the `xrd:XRDS/xrd:Query` element.
- 1597 9. The `NameQualifier` attribute of the  
1598 `xrd:XRDS/saml:Assertion/saml:Subject/saml:NameID` element MUST be  
1599 present and MUST be equal to the `xrd:XRDS/xrd:ProviderID` element.
- 1600 10. There MUST be exactly one `saml:AttributeStatement` present in the  
1601 `xrd:XRDS/saml:Assertion` element. It MUST contain exactly one `saml:Attribute`  
1602 element with a `Name` attribute value of `xri://$xrd*($v*2.0)`. This  
1603 `saml:Attribute` element MUST contain exactly one `saml:AttributeValue`  
1604 element whose text value is a URI reference to the `xml:id` attribute of the `xrd:XRDS`  
1605 element that is the immediate parent of the `saml:Assertion` element.

### 1606 **10.2.3 Recursing Authority Resolution**

1607 If a resolver requests trusted resolution of multiple authority subsegments (see section 9.1.8), a  
1608 recursing authority server SHOULD attempt to perform trusted resolution on behalf of the resolver  
1609 as described in this section. However, if the resolution service is not able to obtain trusted XRDS  
1610 for one or more additional recursing subsegments, it SHOULD return only the trusted XRDS it has  
1611 obtained and allow the resolver to continue.

## 1612 10.2.4 Client Validation of XRDs

1613 For each XRD returned as part of a trusted resolution request, the resolver MUST validate the  
1614 XRD according to the rules defined in this section.

- 1615 1. The `xrd:XRD/saml:Assertion` element MUST be present.
- 1616 2. This assertion MUST be valid per the processing rules described by [SAML].
- 1617 3. The `saml:Assertion` MUST contain a valid enveloped digital signature as defined by  
1618 [XMLDSig] and constrained by Section 5.4 of [SAML].
- 1619 4. The signature MUST apply to the `xrd:XRD` element containing the signed SAML  
1620 assertion. Specifically, the signature MUST contain a single  
1621 `ds:SignedInfo/ds:Reference` element, and the `URI` attribute of this reference  
1622 MUST refer to the `xml:id` attribute of the `xrd:XRD` element that is the immediate parent  
1623 of the signed SAML assertion.
- 1624 5. If the digital signature enveloped by the SAML assertion contains a `ds:KeyInfo`  
1625 element, the resolver MAY reject the signature if this key does not match the signer's  
1626 expected key as specified by the `ds:KeyInfo` element present in the XRD Descriptor  
1627 that was used to describe the current authority. See section 10.2.5.
- 1628 6. The value of the `xrd:XRD/xrd:Query` element MUST match the subsegment whose  
1629 resolution resulted in the current XRD.
- 1630 7. The value of the `xrd:XRD/xrd:ProviderID` element MUST match the value of the  
1631 `xrd:XRD/xrd:Service/xrd:ProviderID` element in any XRD advertising availability  
1632 of trusted resolution service from this authority as required in section 10.2.5.
- 1633 8. The value of the `xrd:XRD/xrd:ProviderID` element MUST match the value of the  
1634 `NameQualifier` attribute of the  
1635 `xrd:XRD/saml:Assertion/saml:Subject/saml:NameID` element.
- 1636 9. The value of the `xrd:XRD/xrd:Query` element MUST match the value of the  
1637 `xrd:XRD/saml:Assertion/saml:Subject/saml:NameID` element.
- 1638 10. There MUST exist exactly one  
1639 `xrd:XRD/saml:Assertion/saml:AttributeStatement` with exactly one  
1640 `saml:Attribute` element that has a `Name` attribute value of `xri://$xrd*($v*2.0)`.  
1641 This `saml:Attribute` element must have exactly one `saml:AttributeValue`  
1642 element whose text value is a URI reference to the `xml:id` attribute of the `xrd:XRD`  
1643 element that is the immediate parent of the signed SAML assertion.

1644 If any of the above requirements are not met for an XRD in the trusted resolution chain, the result  
1645 MUST NOT be considered a valid trusted resolution response as defined by this specification.  
1646 Note that this does not preclude a resolver from considering alternative resolution paths. For  
1647 example, if an XRD advertising SAML trusted resolution service has two or more  
1648 `xrd:XRD/xrd:Service/xrd:URI` elements and the response from one service endpoint fails  
1649 to meet the requirements above, the client MAY repeat the validation process using the second  
1650 URI. If the second URI passes the tests, it MUST be considered a trusted resolution response as  
1651 defined by this document and SAML trusted resolution may continue.

1652 If the above requirements are met, and the `code` attribute of the `xrd:XRD/xrd:ServerStatus`  
1653 element is 100 (SUCCESS), the resolver MUST add an `xrd:XRD/xrd:Status` element  
1654 reporting a status of 100 (SUCCESS) as specified in section 15. Note that this added element  
1655 MUST be disregarded if a consuming application wishes to verify the SAML signature itself. (If  
1656 necessary, the consuming application may request the XRDS document it wishes to verify directly  
1657 from the SAML authority resolution server.)

1658 If all SAML trusted resolution paths fail, the resolver MUST return the appropriate 23x trusted  
1659 resolution error as defined in section 15.

1660 **10.2.5 Correlation of ProviderID and KeyInfo Elements**

1661 Each XRI authority participating in SAML trusted authority resolution MUST be associated with at  
1662 least one unique persistent identifier expressed in the  
1663 `xrd:XRD/xrd:Service/xrd:ProviderID` element of any XRD advertising trusted authority  
1664 resolution service. This ProviderID value MUST NOT ever be reassigned to another XRI  
1665 authority. While a ProviderID may be any valid URI that meets these requirements, it is  
1666 STRONGLY RECOMMENDED to use a persistent identifier such as a persistent XRI  
1667 **[XRISyntax]** or a URN **[RFC2141]**.

1668 The purpose of ProviderIDs in XRI resolution is to enable resolvers to correlate the metadata in  
1669 an XRD advertising SAML trusted authority resolution service with the response received from a  
1670 SAML trusted resolution service endpoint. If the signed XRD response contains the same  
1671 ProviderID as the XRD used to advertise a service, and the resolver has reason to trust the  
1672 signature, the resolver can trust that the XRD response has not been maliciously replaced with  
1673 another XRD.

1674 There is no defined discovery process for the ProviderID for a community root authority; it must  
1675 be published in a self-describing XRDS document (or other equivalent description—see sections  
1676 9.1.5 and 9.1.6) and verified independently. Once the community root XRDS document is known,  
1677 the ProviderID for delegated XRI authorities within this community MAY be discovered using the  
1678 `xrd:XRD/xrd:Service/xrd:ProviderID` element of authority resolution service endpoints.  
1679 This trust mechanism MAY also be used for other services offered by an authority.

1680 In addition, the metadata necessary for SAML trusted authority resolution or other SAML **[SAML]**  
1681 interactions MAY be discovered using the `ds:KeyInfo` element (section 4.2.) Again, if this  
1682 element is present in an XRD advertising SAML authority resolution service (or any other  
1683 service), and the client has reason to trust this XRD, the client MAY use the associated  
1684 ProviderID to correlate the contents of this element with a signed response.

1685 To assist resolvers in using this key discovery mechanism, it is important that trusted authority  
1686 servers be configured to sign responses in such a way that the signature can be verified using the  
1687 correlated `ds:KeyInfo` element. For more information, see **[SAML]**.

1688 **10.3 HTTPS+SAML**

1689 **10.3.1 Service Type and Service Media Type**

1690 The protocol defined in this section is identified by the values in Table 17.

Service Type	Service Media Type	Subparameters
<code>xri://\$res*auth*(\$v*2.0)</code>	<code>application/xrds+xml</code>	<code>https=true</code> <code>saml=true</code>

1691 *Table 17: Service Type and Service Media Type values for HTTPS+SAML trusted authority resolution.*

1692 An HTTPS+SAML trusted resolution service endpoint advertised in an XRDS document MUST  
1693 use the Service Type identifier and Service Media Type identifier defined in Table 17 (including  
1694 the `https=true` and `saml=true` subparameters). In addition, the identifier authority MUST use  
1695 an HTTPS URI as the value of the `xrd:URI` element(s) for this service endpoint.

## 1696 **10.3.2 Protocol**

1697 Following are the normative requirements for HTTPS+SAML trusted authority resolution.

- 1698 1. All authority resolution service endpoints MUST be selected using the values defined in  
1699 Table 17.
- 1700 2. All authority resolution requests and responses, including the starting request to a  
1701 community root authority, MUST conform to both the requirements of the HTTPS trusted  
1702 resolution protocol defined in section 10.1 and the SAML trusted resolution protocol  
1703 defined in section 10.2.
- 1704 3. All authority resolution requests MUST contain an HTTPS Accept header with the media  
1705 type identifier defined in Table 17 (including both the `https=true` and `saml=true`  
1706 parameters). This MUST be interpreted as the value of the Resolution Output Format  
1707 input parameter.
- 1708 4. If the resolver finds that an authority in the resolution chain does not support both HTTPS  
1709 and SAML, the resolver MUST return a 23x error as defined in section 15.

## 1710 11 Proxy Resolution Service

1711 The preceding sections have defined XRI resolution as a set of logical functions. This section  
1712 defines a mapping of these functions to an HTTP(S) interface for remote invocation. This  
1713 mapping is based on a standard syntax for expressing an XRI as an HTTP URI, called an *HXRI*,  
1714 as defined in section 11.2. HXRIs also enable XRI resolution input parameters to be encoded as  
1715 query parameters in the HXRI.

1716 Proxy resolution is useful for:

- 1717 • Offloading XRI resolution and service endpoint selection processing from a client to an  
1718 HTTP(S) server.
- 1719 • Optimizing XRD caching for a resolution community (a *caching proxy resolver*). Proxy  
1720 resolvers SHOULD use caching to resolve the same QXRIs or QXRI components for multiple  
1721 clients as defined in section 16.4.
- 1722 • Returning HTTP(S) redirects to clients such as browsers that have no native understanding  
1723 of XRIs but can process HXRIs. This provides backwards compatibility with the large installed  
1724 base of existing HTTP clients.

### 1725 11.1 Service Type and Media Types

1726 The protocol defined in this section is identified by the values in Table 18.

Service Type	Service Media Types	Subparameters
xri://\$res*proxy*(\$v*2.0)	application/xrds+xml application/xrd+xml text/uri-list	All subparameters specified in Table 6

1727 Table 18: Service Type and Service Media Type values for proxy resolution.

1728 A proxy resolution service endpoint advertised in an XRDS document MUST use the Service  
1729 Type identifier and Service Media Type identifiers defined in Table 18. In addition:

- 1730 • An HTTPS proxy resolver MUST specify the media type parameter `https=true` and MUST  
1731 offer at least one HTTPS URI as the value of the `xrd:URI` element(s) for this service  
1732 endpoint.
- 1733 • A SAML proxy resolver MUST specify the media type parameter `saml=true` and SHOULD  
1734 offer at least one HTTPS URI as the value of the `xrd:URI` element(s) for this service  
1735 endpoint.

1736 It may appear to be of limited value to advertise proxy resolution service in an XRDS document if  
1737 a resolver must already know how to perform local XRI resolution in order to retrieve this  
1738 document. However, advertising a proxy resolution service in the XRDS document for a  
1739 community root authority (sections 9.1.3 and 9.1.6) can be very useful for applications that need  
1740 to consume XRI proxy resolution services or automatically generate HXRIs for resolution by non-  
1741 XRI-aware clients in that community. Those applications may discover the current URI(s) and  
1742 resolution capabilities of a proxy resolver from this source.

### 1743 11.2 HXRIs

1744 The first step in an HTTP binding of the XRI resolution interface is to specify how the QXRI  
1745 parameter is passed within an HTTP(S) URI. Besides providing a binding for proxy resolution,  
1746 defining a standard syntax for expressing an XRI as an HTTP XRI (HXRI) has two other benefits:

- 1747 • It allows XRIs to be used anywhere an HTTP URI can appear, including in Web pages,  
1748 electronic documents, email messages, instant messages, etc.
- 1749 • It allows XRI-aware processors and search agents to recognize an HXRI and extract the  
1750 embedded XRI for direct resolution, processing, and indexing.

1751 To make this syntax as simple as possible for XRI-aware processors or search agents to  
1752 recognize, an HXRI consists of a fully qualified HTTP or HTTPS URI authority component that  
1753 begins with the domain name segment "xri.". The QXRI is then appended as the entire local  
1754 path (and query component, if present). The QXRI MUST NOT include the xri:// prefix and  
1755 MUST be in URI-normal form as defined in [XRISyntax]. (If a proxy resolver receives an HXRI  
1756 containing a QXRI beginning with an xri:// prefix, it SHOULD remove it before continuing.) In  
1757 essence, the proxy resolver URI (including the forward slash after the domain name) serves as a  
1758 machine-readable alternate prefix for an absolute XRI in URI-normal form.

1759 The normative ABNF for an HXRI is defined below based on the ireg-name, xri-hier-part,  
1760 and iquery productions defined in [XRISyntax]. XRIs that need to be understood by non-XRI-  
1761 aware clients SHOULD be published as HTTP URIs conforming to this HXRI production.

```

1762 HXRI           = proxy-resolver "/" QXRI
1763 proxy-resolver = ( "http://" / "https://" ) proxy-reg-name
1764 proxy-reg-name = "xri." ireg-name
1765 QXRI          = xri-hier-part [ "?" i-query ]

```

1766 URI processors that recognize XRIs SHOULD interpret the local part of an HTTP or HTTPS URI  
1767 (the path segment(s) and optional query segment) as an XRI provided that: a) it conforms to this  
1768 ABNF, and b) the first segment of the path conforms to the xri-authority or iauthority productions  
1769 in [XRISyntax].

1770 For references to communities that offer public XRI proxy resolution services, see the Wikipedia  
1771 entry on XRI [WikipediaXRI].

## 1772 11.3 HXRI Query Parameters

1773 In proxy resolution, the XRI resolution input parameters defined in section 8.1 are bound to an  
1774 HTTP(S) interface using the conventional web model of encoding them in an HTTP(S) URI, which  
1775 in this case is an HXRI. The binding of the logical parameter names to HXRI component parts is  
1776 defined in Table 19.

Logical Parameter Name	HXRI Component	HXRI Query Parameter Name
QXRI	Entire path and query string of HXRI (exclusive of HXRI query parameters listed below)	N/A
Resolution Output Format	HXRI query parameter	_xrd_r
Service Type	HXRI query parameter	_xrd_t
Service Media Type	HXRI query parameter	_xrd_m

1777 Table 19: Binding of logical XRI resolution parameters to QXRI query parameters.

- 1778 Following are the rules for the use of the parameters specified in Table 19.
- 1779 1. The QXRI MUST be normalized as specified in section 11.2.
- 1780 2. If the original QXRI has an existing query component, the HXRI query parameters MUST
- 1781 be appended to that query component.
- 1782 **IMPORTANT:** The query parameter names in Table 19 were chosen to minimize the probability of
- 1783 collision with any pre-existing query parameter names in the QXRI. If there is any conflict, the
- 1784 pre-existing query parameter names MUST be percent-encoded prior to transformation into an
- 1785 HXRI.
- 1786 3. After proxy resolution, the HXRI query parameters MUST subsequently be removed from
- 1787 the QXRI query component. The existing QXRI query component MUST NOT be altered
- 1788 in any other way, i.e., it must be passed through with no changes in parameter order,
- 1789 escape encoding, etc.
- 1790 4. If the original QXRI does not have a query component, one MUST be added to pass any
- 1791 HXRI query parameters. After proxy resolution, this query component MUST be entirely
- 1792 removed.
- 1793 5. If the original QXRI had a null query component (only a leading question mark), or a
- 1794 query component consisting of only question marks, *one additional leading question mark*
- 1795 MUST be added before adding any HXRI query parameters. After proxy resolution, any
- 1796 HXRI query parameters and exactly one leading question mark MUST be removed. See
- 1797 the URI construction steps defined in section 13.6.
- 1798 6. Each HXRI query parameter MUST be delimited from other parameters by an ampersand
- 1799 (“&”).
- 1800 7. Each HXRI query parameter MUST be delimited from its value by an equals sign (“=”).
- 1801 8. If an HXRI query parameter includes one of the media type parameters defined in Table
- 1802 6, it MUST be delimited from the HXRI query parameter with a semicolon (“;”).
- 1803 9. The fully-composed HXRI MUST be encoded and decoded as specified in section 11.4.
- 1804 10. If any HXRI query parameter name is included but its value is empty, the value of the
- 1805 parameter MUST be considered null.

## 1806 11.4 HXRI Encoding/Decoding Rules

1807 To conform with the typical requirements of web server URI parsing libraries, HXRIs MUST be

1808 encoded prior to input to a proxy resolver and decoded prior to output from a proxy resolver.

1809 Because web server libraries typically perform some of these decoding functions automatically,

1810 implementers MUST ensure that a proxy resolver, when used in conjunction with a specific web

1811 server, accomplishes the full set of HXRI decoding steps specified in this section. In particular,

1812 these decoding steps MUST be performed prior to any comparison operations defined in this

1813 specification.

1814 Before any HXRI-specific encoding steps are performed, the QXRI portion of the HXRI (including

1815 all HXRI query parameters) MUST be transformed into URI-normal form as defined in section 2.3

1816 of **[XRISyntax]**. This means characters not allowed in URIs, such as SPACE, or characters that

1817 are valid only in IRIs, such as UCS characters above the ASCII range, MUST be percent

1818 encoded. Also, the plus sign character (“+”) MUST NOT be used to encode the SPACE character

1819 because in decoding the percent-encoded sequence %2B MUST be interpreted as the plus sign

1820 character (“+”).

1821 Once the HXRI is in URI-normal form, the following sequence of encoding steps MUST be

1822 performed in the order specified before an HXRI is submitted to a proxy resolver.

1823 **IMPORTANT:** this sequence of steps is not idempotent, so it MUST be performed only once.

- 1824 1. First, in order to preserve percent-encoding when the HXRI is passed through a web  
 1825 server, all percent signs MUST be themselves percent-encoded, i.e., a SPACE encoded  
 1826 as %20 will become %2520.
- 1827 2. Second, to prevent misinterpretation of HXRI query parameters, any occurrences of the  
 1828 ampersand character (“&”) within an HXRI query parameter that are NOT used to delimit  
 1829 it from another query parameter MUST be percent encoded using the sequence %26.
- 1830 3. Third, to prevent misinterpretation of the semicolon character by the web server, any  
 1831 semicolon used to delimit one of the media type parameters defined in Table 6 from the  
 1832 media type value MUST be percent-encoded using the sequence %3B.

1833 To decode an encoded HXRI back into URI-normal form, the above sequence of steps MUST be  
 1834 performed in reverse order. Again, the sequence is not idempotent so it MUST be performed only  
 1835 once.

1836 Table 20 illustrates the components of an example HXRI before transformation to URI-normal  
 1837 form. The characters requiring percent encoding are highlighted in red. Note the space in the  
 1838 string hello planète. Also, for purposes of illustration, the Type component contains a query  
 1839 string (which would not normally appear in a Type identifier).

QXRI	https://xri.example.com/=example*résumé/path?query
_xrd_r	_xrd_r=application/xrds+xml;https=true;sep=true
_xrd_t	_xrd_t=http://example.org/test?a=1&b=hello planète
_xrd_m	_xrd_m=application/atom+xml

1840 Table 20: Example of HXRI components prior to transformation to URI-normal form.

1841 Table 21 illustrates these components after transformation to URI-normal form. Characters that  
 1842 have been percent-encoded are in blue. Characters still requiring percent encoding according to  
 1843 the rules defined in this section are highlighted in red.

QXRI	https://xri.example.com/=example*r% <b>E9</b> sum% <b>E9</b> /path?query
_xrd_r	_xrd_r=application/xrds+xml; <b>;</b> https=true; <b>;</b> sep=true
_xrd_t	_xrd_t=http://example.org/test?a=1&b=hello%20plan% <b>E8</b> te
_xrd_m	_xrd_m=application/atom+xml

1844 Table 21: Example of HXRI components after transformation to URI-normal form.

1845 Table 22 illustrates the components after all encoding rules defined in this section are applied.

QXRI	https://xri.example.com/=example*r% <b>25E9</b> sum% <b>25E9</b> /path?query
_xrd_r	_xrd_r=application/xrds+xml% <b>3B</b> https=true% <b>3B</b> sep=true
_xrd_t	_xrd_t=http://example.org/test?a=1% <b>26</b> b=hello% <b>2520</b> plan% <b>25E8</b> te
_xrd_m	_xrd_m=application/atom+xml

1846 Table 22: Example of HXRI components after application of the required encoding rules.

1847 Following is the fully-encoded HXRI:

```
1848 https://xri.example.com/=example*r%25E9sum%25E9/path?query
1849 &_xrd_r=application/xrds+xml%3Bhttps=true%3Bsep=true
1850 &_xrd_t=http://example.org/test?a=1%26b=hello%2520plan%25E8te
1851 &_xrd_m=application/atom+xml
```

1852 Following is the fully decoded HXRI returned to URI-normal form. Note that the proxy resolver  
1853 MUST leave the HXRI in URI-normal form for any further processing.

```
1854 https://xri.example.com/=example*r%E9sum%E9/path?query
1855 &_xrd_r=application/xrds+xml;https=true;sep=true
1856 &_xrd_t=http://example.org/test?a=1&b=hello%20plan%E8te
1857 &_xrd_m=application/atom+xml
```

## 1858 11.5 HTTP(S) Accept Headers

1859 In proxy resolution, one XRI resolution input parameter, the Service Media Type (section 8.1.4)  
1860 MAY be passed to a proxy resolver via the HTTP(S) Accept header of a resolution request. The  
1861 following rules apply to this input:

- 1862 1. As described in section 14.1 of [RFC2616], the Accept header content type MAY consist  
1863 of multiple media type identifiers. If so, the proxy resolver MUST choose only one to  
1864 accept. A proxy resolver client SHOULD order media type identifiers according to the  
1865 client's preference and a proxy resolver server SHOULD choose the client's highest  
1866 preference.
- 1867 2. If the value of the Accept header content type is null, this MUST be interpreted as the  
1868 value of the Service Media Type parameter.
- 1869 3. If the value of the Service Media Type parameter is explicitly set via the `_xrd_m` query  
1870 parameter in the HXRI (including to a null value), this MUST take precedence over any  
1871 value set via an HTTP(S) Accept header.

## 1872 11.6 Null Resolution Output Format

1873 Unlike authority resolution as defined in the preceding sections, a proxy resolver MAY receive a  
1874 resolution request where the Resolution Output Format input parameter value is null—either  
1875 because this parameter is absent or because it was explicitly set to null using the `_xrd_r` query  
1876 parameter.

1877 If the value of the Resolution Output Format value is null, a resolver MUST proceed as if the  
1878 following media type parameters had the following values: `https=false`, `saml=false`,  
1879 `refs=true`, `sep=true`, `nodefault_t=false`, `nodefault_p=false`,  
1880 `nodefault_m=false`, and `uric=false`. In addition, the output MUST be an HTTP(S) redirect  
1881 as defined in the following section.

## 1882 11.7 Outputs and HTTP(S) Redirects

1883 For all values of the Resolution Output Format parameter except null, a proxy resolver MUST  
1884 follow the output rules defined in section 8.2.

1885 If the value of the Resolution Output Format is null, and the output is not an error, a proxy  
1886 resolver MUST follow the rules for output of a URI List as defined in section 8.2.3. However,  
1887 instead of returning a URI list, it MUST return the highest priority URI (the first one in the list) as  
1888 an HTTP(S) 3XX redirect with the Accept header content type set to the value of the Service  
1889 Media Type parameter.

1890 If the output is an error, a proxy resolver SHOULD return a human-readable error message as  
1891 specified in section 15.4.

1892 These rules enable XRI proxy resolvers to serve clients that do not understand XRI syntax or  
1893 resolution (such as non-XRI-enabled browsers) by automatically returning a redirect to the  
1894 service endpoint identified by a combination of the QXRI and the value of the HTTP(S) Accept  
1895 header (if any).

## 1896 **11.8 Differences Between Proxy Resolution Servers**

1897 An XRI proxy resolution request MAY be sent to any proxy resolver that will accept it. All XRI  
1898 proxy resolvers SHOULD deliver uniform responses given the same QXRI and other input  
1899 parameters. However, because proxy resolvers may potentially need to make decisions about  
1900 network errors, Redirect and Ref processing, and trust policies on behalf of the client they are  
1901 proxying, and these decisions may be based on local policy, in some cases different proxy  
1902 resolvers may return different results.

## 1903 **11.9 Combining Authority and Proxy Resolution Servers**

1904 The majority of DNS nameservers are recursing nameservers that answer both queries for which  
1905 they are authoritative and queries which they must forward to other nameservers. The same rule  
1906 applies in XRI architecture: in many cases the optimum configuration will be combining an  
1907 authority server and proxy resolver in the same server. This server can publish a self-describing  
1908 XRDS document (section 9.1.6) that advertises both its authority resolution and proxy resolution  
1909 service endpoints. It can also optimize caching of XRDs for clients in its resolution community  
1910 (see section 16.4).

## 12 Redirect and Ref Processing

The purpose of the `xrd:Redirect` and `xrd:Ref` elements is to enable identifier authorities to distribute and delegate management of XRDS documents. There are two primary use cases for using multiple XRDS documents to describe the same resource:

- One identifier authority needs to manage descriptions of the resource from different physical locations on the network, e.g., registry, directory, webserver, blog, etc. This is the purpose of the `xrd:Redirect` element.
- One identifier authority needs to delegate all or part of resource description to a different identifier authority, e.g., an individual might delegate responsibility for different aspects of an XRDS to his/her spouse, school, employer, doctor, etc. This is the purpose of the `xrd:Ref` element.

Table 23 summarizes the similarities and differences between the `xrd:Redirect` and `xrd:Ref` elements.

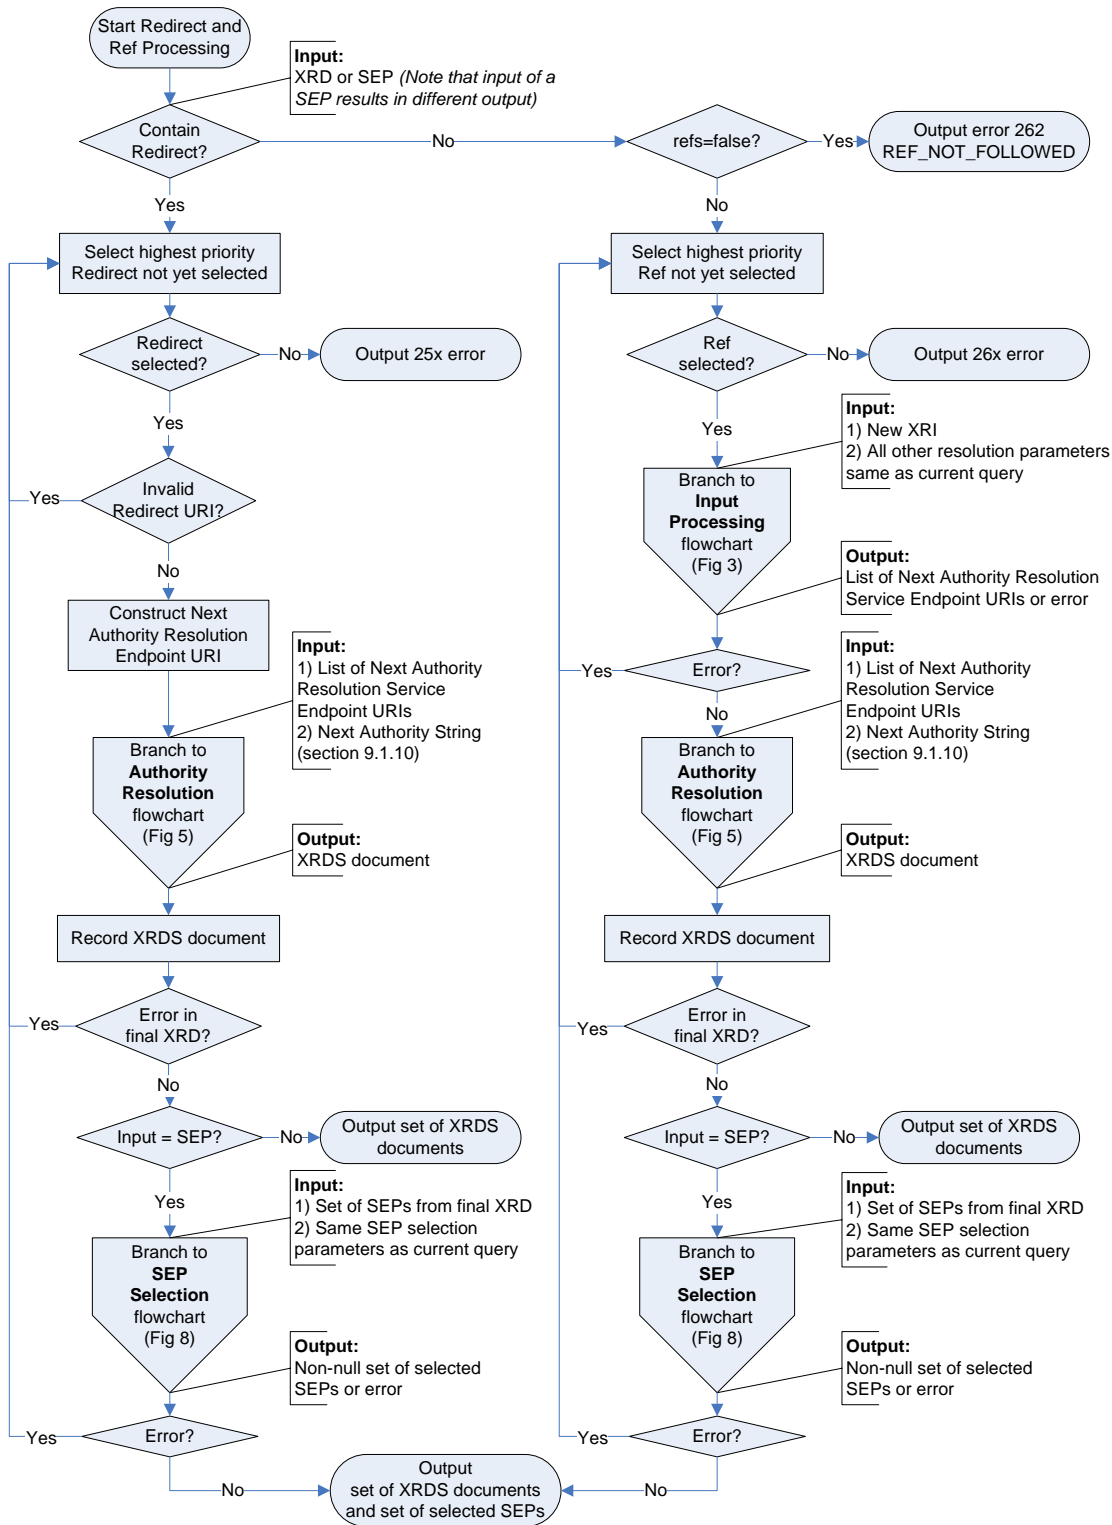

Requirement	Redirect	Ref
Must contain	HTTP(S) URI	XRI
Accepts the same <code>append</code> attribute as the <code>xrd:URI</code> element	Yes	No
Delegates to a different identifier authority	No	Yes
Must include a subset of the synonyms available in the source XRD	Yes	No
Available at both XRD level and SEP level	Yes	Yes
Processed automatically if present at the XRD level	Yes	Yes
Always results in nested XRDS document, even if only to report an error	Yes	Yes
Required attribute of XRDS element for nested XRDS document	<code>redirect</code>	<code>ref</code>
Number of XRDs in nested XRDS document	1	1 or more

Table 23: Comparison of Redirect and Ref elements.

The combination of Redirect and Ref elements should enable identifier authorities to implement a wide variety of distributed XRDS management policies.

**IMPORTANT:** Since they involve recursive calls, XRDS authors SHOULD use Redirects and Refs carefully and SHOULD perform special testing on XRDS documents containing Redirects and/or Refs to ensure they yield expected results. In particular implementers should study the recursive calls between authority resolution and service endpoint selection illustrated in Figure 2, Figure 5, Figure 7, and Figure 8 and see the guidance in section 12.6, *Recursion and Backtracking*.

1932 Figure 7 (non-normative) illustrates the logical flow of Redirect and Ref processing.

1933

1934 Figure 7: Redirect and Ref processing flowchart.

## 1935 12.1 Cardinality

1936 Redirect and Ref elements may be used both at the XRD level (as a child of the `xrd:XRD`  
1937 element) and the SEP level (as a child of the `xrd:XRD/xrd:Service` element) within an XRD.  
1938 In both cases, to simplify processing, the XRD schema (Appendix B) enforces the following rules:

- 1939 • At the XRD level, an XRD MUST contain only one of two choices: zero-or-more  
1940 `xrd:Redirect` or zero-or-more `xrd:Ref` elements.
- 1941 • At the SEP level, a SEP MUST contain only one of three choices: zero-or-more `xrd:URI`  
1942 elements, zero-or-more `xrd:Redirect` elements, or zero-or-more `xrd:Ref` elements.

## 1943 12.2 Precedence

1944 XRDS authors should take special note of the following precedence rules for Redirect and Refs.

- 1945 1. If a Redirect or Ref element is present at the XRD level, it MUST be processed  
1946 immediately before a resolver continues with authority resolution, performs service  
1947 endpoint selection (required or optional), or returns its final output. This rule applies  
1948 recursively to all XRDS documents resolved as a result of Redirect or Ref processing.
- 1949 2. If a Redirect or Ref element is not present at the XRD level, but is present in the highest  
1950 priority service endpoint selected by the rules in section 13, it MUST be processed  
1951 immediately before a resolver completes service endpoint selection (required or optional),  
1952 or returns its final output. This rule also applies recursively to all XRDS documents  
1953 resolved as a result of Redirect or Ref processing.

1954 **IMPORTANT:** Due to these rules, even if a resolver has resolved the final subsegment of an XRI,  
1955 the authority resolution phase is still not complete as long as the final XRD has a Redirect or Ref  
1956 at the XRD level. This Redirect or Ref MUST be resolved until it returns an XRD that does not  
1957 contain an Redirect or Ref at the XRD level. The same rule applies to the optional service  
1958 endpoint selection phase: it is not complete until it locates a final XRD that contains the requested  
1959 SEP but: a) the XRD does not contain an Redirect or Ref at the XRD level, and b) the highest  
1960 priority selected SEP does not contain a Redirect or Ref.

1961 Based on these rules, the following best practices are recommended.

- 1962 1. XRDS authors SHOULD NOT put any service endpoints in an XRD that contains a  
1963 Redirect or Ref at the XRD level because by definition these service endpoints will be  
1964 ignored.
- 1965 2. XRDS authors SHOULD use a Redirect or Ref element at the XRD level if they wish to  
1966 relocate or delegate resolution behavior regardless of any service endpoint query.
- 1967 3. XRDS authors SHOULD use a Redirect or Ref element in a service endpoint for which  
1968 they expect a POSITIVE match as defined in section 13.4.1 if they wish to control  
1969 resolution behavior based an explicit service endpoint match.
- 1970 4. XRDS authors SHOULD use a Redirect or Ref element in a service endpoint for which  
1971 they expect a DEFAULT match as defined in section 13.4.1 if they wish to control  
1972 resolution behavior based on the absence of an explicit service endpoint match.
- 1973 5. XRDS authors SHOULD NOT include two or more SEPs of equal priority in an XRD if  
1974 they contain Redirects or Refs that will make resolution ambiguous or non-deterministic.

1975 Also note that, during the authority resolution phase, a Redirect or Ref placed in the authority  
1976 resolution SEP of an XRD will have effectively the same result as a Redirect or Ref placed at the  
1977 XRD level. The first option SHOULD be used if the XRD contains other service endpoints or  
1978 metadata describing the resource. The second option SHOULD be used only if the XRD contains  
1979 no service endpoints.

## 1980 12.3 Redirect Processing

1981 The purpose of the `xrd:Redirect` element is to enable an authority to redirect from an XRDS  
1982 document managed in one network location (e.g., a registry) to a different XRDS document  
1983 managed in a different network location by the same authority (e.g., a web server, blog, etc.) It is  
1984 similar to an HTTP(S) redirect; however, it is managed at the XRDS document level rather than  
1985 HTTP(S) transport level. Note that unlike a Ref, a Redirect does NOT delegate to a different XRI  
1986 authority, but only to the same authority at a different network location.

1987 Following are the normative rules for processing of the `xrd:Redirect` element.

- 1988 1. To process a Redirect at either the XRD or SEP level, the resolver MUST begin by  
1989 selecting the highest priority `xrd:XRD/xrd:Redirect` element in the XRD or SEP.
- 1990 2. If the value of the resolution subparameter `https` is FALSE, or the subparameter is  
1991 absent or empty, the value of the selected `xrd:Redirect` element MUST be EITHER a  
1992 valid HTTP URI or a valid HTTPS URI. If not, the resolver MUST select the next highest  
1993 priority `xrd:Redirect` element. If all instances of this element fail, the resolver MUST  
1994 stop and return the error 251 `INVALID_REDIRECT` in the XRD containing the Redirect  
1995 or as a plain text error message as specified in section 15.
- 1996 3. If the value of the resolution subparameter `https` is TRUE, the value of the selected  
1997 `xrd:Redirect` element MUST be a valid HTTPS URI. If not, the resolver MUST select  
1998 the next highest priority `xrd:Redirect` element. If all instances of this element fail, the  
1999 resolver MUST stop and return the error 252 `INVALID_HTTPS_REDIRECT` in the XRD  
2000 containing the Redirect or as a plain text error message as specified in section 15.
- 2001 4. Once a valid `xrd:Redirect` element has been selected, if the  
2002 `xrd:XRD/xrd:Redirect` element includes the `append` attribute, the resolver MUST  
2003 construct the final HTTP(S) URI as defined in section 13.7.
- 2004 5. The resolver MUST request a new XRDS document from the final HTTP(S) URI using the  
2005 protocol defined in section 6.3. If the Resolution Output Format is an XRDS document,  
2006 the resolver MUST embed a nested XRDS document containing an XRD representing  
2007 the Redirect as specified in section 12.5.
- 2008 6. If resolution of an `xrd:Redirect` element fails during the authority resolution phase of  
2009 the original resolution query, or if resolution of an `xrd:Redirect` element fails during  
2010 the optional service endpoint selection phase OR the final XRD does not contain the  
2011 requested SEP, then the resolver MUST report the error in the final XRD of the nested  
2012 XRDS document using the status codes defined in section 15. (One nested XRDS  
2013 document will be added for each Redirect attempted by the resolver.) The resolver MUST  
2014 then select the next highest priority `xrd:Redirect` element from the original XRD or  
2015 SEP and repeat rule 7. For more details, see section 12.6, *Recursion and Backtracking*.
- 2016 7. If resolution of all `xrd:Redirect` elements in the XRD or SEP that originally triggered  
2017 Redirect processing fails, the resolver MUST stop and return a 25x error in the XRD  
2018 containing the Redirect or as a plain text error message as specified in section 15. The  
2019 resolver MUST NOT try any other SEPs even if multiple SEPs were selected as specified  
2020 in section 13.
- 2021 8. If resolution succeeds, the resolver MUST verify the synonym elements in the new XRD  
2022 as specified in section 14.1. If synonym verification fails, the resolver MUST stop and  
2023 return the error specified in that section.
- 2024 9. If the value of the resolution subparameter `saml` is TRUE, the resolver MUST verify the  
2025 signature on the XRD as specified in section 10.2.4. If signature verification fails, the  
2026 resolver MUST stop and return the error specified in that section.
- 2027 10. If Redirect resolution succeeds, further authority resolution or service endpoint selection  
2028 MUST continue based on the new XRD.

2029

## 12.4 Ref Processing

2030

The purpose of the `xrd:Redirect` element is to enable one authority to delegate management of all or part of an XRDS document to another authority. For example, an individual might delegate management of all or portions of an XRDS document to his/her spouse, school, employer, doctor, etc. This delegation may cover the entire document (an XRD level Ref), or only one or more specific service endpoints within the document (a SEP level Ref).

2033

2034

Following are the normative rules for processing of the `xrd:Ref` element.

2036

1. Ref processing is only be performed if the value of the `refs` subparameter (Table 6) is TRUE or it is absent or empty. If the value is FALSE and the XRD contains at least one `xrd:Ref` element that could be followed to complete the resolution query, the resolver MUST stop and return the error 262 `REF_NOT_FOLLOWED` in the XRD containing the Ref or as a plain text error message as defined in section 15. The rules below presume that `refs=true`.

2037

2038

2039

2040

2041

2042

2. To process a Ref at either the XRD or SEP level, the resolver MUST begin by selecting the highest priority `xrd:XRD/xrd:Ref` element from the XRD or SEP.

2043

2044

2045

2046

2047

3. The value of the selected `xrd:Ref` element MUST be a valid absolute XRI. If not, the resolver MUST select the next highest priority `xrd:Ref` element. If all instances of this element fail, the resolver MUST stop and return the error 261 `INVALID_REF` in the XRD containing the Ref or as a plain text error message as defined in section 15.

2048

2049

2050

2051

2052

2053

4. Once a valid `xrd:XRD/xrd:Ref` value is selected, the resolver MUST begin resolution of a new XRDS document from this XRI using the protocols defined in this specification. Other than the QXRI, the resolver MUST use the same resolution query parameters as the original query. If the Resolution Output Format is an XRDS document, the resolver MUST embed a nested XRDS document containing an XRD representing the Ref as defined in section 12.5.

2054

2055

2056

2057

2058

2059

2060

2061

5. If resolution of an `xrd:Ref` element fails during the authority resolution phase of the original resolution query, or if resolution of an `xrd:Ref` element fails during the optional service endpoint selection phase OR the final XRD does not contain the requested service endpoint, then the resolver MUST record the nested XRDS document as far as resolution was successful, including the relevant status codes for each XRD as specified in section 15. The resolver MUST then select the next highest priority `xrd:Ref` element as specified above and repeat rule 5. For more details, see section 12.6, *Recursion and Backtracking*.

2062

2063

2064

2065

6. If resolution of all `xrd:Ref` elements in the XRD or SEP originating Ref processing fails, the resolver MUST stop and return a 26x error in the XRD containing the Ref or as a plain text error message as specified in section 15. The resolver MUST NOT try any other SEPs even if multiple SEPs were selected as specified in section 13.

2066

2067

2068

2069

2070

2071

7. If resolution of an `xrd:Ref` element succeeds and `cid=true`, the resolver MUST perform CanonicalID verification across all XRDs in the nested XRDS document as specified in section 14.3. Note that each set of XRDs in each new nested XRDS document produced as a result of Redirect or Ref processing constitutes its own CanonicalID verification chain. *CanonicalID verification never crosses between XRDS documents*. See section 12.5 for examples.

2072

2073

2074

8. If resolution of an `xrd:Ref` element succeeds and the final XRD contains the service endpoint(s) necessary to continue or complete the original resolution query, further authority resolution or service endpoint selection MUST continue based on the final XRD.

## 2075 12.5 Nested XRDS Documents

2076 Processing of a Redirect or Ref ALWAYS produces a new XRDS document that describes the  
2077 Redirect or Ref that was followed, even if the result was an error. If the final requested Resolution  
2078 Output Format is NOT an XRDS document, this new XRDS document is only needed to obtain  
2079 the metadata necessary to continue or complete resolution. However, if the final requested  
2080 Resolution Output Format is an XRDS document, each XRDS document produced as a result of  
2081 Redirect or Ref processing MUST be nested inside the outer XRDS document immediately  
2082 following the `xrd:XRD` element containing the `xrd:Redirect` or `xrd:Ref` element being  
2083 followed. If more than one Redirect or Ref element is resolved due to an error, the corresponding  
2084 nested XRDS documents MUST be included in the same order as the Redirect or Ref elements  
2085 that were followed to produce them.

2086 Each new XRDS document is a recursive authority resolution call and MUST conform to all  
2087 authority resolution requirements. In addition, the following rules apply:

- 2088 • For a Redirect, the `xrds:XRDS/@redirect` attribute of the nested XRDS document MUST  
2089 contain the fully-constructed HTTP(S) URI it describes as specified in section 12.3.
- 2090 • For a Ref, the `xrds:XRDS/@ref` attribute of the nested XRDS document MUST contain the  
2091 exact value of the `xrd:XRD/xrd:Ref` element it describes.

2092 This allows a consuming application to verify the complete chain of XRDs obtained to resolve the  
2093 original query identifier even if resolution traverses multiple Redirects or Refs, and even if errors  
2094 were encountered. Note that like the outer XRDS document, nested XRDS documents MUST  
2095 NOT include an XRD for the community root subsegment because this is part of the configuration  
2096 of the resolver.

2097 In addition, during SAML trusted resolution, if a nested XRDS document includes an XRD with an  
2098 `xml:id` attribute value matching the `xml:id` attribute value of any previous XRD in the chain of  
2099 resolution requests beginning with the original QXRI, the resolver MUST replace this XRD with an  
2100 empty XRD element. The resolver MUST set this empty element's `idref` attribute value to the  
2101 value of the `xml:id` attribute of the matched XRD element. This prevents conflicting `xml:id`  
2102 values.

### 2103 12.5.1 Redirect Examples

#### 2104 Example #1:

2105 In this example the original query identifier is `xri://@a`. The first XRD contains an XRD-level  
2106 Redirect to `http://a.example.com/`. The elements and attributes specific to Redirect  
2107 processing are shown in **bold**. CanonicalIDs are included to illustrate the synonym verification  
2108 rule in section 12.3.

```
2109 <XRDS xmlns="xri://$xrds" ref="xri://@a">
2110   <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">
2111     <Query>*a</Query>
2112     <ProviderID>xri://@</ProviderID>
2113     <CanonicalID>xri://@!1</CanonicalID> ;XRDS #1 CID #1
2114     <Redirect>http://a.example.com/</Redirect>
2115     ...
2116   </XRD>
2117   <XRDS redirect="http://a.example.com/">
2118     <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">
2119       <ProviderID>xri://@</ProviderID>
2120       <CanonicalID>xri://@!1</CanonicalID> ;SAME AS XRDS #1 CID #1
2121       ...
2122     <Service>
2123       <Type>http://openid.net/signon/1.0</Type>
2124       <URI>http://openid.example.com/</URI>
```

```
2125     </Service>
2126     </XRD>
2127     </XRDS>
2128 </XRDS>
```

## 2129 **Example #2:**

2130 In this example the original query identifier is `xri://@a*b*c`. The second XRD contains a SEP-  
2131 level Redirect in its authority resolution SEP to `http://other.example.com/`. Note that  
2132 because authority resolution is not complete when this Redirect is encountered, it continues in the  
2133 outer XRDS after the nested XRDS representing the Redirect is complete. Again, CanonicalIDs  
2134 are included to illustrate the synonym verification rule.

```
2135 <XRDS xmlns="xri://$xrd" ref="xri://@a*b*c">
2136   <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">
2137     <Query>*a</Query>
2138     <ProviderID>xri://@</ProviderID>
2139     <CanonicalID>xri://@!1</CanonicalID> ;XRDS #1 CID #1
2140     ...
2141     <Service>
2142       <Type>xri://$res*auth*($v*2.0)</Type>
2143       <URI>http://a.example.com/</URI>
2144     </Service>
2145   </XRD>
2146   <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">
2147     <Query>*b</Query>
2148     <ProviderID>xri://@!1</ProviderID>
2149     <CanonicalID>xri://@!1!2</CanonicalID> ;XRDS #1 CID #2
2150     ...
2151     <Service>
2152       <Type>xri://$res*auth*($v*2.0)</Type>
2153       <Redirect>http://other.example.com</Redirect>
2154     </Service>
2155   </XRD>
2156   <XRDS redirect="http://other.example.com">
2157     <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">
2158       <Query>*b</Query>
2159       <ProviderID>xri://@!1</ProviderID>
2160       <CanonicalID>xri://@!1!2</CanonicalID> ;SAME AS XRDS #1 CID #2
2161       ...
2162       <Service>
2163         <Type>xri://$res*auth*($v*2.0)</Type>
2164         <URI>http://b.example.com/</URI>
2165       </Service>
2166     </XRD>
2167   </XRDS>
2168   <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">
2169     <Query>*c</Query>
2170     <ProviderID>xri://@!1!2</ProviderID>
2171     <CanonicalID>xri://@!1!2!3</CanonicalID> ;XRDS #1 CID #3
2172     ...
2173     <Service>
2174       ...final service endpoints described here...
2175     </Service>
2176   </XRD>
2177 </XRDS>
```

2179 **Example #3:**

2180 In this example the original query identifier is again `xri://@a*b*c`. This time the final XRD  
2181 contains a SEP-level Redirect to `http://other.example.com/`. Because authority resolution  
2182 is complete, the outer XRDS ends with a nested XRDS representing the SEP-level Redirect.

```
2183 <XRDS xmlns="xri://$xrds" ref="xri://@a*b*c">
2184   <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">
2185     <Query>*a</Query>
2186     <ProviderID>xri://@</ProviderID>
2187     <CanonicalID>xri://@!1</CanonicalID>           ;XRDS #1 CID #1
2188     ...
2189     <Service>
2190       <Type>xri://$res*auth*($v*2.0)</Type>
2191       <URI>http://a.example.com/</URI>
2192     </Service>
2193   </XRD>
2194   <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">
2195     <Query>*b</Query>
2196     <ProviderID>xri://@!1</ProviderID>
2197     <CanonicalID>xri://@!1!2</CanonicalID>         ;XRDS #1 CID #2
2198     ...
2199     <Service>
2200       <Type>xri://$res*auth*($v*2.0)</Type>
2201       <URI>http://b.example.com/</URI>
2202     </Service>
2203   </XRD>
2204   <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">
2205     <Query>*c</Query>
2206     <ProviderID>xri://@!1!2</ProviderID>
2207     <CanonicalID>xri://@!1!2!3</CanonicalID>       ;XRDS #1 CID #3
2208     ...
2209     <Service>
2210       <Type>http://openid.net/signon/1.0</Type>
2211       <Redirect>http://r.example.com/openid</Redirect>
2212     </Service>
2213   </XRD>
2214   <XRDS redirect="http://r.example.com/openid">
2215     <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">
2216       <ProviderID>xri://@!1!2</ProviderID>
2217       <CanonicalID>xri://@!1!2!3</CanonicalID>     ;SAME AS XRDS #1 CID
2218 #3
2219       ...
2220       <Service>
2221         <Type>http://openid.net/signon/1.0</Type>
2222         <URI>http://openid.example.com/</URI>
2223       </Service>
2224     </XRD>
2225   </XRDS>
2226 </XRDS>
```

## 2227 12.5.2 Ref Examples

### 2228 Example #1:

2229 In this example the original query identifier is `xri://@a`. The first XRD contains an XRD-level  
2230 Ref to `xri://@x*y`. The CanonicalID values are included to illustrate the CanonicalID  
2231 verification rules in section 14.3.

```
2232 <XRDS xmlns="xri://$xrds" ref="xri://@a">
2233   <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">
2234     <Query>*a</Query>
2235     <ProviderID>xri://@</ProviderID>
2236     <CanonicalID>xri://@!1</CanonicalID> ;XRDS #1 CID #1
2237     <Ref>xri://@x*y</Ref>
2238   </XRD>
2239   <XRDS ref="xri://@x*y">
2240     <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">
2241       <Query>*x</Query>
2242       <ProviderID>xri://@</ProviderID>
2243       <CanonicalID>xri://@!7</CanonicalID> ;XRDS #2 CID #1
2244       ...
2245       <Service>
2246         <Type>xri://$res*auth*($v*2.0)</Type>
2247         <URI>http://x.example.com/</URI>
2248       </Service>
2249     </XRD>
2250     <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">
2251       <Query>*y</Query>
2252       <ProviderID>xri://@!7</ProviderID>
2253       <CanonicalID>xri://@!7!8</CanonicalID> ;XRDS #2 CID #2
2254       ...
2255       <Service>
2256         <Type>xri://$res*auth*($v*2.0)</Type>
2257         <URI>http://y.example.com/</URI>
2258       </Service>
2259       <Service>
2260         <Type>http://openid.net/signon/1.0</Type>
2261         <URI>http://openid.example.com/</URI>
2262       </Service>
2263     </XRD>
2264   </XRDS>
2265 </XRDS>
```

### 2266 Example #2:

2267 In this example the original query identifier is `xri://@a*b*c`. The second XRD contains a SEP-  
2268 level Ref in its authority resolution SEP to `xri://@x*y`. Note that because authority resolution is  
2269 not complete when this Ref is encountered, it continues in the outer XRDS after the nested XRDS  
2270 representing the Ref. *Note especially how the CanonicalIDs progress to satisfy the CanonicalID*  
2271 *verification rules specified in section 14.3.*

```
2272 <XRDS xmlns="xri://$xrds" ref="xri://@a*b*c">
2273   <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">
2274     <Query>*a</Query>
2275     <ProviderID>xri://@</ProviderID>
2276     <CanonicalID>xri://@!1</CanonicalID> ;XRDS #1 CID #1
2277     ...
2278     <Service>
2279       <Type>xri://$res*auth*($v*2.0)</Type>
2280       <URI>http://a.example.com/</URI>
2281     </Service>
```

```

2282 </XRD>
2283 <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">
2284   <Query>*b</Query>
2285   <ProviderID>xri://@!1</ProviderID>
2286   <CanonicalID>xri://@!1!2</CanonicalID>           ;XRDS #1 CID #2
2287   ...
2288   <Service>
2289     <Type>xri://$res*auth*($v*2.0)</Type>
2290     <Ref>xri://@x*y</Ref>
2291   </Service>
2292 </XRD>
2293 <XRDS ref="xri://@x*y">
2294   <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">
2295     <Query>*x</Query>
2296     <ProviderID>xri://@</ProviderID>
2297     <CanonicalID>xri://@!7</CanonicalID>           ;XRDS #2 CID #1
2298     ...
2299     <Service>
2300       <Type>xri://$res*auth*($v*2.0)</Type>
2301       <URI>http://x.example.com/</URI>
2302     </Service>
2303   </XRD>
2304   <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">
2305     <Query>*y</Query>
2306     <ProviderID>xri://@!7</ProviderID>

## 2388 12.6 Recursion and Backtracking

2389 Redirect and Ref processing triggers recursive calls to authority resolution that produce nested  
2390 XRDS documents. This recursion can continue to any depth, i.e., a Redirect may contain another  
2391 Redirect or a Ref, and a Ref may contain another Ref or a Redirect. To avoid confusion, either in  
2392 resolver implementations or in XRDS documents, it is important to clarify the “backtracking” rules.  
2393 The following should be read in conjunction with the flowcharts in Figure 2, Figure 5, Figure 7,  
2394 and Figure 8.

- 2395 • *Separation of phases.* Redirect and Ref processing invoked during the authority resolution  
2396 phase is separate and distinct from Redirect and Ref processing invoked during the optional  
2397 service endpoint selection phase (see Figure 2). Redirect or Ref processing during the former  
2398 MUST successfully complete authority resolution or else return an error. Redirect or Ref  
2399 processing during the latter MUST successfully locate the requested service endpoint or else  
2400 return an error, i.e., it MUST NOT backtrack into the authority resolution phase.
- 2401 • *First recursion point.* The first time a resolver encounters a Redirect or a Ref within a phase is  
2402 called the *first recursion point*. There MUST be at most one first recursion point during the  
2403 authority resolution phase and at most one first recursion point during the optional service  
2404 endpoint selection phase. During the authority resolution phase, the first recursion point MAY  
2405 be either an XRD or a service endpoint (SEP). During the optional service endpoint selection  
2406 phase, the first recursion point MUST be a SEP.
- 2407 • *Priority order.* As specified in sections 12.3 and 12.4, once a resolver reaches a first  
2408 recursion point during the authority resolution stage, it MUST process Redirects or Refs in  
2409 priority order until either it successfully completes authority resolution (and the final XRD  
2410 does not contain an XRD-level Redirect or Ref), or until all Redirects or Refs have failed.  
2411 Similarly, once a resolver reaches a first recursion point during the optional service endpoint  
2412 selection phase, it MUST process Redirect or Ref in priority order until either it successfully  
2413 locates the requested SEP (and that SEP does not contain a Redirect or Ref), or until all  
2414 Redirects or Refs have failed.
- 2415 • *Next recursion point.* If a Redirect or Ref leads to another Redirect or Ref, this is called the  
2416 *next recursion point*. The same rules apply to the next recursion point as apply to the first  
2417 recursion point, except that if any next recursion point completely fails, the resolver MUST  
2418 return to the previous recursion point and continue trying any untried Redirects or Refs until  
2419 either it is successful or all Redirects or Refs have failed.
- 2420 • *Termination.* If the resolver returns to the first recursion point and all of its Redirects or Refs  
2421 have failed, the resolver MUST stop and return an error.

2422 To avoid excessive recursion and inefficient resolution responses, XRDS authors are  
2423 RECOMMENDED to use as few Redirects or Refs in a resolution chain as possible.

2424

## 13 Service Endpoint Selection

2425

The second phase of XRI resolution is called *service endpoint selection*. As noted in Figure 2, this

2426

phase is invoked automatically for each iteration of authority resolution after the first in order to

2427

select the Next Authority Resolution Service Endpoint as defined in section 9.1.9. It is also

2428

performed after authority resolution is complete if optional service endpoint selection is

2429

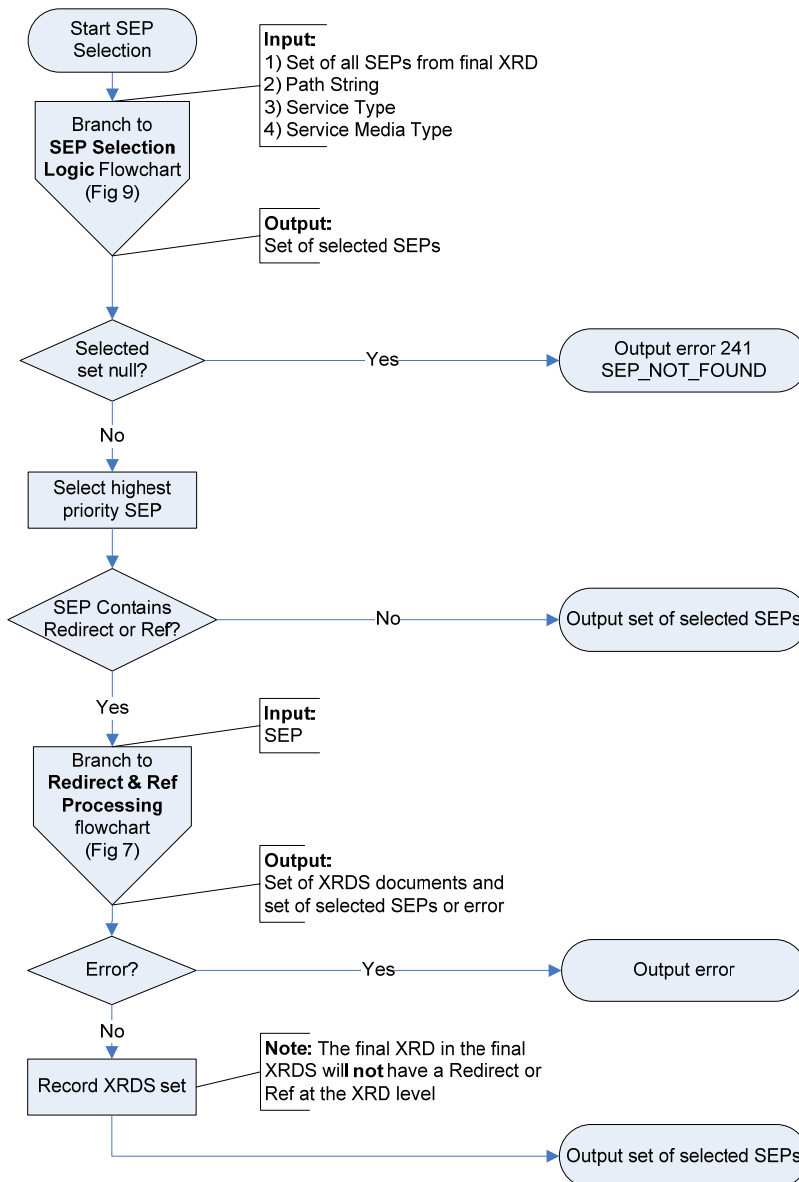

requested.

2430

### 13.1 Processing Rules

2431

Figure 8 (non-normative) shows the overall logical flow of the service endpoint selection process.

2432

2433

Figure 8: Service endpoint (SEP) selection flowchart.

- 2434 Following are the normative rules for the overall service endpoint selection process:
- 2435 1. The inputs for service endpoint selection are defined in Table 8.
  - 2436 2. For the set of all service endpoints (`xrd:XRD/xrd:Service` elements) in the XRD,  
2437 service endpoint selection MUST follow the logic defined in section 13.2. The output of  
2438 this process MUST be either the null set or a selected set of one or more service  
2439 endpoints.
  - 2440 3. If, after applying the service endpoint selection logic, the selected set is null, this function  
2441 MUST return the error 241 `SEP_NOT_FOUND`.
  - 2442 4. If, after applying the service endpoint selection logic, the selected set is not null and the  
2443 highest priority selected service endpoint contains an  
2444 `xrd:XRD/xrd:Service/xrd:Redirect` or `xrd:XRD/xrd:Service/xrd:Ref`  
2445 element, it MUST first be processed as specified in section 12. This is a recursive call  
2446 that will produce a nested XRDS document as defined in section 12.5.

2447

## 13.2 Service Endpoint Selection Logic

2448

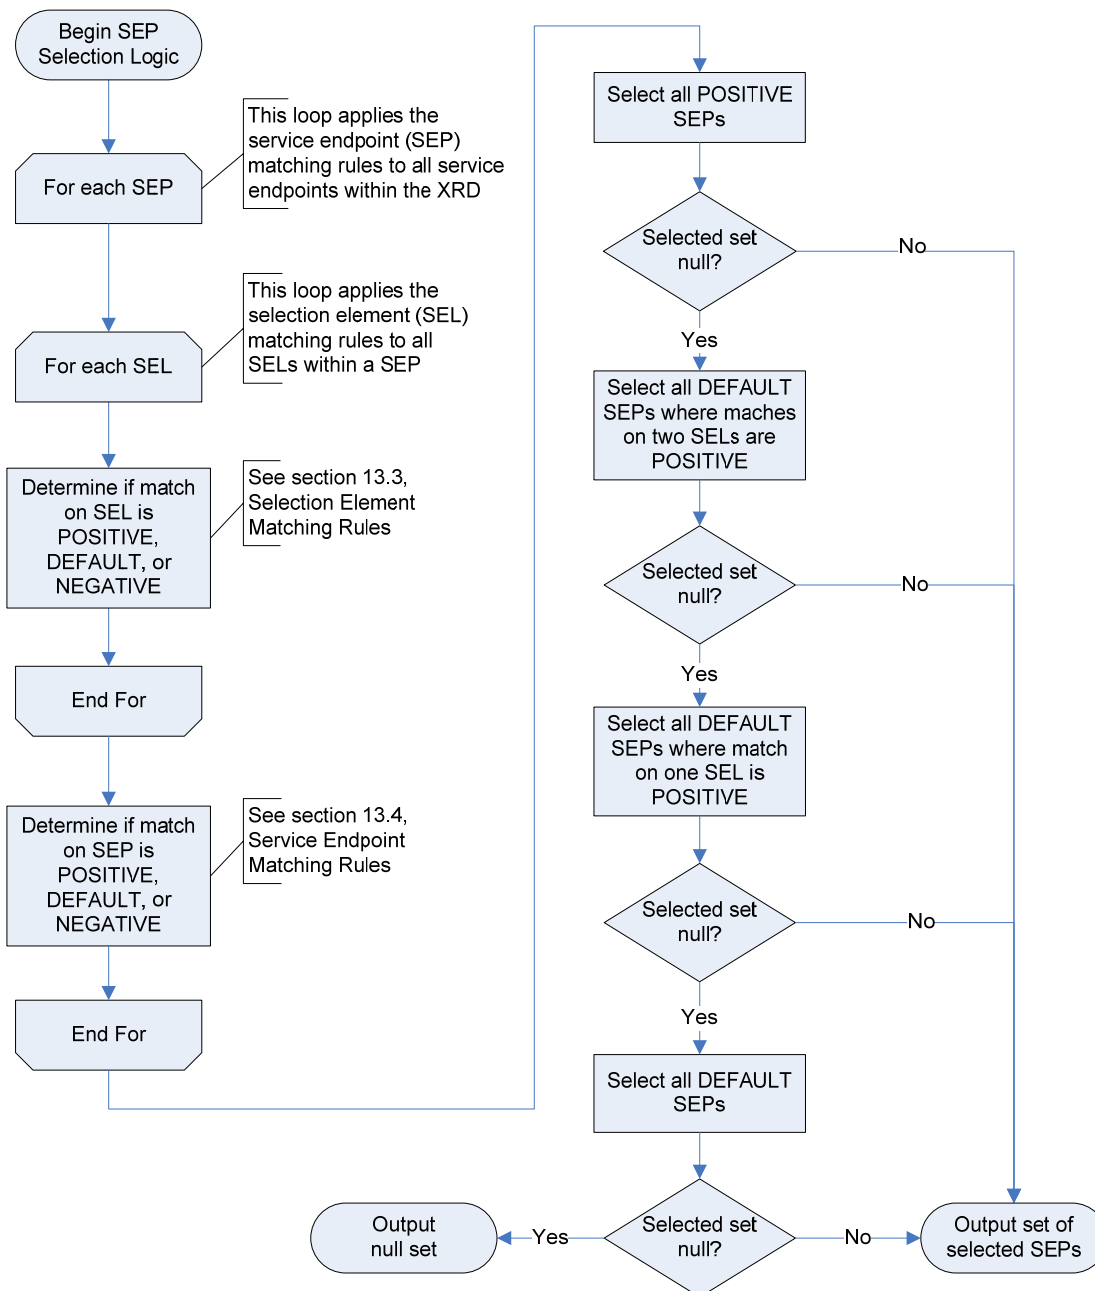

Selection of service endpoints (SEPs) within an XRD is managed using service endpoint selection elements (SEs). As shown in Figure 9 (non-normative), the selection process first applies SEL matching rules (section 13.3), followed by SEP matching rules (section 13.4), to the set of all SEPs in the XRD. It then applies SEP selection rules (section 13.5) to determine the final output.

2449

2450

2451

2452

2453

2454 *Figure 9: Service endpoint (SEP) selection logic flowchart.*

2455

The following sections provide the normative rules for each section of this flowchart.

2456 **13.3 Selection Element Matching Rules**

2457 The first set of rules govern the matching of selection elements.

2458 **13.3.1 Selection Element Match Options**

2459 As defined in section 4.2.6, there are three categories of service endpoint selection elements:  
 2460 `xrd:Type`, `xrd:Path`, and `xrd:MediaType`. Within each service endpoint, there is a match  
 2461 option for each of the three categories of selection elements. Matches are tri-state: the three  
 2462 options and their corresponding precedence order are defined in Table 24:

Match Option	Match Condition	Precedence
POSITIVE	A successful match based on the value of the <code>match</code> attribute as defined in 13.3.2 OR a successful match based the contents of the selection element as defined in sections 13.3.6 - 13.3.8.	1
DEFAULT	The value of the <code>match</code> attribute is <code>default</code> OR there is no instance of this type of selection element contained in the service endpoint as defined in section 13.3.3.	0
NEGATIVE	The selection element does not satisfy either condition above.	-1

2463 *Table 24: Match options for selection elements.*

2464 The Precedence order is used in the Multiple Selection Element Matching Rule (section 13.3.5).

2465 **IMPORTANT:** Failure of a POSITIVE match does not necessarily mean a NEGATIVE match; it  
 2466 may still qualify as a DEFAULT match.

2467 **13.3.2 The Match Attribute**

2468 All three service endpoint selection elements accept the optional `match` attribute. This attribute  
 2469 gives XRDS authors precise control over selection of SEPs based on the QXRI and other service  
 2470 endpoint selection parameters. An enumerated list of the values for the `match` attribute is defined  
 2471 in Table 25. If the `match` attribute is present with one of these values, the contents of the  
 2472 selection element **MUST** be ignored, and the corresponding matching rule **MUST** be applied. If  
 2473 the `match` attribute is absent or has any other value, the rules in this section do not apply.

Value	Matching Rule Applied to Corresponding Input Parameter
any	Automatically a POSITIVE match (i.e., input parameter is ignored).
default	Automatically a DEFAULT match (i.e., input parameter is ignored) UNLESS the value of the Resolution Output Format <code>nodefault_t</code> , <code>nodefault_p</code> or <code>nodefault_m</code> subparameter is set to TRUE for the applicable category of selection element, in which case it is a NEGATIVE match.
non-null	Any input value except null is a POSITIVE match. An input value of null is a NEGATIVE match.
null	An input value of null is a POSITIVE match. Any other input value is a NEGATIVE match.

2474 *Table 25: Enumerated values of the global match attribute and corresponding matching rules.*

2475 BACKWARDS COMPATIBILITY NOTE: earlier working drafts of this specification included the  
2476 values `match="none"` and `match="contents"`. Both are deprecated. The former is no longer  
2477 supported and the latter is now the default behaviour of any selection element that does not  
2478 include the `match` attribute. Implementers SHOULD accept these values accordingly.

### 2479 **13.3.3 Absent Selection Element Matching Rule**

2480 If a service endpoint does not contain at least one instance of a particular category of selection  
2481 element, it MUST be considered equivalent to the service endpoint having a DEFAULT match on  
2482 that category of selection element UNLESS overridden by a `nodefault_*` parameter as specified  
2483 in Table 25.

### 2484 **13.3.4 Empty Selection Element Matching Rule**

2485 If a selection element is present in a service endpoint but the element is empty, and if the element  
2486 does not contain a `match` attribute, it MUST be considered equivalent to having a `match`  
2487 attribute with a value of `null`.

### 2488 **13.3.5 Multiple Selection Element Matching Rule**

2489 Each service endpoint has only one match option for each category of selection element.  
2490 Therefore if a service endpoint contains more than one instance of the same category of selection  
2491 element (i.e., more than one `xrd:Type`, `xrd:Path`, or `xrd:MediaType` element), the match for  
2492 that category of selection element MUST be the match for the selection element(s) with the  
2493 highest precedence match option as defined in Table 24.

### 2494 **13.3.6 Type Element Matching Rules**

2495 The following rules apply to matching the value of the input Service Type parameter with the  
2496 contents of a non-empty `xrd:XRD/xrd:Service/xrd:Type` element when its `match` attribute  
2497 is absent.

- 2498 1. If the value is an XRI or IRI, it MUST be in URI-normal form as defined in section 4.4.
- 2499 2. Prior to comparison (and only for the purpose of comparison), the values of the Service  
2500 Type parameter and the `xrd:XRD/xrd:Service/xrd:Type` element SHOULD be  
2501 normalized according to the requirements of their identifier scheme. In particular, if an  
2502 XRI, IRI, or URI uses hierarchical syntax and does not include a local part (a path and/or  
2503 query component) after the authority component, a trailing forward slash after the  
2504 authority component MUST NOT be considered significant in comparisons. In all other  
2505 cases, a trailing forward slash MUST be considered significant in comparisons unless this  
2506 rule is overridden by scheme-specific comparison rules.
- 2507 3. To result in a POSITIVE match on this selection element, the values MUST be equivalent  
2508 according to the equivalence rules of the applicable identifier scheme. Any other result is  
2509 a NEGATIVE match on this selection element.

2510 As a best practice, service architects SHOULD assign identifiers for service types that are in URI-  
2511 normal form, do not require further normalization, and are easy to match.

2512 **13.3.7 Path Element Matching Rules**

2513 The following rules apply to matching the value of the input Path String (the path portion of the  
2514 QXRI as defined in section 8.1.1) with the contents of a non-empty  
2515 `xrd:XRD/xrd:Service/xrd:Path` element when its `match` attribute is absent.

- 2516 1. If the value is a relative XRI or an IRI it MUST be in URI-normal form as defined in  
2517 section 4.4.
- 2518 2. Prior to comparison, the leading forward slash separating an XRI authority component  
2519 from the path component MUST be prepended to the Path String. Any subsequent  
2520 forward slash, including trailing forward slashes, MUST be significant in comparisons.
- 2521 3. The contents of the `xrd:XRD/xrd:Service/xrd:Path` element SHOULD include the  
2522 leading forward slash separating the XRI authority component from the path. If it does  
2523 not, one MUST be prepended prior to comparison.
- 2524 4. Equivalence comparison SHOULD be performed using Caseless Matching as defined in  
2525 section 3.13 of **[Unicode]**.
- 2526 5. To result in a POSITIVE match on this selection element, the value of the Path String  
2527 MUST be a *subsegment stem match* with the contents of the  
2528 `xrd:XRD/xrd:Service/xrd:Path` element. A subsegment stem match is defined as  
2529 the entire Path String being character-for-character equivalent with any continuous  
2530 sequence of subsegments or segments (including empty subsegments and empty  
2531 segments) in the contents of the Path element beginning from the most significant  
2532 (leftmost) subsegment. Subsegments and segments are formally defined in **[XRISyntax]**.  
2533 Any other result MUST be a NEGATIVE match on this selection element.

2534 Examples of this rule are shown in Table 26.

<b>QXRI (Path in bold)</b>	<b>XRD Path Element</b>	<b>Match</b>
@example	<Path match="null" />	POSITIVE
@example	<Path></Path>	POSITIVE
@example	<Path>/</Path>	POSITIVE
@example/	<Path>/</Path>	POSITIVE
@example//	<Path>/</Path>	NEGATIVE
@example//	<Path>//</Path>	POSITIVE
@example//	<Path>/ <b>foo</b> </Path>	NEGATIVE
@example/ <b>foo</b>	<Path>/ <b>foo</b> </Path>	POSITIVE
@example// <b>foo</b>	<Path>/ <b>foo</b> </Path>	NEGATIVE
@example// <b>foo</b>	<Path>// <b>foo</b> </Path>	POSITIVE
@example/ <b>foo*bar</b>	<Path>/ <b>foo</b> </Path>	NEGATIVE
@example/ <b>foo*bar</b>	<Path>/ <b>foo*bar</b> </Path>	POSITIVE
@example/ <b>foo*bar</b>	<Path>/ <b>foo*bar</b> </Path>	POSITIVE
@example/ <b>foo*bar</b>	<Path>/ <b>foo*bar/baz</b> </Path>	POSITIVE
@example/ <b>foo*bar</b>	<Path>/ <b>foo*bar*baz</b> </Path>	POSITIVE
@example/ <b>foo*bar</b>	<Path>/ <b>foo*bar!baz</b> </Path>	POSITIVE
@example/ <b>foo*bar</b> /	<Path>/ <b>foo*bar</b> </Path>	NEGATIVE
@example/ <b>foo*bar</b> /	<Path>/ <b>foo*bar</b> </Path>	POSITIVE
@example/ <b>foo*bar</b> /	<Path>/ <b>foo*bar/baz</b> </Path>	POSITIVE
@example/ <b>foo*bar</b> /	<Path>/ <b>foo*bar*baz</b> </Path>	NEGATIVE
@example/ <b>foo!bar</b>	<Path>/ <b>foo*bar</b> </Path>	NEGATIVE
@example/ <b>foo!bar</b>	<Path>/ <b>foo!bar*baz</b> </Path>	POSITIVE
@example/( <b>+foo</b> )	<Path>/( <b>+foo</b> )</Path>	POSITIVE
@example/( <b>+foo</b> )*bar	<Path>/( <b>+foo</b> )</Path>	NEGATIVE
@example/( <b>+foo</b> )*bar	<Path>/( <b>+foo</b> )*bar</Path>	POSITIVE
@example/( <b>+foo</b> )*bar	<Path>/( <b>+foo</b> )*bar*baz</Path>	POSITIVE
@example/( <b>+foo</b> )!bar	<Path>/( <b>+foo</b> )*bar</Path>	NEGATIVE

2535 Table 26: Examples of applying the Path element matching rules.

### 2536 13.3.8 MediaType Element Matching Rules

2537 The following rules apply to matching the value of the input Service Media Type parameter with  
2538 the contents of of a non-empty `xrd:XRD/xrd:Service/xrd:MediaType` element when its  
2539 `match` attribute is absent.

- 2540 1. The values of the Service Media Type parameter and the `xrd:MediaType` element  
2541 SHOULD be normalized according to the rules for media types in section 3.7 of  
2542 [RFC2616] prior to input. (The rules are that media type and media type parameter  
2543 names are case-insensitive, but parameter values may or may not be case-sensitive  
2544 depending on the semantics of the parameter name. XRI Resolution Output Format  
2545 parameters and subparameters are all case-insensitive.) XRI resolvers MAY perform  
2546 normalization of these values but MUST NOT be required to do so.
- 2547 2. To be a POSITIVE match on this selection element, the values MUST be character-for-  
2548 character equivalent. Any other result is a NEGATIVE match on this selection element.

### 2549 13.4 Service Endpoint Matching Rules

2550 The next set of matching rules govern the matching of service endpoints based on the matches of  
2551 the selection elements they contain.

#### 2552 13.4.1 Service Endpoint Match Options

2553 For each service endpoint in an XRD, there are three match options as defined in Table 27:

Match Option	Condition
POSITIVE	Meets the Select Attribute Match Rule (section 13.4.2) or the All Positive Match Rule (section 13.4.3).
DEFAULT	Meets the Default Match Rule (section 13.4.4).
NEGATIVE	The service endpoint does not satisfy either condition above.

2554 *Table 27: Match options for service endpoints.*

#### 2555 13.4.2 Select Attribute Match Rule

2556 All three service endpoint selection elements accept the optional `select` attribute. This attribute  
2557 is a Boolean value used to govern matching of the containing service endpoint according to the  
2558 following rule. If service endpoint contains a selection element with a POSITIVE match as defined  
2559 in section 13.3, and the value of this selection element's `select` attribute is TRUE, the service  
2560 endpoint automatically MUST be a POSITIVE match, i.e., all other selection elements for this  
2561 service endpoint MUST be ignored.

#### 2562 13.4.3 All Positive Match Rule

2563 If a service endpoint has a POSITIVE match on all three categories of selection elements  
2564 (`xrd:Type`, `xrd:MediaType`, and `xrd:Path`) as defined in section 13.3, the service endpoint  
2565 MUST be a POSITIVE match. If even one of the three selection element match types is not  
2566 POSITIVE, this rule fails.

#### 2567 13.4.4 Default Match Rule

2568 If a service endpoint fails the Select Attribute Match Rule and the All Positive Match Rule, but  
2569 none of the three categories of selection elements has a NEGATIVE match as defined in section  
2570 13.3, the service endpoint MUST be a DEFAULT match.

## 2571 **13.5 Service Endpoint Selection Rules**

2572 The final set of rules governs the selection of service endpoints based on their matches.

### 2573 **13.5.1 Positive Match Rule**

2574 After applying the matching rules to service endpoints in section 13.4, all service endpoints that  
2575 have a POSITIVE match MUST be selected. Only if there are no service endpoints with a  
2576 POSITIVE match is the Default Match Rule invoked.

### 2577 **13.5.2 Default Match Rule**

2578 If the Positive Match Rule above fails, then the service endpoints with a DEFAULT match that  
2579 have the highest number of POSITIVE matches on each category of selection element MUST be  
2580 selected. This means:

- 2581 1. The service endpoints in the DEFAULT set that have two POSITIVE selection element  
2582 matches MUST be selected.
- 2583 2. If the previous set is empty, the service endpoints in the DEFAULT set that have one  
2584 POSITIVE selection element match MUST be selected.
- 2585 3. If the previous set is empty, all service endpoints in the DEFAULT set MUST be selected.
- 2586 4. If the previous set is empty, no service endpoint is selected and the return set is null.

## 2587 **13.6 Pseudocode**

2588 The following pseudocode provides a precise description of the service endpoint selection logic.  
2589 The pseudocode is normative, however if there is a conflict between it and the rules stated in the  
2590 preceding sections, the preceding sections shall prevail.

2591 The pseudocode uses nine Boolean flags to record the match state for each category of selection  
2592 element (SEL) in a service endpoint (SEP):

- 2593 • Postive.Type
- 2594 • Postive.Path
- 2595 • Positive.MediaType
- 2596 • Default.Type
- 2597 • Default.Path
- 2598 • Default.MediaType
- 2599 • Present.Type
- 2600 • Present.Path
- 2601 • Present.MediaType

2602 Note that the complete set of nine SEL match flags is needed for each SEP. The pseudocode first  
2603 does a loop through all SEPs in the XRD to:

- 2604 1. Set the SEL match flags according to the rules specified in section 13.3;
- 2605 2. Process the SEL match flags to apply the SEP matching rules specified in section 13.4;
- 2606 3. Apply the positive SEP selection rule specified in section 13.5.1.

2607 After this loop is complete, the pseudocode tests to see if default SEP selection processing is  
2608 required. If so, it performs a second loop applying the default SEP selection rules specified in  
2609 section 13.5.2.

2610

```
2611 FOR EACH SEP
2612     CREATE set of SEL match flags
2613     SET all flags to FALSE
2614     FOR EACH SEL of category x (where x=Type, Path, or Mediatype)
2615         SET Present.x=TRUE
2616         IF match on this SEL is POSITIVE

2664 ENDIF
2665 IF SELECTED SET != EMPTY
2666     RETURN SELECTED SET
2667 ELSE
2668     RETURN DEFAULT SET
2669 ENDIF
```

2671 **13.7 Construction of Service Endpoint URIs**

2672 The final step in the service endpoint selection process is construction of the service endpoint  
2673 URI(s). This step is necessary if either:

- 2674 • The resolution output format is a URI List.
- 2675 • Automatic URI construction is requested using the `uric` parameter.

2676 **13.7.1 The append Attribute**

2677 The `append` attribute of a `xrd:XRD/xrd:Service/xrd:URI` element is used to specify how  
2678 the final URI is constructed. The values of this attribute are shown in Table 28.

Value	Component of QXRI to Append
none	None. This is the default if the <code>append</code> attribute is absent
local	The entire local part of the QXRI, defined as being one of three cases: a) If only a path is present, the Path String <i>including the leading forward slash</i> b) If only a query is present, the Query String <i>including the leading question mark</i> c) If both a path and a query are present, the entire combination of the Path String <i>including the leading forward slash</i> and the Query String <i>plus the leading question mark</i> Note that as defined in section 8.1.1, a fragment is never part of a QXRI.
authority	Authority String only (including the community root subsegment) <i>not including the trailing forward slash</i>
path	Path String <i>including the leading forward slash</i>
query	Query String <i>including the leading question mark</i>
qxri	Entire QXRI

2679 Table 28: Values of the `append` attribute and the corresponding QXRI component to append.

2680 If the `append` attribute is absent, the default value is `none`. Following are the rules for  
2681 construction of the final service endpoint URI based on the value of the `append` attribute.

2682 **IMPORTANT:** Implementers must follow these rules exactly in order to give XRDS authors  
2683 precise control over construction of service endpoint URIs.

- 2684 1. If the value is `none`, the exact contents of the `xrd:URI` element **MUST** be returned  
2685 directly without any further processing.
- 2686 2. For any other value, the exact value in URI-normal form of the QXRI component specified  
2687 in Table 28, *including any leading delimiter(s)* and *without any additional escaping or*  
2688 *percent encoding* **MUST** be appended directly to the exact contents of the `xrd:URI`  
2689 element *including any trailing delimiter(s)*. If the value of the QXRI component specified in  
2690 Table 28 consists of only a leading delimiter, then this value **MUST** be appended  
2691 according to these rules. If the value of the QXRI component specified in Table 28 is null,  
2692 then the contents of the `xrd:URI` element **MUST** be returned directly exactly as if the  
2693 value of the `append` attribute was `none`.

2694 3. If any HXRI query parameters for proxy resolution were added to an existing QXRI query  
2695 component as defined in section 11.3, these query parameters MUST be removed prior  
2696 to performing the append operation as also defined in section 11.3. In particular, if after  
2697 removal of these query parameters the QXRI query component consists of only a *string*  
2698 *of one or more question marks* (the delimiting question mark plus zero or more additional  
2699 question marks) then *exactly one question mark* MUST also be removed. This preserves  
2700 the query component of the original QXRI if it was null or contained only question marks.

2701 **IMPORTANT:** Construction of HTTP(S) URIs for authority resolution service endpoints is defined  
2702 in section 9.1.10. Note that this involves an additional step taken after all URI construction steps  
2703 specified in this section are complete. In other words, if the URI element of an authority resolution  
2704 service endpoint includes an `append` attribute, the Next Authority Resolution Service URI MUST  
2705 be fully constructed according to the algorithm in this section before appending the Next Authority  
2706 String as defined in section 9.1.10.

2707 **WARNING:** Use of any value of the `append` attribute other than `authority` on the URI element  
2708 for an authority resolution service endpoint is **NOT RECOMMENDED** due to the complexity it  
2709 introduces.

## 2710 **13.7.2 The `uric` Parameter**

2711 The `uric` subparameter of the Resolution Output Format is used to govern whether a resolver  
2712 should perform construction of the URI automatically on behalf of a consuming application.  
2713 Following are the processing rules for this parameter:

- 2714 1. If `uric=true`, a resolver MUST apply the URI construction rules specified in section  
2715 13.7.1 to each `xrd:XRD/xrd:Service/xrd:URI` element in the final XRD in the  
2716 resolution chain. Note that this step is identical to the processing a resolver must perform  
2717 to output a URI list.
- 2718 2. The resolver MUST replace the value of each `xrd:XRD/xrd:Service/xrd:URI`  
2719 element in the final XRD with the fully constructed URI value.
- 2720 3. The resolver MUST subsequently remove the `append` attribute from each  
2721 `xrd:XRD/xrd:Service/xrd:URI` element in the final XRD.
- 2722 4. If `uric=false` or the parameter is absent or empty, a resolver MUST NOT perform any  
2723 of the processing specified in this section.

2724

## 14 Synonym Verification

2725  
2726  
2727

As described in section 5, a consuming application must be able to verify the security of the binding between the fully-qualified query identifier (the identifier resolved to an XRDS document) and any synonyms asserted in the final XRD. This section defines synonym verification rules.

2728

### 14.1 Redirect Verification

2729  
2730

As specified in section 12.3, XRI resolvers MUST verify the synonyms asserted in the XRD obtained by following a Redirect element. These rules are:

2731  
2732  
2733  
2734  
2735  
2736  
2737  
2738  
2739

1. If resolution of the Redirect succeeds, the resolver MUST first verify that the set of XRD synonym elements (as specified in section 5.2) contained in the new XRD are *equivalent to or a subset of* those contained in the XRD containing the Redirect.
2. Secondly, the resolver MUST verify that the content of each synonym element contained in the new XRD is exactly equivalent to the content of the corresponding element in the XRD containing the Redirect.
3. If either rule above fails, the resolver MUST stop and return the error 253 REDIRECT\_VERIFY\_FAILED in the XRD where the error occurred or as a plain text error message as defined in section 15.

2740

For examples see section 12.5.1.

2741

### 14.2 EquivID Verification

2742  
2743

Although XRI resolvers do not automatically perform EquivID synonym verification, a consuming application can easily request it using the following steps:

2744  
2745  
2746  
2747  
2748  
2749  
2750  
2751  
2752

1. First request resolution for the original query identifier with CanonicalID verification enabled (`cid=true`).
2. From the final XRD in the resolution chain, select the EquivID for which verification is desired.
3. Request resolution of the EquivID identifier.
4. From the final XRD in this second resolution chain, determine if there is either: a) a `xrd:XRD/xrd:EquivID` element, or b) a `xrd:XRD/xrd:CanonicalEquivID` element whose value matches the verified CanonicalID of the original query identifier. If there is a match, the EquivID is verified; otherwise it is not verified.

2753

#### Example:

2754  
2755

- Fully-Qualified Query Identifier: `http://example.com/user`
- Asserted EquivID: `xri://=!1000.c78d.402a.8824.bf20`

2756

First XRDS (for `http://example.com/user` — simplified for illustration purposes):

2757  
2758  
2759  
2760  
2761  
2762  
2763  
2764  
2765  
2766

```
<XRDS>
  <XRD>
    <EquivID>xri://=!1000.c78d.402a.8824.bf20</EquivID>
    <CanonicalID>http://example.com/user</CanonicalID>
    <Service priority="10">
      ...
    </Service>
    ...
  </XRD>
</XRDS>
```

2767 Second XRDS (for `xri://=!1000.c78d.402a.8824.bf20`):

2768  
2769  
2770  
2771  
2772  
2773  
2774  
2775  
2776  
2777  
2778  
2779

```
<XRDS>
  <XRD>
    <Query>!1000.c78d.402a.8824.bf20</Query>
    <ProviderID>xri://=</ProviderID>
    <EquivID>http://example.com/user</EquivID>
    <CanonicalID>xri://=!1000.c78d.402a.8824.bf20</CanonicalID>
    <Service priority="10">
      ...
    </Service>
    ...
  </XRD>
</XRDS>
```

2780 The EquivID is verified because the XRD in the second XRDS asserts an EquivID backpointer to  
2781 the CanonicalID of the XRD in the first XRDS.

## 2782 14.3 CanonicalID Verification

2783 XRI resolvers automatically perform verification of CanonicalID and CanonicalEquivID synonyms  
2784 unless this function is explicitly turned off using the Resolution Output Format subparameter `cid`.  
2785 The following synonym verification MUST be applied by an XRI resolver if `cid=true` or the  
2786 parameter is absent or empty, and MUST NOT be applied if `cid=false`.

- 2787 1. If the value of the `xrd:XRD/xrd:CanonicalID` element is an HTTP(S) URI, it MUST  
2788 be verified as specified in section 14.3.1.
- 2789 2. If the value of the `xrd:XRD/xrd:CanonicalID` element is an XRI, it MUST be verified  
2790 as specified in section 14.3.2.
- 2791 3. If the value of the `xrd:XRD/xrd:CanonicalID` element is any other identifier,  
2792 CanonicalID verification fails and the resolver MUST return the CanonicalID verification  
2793 status specified in section 14.3.4.
- 2794 4. If CanonicalID verification succeeds but the final XRD in the resolution chain also  
2795 contains a `xrd:XRD/xrd:CanonicalEquivID` element, it MUST also be verified as  
2796 specified in section 14.3.3, and the resolver MUST return the CanonicalEquivID  
2797 verification status as specified in section 14.3.4.
- 2798 5. In all cases, since synonym verification depends on trusting each authority in the  
2799 resolution chain, trusted resolution (section 10) SHOULD be used with either  
2800 `https=true` or `saml=true` or both to provide additional assurance of the authenticity of  
2801 the results.

2802 **IMPORTANT:** There is no guarantee that all XRDS that describe the same target resource will  
2803 return the same verified CanonicalID or CanonicalEquivID. Different parent authorities may assert  
2804 different CanonicalIDs or CanonicalEquivIDs for the same target resource and all of these may all  
2805 be verifiable. In addition, due to Redirect and Ref processing, the verified CanonicalID or  
2806 CanonicalEquivID returned for an XRI MAY differ depending on the resolution input parameters.  
2807 For example, as described in section 12, a request for a specific service endpoint type may  
2808 trigger processing of a Redirect or Ref resulting in a nested XRDS document. The final XRD in  
2809 the nested XRDS document may come from a different parent authority and have a different but  
2810 still verifiable CanonicalID or CanonicalEquivID.

### 2811 14.3.1 HTTP(S) URI Verification Rules

2812 To verify that an HTTP(S) URI is a valid CanonicalID synonym for a fully-qualified query identifier  
2813 (defined in section 5.1), a resolver MUST verify that all the following tests are successful:

- 2814 1. The fully-qualified query identifier MUST also be an HTTP(S) URI.
- 2815 2. The query identifier MUST be resolved as specified in section 6.
- 2816 3. The asserted CanonicalID synonym MUST be an HTTP(S) URI equivalent to: a) the fully-  
2817 qualified query identifier, or b) the fully-qualified query identifier plus a valid fragment as  
2818 defined by [RFC3986].

2819 See the example in section 14.3.5.

### 2820 14.3.2 XRI Verification Rules

2821 To verify that an XRI is a valid CanonicalID synonym for a fully-qualified query identifier (defined  
2822 in section 5.1), a resolver MUST verify that all the following tests are successful.

- 2823 1. In the first XRD in the resolution chain for the fully-qualified query identifier, the value of  
2824 the `xrd:XRD/xrd:ProviderID` element in the XRD from the community root authority  
2825 MUST match the value of the `xrd:XRD/xrd:CanonicalID` element configured in the  
2826 XRI resolver or available in a self-describing XRD from the community root authority (or  
2827 its equivalent). See section 9.1.6.
- 2828 2. In the first XRD in the resolution chain, the value of the `xrd:XRD/xrd:CanonicalID`  
2829 element MUST consist of the value of the `xrd:XRD/xrd:ProviderID` element plus  
2830 one additional XRI subsegment as defined in [XRISyntax]. For example, if the value of  
2831 the `xrd:XRD/xrd:CanonicalID` element is `@!1`, then the the value of the  
2832 `xrd:XRD/xrd:ProviderID` element must be `@`.
- 2833 3. For each subsequent XRD in the resolution chain, the value of the  
2834 `xrd:XRD/xrd:CanonicalID` element MUST consist of the value the  
2835 `xrd:XRD/xrd:CanonicalID` element of the preceding XRD in the same XRDS  
2836 document plus one additional XRI subsegment. For example, if the value of the  
2837 `xrd:XRD/xrd:CanonicalID` element asserted in an XRD is `@!1!2!3`, then the value  
2838 of the `xrd:XRD/xrd:CanonicalID` element in the immediately preceding XRD in the  
2839 same XRDS document must be `@!1!2`.
- 2840 4. If Redirect or Ref processing is required during resolution as specified in section 12, the  
2841 rules above MUST also apply for each nested XRDS document.

2842 **IMPORTANT:** Each set of XRDs in each new nested XRDS document produced as a result of  
2843 Redirect or Ref processing constitutes its own CanonicalID verification chain. *CanonicalID*  
2844 *verification never crosses between XRDS documents.* See the examples in section 12.5.

### 2845 14.3.3 CanonicalEquivID Verification

2846 CanonicalID verification also requires verification of a CanonicalEquivID *only if it is present in the*  
2847 *final XRD in the resolution chain.* Since CanonicalEquivID verification typically requires an extra  
2848 resolution cycle, restricting automatic verification to the final XRD in the resolution chain ensures  
2849 it will add at most one additional resolution cycle.

2850 CanonicalEquivID verification MUST NOT be performed unless CanonicalID verification as  
2851 specified in section 14.3 has completed successfully. The resulting value is called the *verified*  
2852 *CanonicalID*.

2853 To verify that a CanonicalEquivID is an authorized synonym for a verified CanonicalEquivID, a  
2854 resolver MUST verify that either: a) the value of the CanonicalEquivID element is character-by-

- 2855 character equivalent to the verified CanonicalID (since both appear in the same XRD, all other  
2856 normalization rules are waived), or b) that all the following tests are successful:
- 2857 1. The asserted CanonicalEquivID value MUST be a valid HTTP(S) URI or XRI.
  - 2858 2. The asserted CanonicalEquivID value MUST resolve successfully to an XRDS document  
2859 according to the rules in this specification *using the same resolution parameters as in the*  
2860 *original resolution request.*
  - 2861 3. The CanonicalID in the final XRD of the resolved XRDS document MUST be verified and  
2862 MUST be equivalent to the asserted CanonicalEquivID.
  - 2863 4. The final XRD in the resolved XRDS document MUST contain either an EquivID or a  
2864 CanonicalEquivID “backpointer” whose value is equivalent to the verified CanonicalID in  
2865 the XRD asserting the CanonicalEquivID.

2866 **SPECIAL SECURITY CONSIDERATION:** See section 5.2.2 regarding the rules for provisioning  
2867 of `xrd:XRD/xrd:EquivID` and `xrd:XRD/xrd:CanonicalEquivID` elements in an XRD.

#### 2868 **14.3.4 Verification Status Attributes**

2869 If CanonicalID verification is performed, an XRI resolver MUST return the CanonicalID and  
2870 CanonicalEquivID verification status using an attribute of the `xrd:XRD/xrd:Status` element in  
2871 each XRD in the output as follows:

- 2872 1. CanonicalID verification MUST be reported using the `cid` attribute.
- 2873 2. CanonicalEquivID verification MUST be reported using the `ceid` attribute.
- 2874 3. Both attributes accept four enumerated values: `absent` if the element is not present, `off`  
2875 if verification is not performed, `verified` if the element is verified, and `failed` if  
2876 verification fails.
- 2877 4. The `off` value applies to both elements if CanonicalID verification is not performed  
2878 (`cid=false`).
- 2879 5. The `off` value applies to the CanonicalEquivID element in any XRD before the final XRD  
2880 if CanonicalID verification is performed (`cid=true`), because a resolver only verifies this  
2881 element in the final XRD.
- 2882 6. If `cid=true` and verification of any CanonicalID element fails, *verification of all*  
2883 *CanonicalIDs in all subsequent XRDs in the same XRDS document MUST fail.*

2884 From these verification status attributes, a consuming application can confirm on every XRD in  
2885 the XRDS document whether the CanonicalID is present and has been verified. In addition, for  
2886 the final XRD in the XRDS document, it can confirm whether the CanonicalEquivID element is  
2887 present and has been verified.

## 2888 14.3.5 Examples

### 2889 Example #1:

- 2890 • Fully-Qualified Query Identifier: `http://example.com/user`
- 2891 • Asserted CanonicalID: `http://example.com/user#1234`

2892 XRDS (simplified for illustration purposes):

```
2893 <XRDS ref="http://example.com/user">
2894   <XRD>
2895     <CanonicalID>http://example.com/user#1234</CanonicalID>
2896     <Service priority="10">
2897       ...
2898     </Service>
2899     ...
2900   </XRD>
2901 </XRDS>
```

2902 The asserted CanonicalID satisfies the HTTP(S) URI verification rules in section 14.3.1.

---

2903

### 2904 Example #2:

- 2905 • Fully-Qualified Query Identifier: `=example.name*delegate.name`
- 2906 • Asserted CanonicalID: `!=1000.62b1.44fd.2855!1234`

2907 XRDS (for `=example.name*delegate.name`):

```
2908 <XRDS ref="xri://=example.name*delegate.name">
2909   <XRD>
2910     <Query>*example.name</Query>
2911     <ProviderID>xri://= </ProviderID>
2912     <LocalID>!1000.62b1.44fd.2855</LocalID>
2913     <CanonicalID>xri://=!1000.62b1.44fd.2855</CanonicalID>
2914     <Service>
2915       <ProviderID>xri://=!1000.62b1.44fd.2855</ProviderID>
2916       <Type>xri://$res*auth*($v*2.0)</Type>
2917       <MediaType>application/xrds+xml</MediaType>
2918       <URI priority="10">http://resolve.example.com</URI>
2919       <URI priority="15">http://resolve2.example.com</URI>
2920       <URI>https://resolve.example.com</URI>
2921     </Service>
2922     ...
2923   </XRD>
2924   <XRD>
2925     <Query>*delegate.name</Query>
2926     <ProviderID>xri://=!1000.62b1.44fd.2855</ProviderID>
2927     <LocalID>!1234</LocalID>
2928     <CanonicalID>xri://=!1000.62b1.44fd.2855!1234</CanonicalID>
2929     <Service priority="1">
2930       ...
2931     </Service>
2932     ...
2933   </XRD>
2934 </XRDS>
```

2935 The asserted CanonicalID satisfies the XRI verification rules in section 14.3.2.

---

2936

2937 **Example #3:**

- 2938 • Fully-Qualified Query Identifier: `http://example.com/user`
- 2939 • Asserted CanonicalID: `http://example.com/user`
- 2940 • Asserted CanonicalEquivID: `https://different.example.net/path/user`

2941 First XRDS (for `http://example.com/user`):

```
2942 <XRDS ref="http://example.com/user">
2943   <XRD>
2944     <CanonicalID>http://example.com/user</CanonicalID>
2945     <CanonicalEquivID>
2946       https://different.example.net/path/user
2947     </CanonicalEquivID>
2948     <Service priority="10">
2949       ...
2950     </Service>
2951     ...
2952   </XRD>
2953 </XRDS>
```

2954 Second XRDS (for `https://different.example.net/path/user`):

```
2955 <XRDS ref="https://different.example.net/path/user">
2956   <XRD>
2957     <EquivID>http://example.com/user</EquivID>
2958     <CanonicalID>https://different.example.net/path/user</CanonicalID>
2959     <Service priority="10">
2960       ...
2961     </Service>
2962     ...
2963   </XRD>
2964 </XRDS>
```

2965 The CanonicalEquivID asserted in the first XRDS satisfies the verification rules in section 14.3.3  
2966 because it resolves to a second XRDS that asserts an EquivID backpointer to the CanonicalID of  
2967 the first XRDS.

2968

---

2969 **Example #4:**

- 2970 • Fully-Qualified Query Identifier: `http://example.com/user`
- 2971 • Asserted CanonicalID: `http://example.com/user`
- 2972 • Asserted CanonicalEquivID: `!=1000.62b1.44fd.2855`

2973 XRDS (for `http://example.com/user`):

```
2974 <XRDS ref="http://example.com/user">
2975   <XRD>
2976     <CanonicalID>http://example.com/user</CanonicalID>
2977     <CanonicalEquivID>xri://!=1000.62b1.44fd.2855</CanonicalEquivID>
2978     <Service priority="10">
2979       ...
2980     </Service>
2981     ...
2982   </XRD>
2983 </XRDS>
```

2984 XRDS (for xri://=!1000.62b1.44fd.2855):

```
2985 <XRDS ref="xri://=!1000.62b1.44fd.2855">
2986   <XRD>
2987     <Query>!1000.62b1.44fd.2855</Query>
2988     <ProviderID>xri://=</ProviderID>
2989     <EquivID>http://example.com/user</EquivID>
2990     <CanonicalID>xri://=!1000.62b1.44fd.2855</CanonicalID>
2991     <Service priority="10">
2992       ...
2993     </Service>
2994     ...
2995   </XRD>
2996 </XRDS>
```

2997 The CanonicalEquivID asserted in the first XRDS satisfies the verification rules in section 14.3.3  
2998 because it resolves to a second XRDS that asserts an EquivID backpointer to the CanonicalID of  
2999 the first XRDS.

3000

---

3001 **Example #5:**

- 3002 • Fully-Qualified Query Identifier: =example.name
- 3003 • Asserted CanonicalID: xri://=!1000.62b1.44fd.2855
- 3004 • Asserted CanonicalEquivID: https://example.com/user

3005 First XRDS (for =example.name):

```
3006 <XRDS ref="xri://=example.name">
3007   <XRD>
3008     <Query>*example.name</Query>
3009     <ProviderID>xri://=</ProviderID>
3010     <LocalID>!1000.62b1.44fd.2855</LocalID>
3011     <CanonicalID>xri://=!1000.62b1.44fd.2855</CanonicalID>
3012     <CanonicalEquivID>https://example.com/user</CanonicalEquivID>
3013     <Service priority="10">
3014       ...
3015     </Service>
3016     ...
3017   </XRD>
3018 </XRDS>
```

3019 Second XRDS (for https://example.com/user):

```
3020 <XRDS ref="https://example.com/user">
3021   <XRD>
3022     <EquivID>xri://=!1000.62b1.44fd.2855</EquivID>
3023     <CanonicalID>https://example.com/user</CanonicalID>
3024     <Service priority="10">
3025       ...
3026     </Service>
3027     ...
3028   </XRD>
3029 </XRDS>
```

3030 The CanonicalEquivID asserted in the first XRDS satisfies the verification rules in section 14.3.3  
3031 because it resolves to a second XRDS that asserts an EquivID backpointer to the CanonicalID of  
3032 the first XRDS.

3033

---

3034 **Example #6:**

- 3035 • Fully-Qualified Query Identifier: =example.name\*delegate.name
- 3036 • Asserted CanonicalID: xri://=!1000.62b1.44fd.2855!1234
- 3037 • Asserted CanonicalEquivID: @!1000.f3da.9056.aca3!5555

3038 First XRDS (for =example.name\*delegate.name):

```
3039 <XRDS ref="xri://=example.name*delegate.name">
3040 <XRD>
3041 <Query>*example.name</Query>
3042 <ProviderID>xri://= </ProviderID>
3043 <LocalID>!1000.62b1.44fd.2855</LocalID>
3044 <CanonicalID>xri://=!1000.62b1.44fd.2855</CanonicalID>
3045 <Service>
3046 <ProviderID>xri://=!1000.62b1.44fd.2855</ProviderID>
3047 <Type>xri://$res*auth*($v*2.0)</Type>
3048 <MediaType>application/xrds+xml</MediaType>
3049 <URI priority="10">http://resolve.example.com</URI>
3050 <URI priority="15">http://resolve2.example.com</URI>
3051 <URI>https://resolve.example.com</URI>
3052 </Service>
3053 ...
3054 </XRD>
3055 <XRD>
3056 <Query>*delegate.name</Query>
3057 <ProviderID>xri://=!1000.62b1.44fd.2855</ProviderID>
3058 <LocalID>!1234</LocalID>
3059 <CanonicalID>xri://=!1000.62b1.44fd.2855!1234</CanonicalID>
3060 <CanonicalEquivID>
3061 xri://@1000.f3da.9056.aca3!5555
3062 </CanonicalEquivID>
3063 <Service priority="1">
3064 ...
3065 </Service>
3066 ...
3067 </XRD>
3068 </XRDS>
```

- 3069 • Second XRDS (for @!1000.f3da.9056.aca3!5555):

```
3070 <XRDS ref="xri://@!1000.f3da.9056.aca3!5555">
3071 <XRD>
3072 <Query>!1000.f3da.9056.aca3</Query>
3073 <ProviderID>xri://@ </ProviderID>
3074 <CanonicalID>xri://@!1000.f3da.9056.aca3</CanonicalID>
3075 <Service>
3076 <ProviderID>xri://@!1000.f3da.9056.aca3</ProviderID>
3077 <Type>xri://$res*auth*($v*2.0)</Type>
3078 <MediaType>application/xrds+xml</MediaType>
3079 <URI priority="10">http://resolve.example.com</URI>
3080 <URI priority="15">http://resolve2.example.com</URI>
3081 <URI>https://resolve.example.com</URI>
3082 </Service>
3083 ...
3084 </XRD>
3085 <XRD>
3086 <Query>!5555</Query>
3087 <ProviderID>xri://@!1000.f3da.9056.aca3</ProviderID>
3088 <LocalID>!5555</LocalID>
3089 <EquivID>xri://=!1000.62b1.44fd.2855!1234</EquivID>
```

```
3090     <CanonicalID>xri://@!1000.f3da.9056.aca3!5555</CanonicalID>
3091     <Service priority="1">
3092         ...
3093     </Service>
3094     ...
3095 </XRD>
3096 </XRDS>
```

3097 The CanonicalEquivID asserted in the final XRD of the first XRDS satisfies the verification rules  
3098 in section 14.3.3 because it resolves to a second XRDS whose final XRD asserts an EquivID  
3099 backpointer to the CanonicalID of the final XRD in the first XRDS.

---

## 3100 15 Status Codes and Error Processing

### 3101 15.1 Status Elements

3102 XRDS architecture uses two XRD elements for status reporting:

- 3103 • The `xrd:XRD/xrd:ServerStatus` element is used by an authority server to report the  
3104 server-side status of a resolution query to a resolver.
- 3105 • The `xrd:XRD/xrd:Status` element is used by a resolver to report the client-side status of  
3106 a resolution query to a consuming application. Note that attributes and contents of this  
3107 element MAY differ from those of the `xrd:XRD/xrd:ServerStatus` element due to either  
3108 client-side error detection or reporting of CanonicalID verification status (section 14.3.4).

3109 Following are the normative rules that apply to usage of these elements:

- 3110 1. For XRDS servers and clients, each of these elements is OPTIONAL.
- 3111 2. An XRI authority server is REQUIRED to include an `xrd:XRD/xrd:ServerStatus`  
3112 element for each XRD in a resolution response.

3113 **BACKWARDS COMPATIBILITY NOTE:** The `xrd:XRD/xrd:ServerStatus` element was not  
3114 included in earlier versions of this specification. If an older authority resolution server does not  
3115 produce this element in generic or HTTPS trusted resolution, a resolver SHOULD generate it. For  
3116 SAML trusted resolution, a resolver MUST NOT generate it.

- 3117 3. An XRI resolver is REQUIRED to add an `xrd:XRD/xrd:Status` element to each XRD  
3118 if the Resolution Output Format is an XRDS document or an XRD element.
- 3119 4. In SAML trusted resolution, a resolver MUST verify the SAML signature on the XRD  
3120 received from the server as specified in section 10.2.4 before adding the  
3121 `xrd:XRD/xrd:Status` element to the XRD. Because this modifies the XRD, a  
3122 consuming application may not be able to easily verify the SAML signature itself. Should  
3123 this be necessary, the consuming application may request the XRD it wishes to verify  
3124 directly from an authority server using the SAML trusted resolution protocol in section  
3125 10.2.
- 3126 5. These elements MUST include the status codes specified in section 15.2 as the value of  
3127 the required `code` attribute.
- 3128 6. These elements SHOULD contain the status context strings specified in section 15.3.  
3129 Authority servers or resolvers MAY add additional information to status context strings.

### 3130 15.2 Status Codes

3131 XRI resolution status codes are patterned after the HTTP model. They are broken into three  
3132 major categories:

- 3133 • 1xx: Success—the requested resolution operation was completed successfully.
- 3134 • 2xx: Permanent errors—the resolver encountered an error from which it could not recover.
- 3135 • 3xx: Temporary errors—the resolver encountered an error condition that may be only  
3136 temporary.

- 3137 The 2xx and 3xx categories are broken into seven minor categories:
- 3138 • x0x: General error that may take place during any phase of resolution.
- 3139 • x1x: Input error
- 3140 • x2x: Generic authority resolution error.
- 3141 • x3x: Trusted authority resolution error.
- 3142 • x4x: Service endpoint (SEP) selection error.
- 3143 • x5x: Redirect error.
- 3144 • x6x: Ref error.

3145 The full list of XRI resolution status codes is defined in Table 29.

3146

Code	Symbolic Status	Phase(s)	Description
100	SUCCESS	Any	Operation was successful.
200	PERM_FAIL	Any	Generic permanent failure.
201	NOT_IMPLEMENTED	Any	The requested function (trusted resolution, service endpoint selection) is not implement by the resolver.
202	LIMIT_EXCEEDED	Any	A locally configured resource limit was exceeded. Examples: number of Redirect or Refs to follow, number of XRD elements that can be handled, size of an XRDS document.
210	INVALID_INPUT	Input	Generic input error.
211	INVALID_QXRI	Input	Input QXRI does not conform to XRI syntax.
212	INVALID_OUTPUT_FORMAT	Input	Input Resolution Output Format is invalid.
213	INVALID_SEP_TYPE	Input	Input Service Type is invalid.
214	INVALID_SEP_MEDIA_TYPE	Input	Input Service Media Type is invalid.
215	UNKNOWN_ROOT	Input	Community root specified in QXRI is not configured in the resolver.
220	AUTH_RES_ERROR	Authority resolution	Generic authority resolution error.
221	AUTH_RES_NOT_FOUND	Authority resolution	The subsegment cannot be resolved due to a missing authority resolution service endpoint in an XRD.
222	QUERY_NOT_FOUND	Authority resolution	Responding authority does not have an XRI matching the query.
223	UNEXPECTED_XRD	Authority resolution	Value of the <code>xrd:Query</code> element does not match the subsegment requested.
224	INACTIVE	Authority resolution	The query XRI has been assigned but the authority does not provide resolution metadata.

230	TRUSTED_RES_ERROR	Trusted resolution	Generic trusted resolution error.
231	HTTPS_RES_NOT_FOUND	Trusted resolution	The resolver was unable to locate an HTTPS authority resolution endpoint.
232	SAML_RES_NOT_FOUND	Trusted resolution	The resolver was unable to locate a SAML authority resolution endpoint.
233	HTTPS+SAML_RES_NOT_FOUND	Trusted resolution	The resolver was unable to locate an HTTPS+SAML authority resolution endpoint.
234	UNVERIFIED_SIGNATURE	Trusted resolution	Signature verification failed.
240	SEP_SELECTION_ERROR	SEP selection	Generic service endpoint selection error.
241	SEP_NOT_FOUND	SEP selection	The requested service endpoint could not be found in the current XRD or via Redirect or Ref processing.
250	REDIRECT_ERROR	Redirect Processing	Generic Redirect error.
251	INVALID_REDIRECT	Redirect Processing	At least one Redirect element was found but resolution failed.
252	INVALID_HTTPS_REDIRECT	Redirect Processing	<code>https=true</code> but a Redirect element containing an HTTPS URI was not found.
253	REDIRECT_VERIFY_FAILED	Redirect Processing	Synonym verification failed in an XRD after following a redirect. See section 12.3
260	REF_ERROR	Ref Processing	Generic Ref processing error.
261	INVALID_REF	Ref Processing	A valid Ref XRI was not found.
262	REF_NOT_FOLLOWED	Ref Processing	At least one Ref was present but the <code>refs</code> parameter was set to <code>false</code> .
300	TEMPORARY_FAIL	Any	Generic temporary failure.
301	TIMEOUT_ERROR	Any	Locally-defined timeout limit has lapsed during an operation (e.g. network latency).
320	NETWORK_ERROR	Authority resolution	Generic error during authority resolution phase (includes uncaught exception, system error, network error).
321	UNEXPECTED_RESPONSE	Authority resolution	When querying an authority server, the server returned a non-200 HTTP status.
322	INVALID_XRDS	Authority resolution	Invalid XRDS received from an authority server (includes malformed XML, truncated content, or wrong content type).

3148 Table 29: Error codes for XRI resolution.

### 3149 **15.3 Status Context Strings**

3150 Each status code in Table 29 MAY be returned with an optional status context string that provides  
3151 additional human-readable information about the status or error condition. When the Resolution  
3152 Output Format is an XRDS document or XRD element, this string is returned as the contents of  
3153 the `xrd:XRD/xrd:ServerStatus` and `xrd:XRD/xrd:Status` elements. When the  
3154 Resolution Output Format is a URI List, this string MUST be returned as specified in section 15.4.  
3155 Implementers SHOULD provide error context strings with additional information about an error  
3156 and possible solutions whenever it can be helpful to developers or end users.

### 3157 **15.4 Returning Errors in Plain Text or HTML**

3158 If the Resolution Output Format is a URI List as defined in section 8.2, an error MUST be  
3159 returned with the content type `text/plain`. In this content:

- 3160 • The first line MUST consist of only the numeric error code as defined in section 15.2 followed  
3161 by a CRLF.
- 3162 • The second line is RECOMMENDED; if present it MUST contain the error context string as  
3163 defined in section 15.3.

3164 The same rules apply if the Resolution Output Format is an HTTP(S) Redirect as defined in  
3165 section 8.2, except the media type MAY also be `text/html`. It is particularly important in this  
3166 case to return an error message that will be understandable to an end-user who may have no  
3167 knowledge of XRI resolution or the fact that the error is coming from an XRI proxy resolver.

### 3168 **15.5 Error Handling in Recursing and Proxy Resolution**

3169 In recursing and proxy resolution (sections 9.1.8 and 11), a server is acting as a client resolver for  
3170 other authority resolution service endpoints. If in this intermediary capacity it receives an  
3171 unrecoverable error, it MUST return the error to the originating client in the output format  
3172 specified by the value of the requested Resolution Output Format as defined in section 8.2.

3173 If the output format is an XRDS document, it MUST contain `xrd:XRD` elements for all  
3174 subsegments successfully resolved or retrieved from cache prior to the error. Each XRD MUST  
3175 include the `xrd:ServerStatus` element as reported by the authoritative server. The final  
3176 `xrd:XRD` element MUST include the `xrd:Query` element that produced the error and the  
3177 `xrd:Status` element that describes the error as defined above.

3178 If the output format is an XRD element, it MUST include the `xrd:Query` element that produced  
3179 the error, the `xrd:ServerStatus` element as reported by the authoritative server, and the  
3180 `xrd:Status` element that describes the error as defined above.

3181 If this output format is a URI List or an HTTP(S) redirect, a proxy resolver SHOULD return a  
3182 human-readable error message as specified in section 15.4.

---

## 3183 16 Use of HTTP(S)

### 3184 16.1 HTTP Errors

3185 When a resolver encounters fatal HTTP(S) errors during the resolution process, it MUST return  
3186 the appropriate XRI resolution error code and error message as defined in section 15. In this way  
3187 calling applications do not have to deal separately with XRI and HTTP error messages.

### 3188 16.2 HTTP Headers

#### 3189 16.2.1 Caching

3190 The HTTP caching capabilities described by [RFC2616] should be leveraged for all XRDS and  
3191 XRI resolution protocols. Specifically, implementations SHOULD implement the caching model  
3192 described in section 13 of [RFC2616], and in particular, the “Expiration Model” of section 13.2, as  
3193 this requires the fewest round-trip network connections.

3194 All XRI resolution servers SHOULD send the Cache-Control or Expires headers in their  
3195 responses per section 13.2 of [RFC2616] unless there are overriding security or policy reasons to  
3196 omit them.

3197 Note that HTTP Cache headers SHOULD NOT conflict with expiration information in an XRD.  
3198 That is, the expiration date specified by HTTP caching headers SHOULD NOT be later than any  
3199 of the expiration dates for any of the `xrd:Expires` elements returned in the HTTP response.  
3200 This implies that recursing and proxy resolvers SHOULD compute the “soonest” expiration date  
3201 for the XRDs in a resolution chain and ensure a later date is not specified by the HTTP caching  
3202 headers for the HTTP response.

#### 3203 16.2.2 Location

3204 During HTTP interaction, “Location” headers may be present per [RFC2616] (i.e., during 3XX  
3205 redirects). Redirects SHOULD be made cacheable through appropriate HTTP headers, as  
3206 specified in section 16.2.1.

#### 3207 16.2.3 Content-Type

3208 For authority resolution, the Content-Type header in the 2XX responses MUST contain the media  
3209 type identifier values specified in Table 11 (for generic resolution), Table 15 (for HTTPS trusted  
3210 resolution), Table 16 (for SAML trusted resolution), or Table 17 (or HTTPS+SAML trusted  
3211 resolution).

3212 Following the optional service endpoint selection phase, clients and servers MAY negotiate  
3213 content type using standard HTTP content negotiation features. Regardless of whether this  
3214 feature is used, however, the server MUST respond with an appropriate media type in the  
3215 Content-Type header if the resource is found and an appropriate content type is returned.

### 3216 16.3 Other HTTP Features

3217 HTTP provides a number of other features including transfer-coding, proxying, validation-model  
3218 caching, and so forth. All these features may be used insofar as they do not conflict with the  
3219 required uses of HTTP described in this document.

## 3220 16.4 Caching and Efficiency

### 3221 16.4.1 Resolver Caching

3222 In addition to HTTP-level caching, resolution clients are encouraged to perform caching at the  
3223 application level. For best results, however, resolution clients SHOULD be conservative with  
3224 caching expiration semantics, including cache expiration dates. This implies that in a series of  
3225 HTTP redirects, for example, the results of the entire process SHOULD only be cached as long  
3226 as the shortest period of time allowed by any of the intermediate HTTP responses.

3227 Because not all HTTP client libraries expose caching expiration to applications, identifier  
3228 authorities SHOULD NOT use cacheable redirects with expiration times sooner than the  
3229 expiration times of other HTTP responses in the resolution chain. In general, all XRI deployments  
3230 should be mindful of limitations in current HTTP clients and proxies.

3231 The cache expiration time of an XRD may also be explicitly limited by the parent authority. If the  
3232 expiration time in the `xrd:Expires` element is sooner than the expiration time calculated from  
3233 the HTTP caching semantics, the XRD MUST be discarded before the expiration time in  
3234 `xrd:Expires`. Note also that a `saml:Assertion` element returned during SAML trusted  
3235 resolution has its own signature expiration semantics as defined in [SAML]. While this may  
3236 invalidate the SAML signature, a resolver MAY still use the balance of the contents of the XRD if  
3237 it is not expired by HTTP caching semantics or the `xrd:Expires` element.

3238 With both application-level and HTTP-level caching, the resolution process is designed to have  
3239 minimal overhead. Resolution of each qualified subsegment of an XRI authority component is a  
3240 separate step described by a separate XRD, so intermediate results can typically be cached in  
3241 their entirety. For this reason, resolution of higher-level (i.e., further to the left) qualified  
3242 subsegments, which are common to more identifiers, will naturally result in a greater number of  
3243 cache hits than resolution of lower-level subsegments.

### 3244 16.4.2 Synonyms

3245 The publication of synonyms in XRDS documents (section 5) can further increase cache  
3246 efficiency. If an XRI resolution request produces a cache hit on a synonym, the following rules  
3247 apply:

- 3248 1. If the cache hit is on a LocalID synonym, the resolver MAY return the cached XRD  
3249 element if: a) it is from the correct ProviderID, b) it has not expired, and c) it was obtained  
3250 using the same trusted resolution and synonym verification parameters as the current  
3251 resolution request.
- 3252 2. If the cache hit is on a CanonicalID synonym, the resolver MAY return the entire cached  
3253 XRDS document if: a) it has not expired, and b) it was obtained using the same trusted  
3254 resolution and synonym verification parameters as the current resolution request.

3255 **IMPORTANT:** The effect of these rules is that the application calling an XRI resolver MAY receive  
3256 back an XRD element, or an XRDS document containing XRD element(s), in which the value of  
3257 the `<xrd:Query>` element does not match the resolution request, but in which the value of an  
3258 `<xrd:LocalID>` element does match the resolution request. This is acceptable for the generic  
3259 and HTTPS trusted resolution protocols but not the SAML trusted resolution protocol, where the  
3260 value of the `<xrd:Query>` element MUST match the resolution request as specified in section  
3261 10.2.4.

3262

## 17 Extensibility and Versioning

3263

### 17.1 Extensibility

3264

#### 17.1.1 Extensibility of XRDs

3265

The XRD schema in Appendix B use an an open-content model that is designed to be extended with other metadata. In most places, extension elements and attributes from namespaces other than `xri://$xrd*($v*2.0)` are explicitly allowed. These extension points are designed to simplify default processing using a “Must Ignore” rule. The base rule is that unrecognized elements and attributes, and the content and child elements of unrecognized elements, MUST be ignored. As a consequence, elements that would normally be recognized by a processor MUST be ignored if they appear as descendants of an unrecognized element.

3272

Extension elements MUST NOT require new interpretation of elements defined in this document. If an extension element is present, a processor MUST be able to ignore it and still correctly process the XRDS document.

3273

3274

3275

Extension specifications MAY simulate “Must Understand” behavior by applying an “enclosure” pattern. Elements defined by the XRD schema in Appendix B whose meaning or interpretation is modified by extension elements can be wrapped in an extension container element defined by the extension specification. This extension container element SHOULD be in the same namespace as the other extension elements defined by the extension specification.

3276

3277

3278

3279

3280

Using this design, all elements whose interpretations are modified by the extension will now be contained in the extension container element and thus will be ignored by clients or other applications unable to process the extension. The following example illustrates this pattern using an extension container element from an extension namespace (`other:SuperService`) that contains an extension element (`other:ExtensionElement`):

3281

3282

3283

3284

3285

3286

3287

3288

3289

3290

3291

3292

3293

3294

3295

```
<XRD>
  <Service>
    ...
  </Service>
  <other:SuperService>
    <Service>
      ...
      <other:ExtensionElement>...</other:ExtensionElement>
    </Service>
  </other:SuperService>
</XRD>
```

3296

In this example, the `other:ExtensionElement` modifies the interpretation or processing rules for the parent `xrd:Service` element and therefore must be understood by the consumer for the proper interpretation of the parent `xrd:Service` element. To preserve the correct interpretation of the `xrd:Service` element in this context, the `xrd:Service` element is “wrapped” in the `other:SuperService` element so only consumers that understand elements in the `other:SuperService` namespace will attempt to process the `xrd:Service` element.

3297

3298

3299

3300

3301

3302

The addition of extension elements does not change the requirement for SAML signatures to be verified across all elements, whether recognized or not.

3303

## 3304 17.1.2 Other Points of Extensibility

3305 The use of HTTP(S), XML, XRIs, and URIs in the design of XRDS documents, XRD elements,  
3306 and XRI resolution architecture provides additional specific points of extensibility:

- 3307 • Specification of new resolution service types or other service types using XRIs, IRIs, or URIs  
3308 as values of the `xrd:Type` element.
- 3309 • Specification of new resolution output formats or features using media types and media type  
3310 parameters as values of the `xrd:MediaType` element as defined in [RFC2045] and  
3311 [RFC2046].
- 3312 • HTTP negotiation of content types, language, encoding, etc. as defined by [RFC2616].
- 3313 • Use of HTTP redirects (3XX) or other response codes defined by [RFC2616].
- 3314 • Use of cross-references within XRIs, particularly for associating new types of metadata with a  
3315 resource. See [XRISyntax] and [XRIMetadata].

## 3316 17.2 Versioning

3317 Versioning of the XRI specification set is expected to occur infrequently. Should it be necessary,  
3318 this section describes versioning guidelines.

3319 In general, this specification follows the same versioning guidelines as established in section  
3320 4.2.1 of [SAML]:

3321 *In general, maintaining namespace stability while adding or changing the content of a*  
3322 *schema are competing goals. While certain design strategies can facilitate such changes,*  
3323 *it is complex to predict how older implementations will react to any given change, making*  
3324 *forward compatibility difficult to achieve. Nevertheless, the right to make such changes in*  
3325 *minor revisions is reserved, in the interest of namespace stability. Except in special*  
3326 *circumstances (for example, to correct major deficiencies or to fix errors),*  
3327 *implementations should expect forward-compatible schema changes in minor revisions,*  
3328 *allowing new messages to validate against older schemas.*

3329 *Implementations SHOULD expect and be prepared to deal with new extensions and*  
3330 *message types in accordance with the processing rules laid out for those types. Minor*  
3331 *revisions MAY introduce new types that leverage the extension facilities described in [this*  
3332 *section]. Older implementations SHOULD reject such extensions gracefully when they*  
3333 *are encountered in contexts that dictate mandatory semantics.*

### 3334 17.2.1 Version Numbering

3335 Specifications from the OASIS XRI Technical Committee use a Major and Minor version number  
3336 expressed in the form Major.Minor. The version number MajorB.MinorB is higher than the version  
3337 number MajorA.MinorA if and only if:

3338 
$$\text{Major}_B > \text{Major}_A \text{ OR } ( (\text{Major}_B = \text{Major}_A) \text{ AND } \text{Minor}_B > \text{Minor}_A )$$

### 3339 17.2.2 Versioning of the XRI Resolution Specification

3340 New releases of the XRI Resolution specification may specify changes to the resolution protocols  
3341 and/or the XRD schema in Appendix B. When changes affect either of these, the resolution  
3342 service type version number will be changed. Where changes are purely editorial, the version  
3343 number will not be changed.

3344 In general, if a change is backward-compatible, the new version will be identified using the  
3345 current major version number and a new minor version number. If the change is not backward-  
3346 compatible, the new version will be identified with a new major version number.

### 3347 **17.2.3 Versioning of Protocols**

3348 The protocols defined in this document may also be versioned by future releases of the XRI  
3349 Resolution specification. If these protocols are not backward-compatible with older  
3350 implementations, they will be assigned a new XRI with a new version identifier for use in  
3351 identifying their service type in XRDs. See section 3.1.2.

3352 Note that it is possible for version negotiation to happen in the protocol itself. For example, HTTP  
3353 provides a mechanism to negotiate the version of the HTTP protocol being used. If and when an  
3354 XRI resolution protocol provides its own version-negotiation mechanism, the specification is likely  
3355 to continue to use the same XRI to identify the protocol as was used in previous versions of the  
3356 XRI Resolution specification.

### 3357 **17.2.4 Versioning of XRDs**

3358 The `xrd:XRDS` document element is intended to be a completely generic container, i.e., to have  
3359 no specific knowledge of the elements it may contain. Therefore it has no version indicator, and  
3360 can remain stable indefinitely because there is no need to version its namespace.

3361 The `xrd:XRD` element has a `version` attribute. This attribute is OPTIONAL for this version of  
3362 the XRI resolution specification (version 2.0). This attribute will be REQUIRED for all future  
3363 versions of this specification. When used, the value of this attribute MUST be the exact numeric  
3364 version value of the XRI Resolution specification to which its containing elements conform.

3365 When new versions of the XRI Resolution specification are released, the namespace for the XRD  
3366 schema may or may not be changed. If there is a major version number change, the namespace  
3367 for the `xrd:XRD` schema is likely to change. If there is only a minor version number change, the  
3368 namespace for the `xrd:XRD` schema may remain unchanged.

3369 Note that conformance to a specific XRD version does not preclude an author from including  
3370 extension elements from a different namespace in the XRD. See section 17.1 above.

---

## 3371 18 Security and Data Protection

3372 Significant portions of this specification deal directly with security issues; these will not be  
3373 summarized again here. In addition, basic security practices and typical risks in resolution  
3374 protocols are well-documented in many other specifications. Only security considerations directly  
3375 relevant to XRI resolution are included here.

### 3376 18.1 DNS Spoofing or Poisoning

3377 When XRI resolution is deployed to use HTTP URIs or other URIs which include DNS names, the  
3378 accuracy of the XRI resolution response may be dependent on the accuracy of DNS queries. For  
3379 those deployments where DNS is not trusted, the resolution infrastructure may be deployed with  
3380 HTTP URIs that use IP addresses in the authority portion of HTTP URIs and/or with the trusted  
3381 resolution mechanisms defined by this specification. Resolution results obtained using trusted  
3382 resolution can be evaluated independently of DNS resolution results. While this does not solve  
3383 the problem of DNS spoofing, it does allow the client to detect an error condition and reject the  
3384 resolution result as untrustworthy. In addition, **[DNSSEC]** may be considered if DNS names are  
3385 used in HTTP URIs.

### 3386 18.2 HTTP Security

3387 Many of the security considerations set forth in HTTP/1.1 **[RFC2616]** apply to XRI Resolution  
3388 protocols defined here. In particular, confidentiality of the communication channel is not  
3389 guaranteed by HTTP. Server-authenticated HTTPS should be used in cases where confidentiality  
3390 of resolution requests and responses is desired.

3391 Special consideration should be given to proxy and caching behaviors to ensure accurate and  
3392 reliable responses from resolution requests. For various reasons, network topologies increasingly  
3393 have transparent proxies, some of which may insert VIA and other headers as a consequence, or  
3394 may even cache content without regard to caching policies set by a resource's HTTP authority.

3395 Implementations of XRI Proxies and caching authorities should also take special note of the  
3396 security recommendations in HTTP/1.1 **[RFC2616]** section 15.7.

### 3397 18.3 SAML Considerations

3398 SAML trusted authority resolution must adhere to the rules defined by the SAML 2.0 Core  
3399 Specification **[SAML]**. Particularly noteworthy are the XML Transform restrictions on XML  
3400 Signature and the enforcement of the SAML Conditions element regarding the validity period.

### 3401 18.4 Limitations of Trusted Resolution

3402 While the trusted resolution protocols specified in this document provide a way to verify the  
3403 integrity of a successful XRI resolution, it may not provide a way to verify the integrity of a  
3404 resolution failure. Reasons for this limitation include the prevalence of non-malicious network  
3405 failures, the existence of denial-of-service attacks, and the ability of a man-in-the-middle attacker  
3406 to modify HTTP responses when resolution is not performed over HTTPS.

3407 Additionally, there is no revocation mechanism for the keys used in trusted resolution. Therefore,  
3408 a signed resolution's validity period should be limited appropriately to mitigate the risk of an  
3409 incorrect or invalid resolution.

## 3410 **18.5 Synonym Verification**

3411 As discussed in section 5, XRI and XRDS infrastructure has rich support for identifier synonyms,  
3412 including synonyms that cross security domains. For this reason it is particularly important that  
3413 identifier authorities, including registries, registrars, directory administrators, identity providers,  
3414 and other parties who issue XRIs and manage XRDS documents, enforce the security policies  
3415 highlighted in section 5 regarding registration and management of XRDS synonym elements.

## 3416 **18.6 Redirect and Ref Management**

3417 As discussed in sections 5.3 and 12, XRI and XRDS infrastructure includes the capability to  
3418 distribute and delegate XRDS document management across multiple network locations or  
3419 identifier authorities. Identifier authorities should follow the security precautions highlighted in  
3420 section 5.3 to ensure Redirects and Refs are properly authorized and represent the intended  
3421 delegation policies.

## 3422 **18.7 Community Root Authorities**

3423 The XRI authority information for a community root needs to be well-known to the clients that  
3424 request resolution within that community. For trusted resolution, this includes the authority  
3425 resolution service endpoint URIs, the `xrd:XRD/xrd:ProviderID`, and the `ds:KeyInfo`  
3426 information. An acceptable means of providing this information is for the community root authority  
3427 to produce a self-signed XRD and publish it to a server-authenticated HTTPS endpoint. Special  
3428 care should be taken to ensure the correctness of such an XRD; if this information is incorrect, an  
3429 attacker may be able to convince a client of an incorrect result during trusted resolution.

## 3430 **18.8 Caching Authorities**

3431 In addition to traditional HTTP caching proxies, XRI proxy resolvers may be a part of the  
3432 resolution topology. Such proxy resolvers should take special precautions against cache  
3433 poisoning, as these caching entities may represent trusted decision points within a deployment's  
3434 resolution architecture.

## 3435 **18.9 Recursing and Proxy Resolution**

3436 During recursing resolution, subsegments of the XRI authority component for which the resolving  
3437 network endpoint is not authoritative may be revealed to that service endpoint. During proxy  
3438 resolution, some or all of an XRI is provided to the proxy resolver.

3439 In both cases, privacy considerations should be evaluated before disclosing such information.

## 3440 **18.10 Denial-Of-Service Attacks**

3441 XRI Resolution, including trusted resolution, is vulnerable to denial-of-service (DOS) attacks  
3442 typical of systems relying on DNS and HTTP(S).

---

3443

## A. Acknowledgments

3444 The editors would like to thank the following current and former members of the OASIS XRI TC  
3445 for their particular contributions to this and previous versions of this specification:

- 3446 • William Barnhill, Booz Allen and Hamilton
- 3447 • Dave McAlpin, Epok
- 3448 • Chetan Sabnis, Epok
- 3449 • Peter Davis, Neustar
- 3450 • Victor Grey, PlaNetwork
- 3451 • Mike Lindelsee, Visa International
- 3452 • Markus Sabadello, XDI.org
- 3453 • John Bradley
- 3454 • Kermit Snelson

3455 The editors would also like to acknowledge the contributions of the other members of the OASIS  
3456 XRI Technical Committee, whose other voting members at the time of publication were:

- 3457 • Geoffrey Strongin, Advanced Micro Devices
- 3458 • Ajay Madhok, AmSoft Systems
- 3459 • Dr. XiaoDong Lee, China Internet Network Information
- 3460 • Nat Sakimura, Nomura Research
- 3461 • Owen Davis, PlaNetwork
- 3462 • Fen Labalme, PlaNetwork
- 3463 • Marty Schleiff, The Boeing Company
- 3464 • Dave Wentker, Visa International
- 3465 • Paul Trevithick

3466 The editors also would like to acknowledge the following people for their contributions to previous  
3467 versions of OASIS XRI specifications (affiliations listed for OASIS members):

3468 Marc Le Maitre, Cordance Corporation; Thomas Bikeev, EAN International; Krishna Sankar,  
3469 Cisco; Winston Bumpus, Dell; Joseph Moeller, EDS; Steve Green, Epok; Lance Hood, Jerry  
3470 Kindall, Adarbad Master, Davis McPherson, Chetan Sabnis, and Loren West, Epok; Phillipe  
3471 LeBlanc, Jim Schreckengast, and Xavier Serret, Gemplus; John McGarvey, IBM; Reva Modi,  
3472 Infosys; Krishnan Rajagopalan, Novell; Masaki Nishitani, Tomonori Seki, and Tetsu Watanabe,  
3473 Nomura Research Institute; James Bryce Clark, OASIS; Marc Stephenson, TSO; Mike Mealling,  
3474 Verisign; Rajeev Maria, Terence Spielman, and John Veizades, Visa International; Lark Allen and  
3475 Michael Willett, Wave Systems; Matthew Dovey; Eamonn Neylon; Mary Nishikawa; Lars Marius  
3476 Garshol; Norman Paskin; and Bernard Vatan.

3477

## B. RelaxNG Schema for XRDS and XRD

3478 Following are links to the normative RelaxNG compact schema files for XRDS and XRD:

- 3479 • **xrds.rnc**: <http://www.oasis-open.org/committees/download.php/26145/xrds.rnc>
- 3480 • **xrd-2.0.rnc**: <http://www.oasis-open.org/committees/download.php/26146/xrd-v2.0.rnc>

3481 **IMPORTANT:** The **xrd-2.0.rnc** schema does NOT include deprecated attribute values that are  
3482 recommended for backwards compatibility. See the highlighted Backwards Compatibility notes in  
3483 sections 9.1.1 and 13.3.2 for more details.

3484 Listings of these files are provided in this appendix for reference but are non-normative.

### 3485 **xrds.rnc**

```
3486 namespace xrds = "xri://$xrds"  
3487 namespace xrd = "xri://$xrd*($v*2.0)"  
3488 namespace local = ""  
3489 datatypes xs = "http://www.w3.org/2001/XMLSchema-datatypes"  
3490  
3491 any.element =  
3492   element * {  
3493     (attribute * { text } *  
3494       | text  
3495       | any.element)*  
3496   }  
3497  
3498 any.external.element =  
3499   element * - (xrd:XRD | xrds:XRDS) {  
3500     (attribute * { text } *  
3501       | text  
3502       | any.element)*  
3503   }

3661

## C. XML Schema for XRDS and XRD

3662  
3663  
3664

Following are links to the non-normative W3C XML Schema files for XRDS and XRD. These are provided for reference only as they are not able to fully express the extensibility semantics of the RelaxNG versions.

3665  
3666

- **xrds.xsd**: <http://www.oasis-open.org/committees/download.php/26143/xrds.xsd>
- **xrd-2.0.xsd**: <http://www.oasis-open.org/committees/download.php/26144/xrd-v2.0.xsd>

3667  
3668  
3669

**IMPORTANT:** The **xrd-2.0.xsd** schema does NOT include deprecated attribute values that are recommended for backwards compatibility. See the highlighted Backwards Compatibility notes in sections 9.1.1 and 13.3.2 for more details.

3670

Listings of these files are provided in this appendix for reference.

3671

3912 **D. Media Type Definition for application/xrds+xml**

3913 This section is prepared in anticipation of filing a media type registration meeting the  
3914 requirements of [RFC4288].

3915 **Type name:** application

3916 **Subtype name:** xrds+xml

3917 **Required parameters:** None

3918 **Optional parameters:** See Table 6 of this document.

3919 **Encoding considerations:** Identical to those of "application/xml" as described in [RFC3023],  
3920 Section 3.2.

3921 **Security considerations:** As defined in this specification. In addition, as this media type uses the  
3922 "+xml" convention, it shares the same security considerations as described in [RFC3023],  
3923 Section 10.

3924 **Interoperability considerations:** There are no known interoperability issues.

3925 **Published specification:** This specification.

3926 **Applications that use this media type:** Applications conforming to this specification use this  
3927 media type.

3928 **Person & email address to contact for further information:** Drummond Reed, OASIS XRI  
3929 Technical Committee Co-Chair, drummond.reed@cordance.net

3930 **Intended usage:** COMMON

3931 **Restrictions on usage:** None

3932 **Author:** OASIS XRI TC

3933 **Change controller:** OASIS XRI TC

---

3934 **E. Media Type Definition for application/xrd+xml**

3935 This section is prepared in anticipation of filing a media type registration meeting the  
3936 requirements of [RFC4288].

3937 **Type name:** application

3938 **Subtype name:** xrd+xml

3939 **Required parameters:** None

3940 **Optional parameters:** See Table 6 of this document.

3941 **Encoding considerations:** Identical to those of "application/xml" as described in [RFC3023],  
3942 Section 3.2.

3943 **Security considerations:** As defined in this specification. In addition, as this media type uses the  
3944 "+xml" convention, it shares the same security considerations as described in [RFC3023],  
3945 Section 10.

3946 **Interoperability considerations:** There are no known interoperability issues.

3947 **Published specification:** This specification.

3948 **Applications that use this media type:** Applications conforming to this specification use this  
3949 media type.

3950 **Person & email address to contact for further information:** Drummond Reed, OASIS XRI  
3951 Technical Committee Co-Chair, drummond.reed@cordance.net

3952 **Intended usage:** COMMON

3953 **Restrictions on usage:** None

3954 **Author:** OASIS XRI TC

3955 **Change controller:** OASIS XRI TC

3956

## F. Example Local Resolver Interface Definition

3957  
3958

Following is a non-normative language-neutral example interface definition for a XRI resolver consistent with the requirements of this specification.

3959  
3960  
3961  
3962  
3963

The interface definition is provided as five operations where each operation takes two or more of the following input parameters. These input parameters correspond to the normative text in section 8.1. In all of these parameters, the value empty string ("") is interpreted the same as the value null.

Parameter name	Description
QXRI	Query XRI as defined in section 8.1.1.
sepType	Service Types as defined in section 8.1.3
sepMediaType	Service Media Type as defined in section 8.1.4
flags	Language binding-specific representation of resolution flags defined in the following table.

3964

3965  
3966  
3967  
3968

The `flags` parameter is a binding-specific container data structure that encapsulates the following subparameters of the Resolution Output Format parameter. All of these are Boolean parameters defined in Table 6 in section 3.3.

Subparameter	Description
<code>https</code> , <code>saml</code>	Specifies use of HTTPS or SAML trusted resolution as defined in sections 10.1 and 10.2.
<code>refs</code>	Specifies whether Refs should be followed during resolution as defined in section 12.4.
<code>nodefault_t</code> , <code>nodefault_p</code> , <code>nodefault_m</code>	Specifies whether a default match is allowed on the Type, Path, or MediaType elements respectively during service endpoint selection as defined in section 13.3.
<code>uric</code>	Specifies whether a resolver should automatically construct service endpoint URIs as defined in section 13.7.1.
<code>cid</code>	Specifies whether automatic canonical ID verification should performed as defined in section 14.3.

3969

3970  
3971  
3972  
3973  
3974  
3975

Note that one subparameter defined in in Table 6, `sep` (service endpoint), is not included in this flags table because it is implicitly represented in the operation being called. The five operations shown in the table below correspond to the five possible combinations of the value of the Resolution Output Format parameter and the `sep` subparameter. (Note that if the Resolution Output Format is URI List, the `sep` subparameter MUST be considered to be TRUE, so there is no `resolveAuthToURIList` operation.)

3976

	Operation name	Resolution Output Format Parameter Value	sep Subparameter Value
1	resolveAuthToXRDS	application/xrds+xml	false
2	resolveAuthToXRD	application/xrd+xml	false
3	resolveSepToXRDS	application/xrds+xml	true
4	resolveSepToXRD	application/xrd+xml	true
5	resolveSepToURIList	text/uri-list	ignored

3977 Following is the API and descriptions of the five operations.

### 3978 1. Resolve Authority to XRDS

```
3979 Result resolveAuthToXRDS(  
3980     in string QXRI, in Flags flags);
```

- 3981 • Performs authority resolution only (sections 9 and 10) and outputs an XRDS document as  
3982 specified in section 8.2.1 when the `sep` subparameter is FALSE.
- 3983 • Only the authority component of the QXRI is processed by this function. If the QXRI contains  
3984 a path or query component, it is ignored.
- 3985 • Returns a binding-specific representation of the resolution result which may include, but is not  
3986 limited to, XRDS output, success/failure code, exceptions and error context.
- 3987 • The XRD element(s) in the output XRDS will be signed or not depending on the value of the  
3988 `saml` flag.

3989

### 3990 2. Resolve Authority to XRD

```
3991 Result resolveAuthToXRD(  
3992     in string QXRI, in Flags flags);
```

- 3993 • Performs authority resolution only (sections 9 and 10) and outputs an XRD element as  
3994 specified in section 8.2.2 when the `sep` subparameter is FALSE.
- 3995 • Only the authority component of the QXRI is processed by this function. If the QXRI contains  
3996 a path or query component, it is ignored.
- 3997 • Returns a binding-specific representation of the resolution result which may include, but is not  
3998 limited to, XRD output, success/failure code, exceptions and error context.
- 3999 • The output XRD will be signed or not depending on the value of the `saml` flag.

4000

### 4001 3. Resolve Service Endpoint to XRDS

```
4002 Result resolveSEPToXRDS(  
4003     in string QXRI, in string sepType,  
4004     in string sepMediaType, in Flags flags);
```

- 4005 • Performs authority resolution (sections 9 and 10) and service endpoint selection (section 13)  
4006 and outputs the XRDS as specified in section 8.2.1 when the `sep` subparameter is TRUE.
- 4007 • Returns a binding-specific representation of the resolution result which may include, but is not  
4008 limited to, XRDS output, success/failure code, exceptions and error context.
- 4009 • The final XRD in the output XRDS will either contain at least one instance of the requested  
4010 service endpoint or an error. *IMPORTANT: Although the resolver will perform service  
4011 selection, the final XRD is NOT filtered when the Resolution Output Format is an XRDS  
4012 document. Filtering is only performed when the Resolution Output Format is an XRD  
4013 document (below).*
- 4014 • The XRD element(s) in the output XRDS will be signed or not depending on the value of  
4015 `saml` flag.

4016

### 4017 4. Resolve Service Endpoint to XRD

```
4018 Result resolveSEPToXRD(  
4019     in string QXRI, in string sepType,  
4020     in string sepMediaType, in Flags flags);
```

- 4021 • Performs authority resolution (sections 9 and 10) and service endpoint selection (section 13)  
4022 and outputs an XRD as specified in section 8.2.2 when the `sep` subparameter is TRUE.
- 4023 • Returns a binding-specific representation of the resolution result which may include, but is not  
4024 limited to, XRD output, success/failure code, exceptions and error context.
- 4025 • The output XRD will contain at least one instance of the requested service endpoint or an  
4026 error. Also, all elements in the output XRD subject to the global `priority` attribute will be  
4027 returned in order of highest to lowest priority. See section 8.2.2 for details.
- 4028 • The XRD element will be signed or not depending on the value of `saml` flag, however that  
4029 signature may not be able to be independently verified because the XRD has been filtered to  
4030 contain only the selected service endpoints.

4031

4032 **5. Resolve Service Endpoint to URI List**

```
4033 Result resolveSepToURIList(  
4034     in string QXRI, in string sepType,  
4035     in string sepMediaType, in Flags flags);
```

- 4036 • Performs authority resolution (sections 9 and 10) and service endpoint selection (section 13)  
4037 and outputs a non-empty URI List or an error as specified in section 8.2.3.
- 4038 • Returns a binding-specific representation of the resolution result which may include, but not  
4039 limited to, URI-list output, success/failure code, exceptions and error context.
- 4040 • If successful, the output URI-list will contain zero or more elements. It is possible that the  
4041 selected service contains no URI element and it is up to the consuming application to  
4042 interpret such a result.
- 4043

4044

## G. Revision History

4045

Revision	Date	Editor	Changes Made
WD11 ED01	2007-05-23	Drummond Reed	All major changes from <a href="http://wiki.oasis-open.org/xri/Xri2Cd02/ResWorkingDraft11">http://wiki.oasis-open.org/xri/Xri2Cd02/ResWorkingDraft11</a> . A number of the more minor changes remain to be done.
WD11 ED02	2007-06-06	Drummond Reed	Added content of Appendix F and G prepared by Gabe Wachob. Moved "Discovery of XRDS Documents from HTTP URIs" to section 4, added overview, added extensive feedback. Fixed bug in section 9, Pseudocode (for Service Endpoint Selection) spotted by Markus Sabadello. Numerous minor errata identified by Gabe Wachob and Marcus Sabadello fixed. Added comments to section 11, CanonicalID Verification, indicating work to be done.
WD11 ED03	2007-07-24	Drummond Reed	Added section 2, Conformance (still needs to be completed). Revised section 5. Added section 7.1.4. Added section 9.8. Added new section 11, Synonyms. Renamed and rewrote section 12, Synonym Verification. 40+ other smaller changes as detailed on the XRI TC wiki at <a href="http://wiki.oasis-open.org/xri/Xri2Cd02/ResWorkingDraft11">http://wiki.oasis-open.org/xri/Xri2Cd02/ResWorkingDraft11</a> .
