**Abstract:**

This document defines a simple generic format for resource description (XRDS documents), a protocol for obtaining XRDS documents from HTTP(S) URIs, and generic and trusted protocols for resolving Extensible Resource Identifiers (XRI) using XRDS documents and HTTP(S) URIs. These protocols are intended for use with both HTTP(S) URIs as defined in [RFC2616] and with XRI as defined by *Extensible Resource Identifier (XRI) Syntax Version 2.0* [XRISyntax] or higher. For a dictionary of XRI defined to provide standardized identifier metadata, see *Extensible Resource Identifier (XRI) Metadata Version 2.0* [XRIMetadata]. For a basic introduction to XRI, see the *XRI 2.0 FAQ* [XRIFAQ].

**Status:**

This document was last revised or approved by the XRI Technical Committee on the above date. The level of approval is also listed above. Check the “Latest Version” or “Latest Approved Version” location noted above for possible later revisions of this document.

Technical Committee members should send comments on this specification to the Technical Committee’s email list. Others should send comments to the Technical Committee by using the “Send A Comment” button on the Technical Committee’s web page at <http://www.oasis-open.org/committees/xri>.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Technical Committee web page (<http://www.oasis-open.org/committees/xri/ipr.php>).

The non-normative errata page for this specification is located at <http://www.oasis-open.org/committees/xri>.

## Notices

Copyright © OASIS® 1993–2008. All Rights Reserved.

All capitalized terms in the following text have the meanings assigned to them in the OASIS Intellectual Property Rights Policy (the "OASIS IPR Policy"). The full Policy may be found at the OASIS website.

This document and translations of it may be copied and furnished to others, and derivative works that comment on or otherwise explain it or assist in its implementation may be prepared, copied, published, and distributed, in whole or in part, without restriction of any kind, provided that the above copyright notice and this section are included on all such copies and derivative works. However, this document itself may not be modified in any way, including by removing the copyright notice or references to OASIS, except as needed for the purpose of developing any document or deliverable produced by an OASIS Technical Committee (in which case the rules applicable to copyrights, as set forth in the OASIS IPR Policy, must be followed) or as required to translate it into languages other than English.

The limited permissions granted above are perpetual and will not be revoked by OASIS or its successors or assigns.

This document and the information contained herein is provided on an "AS IS" basis and OASIS DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY WARRANTY THAT THE USE OF THE INFORMATION HEREIN WILL NOT INFRINGE ANY OWNERSHIP RIGHTS OR ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

OASIS requests that any OASIS Party or any other party that believes it has patent claims that would necessarily be infringed by implementations of this OASIS Committee Specification or OASIS Standard, to notify OASIS TC Administrator and provide an indication of its willingness to grant patent licenses to such patent claims in a manner consistent with the IPR Mode of the OASIS Technical Committee that produced this specification.

OASIS invites any party to contact the OASIS TC Administrator if it is aware of a claim of ownership of any patent claims that would necessarily be infringed by implementations of this specification by a patent holder that is not willing to provide a license to such patent claims in a manner consistent with the IPR Mode of the OASIS Technical Committee that produced this specification. OASIS may include such claims on its website, but disclaims any obligation to do so.

OASIS takes no position regarding the validity or scope of any intellectual property or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; neither does it represent that it has made any effort to identify any such rights. Information on OASIS' procedures with respect to rights in any document or deliverable produced by an OASIS Technical Committee can be found on the OASIS website. Copies of claims of rights made available for publication and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementers or users of this OASIS Committee Specification or OASIS Standard, can be obtained from the OASIS TC Administrator. OASIS makes no representation that any information or list of intellectual property rights will at any time be complete, or that any claims in such list are, in fact, Essential Claims.

# 1 Introduction

Extensible Resource Identifier (XRI) provides a uniform syntax for abstract structured identifiers as defined in [XRISyntax]. Because XRIs may be used across a wide variety of communities and applications (as Web addresses, database keys, filenames, object IDs, XML IDs, tags, etc.), no single resolution mechanism may prove appropriate for all XRIs. However, in the interest of promoting interoperability, this specification defines a simple generic resource description format called XRDS (Extensible Resource Descriptor Sequence), a standard protocol for requesting XRDS documents using HTTP(S) URIs, and standard protocol for resolving XRIs using XRDS documents and HTTP(S) URIs. Both generic and trusted versions of the XRI resolution protocol are defined (the latter using HTTPS [RFC2818] and/or signed SAML assertions [SAML]). In addition, an HTTP(S) proxy resolution service is specified both to provide network-based resolution services and for backwards compatibility with existing HTTP(S) infrastructure.

## 1.1 Overview of XRI Resolution Architecture

Resolution is the function of dereferencing an identifier to a set of metadata describing the identified resource. For example, in DNS, a domain name is typically resolved using the UDP protocol into a set of resource records describing a host. If the resolver does not have the answer cached, it will start by querying one of the well-known DNS root nameservers for the fully qualified domain name. Since domain names work from right to left, and the root nameservers know only about top level domains, they will return the NS (name server) records for the top-level domain. The resolver will then repeat the same query to those name servers and “walk down the tree” until the domain name is fully resolved or an error is encountered.

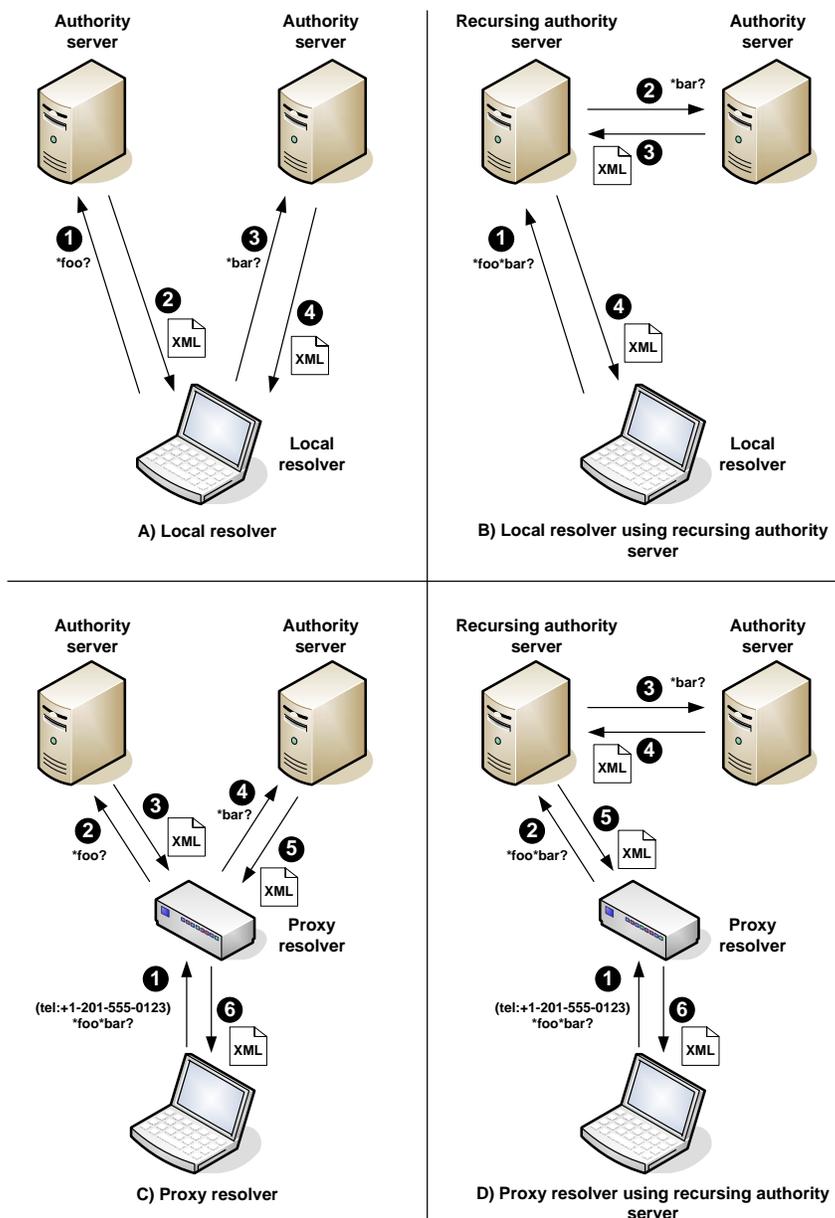

A simple *non-recursing resolver* will rely on a *recursing nameserver* to do this work. For example, it will send a query for the fully qualified domain name `docs.oasis-open.org` to a local nameserver. If the nameserver doesn't have the answer cached, it will resolve the domain name and return the results back to the resolver (and cache the results for subsequent queries).

XRI resolution follows this same architecture except at a higher level of abstraction, i.e., rather than using UDP to resolve a domain name into a text-based resource descriptor, it uses HTTP(S) to resolve an XRI into an XML-based resource descriptor called an *XRDS document*. Table 1 provides a high-level comparison between DNS and XRI resolution architectures.

Resolution Component	DNS Architecture	XRI Architecture
Identifier	domain name	XRI (authority + path + query)
Resource record format	text (resource record)	XML (XRDS document)
Attribute identifier	string	anyURI
Network endpoint identifier	IP address	URI
Synonyms	CNAME	LocalID, EquivID, CanonicalID, CanonicalEquivID
Primary resolution protocol	UDP	HTTP(S)
Trusted resolution options	DNSSEC	HTTPS and/or SAML
Resolution client	resolver	resolver
Resolution server	authoritative nameserver	authority server
Recursing resolution	recursing nameserver	recursing authority server or proxy resolver

Table 1: Comparing DNS and XRI resolution architecture.

31 As Table 1 notes, XRI resolution architecture supports both recursing authority servers and *proxy*  
 32 *resolvers*. A proxy resolver is simply an HTTP(S) interface to a local XRI resolver (one  
 33 implemented using a platform-specific API). Proxy resolvers enable applications—even those that  
 34 only understand HTTP URIs—to easily access the functions of an XRI resolver remotely.  
 35 Figure 1 shows four scenarios of how these components might interact to resolve  
 36 `xri://(tel:+1-201-555-0123)*foo*bar` (unlike DNS, this works from left-to-right).

37  
 38 *Figure 1: Four typical scenarios for XRI authority resolution.*

39 Each of these scenarios may involve two phases of XRI resolution:

- 40 • *Phase 1: Authority resolution.* This is the phase required to resolve the authority component  
41 of an XRI into an XRDS document describing the target authority. Authority resolution works  
42 iteratively from left-to-right across each subsegment in the authority component of the XRI. In  
43 XRIs, subsegments are delimited using either a specified set of symbol characters or  
44 parentheses. For example, in the XRI `xri://(tel:+1-201-555-0123)*foo*bar`, the  
45 authority subsegments are `(tel:+1-201-555-0123)` (the community root authority, in this  
46 case a URI expressed as an cross-reference delimited with parentheses), `*foo`, (the first  
47 resolvable subsegment), and `*bar`, (the second resolvable subsegment). Note that a  
48 resolver must be preconfigured (or have its own way of discovering) the community root  
49 authority starting point, so the community root subsegment is not resolved except in one  
50 special case (see section 9.1.6).
- 51 • *Phase 2: Optional service endpoint selection.* Once authority resolution is complete, there is  
52 an optional second phase of XRI resolution to select a specific type of metadata from the final  
53 XRDS document retrieved called a *service endpoint* (SEP). Service endpoints are descriptors  
54 of concrete URIs at which network services are available for the target resource. Additional  
55 XRI resolution parameters as well as the path component of an XRI may be used as service  
56 endpoint selection criteria.

57 It is worth highlighting several other key differences between DNS and XRI resolution:

- 58 • *HTTP.* As a resolution protocol, HTTP not only makes it easy to deploy XRI resolution  
59 services (including proxy resolution services), but also allows them to employ both HTTP  
60 security standards (e.g., HTTPS) and XML-based security standards (e.g., SAML). Although  
61 less efficient than UDP, HTTP(S) is suitable for the higher level of abstraction represented by  
62 XRIs and can take advantage of the full caching capabilities of modern web infrastructure.
- 63 • *XRDS documents.* This simple, extensible XML resource description format makes it easy to  
64 describe the capabilities of any XRI-, IRI-, or URI-identified resource in a manner that can be  
65 consumed by any XML-aware application (or even by non-XRI aware browsers via a proxy  
66 resolver).
- 67 • *Service endpoint descriptors.* DNS can use NAPTR records to do string transformations into  
68 URIs representing network endpoints. XRDS documents have *service endpoint descriptors*—  
69 elements that describe the set of URIs at which a particular type of service is available. Each  
70 service endpoint may present a different type of data or metadata representing or describing  
71 the identified resource. Thus XRI resolution can serve as a lightweight, interoperable  
72 discovery mechanism for resource attributes available via HTTP(S), LDAP, UDDI, SAML,  
73 WS-Trust, or other directory or discovery protocols.
- 74 • *Synonyms.* DNS uses the CNAME attribute to establish equivalence between domain names.  
75 XRDS architecture supports four synonym elements (LocalID, EquivID, CanonicalID, and  
76 CanonicalEquivID) to provide robust support for mapping XRIs, IRIs, or URIs to other XRIs,  
77 IRIs, or URIs that identify the same target resource. This is particularly useful for discovering  
78 and mapping to persistent identifiers as often required by trust infrastructures.
- 79 • *Redirects and Refs.* XRDS architecture also includes two mechanisms for distributed XRDS  
80 document management. The *Redirect* element allows an identifier authority to manage  
81 multiple XRDS documents describing a target resource from different network locations. The  
82 *Ref* element allows one identifier authority to delegate all or part of an XRDS document to a  
83 different identifier authority.

## 84 1.2 Structure of this Specification

85 This specification is structured into the following sections:

- 86 • *Conformance* (section 2) specifies the conformance targets and conformance claims for this  
87 specification.
- 88 • *Namespaces* (section 3) specifies the XRI and XML namespaces and media types used for  
89 the XRI resolution protocol.

90 The next three sections cover XRDS documents and the requirements for XRDS clients and  
91 servers:

- 92 • *XRDS Documents* (section 4) specifies a simple, flexible XML-based container for XRI  
93 resolution metadata, service endpoints, and/or other metadata describing a resource.
- 94 • *XRDS Synonyms* (section 5) specifies usage of the four XRDS synonym elements.
- 95 • *Discovering an XRDS Document from an HTTP(S) URI* (section 6) specifies a protocol for  
96 obtaining an XRDS description of a resource by starting from an HTTP(S) URI identifying the  
97 resource.

98 The remaining sections cover XRI resolution and the requirements for XRI authority servers, local  
99 resolvers, and proxy resolvers:

- 100 • *XRI Resolution Flow* (section 7) provides a top-level flowchart of the XRI resolution function  
101 together with a list of other supporting flowcharts used throughout the specification.
- 102 • *Inputs and Outputs* (section 8) specifies the input parameters, output formats, and associated  
103 processing rules.
- 104 • *Generic Authority Resolution* (section 9) specifies a simple resolution protocol for the  
105 authority component of an XRI using HTTP/HTTPS as a transport.
- 106 • *Trusted Authority Resolution* (section 10) specifies three extensions to generic authority  
107 resolution for creating a chain of trust between the participating identifier authorities using  
108 HTTPS connections, SAML assertions, or both.
- 109 • *Proxy Resolution* (section 11) specifies an HTTP(S) interface for an XRI resolver plus a  
110 format for expressing an XRI as an HTTP(S) URI to provide backwards compatibility with  
111 existing HTTP(S) infrastructure.
- 112 • *Redirect and Ref Processing* (section 12) specifies how a resolver follows a reference from  
113 one XRDS document to another to enable federation of XRDS documents across multiple  
114 network locations (Redirects) or identifier authorities (Refs).
- 115 • *Service Endpoint Selection* (section 13) specifies an optional second phase of resolution for  
116 selecting a set of service endpoints from an XRDS document.
- 117 • *Synonym Verification* (section 14) specifies how a resolver can verify that one XRI, IRI, or  
118 HTTP(S) URI is an authorized synonym for another.
- 119 • *Status Codes and Error Processing* (section 15) specifies status reporting and error handling.
- 120 • *Use of HTTP(S)* (section 16) specifies how the XRDS and XRI resolution protocols leverage  
121 features of the HTTP(S) protocol.
- 122 • *Extensibility and Versioning* (section 17) describes how the XRI resolution protocol can be  
123 easily extended and how new versions will be identified and accommodated.
- 124 • *Security and Data Protection* (section 18) summarizes key security and privacy  
125 considerations for XRI resolution infrastructure.

## 126 1.3 Terminology and Notation

127 The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”,  
128 “SHOULD NOT”, “RECOMMENDED”, “NOT RECOMMENDED”, “MAY”, and “OPTIONAL” in this  
129 document are to be interpreted as described in [RFC2119]. When these words are not capitalized  
130 in this document, they are meant in their natural language sense.

131 This specification uses the Augmented Backus-Naur Form (ABNF) syntax notation defined in  
132 [RFC4234].

133 Other terms used in this document and not defined herein are defined in the glossary in Appendix  
134 C of [XRISyntax].

135 Formatting conventions used in this document:

136 Examples look like this.

137 ABNF productions look like this.

138 In running text, XML elements, attributes, and values look like this.

## 139 1.4 Examples

140 The specification includes short examples as necessary to clarify interpretation. However, to  
141 minimize non-normative material, it does not include extensive examples of XRI resolution  
142 requests and responses. Many such examples are available via open source implementations,  
143 operating XRI registry and resolution services, and public websites about XRI. For a list of such  
144 resources, see the Wikipedia page on XRI [WikipediaXRI].

## 218 2 Conformance

219 This section specifies the conformance targets of this specification and the requirements that  
220 apply to each of them.

### 221 2.1 Conformance Targets

222 The conformance targets of this specification are:

- 223 1. *XRDS clients*, which provide a limited subset of the functionality of XRI resolvers.
- 224 2. *XRDS servers*, which provide a limited subset of the functionality of XRI authority servers.
- 225 3. *XRI local resolvers*, which may implement any combination of the generic, HTTPS, or  
226 SAML resolution protocols.
- 227 4. *XRI proxy resolvers*, which may implement any combination of the generic, HTTPS, or  
228 SAML resolution protocols.
- 229 5. *XRI authority servers*, which may implement any combination of the generic, HTTPS, or  
230 SAML resolution protocols.

231 Note that a single implementation may serve any combination of these functions. For example, an  
232 XRI authority server may also function as an XRDS client and server and an XRI local and proxy  
233 resolver.

### 234 2.2 Conformance Claims

235 A claim of conformance with this specification **MUST** meet the following requirements:

- 236 1. It **MUST** state which conformance targets it implements.
- 237 2. If the conformance target is an XRI local resolver, XRI proxy resolver, or XRI authority  
238 server, it **MUST** state which resolution protocols are supported, i.e., generic, HTTPS,  
239 and/or SAML.

### 240 2.3 XRDS Clients

241 An implementation conforms to this specification as an XRDS client if it meets the following  
242 conditions:

- 243 1. It **MAY** implement parsing of XRDS Documents as specified in section 4.
- 244 2. It **MUST** implement the client requirements of the XRDS request protocol specified in  
245 section 6.

### 246 2.4 XRDS Servers

247 An implementation conforms to this specification as an XRDS server if it meets the following  
248 conditions:

- 249 1. It **MUST** produce valid XRDS Documents as specified in section 4.
- 250 2. It **MUST** implement the server requirements of the XRDS request protocol specified in  
251 section 6.

## 252 **2.5 XRI Local Resolvers**

### 253 **2.5.1 Generic**

254 An implementation conforms to this specification as a generic local resolver if it meets the  
255 following conditions:

- 256 1. It parses XRDS documents as specified in section 4.
- 257 2. It processes resolution inputs and outputs as specified in section 8.
- 258 3. It implements the resolver requirements of the generic resolution protocol specified in  
259 section 9.
- 260 4. It implements the Redirect and Ref processing rules specified in section 12.
- 261 5. It implements the Service Endpoint Selection processing rules specified in section 13.
- 262 6. It implements the Synonym Verification processing rules specified in section 14.
- 263 7. It implements the Status Code and Error Processing rules specified in section 15.
- 264 8. It follows the HTTP(S) usage recommendations specified in section 16.

### 265 **2.5.2 HTTPS**

266 An implementation conforms to this specification as an HTTPS local resolver if it meets all the  
267 requirements of a generic local resolver plus the following conditions:

- 268 1. It implements the resolver requirements of the HTTPS trusted resolution protocol  
269 specified in section 10.1.

### 270 **2.5.3 SAML**

271 An implementation conforms to this specification as a SAML local resolver if it meets all the  
272 requirements of a generic local resolver plus the following conditions:

- 273 1. It implements the resolver requirements of the SAML trusted resolution protocol specified  
274 in section 10.2.
- 275 2. It SHOULD also meet the requirements of an HTTPS local resolver. This is STRONGLY  
276 RECOMMENDED for confidentiality of SAML interactions.

## 277 **2.6 XRI Proxy Resolvers**

### 278 **2.6.1 Generic**

279 An implementation conforms to this specification as a generic proxy resolver if it meets all the  
280 requirements of a generic local resolver plus the following conditions:

- 281 1. It implements the requirements for a proxy resolver specified in section 11.

### 282 **2.6.2 HTTPS**

283 An implementation conforms to this specification as a HTTPS proxy resolver if it meets all the  
284 requirements of a HTTPS local resolver plus the following conditions:

- 285 1. It implements the requirements for a HTTPS proxy resolver specified in section 11.

### 286 **2.6.3 SAML**

287 An implementation conforms to this specification as a SAML proxy resolver if it meets all the  
288 requirements of a SAML local resolver plus the following conditions:

- 289 1. It implements the requirements for a proxy resolver specified in section 11.

- 290 2. It SHOULD also meet the requirements of an HTTPS proxy resolver. This is STRONGLY  
291 RECOMMENDED for confidentiality of SAML interactions.

## 292 **2.7 XRI Authority Servers**

### 293 **2.7.1 Generic**

294 An implementation conforms to this specification as a generic authority server if it meets the  
295 following conditions:

- 296 1. It produces XRDS documents as specified in section 4.
- 297 2. It assigns XRDS synonyms as specified in section 5.
- 298 3. It processes resolution inputs and outputs as specified in section 8.
- 299 4. It implements the server requirements of the generic resolution protocol specified in  
300 section 9.
- 301 5. It implements the Status Code and Error Processing rules specified in section 15.
- 302 6. It follows the HTTP(S) usage recommendations specified in section 16.

### 303 **2.7.2 HTTPS**

304 An implementation conforms to this specification as an HTTPS authority server if it meets all the  
305 requirements of a generic authority server plus the following conditions:

- 306 1. It implements the server requirements of the HTTPS trusted resolution protocol specified  
307 in section 10.1.

### 308 **2.7.3 SAML**

309 An implementation conforms to this specification as an SAML authority server if it meets all the  
310 requirements of a generic authority server plus the following conditions:

- 311 1. It implements the server requirements of the SAML trusted resolution protocol specified  
312 in section 10.2.
- 313 2. It SHOULD also meet the requirements of an HTTPS authority server. This is  
314 STRONGLY RECOMMENDED for confidentiality of SAML interactions.

## 315 **2.8 Extensions**

316 The protocols and XML documents defined in this specification MAY be extended. To maintain  
317 interoperability, extensions MUST use the extensibility architecture specified in section 17.

318 Extensions MUST NOT be implemented in a manner that would cause them to be non-  
319 interoperable with implementations that do not implement the extensions.

## 320 **2.9 Language**

321 This specification's normative language is English. Translation into other languages is  
322 encouraged.

## 323 3 Namespaces

### 324 3.1 XRI Namespaces for XRI Resolution

325 As defined in section 2.2.1.2 of [XRISyntax], the GCS symbol \$ is reserved for specified  
326 identifiers, i.e., those assigned and defined by XRI TC specifications, other OASIS specifications,  
327 or other standards bodies. (See also [XRIMetadata].) This section specifies the \$ namespaces  
328 reserved for XRI resolution.

#### 329 3.1.1 XRIs Reserved for XRI Resolution

330 The XRIs in Table 2 are assigned by this specification for the purposes of XRI resolution and  
331 resource description.

XRI (in URI-Normal Form)	Usage	See Section
xri://\$res	Namespace for XRI resolution service types	3.1.2
xri://\$xrds	Namespace for the generic XRDS (Extensible Resource Descriptor Sequence) schema (not versioned)	3.2
xri://\$xrd	Namespace for the XRD (Extensible Resource Descriptor) schema (versioned)	3.2
xri://\$xrd*(\$v*2.0)	Version 2.0 of above (using an XRI version identifier as defined in [XRIMetadata])	3.2

332 Table 2: XRIs reserved for XRI resolution.

#### 333 3.1.2 XRIs Assigned to XRI Resolution Service Types

334 The XRIs in Table 3 are assigned to the XRI resolution service types defined in this specification.

XRI	Usage	See Section
xri://\$res*auth	Authority resolution service	9
xri://\$res*auth*(\$v*2.0)	Version 2.0 of above	9
xri://\$res*proxy	HTTP(S) proxy resolution service	11
xri://\$res*proxy*(\$v*2.0)	Version 2.0 of above	11

335 Table 3: XRIs assigned to identify XRI resolution service types.

336 Using the standard XRI extensibility mechanisms described in [XRISyntax], the \$res  
337 namespace may be extended by other authorities besides the XRI Technical Committee. See  
338 [XRIMetadata] for more information about extending \$ namespaces.

339 **3.2 XML Namespaces for XRI Resolution**

340 Throughout this document, the following XML namespace prefixes have the meanings defined in  
 341 Table 4 whether or not they are explicitly declared in the example or text.

Prefix	XML Namespace	Reference
xs	http://www.w3.org/2001/XMLSchema	[XMLSchema]
saml	urn:oasis:names:tc:SAML:2.0:assertion	[SAML]
ds	http://www.w3.org/2000/09/xmldsig#	[XMLDSig]
xrds	xri://\$xrds	Section 3.1.1 of this document
xrd	xri://\$xrd*(\$v*2.0)	Section 3.1.1 of this document

342 *Table 4: XML namespace prefixes used in this specification.*

343 **3.3 Media Types for XRI Resolution**

344 Because XRI resolution architecture is based on HTTP, it makes use of standard media types as  
 345 defined by [RFC2046], particularly in HTTP Accept headers as specified in [RFC2616]. Table 5  
 346 specifies the media types used for XRI resolution. Note that in XRI authority resolution, these  
 347 media types MUST be passed as HTTP Accept header values. By contrast, in XRI proxy  
 348 resolution these media types MUST be passed as query parameters in an HTTP(S) URI as  
 349 specified in section 11.

Media Type	Usage	Reference
application/xrds+xml	Content type for returning the full XRDS document describing a resolution chain	Appendix D
application/xrd+xml	Content type for returning only the final XRD element in a resolution chain	Appendix E
text/uri-list	Content type for returning a list of URIs output from the service endpoint selection process defined in section 12	Section 5 of [RFC2483]

350 *Table 5: Media types defined or used in this specification.*

351 To provide full control of XRI resolution, the media types specified in Table 5 accept the media  
 352 type parameters defined in Table 6. All are Boolean flags. Note that when these media type  
 353 parameters are appended to a media type in the XRI proxy resolver interface, the semicolon  
 354 character used to concatenate them MUST be percent-encoded as specified in section 11.4.

Media Type Parameter	Default Value	Usage	See Section
https	FALSE	Specifies use of HTTPS trusted resolution	10.1
saml	FALSE	Specifies use of SAML trusted resolution	10.2
refs	TRUE	Specifies whether Refs should be followed during resolution (by default they are followed)	12.4
sep	FALSE	Specifies whether service endpoint selection should be performed	13
nodefault_t	TRUE	Specifies whether a default match on a Type service endpoint selection element is allowed	13.3
nodefault_p	TRUE	Specifies whether a default match on a Path service endpoint selection element is allowed	13.3
nodefault_m	TRUE	Specifies whether a default match on a MediaType service endpoint selection element is allowed	13.3
uric	FALSE	Specifies whether a resolver should automatically construct service endpoint URIs	13.7.1
cid	TRUE	Specifies whether automatic canonical ID verification should be performed	14.3

356 *Table 6: Parameters for the media types defined in Table 5.*

357 When used as logical XRI resolution input parameters, these media type parameters will be  
 358 referred to as *subparameters*.

359

## 4 XRDS Documents

360  
361  
362  
363  
364

XRI resolution provides resource description metadata using a simple, extensible XML format called an XRDS (Extensible Resource Descriptor Sequence) document. An XRDS document contains one or more XRD (Extensible Resource Descriptor) elements. While this specification defines only the XRD elements necessary to support XRI resolution, XRD elements can easily be extended to publish any form of metadata about the resources they describe.

365

### 4.1 XRDS and XRD Namespaces and Schema Locations

366  
367  
368  
369  
370

An XRDS document is intended to serve exclusively as an XML container document for XML schemas from other XML namespaces. Therefore it has only a single root element `xrds:XRDS` in its own XML namespace identified by the XRI `xri://$xrds`. It also has two attributes, `redirect` and `ref`, that are used to identify the resource described by the XRDS document. Both are of type `anyURI`. Use of these attributes is defined in section 12.5.

371  
372  
373  
374  
375

The elements in the XRD schema are intended for generic resource description, including the metadata necessary for XRI resolution. Since the XRD schema has simple semantics that may evolve over time, the version defined in this specification uses the XML namespace `xri://$xrd*($v*2.0)`. This namespace is versioned using XRI version metadata as defined in [XRIMetadata].

376  
377

The attributes defined in both the XRDS and XRD schemas are not namespace qualified. In order to prevent conflicts, attributes defined in extensions MUST be namespace qualified.

378  
379  
380  
381

This namespace architecture enables the XRDS namespace to remain constant while allowing the XRD namespace (and the namespaces of other XML elements that may be included in an XRDS document) to be versioned over time. See section 17.2 for more about versioning of the XRD schema.

382  
383

The locations of the normative RelaxNG schema files for an XRDS document and an XRD element as defined by this specification are:

384  
385

- **xrds.rnc**: <http://www.oasis-open.org/committees/download.php/27422/xrds.rnc>
- **xrd.rnc**: <http://www.oasis-open.org/committees/download.php/27421/xrd.rnc>

Comment [DSR2]: Links to the updated files in Kavi. These will need to be updated after the CD03 vote.

386

The following URIs will always reference the latest versions of these files:

387  
388

- **xrds.rnc**: <http://docs.oasis-open.org/xri/2.0/specs/xrds.rnc>
- **xrd.rnc**: <http://docs.oasis-open.org/xri/2.0/specs/xrd.rnc>

389  
390

A reference listing of each of these files is provided in Appendix B, and a reference listing of the informative W3C XML Schema versions is provided in Appendix C.

391

### 4.2 XRD Elements and Attributes

392  
393  
394  
395

The following example XRDS instance document illustrates the elements and attributes defined in the XRD schema. Note that because it is provided by the community root authority (`tel:+1-201-555-0123`), it includes only one XRD describing the subsegment `*foo`. Examples in later sections show multiple XRDs.

```

397 <XRDS xmlns="xri://$xrd" ref="xri://(tel:+1-201-555-0123)*foo">
398   <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">
399     <Query>*foo</Query>
400     <Status code="100"/>
401     <ServerStatus code="100"/>
402     <Expires>2005-05-30T09:30:10Z</Expires>
403     <ProviderID>xri://(tel:+1-201-555-0123)</ProviderID>
404     <LocalID>*baz</LocalID>
405     <EquivID>https://example.com/example/resource/</EquivID>
406     <CanonicalID>xri://(tel:+1-201-555-0123)!1234</CanonicalID>
407     <CanonicalEquivID>

450     </Service>
451   </XRD>
452 </XRDS>

```

453 A link to the normative RelaxNG schema definition of the XRD schema is provided in Appendix B.  
454 Additional normative requirements that cannot be captured in XML schema notation are specified  
455 in the following sections. In the case of any conflict, the normative text in this section shall prevail.

**Comment [DSR3]:** Throughout this and the following sections, all attribute definitions have been moved to bullet points following the element definition as suggested by Eran Hammer-Lahav.

## 4.2.1 Management Elements

The first set of elements are used to manage XRDs, particularly from the perspective of caching, error handling, and delegation. Note that to prevent processing conflicts, the XRD schema permits a choice of either `xrd:XRD/xrd:Redirect` elements or `xrd:XRD/xrd:Ref` elements but not both.

### **xrd:XRD**

Container element for all other XRD elements. Attributes:

- `xml:id` (type `xs:ID`). OPTIONAL except in trusted resolution where it is REQUIRED to uniquely identify this element within the containing `xrds:XRDS` document. See sections 4.3.1 and 12.5. Note that this attribute is not explicitly declared in the normative schema as it is an implicit XML attribute defined in [XMLID].
- `idref` (type `xs:idref`). OPTIONAL except in trusted resolution where it is REQUIRED when an XRD element in a nested `xrds:XRDS` document must reference a previously included XRD instance. See sections 4.3.1 and 12.5.
- `version` (type `xs:string`). OPTIONAL for uses outside of XRI resolution but REQUIRED for XRI resolution as defined in section 4.3.2.

### **xrd:XRD/xrd:Type**

0 or more per `xrd:XRD` element. A unique identifier of type `xs:anyURI` that identifies the type of this XRD. This element is provided to support XRD extensibility as described in section 17.1.1. If no instances of this element are present, the type is as defined by this specification. If one or more instances of this element are present, the requirements of the specified XRD type SHOULD be defined by an extension specification, which SHOULD be dereferenceable from the URI, IRI, or XRI used as the value of this element. In all cases XRD processors MAY ignore instances of this element and process the XRD as specified in this document.

**Comment [DSR4]:** Added for XRD extensibility per comment from Eran Hammer-Lahav.

### **xrd:XRD/xrd:Query**

0 or 1 per `xrd:XRD` element. Expresses the XRI, IRI, or URI reference in URI-normal form whose resolution results in this `xrd:XRD` element. See section 5.1.

### **xrd:XRD/xrd:Status**

0 or 1 per `xrd:XRD` element. RECOMMENDED for all XRDs. REQUIRED if the resolver must report certain error conditions. The contents of the element are a human-readable message string describing the status of the response as determined by the resolver. For XRI resolution, values of the Status element are defined in section 15. Attributes:

- `code` (type `xs:int`). REQUIRED. Provides a numeric status code. See section 15.
- `cid` (type `xs:enumeration`). OPTIONAL except when REQUIRED to report the results of CanonicalID verification as defined in section 14.3.4.
- `ceid` (type `xs:enumeration`). OPTIONAL except when REQUIRED to report the results of CanonicalID verification as defined in section 14.3.4.

### **xrd:XRD/xrd:ServerStatus**

0 or 1 per `xrd:XRD` element. Used by an XRI authority server to report the status of a resolution request to an XRI resolver. See section 15.1. Attributes:

- `code` (type `xs:int`). REQUIRED. Provides a numeric status code. See section 15.

**Deleted:** Identical to `xrd:XRD/xrd:Status` except this element is

**Comment [DSR5]:** Wording improvements suggested by Eran Hammer-Lahav.

**Deleted:** , and it does not include the `cid` and `ceid` attributes

499 **xrd:XRD/xrd:Expires**  
500 0 or 1 per `xrd:XRD` element. The date/time, in the form of `xs:dateTime`, after which  
501 this XRD cannot be relied upon. To promote interoperability, this date/time value  
502 SHOULD use the UTC "Z" time zone and SHOULD NOT use fractional seconds. A  
503 resolver MUST NOT use an XRD after the time stated here. A resolver MAY discard this  
504 XRD before the time indicated in this result. If the HTTP transport caching semantics  
505 specify an expiry time earlier than the time expressed in this attribute, then a resolver  
506 MUST NOT use this XRD after the expiry time declared in the HTTP headers per section  
507 13.2 of [RFC2616]. See section 16.2.1.

508 **xrd:XRD/xrd:Redirect**  
509 0 or more per `xrd:XRD` element. Type `xs:anyURI`. MUST contain an absolute HTTP(S)  
510 URI. Choice between this or the `xrd:XRD/xrd:Ref` element below. MUST be  
511 processed by a resolver to locate another XRDS document authorized to describe the  
512 target resource as defined in section 12. Attributes:

- 513 • `priority` (type `xs:nonNegativeInteger`). OPTIONAL. See section 4.3.3.
- 514 • `append` (type `xs:enumeration`). OPTIONAL. Governs construction of the final  
515 redirect URI as defined in section 13.7.

516 **xrd:XRD/xrd:Ref**  
517 0 or more more per `xrd:XRD` element. Type `xs:anyURI`. MUST contain an absolute  
518 XRI. Choice between this or the `xrd:XRD/xrd:Redirect` element above. MUST be  
519 processed by a resolver (depending on the value of the `refs` subparameter) to locate  
520 another XRDS document authorized to describe the target resource as defined in section  
521 12. Attributes:

- 522 • `priority` (type `xs:nonNegativeInteger`). OPTIONAL. See section 4.3.3.

## 523 4.2.2 Trust Elements

524 The second set of elements are for applications where trust must be established in the identifier  
525 authority providing the XRD. These elements are OPTIONAL for generic authority resolution  
526 (section 9), but may be REQUIRED for specific types of trusted authority resolution (section 10)  
527 and CanonicalID verification (section 14.3).

### 528 **xrd:XRD/xrd:ProviderID**

529 0 or 1 per `xrd:XRD` element. A unique identifier of type `xs:anyURI` for the parent  
530 authority providing this XRD. The value of this element MUST be a persistent identifier.  
531 There MUST be negligible probability that the value of this element will be assigned as an  
532 identifier to any other authority. It is RECOMMENDED to use a fully persistent XRI as  
533 defined in [XRISyntax]. If a URN [RFC2141] or other persistent identifier is used, it is  
534 RECOMMENDED to express it as an XRI cross-reference as defined in [XRISyntax].  
535 Note that for XRI authority resolution, the authority identified by this element is the parent  
536 authority (the provider of the current XRD), not the child authority (the target of the  
537 current XRD). The latter is identified by the `xrd:XRD/xrd:Service/xrd:ProviderID`  
538 element inside a authority resolution service endpoint (see below).

Deleted: For purposes of CanonicalID verification (section 14.3),

Comment [DSR6]: Deleted per revision to section 14.3.2 as suggested by Wil Tan.

539 **xrd:XRD/saml:Assertion**

540 0 or 1 per `xrd:XRD` element. A SAML assertion from the provider of the current XRD  
541 that asserts that the information contained in the current XRD is authoritative. Because  
542 the assertion is digitally signed and the digital signature encompasses the containing  
543 `xrd:XRD` element, it also provides a mechanism for the recipient to detect unauthorized  
544 changes since the last time the XRD was published.

545 Note that while a `saml:Issuer` element is required within a `saml:Assertion` element,  
546 this specification makes no requirement as to the value of the `saml:Issuer` element. It  
547 is up to the XRI community root authority to place restrictions, if any, on the  
548 `saml:Issuer` element. A suitable approach is to use an XRI in URI-normal form that  
549 identifies the community root authority. See section 9.1.3.

550 **4.2.3 Synonym Elements**

551 In XRDS architecture, an identifier is a *synonym* of the query identifier (the identifier resolved to  
552 obtain the XRDS document) if it is not character-for-character equivalent but identifies the same  
553 target resource (the resource to which the identifier was assigned by the identifier authority). The  
554 normative rules for synonym usage are specified in section 5.

555 **xrd:XRD/xrd:LocalID**

556 0 or more per `xrd:XRD` element. Type `xs:anyURI`. Asserts an interchangeable  
557 synonym for the value of the `xrd:Query` element. See section 5.2.1 for detailed  
558 requirements. Attributes:

- 559
  - `priority` (type `xs:nonNegativeInteger`). OPTIONAL. See section 4.3.3.

560 **xrd:XRD/xrd:EquiVID**

561 0 or more per `xrd:XRD` element. Type `xs:anyURI`. Asserts an absolute identifier for the  
562 target resource that is not equivalent to the `CanonicalID` or `CanonicalEquiVID` (see  
563 below). See section 5.2.2 for detailed requirements. Attributes:

- 564
  - `priority` (type `xs:nonNegativeInteger`). OPTIONAL. See section 4.3.3.

565 **xrd:XRD/xrd:CanonicalID**

566 0 or 1 per `xrd:XRD` element. Type `xs:anyURI`. Asserts the canonical identifier assigned  
567 to the target resource by the authority providing the XRD. See section 5.2.3 for detailed  
568 requirements.

569 **xrd:XRD/xrd:CanonicalEquiVID**

570 0 or 1 per `xrd:XRD` element. Type `xs:anyURI`. Asserts the canonical identifier for the  
571 target resource assigned by *any* identifier authority. See section 5.2.4 for detailed  
572 requirements.

573 **4.2.4 Service Endpoint Descriptor Elements**

574 The next set of elements is used to describe service endpoints—the set of network endpoints  
575 advertised in an XRD for performing delegated resolution, obtaining further metadata, or  
576 interacting directly with the target resource. Again, because there can be more than one instance  
577 of a service endpoint that satisfies a service endpoint selection query, or more than one instance  
578 of these elements inside a service descriptor, these elements all accept the global `priority`  
579 attribute (section 4.3.3).

580 IMPORTANT: Establishing unambiguous priority is especially important for service endpoints  
581 because they are used to control the direction of authority resolution, the order of Redirect and  
582 Ref processing, and the prioritization of the final service endpoint URIs selected (if any). See  
583 section 4.3.3 for rules and recommendations about usage of the `priority` attribute.

584 Note that to prevent processing conflicts, the XRD schema permits only one of these element  
585 types in a service endpoint: `xrd:URI`, `xrd:Redirect`, or `xrd:Ref`.

#### 586 **xrd:XRD/xrd:Service**

587 0 or more per `xrd:XRD` element. The container element for service endpoint metadata.  
588 Referred to by the abbreviation *SEP*. Attributes:

- 589 • `priority` (type `xs:nonNegativeInteger`). OPTIONAL. See section 4.3.3.

#### 590 **xrd:XRD/xrd:Service/xrd:LocalID**

591 0 or more per `xrd:XRD/xrd:Service` element. Identical to the  
592 `xrd:XRD/xrd:LocalID` element defined above except this synonym is asserted by the  
593 provider of the service and not the parent authority for the XRD. MAY be used to provide  
594 one or more identifiers by which the target resource SHOULD be identified in the context  
595 of the service endpoint. See section 5.2.1 for detailed requirements. Attributes:

- 596 • `priority` (type `xs:nonNegativeInteger`). OPTIONAL. See section 4.3.3.

#### 597 **xrd:XRD/xrd:Service/xrd:URI**

598 0 more per `xrd:XRD/xrd:Service` element. Type `xs:anyURI`. Choice between this or  
599 the `xrd:XRD/xrd:Service/xrd:Redirect` or `xrd:XRD/xrd:Service/xrd:Ref`  
600 elements. If present, it indicates a transport-level URI for accessing the capability  
601 described by the parent `Service` element. For the service types defined for XRI resolution  
602 in section 3.1.2, this URI MUST be an HTTP or HTTPS URI. Other services may use  
603 other transport protocols. Attributes:

- 604 • `priority` (type `xs:nonNegativeInteger`). OPTIONAL. See section 4.3.3.
- 605 • `append` (type `xs:enumeration`). OPTIONAL. Governs construction of the final  
606 service endpoint URI as defined in section 13.7.

#### 607 **xrd:XRD/xrd:Service/xrd:Redirect**

608 0 more per `xrd:XRD/xrd:Service` element. Choice between this or the  
609 `xrd:XRD/xrd:Service/xrd:URI` or `xrd:XRD/xrd:Service/xrd:Ref` elements.  
610 Identical to the `xrd:XRD/xrd:Redirect` element defined above except processed only  
611 in the context of service endpoint selection. See section 12. Attributes:

- 612 • `priority` (type `xs:nonNegativeInteger`). OPTIONAL. See section 4.3.3.

#### 613 **xrd:XRD/xrd:Service/xrd:Ref**

614 0 more per `xrd:XRD/xrd:Service` element. Choice between this or the  
615 `xrd:XRD/xrd:Service/xrd:URI` or `xrd:XRD/xrd:Service/xrd:Redirect`  
616 elements. Identical to the `xrd:XRD/xrd:Ref` element defined above except processed  
617 only in the context of service endpoint selection. See section 12. Attributes:

- 618 • `priority` (type `xs:nonNegativeInteger`). OPTIONAL. See section 4.3.3.

## 619 4.2.5 Service Endpoint Trust Elements

620 Similar to the XRD trust elements defined above, these elements enable trust to be established in  
621 the provider of the service endpoint. These elements are OPTIONAL for generic authority  
622 resolution (section 9), but REQUIRED for SAML trusted authority resolution (section 10.2).

### 623 **xrd:XRD/xrd:Service/xrd:ProviderID**

624 0 or 1 per `xrd:XRD/xrd:Service` element. Identical to the  
625 `xrd:XRD/xrd:ProviderID` above, except this identifies the provider of the *described*  
626 *service endpoint* instead of the provider of the XRD. For an XRI authority resolution  
627 service endpoint, it identifies the *child authority* who will perform resolution of subsequent  
628 XRI subsegments. In SAML trusted resolution, when a resolution request is made to the  
629 child authority at this service endpoint, the contents of the `xrd:XRD/xrd:ProviderID`  
630 element in the response MUST match the content of this element for correlation as  
631 defined in section 10.2.5. The same usage MAY apply to other services not defined in  
632 this specification. Authors of other specifications employing XRD service endpoints  
633 SHOULD define the scope and usage of this element, particularly for trust verification.

### 634 **xrd:XRD/xrd:Service/ds:KeyInfo**

635 0 or 1 per `xrd:XRD/xrd:Service` element. This element provides the digital signature  
636 metadata necessary to validate interaction with the resource identified by the  
637 `xrd:XRD/xrd:Service/xrd:ProviderID` (above). In XRI resolution, this element  
638 comprises the key distribution method for SAML trusted authority resolution as defined in  
639 section 10.2.5. The same usage MAY apply to other services not defined in this  
640 specification.

## 641 4.2.6 Service Endpoint Selection Elements

642 The final set of service endpoint descriptor elements is used in XRI resolution for service endpoint  
643 selection. These all include two global attributes used for this purpose: `match` and `select`.

### 644 **xrd:XRD/xrd:Service/xrd:Type**

645 0 or more per `xrd:XRD/xrd:Service` element. A unique identifier of type `xs:anyURI`  
646 that identifies the type of capability available at this service endpoint. See section 3.1.2  
647 for the resolution service types defined in this specification. If a service endpoint does not  
648 include at least one `xrd:Type` element, the service type is effectively described by the  
649 type of URI specified in the `xrd:XRD/xrd:Service/xrd:URI` element, i.e., an HTTP  
650 URI specifies an HTTP service. See section 13.3.6 for Type element matching rules.  
651 Attributes:

- 652 • `match` (type `xs:enumeration`). OPTIONAL. See section 13.3.2.
- 653 • `select` (type `xs:boolean`). OPTIONAL. See section 13.4.2.

### 654 **xrd:XRD/xrd:Service/xrd:Path**

655 0 or more per `xrd:XRD/xrd:Service` element. Of type `xs:string`. Contains a string  
656 meeting the `xri-path` production defined in section 2.2.3 of [XRISyntax]. See section  
657 13.3.7 for Path element matching rules. Attributes:

- 658 • `match` (type `xs:enumeration`). OPTIONAL. See section 13.3.2.
- 659 • `select` (type `xs:boolean`). OPTIONAL. See section 13.4.2.

### 660 **xrd:XRD/xrd:Service/xrd:MediaType**

661 0 or more per `xrd:XRD/xrd:Service` element. Of type `xs:string`. The media type of  
662 content available at this service endpoint. The value of this element MUST be of the form

663 of a media type defined in [RFC2046]. See section 3.3 for the media types used in XRI  
664 resolution. See section 13.3.8 for MediaType element matching rules. Attributes:

- 665 • `match` (type `xs:enumeration`). OPTIONAL. See section 13.3.2.
- 666 • `select` (type `xs:boolean`). OPTIONAL. See section 13.4.2.

667 The XRD schema (Appendix B) allows other elements and attributes from other namespaces to  
668 be added throughout. As described in section 17.1.1, these points of extensibility can be used to  
669 deploy new XRI resolution schemes, new service description schemes, or other metadata about  
670 the described resource.

## 671 4.3 XRD Attribute Processing Rules

### 672 4.3.1 ID Attribute

673 For uses such as SAML trusted resolution (section 10.2) that require unique identification of  
674 multiple XRD elements within an XRDS document, the XRD element uses the implicit `xml:id`  
675 attribute as defined by the W3C XML ID specification [XMLID]. Note that this attribute is NOT  
676 explicitly declared in either the RelaxNG schema in Appendix B or the XML Schema in Appendix  
677 C since it is inherently included by the extensibility design of both schemas.

678 If present, the value of this attribute MUST be unique for all elements in the containing XML  
679 document. Because an XRI resolver may need to assemble multiple XRDs received from different  
680 authority servers into one XRDS document, there MUST be negligible probability that the value of  
681 the `xrd:XRD/@xml:id` attribute is not globally unique. For this reason the value of this attribute  
682 SHOULD be a UUID as defined by [UUID] prefixed by a single underscore character (“\_”) in  
683 order to make it a legal *NCName* as required by [XMLID]. However, the value of this attribute  
684 MAY be generated by any algorithm that fulfills the same requirements of global uniqueness and  
685 *NCName* conformance.

686 Note that when an XRI resolver is assembling multiple XRDs into a single XRDS document, their  
687 XML document order MUST match the order in which they were resolved (see section 9.1.2).  
688 Also, if Redirect or Ref processing requires the same XRD to be included in an XRDS document  
689 twice (via a nested XRDS document), that XRD MUST reference the previous instance using the  
690 `xrd:XRD/@idref` attribute as defined in section 12.5.

### 691 4.3.2 Version Attribute

692 Unlike the XRDS element, which is not intended to be versioned, the `xrd:XRD` element has the  
693 optional attribute `xrd:XRD/@version`. Use of this attribute is REQUIRED for XRI resolution.  
694 The value of this attribute MUST be the exact numeric version value of the XRI Resolution  
695 specification to which the containing XRD element conforms. See sections 3.1.1 and 17.2.1.  
696 General rules about versioning of the XRI resolution protocol are defined in section 17.2. Specific  
697 rules for processing the XRD version attribute are specified in section 17.2.4.

### 698 4.3.3 Priority Attribute

699 Certain XRD elements involved in the XRI resolution process (`xrd:Redirect`, `xrd:Ref`,  
700 `xrd:Service`, and `xrd:URI`) may be present multiple times in an XRDS document to enable  
701 delegation, provide redundancy, expose differing capabilities, or other purposes. In this case XRD  
702 authors SHOULD use the global `priority` attribute to prioritize selection of these element  
703 instances. Like the priority attribute of DNS records, this attribute accepts a non-negative integer  
704 value.

705 Following are the normative processing rules that apply whenever there is more than one  
706 instance of the same type of element selected in an XRD (if there is only one instance selected,  
707 the `priority` attribute is ignored.)

- 708 1. The consuming application SHOULD select the element instance with the lowest numeric  
709 value of the `priority` attribute. For example, an element with `priority` attribute value  
710 of "10" should be selected before an element with a `priority` attribute value of "11",  
711 and an element with `priority` attribute value of "11" should be selected before an  
712 element with a `priority` attribute value of "25". Zero is the highest `priority` attribute  
713 value. Null is the lowest `priority` attribute value—it is the equivalent of a value of  
714 infinity. It is RECOMMENDED to use a large finite value (100 or more) rather than a null  
715 value.
- 716 2. If an element has no `priority` attribute, its `priority` attribute value is considered to  
717 be null, i.e., the lowest possible priority value. Rather than omitting a `priority` attribute,  
718 it is RECOMMENDED that XRI authorities follow the standard practice in DNS and set  
719 the default `priority` attribute value to "10".
- 720 3. If two or more instances of the same element type have identical `priority` attribute  
721 values (including the null value), the consuming application SHOULD select one of the  
722 instances at random. This consuming application SHOULD NOT simply choose the first  
723 instance that appears in XML document order.

724 **IMPORTANT:** It is vital that implementers observe the preceding rule in order to support  
725 intentional redundancy or load balancing semantics. At the same time, it is vital that XRDS  
726 authors understand that this rule can result in non-deterministic behavior if two or more of the  
727 same type of synonym elements or service endpoint elements are included with the same priority  
728 in an XRD but are NOT intended for redundancy or load balancing.

- 729 4. An element selected according to these rules is referred to in this specification as *the*  
730 *highest priority element*. If this element is subsequently disqualified from the set of  
731 qualified elements, the next element selected according to these rules is referred to as  
732 *the next highest priority element*. If a resolution operation specifying selection of the  
733 highest priority element fails, the resolver SHOULD attempt to select the next highest  
734 priority element unless otherwise specified. This process SHOULD be continued for all  
735 other instances of the qualified elements until success is achieved or all instances are  
736 exhausted.

#### 737 4.4 XRI and IRI Encoding Requirements

738 The W3C XML 1.0 specification [XML] requires values of XML elements of type `xs:anyURI` to  
739 be valid IRIs. Thus all XRIs used as the values of XRD elements of this type MUST be in at least  
740 IRI-normal form as defined in section 2.3 of [XRISyntax].

741 A further restriction applies to XRIs or IRIs used in XRI resolution because it relies on HTTP(S) as  
742 a transport protocol. Therefore when an XRI or IRI is used as the value of an `xrd:Query`,  
743 `xrd:LocalID`, `xrd:EquivID`, `xrd:CanonicalID`, `xrd:CanonicalEquivID`,  
744 `xrd:Redirect`, `xrd:Ref`, `xrd:Type`, or `xrd:Path` element, it MUST be in URI-normal form  
745 as defined in section 2.3 of [XRISyntax].

746 Note: XRIs composed entirely of valid URI characters and which do not use XRI parenthetical  
747 cross-reference syntax do not require escaping in the transformation to URI-normal form.  
748 However, XRIs that use characters valid only in IRIs or that use XRI parenthetical cross-reference  
749 syntax may require percent encoding in the transformation to URI-normal form as explained in  
750 section 2.3 of [XRISyntax].

## 751 5 XRD Synonym Elements

752 XRDS architecture includes support for *synonyms*—XRI, IRIs, or URIs that are not character-for-  
753 character equivalent, but which identify the same target resource (in the same context, or across  
754 different contexts). Table 7 lists the four synonym elements supported in XRDs.

XRD Synonym Element	Cardinality	Resolution Scope	Assigning Authority	Resolves to different XRD?
LocalID	Zero-or-more	Local	MUST be the parent authority	MUST NOT
EquivID	Zero-or-more	Global	Any authority	SHOULD
CanonicalID	Zero-or-one	Global	MUST be the parent authority	MUST NOT
CanonicalEquivID	Zero-or-one	Global	Any authority	SHOULD

755 Table 7: The four XRD synonym elements.

756 This section specifies the normative rules for usage of each XRD synonym element.

### 757 5.1 Query Identifiers

758 Each XRI synonym element asserts a synonym for the *query identifier*. This is the identifier  
759 resolved to obtain the XRDS document containing the XRD asserting the synonym. A *fully-*  
760 *qualified query identifier* may be either:

- 761 1. A valid absolute HTTP(S) URI that does not contain an XRI.
- 762 2. A valid absolute XRI, either in a standard XRI form as defined in **[XRISyntax]**, or  
763 encoded in an HTTP(S) URI (called an *HXRI*) as specified in section 11.2.

#### 764 5.1.1 HTTP(S) URI Query Identifiers

765 If the fully-qualified query identifier is an absolute HTTP(S) URI, the XRDS document to which it  
766 resolves (via the protocol specified in section 6) MUST contain a single XRD. This XRD MAY  
767 include an `xrd:Query` element; if present, the value MUST be equivalent to the original HTTP(S)  
768 URI query identifier.

769 In this single XRD, all synonym elements in Table 7 assert synonyms for the original HTTP(S)  
770 URI.

#### 771 5.1.2 XRI Query Identifiers

772 If the fully-qualified query identifier is an absolute XRI, the XRDS document to which it resolves  
773 (via the protocol specified in section 9.1.2) MAY contain multiple XRDs, each XRD corresponding  
774 to one subsegment of the authority component of the XRI. Each XRD SHOULD include an  
775 `xrd:Query` element that echos back the XRI subsegment described by this XRD. This is called  
776 the *local query identifier*, because it represents just one subsegment of the fully-qualified query  
777 identifier.

778 At any point in the XRI resolution chain, the combination of the community root authority XRI  
779 (section 9.1.3) plus all local query identifiers resolved in all XRDs up to that point is called the  
780 *current fully-qualified query identifier*. When the resolution chain is complete, the current fully-  
781 qualified query identifier is equal to the starting fully-qualified query identifier.

782 In each XRD in the resolution chain, the LocalID element asserts a synonym for the local query  
783 identifier, and the EquivID, CanonicalID, and CanonicalEquivID elements assert a synonym for  
784 the current fully-qualified query identifier.

## 785 5.2 Synonym Elements

### 786 5.2.1 LocalID

787 In an XRD, a synonym for the local query identifier is asserted using the `xrd:LocalID` element.  
788 LocalIDs may be used at both the XRD level (as a child of the root `xrd:XRD` element) and at the  
789 service endpoint (SEP) level (as a child of the root `xrd:XRD/xrd:Service` element).

790 At the XRD level, the value of the `xrd:XRD/xrd:LocalID` element asserts a synonym that is  
791 interchangeable with the contents of the `xrd:Query` element in the XRD. This means that  
792 resolution of a LocalID in the context of the same parent authority using the same resolution  
793 query parameters as the current query MUST result in an equivalent XRD as defined in section  
794 5.4. It also means an XRI resolver MAY use a LocalID as an alternate key for the XRD in its  
795 cache (see section 16.4.2).

796 If the parent authority has assigned a persistent local identifier to the resource described by an  
797 XRD, it SHOULD return this persistent identifier as an `xrd:XRD/xrd:LocalID` value in any  
798 resolution response for a reassignable local identifier for the same resource. The reverse MAY  
799 also be true, however parent authorities MAY adopt privacy or other policies that restrict the  
800 reassignable synonyms returned for any particular resolution request.

801 At the SEP level, the `xrd:XRD/xrd:Service/xrd:LocalID` element MAY be used to express  
802 either a local or global identifier for the target resource in the context of the specific service being  
803 described. If present, consuming applications SHOULD use the value of the highest priority  
804 instance of the `xrd:XRD/xrd:Service/xrd:LocalID` element to identify the target resource  
805 in the context of this service endpoint. If not present, consuming applications SHOULD select a  
806 synonym as defined in section 5.6.

807 SPECIAL SECURITY CONSIDERATIONS: A parent authority SHOULD NOT permit a child  
808 authority to edit a LocalID value in an XRD without authenticating the child authority and verifying  
809 that the child authority is authorized to use this LocalID value either at the XRD level and/or the  
810 SEP level.

### 811 5.2.2 EquivID

812 In an XRD, any synonym for the current fully-qualified query identifier *except* a CanonicalID or a  
813 CanonicalEquivID (see below) is asserted using the `xrd:EquivID` element. Unlike a LocalID, an  
814 EquivID is NOT REQUIRED to be issued by the parent authority.

815 An EquivID MUST be an absolute identifier. For durability of the reference, it is RECOMMENDED  
816 to use a persistent identifier such as a persistent XRI [XRISyntax] or a URN [RFC2141].

817 An EquivID element is OPTIONAL in an XRD except in two cases:

- 818 1. When it is REQUIRED as a backpointer to verify another EquivID element in a different  
819 XRD as specified in section 14.2.
- 820 2. When it is REQUIRED as a backpointer to verify a CanonicalEquivID element as  
821 specified in section 14.3.3.

822 SPECIAL SECURITY CONSIDERATIONS: An EquivID synonym SHOULD NOT be trusted  
823 unless it is verified. This function is not performed automatically by XRI resolvers but may be  
824 easily performed by consuming applications using one additional XRI resolution call as specified  
825 in section 14.2. A parent authority SHOULD NOT permit a child authority to edit the EquivID value  
826 in an XRD without authenticating the child authority and verifying that the child authority is

827 authorized to use this EquivID value. A parent authority SHOULD NOT assert an EquivID  
828 element if the identifier authority to whom it points is not authorized to make a CanonicalEquivID  
829 assertion.

### 830 5.2.3 CanonicalID

831 The purpose of the `xrd:CanonicalID` element is to assert the canonical identifier assigned by  
832 the parent authority to the target resource described by an XRD. It plays a special role in XRD  
833 synonym architecture because it is the ultimate test of XRD equivalence as defined in section 5.4.  
834 A CanonicalID MUST meet all the requirements of an EquivID plus the following:

- 835 1. It MUST be an identifier for which the parent authority is the final authority. This means  
836 that resolution of a CanonicalID using the same resolution query parameters as the  
837 current query MUST result in an equivalent XRD as defined in section 5.4.
- 838 2. If the CanonicalID is any XRI except a community root authority XRI (section 9.1.3), it  
839 MUST consist of the parent authority's CanonicalID plus one additional subsegment. (In  
840 XRI resolution the parent authority's CanonicalID is always in the immediately preceding  
841 XRD in the same XRDS document, not in a nested XRDS document produced as a result  
842 of Redirect and Ref processing as defined in section 12.5.) For example, if the  
843 CanonicalID asserted for a target resource is `@!1!2!3`, then the CanonicalID for the  
844 parent authority must be `@!1!2`. See section 14.3.2 for details.
- 845 3. Once assigned, a parent authority SHOULD NEVER: a) change or reassign a  
846 CanonicalID value, or b) stop asserting a CanonicalID element in an XRD in which it has  
847 been asserted. For this reason, it is STRONGLY RECOMMENDED to use a persistent  
848 identifier such as a persistent XRI [**XRISyntax**] or a URN [**RFC2141**].

849 As a best practice, a parent authority SHOULD ALWAYS publish a CanonicalID element in an  
850 XRD, even if its value is equivalent to the current fully-qualified query identifier. This practice:

- 851 • Makes it unambiguous to consuming applications which absolute synonym they should use to  
852 identify the target resource in the context of the parent authority.
- 853 • Enables child authorities to issue their own verifiable CanonicalIDs.
- 854 • Enables verification of a CanonicalEquivID if asserted (below).

855 SPECIAL SECURITY CONSIDERATIONS: A CanonicalID synonym SHOULD NOT be trusted  
856 unless it is verified. CanonicalID verification is performed automatically during resolution by an  
857 XRI resolver unless this function is explicitly turned off; see section 14. A parent authority  
858 SHOULD NOT permit a child authority to edit the CanonicalID value in an XRD without  
859 authenticating the child authority and verifying that the child authority is authorized to use this  
860 CanonicalID value.

### 861 5.2.4 CanonicalEquivID

862 The purpose of the `xrd:CanonicalEquivID` element is to assert a canonical synonym for the  
863 fully-qualified query identifier for which the parent authority MAY NOT be authoritative. A  
864 CanonicalEquivID MUST meet all the requirements of an EquivID plus the following:

- 865 1. In order for the value of the `xrd:CanonicalEquivID` element to be verified: a) the  
866 XRD in which it appears MUST include a CanonicalID that can be verified as specified in  
867 section 14.2, and b) the XRD to which it resolves MUST meet the rules specified in  
868 section 14.3.3. In particular, those rules require that the CanonicalID of that XRD match  
869 the asserted CanonicalEquivID.
- 870 2. For the same reasons as with a CanonicalID, it is STRONGLY RECOMMENDED to use  
871 a persistent identifier such as a persistent XRI [**XRISyntax**] or a URN [**RFC2141**].

872 3. Although the CanonicalEquivID associated with a CanonicalID MAY change over time, at  
873 any one point in time, every XRD from the same parent authority that asserts the same  
874 CanonicalID value MUST assert the same CanonicalEquivID value if the XRD includes a  
875 CanonicalEquivID element.

876 As a best practice, a parent authority SHOULD publish a CanonicalEquivID in an XRD if  
877 consuming applications SHOULD be able to persistently identify the target resource using this  
878 identifier in other contexts. Also, a CanonicalEquivID value SHOULD change very infrequently, if  
879 at all.

880 SPECIAL SECURITY CONSIDERATIONS: A CanonicalEquivID synonym SHOULD NOT be  
881 trusted unless it is verified. Verification of the value of the CanonicalEquivID element in the final  
882 XRD in an XRDS document is performed automatically during resolution by an XRI resolver  
883 unless this function is explicitly turned off; see section 14. A parent authority SHOULD NOT  
884 permit a child authority to edit the CanonicalEquivID value in an XRD without authenticating the  
885 child authority and verifying that the child authority is authorized to use this CanonicalEquivID  
886 value.

### 887 5.3 Redirect and Ref Elements

888 While similar in some ways to synonym elements, the `xrd:Redirect` and `xrd:Ref` elements  
889 MUST NOT be used to assert a synonym. Instead their purpose is to assert that a different XRDS  
890 document is authorized to serve as an equally valid descriptor of the target resource. These  
891 elements enable separation of synonym assertion semantics vs. distributed XRDS document  
892 authorization semantics.

893 In the same way as a LocalID, both a Redirect and a Ref may be used in an XRD at either the  
894 XRD level (as a child of the root `xrd:XRD` element) and at the SEP level (as a child of the root  
895 `xrd:XRD/xrd:Service` element). The complete rules for Redirect and Ref processing in XRI  
896 resolution are specified in section 12.

897 If two independent resources are later merged into the same resource, e.g., two businesses are  
898 merged into one, the use of an EquivID, CanonicalID, or CanonicalEquivID element SHOULD be  
899 combined with the use of a Redirect or Ref element to provide the semantics of BOTH identifier  
900 synonymity and XRDS authorization.

901 SPECIAL SECURITY CONSIDERATIONS: A parent authority SHOULD NOT permit a child  
902 authority to edit a Redirect or Ref value in an XRD without authenticating the child authority and  
903 verifying that the child authority is authorized to use this Redirect or Ref value at either the XRD  
904 level and/or the SEP level.

### 905 5.4 XRD Equivalence

906 LocalID and CanonicalID synonyms are required to resolve to an XRD that is equivalent to the  
907 XRD in which the synonym is asserted. Two XRDS MUST be considered equivalent if they meet  
908 the following rules:

- 909 1. Both XRDS contain a CanonicalID element.
- 910 2. The values of these CanonicalID elements are equivalent according to the equivalence  
911 rules of the applicable identifier scheme. Note that these identifiers MUST be in URI-  
912 normal form as specified in section 4.4. In addition, if the CanonicalID values are  
913 HTTP(S) URIs, fragments MUST be considered significant in comparison.

914 In addition, while not strictly required for XRD equivalence, section 5.2.4 REQUIRES that two  
915 equivalent XRDS issued at the same point in time assert the same CanonicalEquivID value if they  
916 both contain a CanonicalEquivID element. It is RECOMMENDED that all other elements in the  
917 XRD that are not relative to a specific resolution request also be equivalent.

## 918 5.5 Synonym Verification

919 For security purposes, it is STRONGLY RECOMMENDED that a consuming application not rely  
920 on EquivID, CanonicalID, or CanonicalEquivID synonyms unless they are verified as specified in  
921 section 14.

## 922 5.6 Synonym Selection

923 It is out of the scope of this specification to specify policies consuming applications should use to  
924 select their desired synonym(s) to identify a target resource. However, the following are  
925 RECOMMENDED best practices:

- 926 • Only select a verified synonym (see above).
- 927 • Select a persistent synonym, particularly if a long term or immutable reference is required. If  
928 a persistent synonym is present, other reassignable synonyms (including the current fully-  
929 qualified query identifier) SHOULD be treated only as temporary identifiers.
- 930 • Select a CanonicalID if present, verified, and persistent. This identifier SHOULD be used  
931 whenever referencing the target resource in the context of the parent authority issuing the  
932 CanonicalID.
- 933 • If possible, *also* select a CanonicalEquivID if present, verified, and persistent. This identifier  
934 SHOULD be used as a reference to the target resource in any context other than that of the  
935 parent authority.
- 936 • When selecting a synonym to use in the context of a specific service endpoint, follow the  
937 recommendations for use of the `xrd:XRD/xrd:Service/xrd:LocalID` element as  
938 specified in section 5.2.1.

---

939 **6 Discovering an XRDS Document from an**  
940 **HTTP(S) URI**

941 A resource described by an XRDS document and potentially identified by one or more XRIs may  
942 also be identified with one or more HTTP(S) URIs. For backwards compatibility with HTTP(S)  
943 infrastructure, this section defines two protocols, originally specified in [Yadis], for discovering an  
944 XRDS document starting with an HTTP(S) URI.

945 **6.1 Overview**

946 There are two protocols for discovery of an XRDS document from an HTTP(S) URI:

- 947 1. *HEAD protocol*: using an HTTP(S) HEAD request to obtain a header with XRDS  
948 document location information as specified in section 6.2.
- 949 2. *GET protocol*: using an HTTP(S) GET request with content negotiation as specified in  
950 section 6.3.

951 An XRDS server **MUST** support the GET protocol and **MAY** support the HEAD protocol. An  
952 XRDS client **MAY** attempt the HEAD protocol but **MUST** attempt the GET protocol if the HEAD  
953 protocol fails.

954 **6.2 HEAD Protocol**

955 Under this protocol the XRDS client **MUST** begin by issuing an HTTP(S) HEAD request. This  
956 request **SHOULD** include an Accept header specifying the content type  
957 `application/xrds+xml`.

958 The response from the XRDS server **MUST** be HTTP(S) response-headers only, which **MAY**  
959 include one or both of the following:

- 960 1. An `X-XRDS-Location` response-header.
- 961 2. A content type response-header specifying the content type `application/xrds+xml`.

962 If the response includes the first option above, the value of the `X-XRDS-Location` response-  
963 header **MUST** be an HTTP(S) URI which gives the location of an XRDS document describing the  
964 target resource. The XRDS client **MUST** then request this document as specified in section 6.3.

965 If the response includes the second option above, the XRDS client **MUST** request the XRDS  
966 document from the original HTTP(S) URI as specified in section 6.3.

967 If the response includes both options above, the value of the `X-XRDS-Location` element in the  
968 HTTP(S) response-header **MUST** take precedence.

969 If response includes neither of the two options above, this protocol fails and the XRDS client  
970 **MUST** fall back to using the protocol specified in section 6.3.

971 In all cases the HTTP(S) status messages and error codes defined in [RFC2616] apply.

972 **6.3 GET Protocol**

973 Under this protocol the XRDS client **MUST** begin by issuing an HTTP(S) GET request. This  
974 request **SHOULD** include an Accept header specifying the content type  
975 `application/xrds+xml`.

976 The XRDS server response **MUST** be one of four options:

- 977 1. HTTP(S) response-headers only as defined in section 6.2.

- 978 2. HTTP(S) response-headers as defined in section 6.2 together with a document, which  
979 MAY be either document type specified in options 3 or 4 below.
- 980 3. A valid HTML document with a <head> element that includes a <meta> element with an  
981 http-equiv attribute equal to X-XRDS-Location.
- 982 4. A valid XRDS document (content type application/xrds+xml).

983 If the response is only HTTP(S) response headers as defined in section 6.2, or if in addition to  
984 these response headers it includes any document other than the two document types defined in  
985 the third and fourth options above, the protocol MUST proceed as defined in section 6.2, *except*  
986 *that there is no fallback to this section if that protocol fails.*

987 If the response is only an HTML document as defined in the third option above, the value of the  
988 <meta> element with an http-equiv attribute equal to X-XRDS-Location MUST be an  
989 HTTP(S) URI which gives the location of an XRDS document describing the target resource. If  
990 this HTTP(S) URI is identical to the starting HTTP(S) URI, this is a loop and the protocol fails.  
991 Otherwise, the XRDS client MUST request the XRDS document from this URI using an HTTP(S)  
992 GET. This request SHOULD include an Accept header specifying the content type  
993 application/xrds+xml.

994 If the response includes both an HTTP(S) response header and the HTML document defined in  
995 the third option above, the value of the X-XRDS-Location element in the HTTP(S) response-  
996 header MUST take precedence.

997 If the response includes an XRDS document as specified in the fourth option above, the protocol  
998 has completed successfully.

999 In all cases the HTTP(S) status messages and error codes defined in **[RFC2616]** apply.

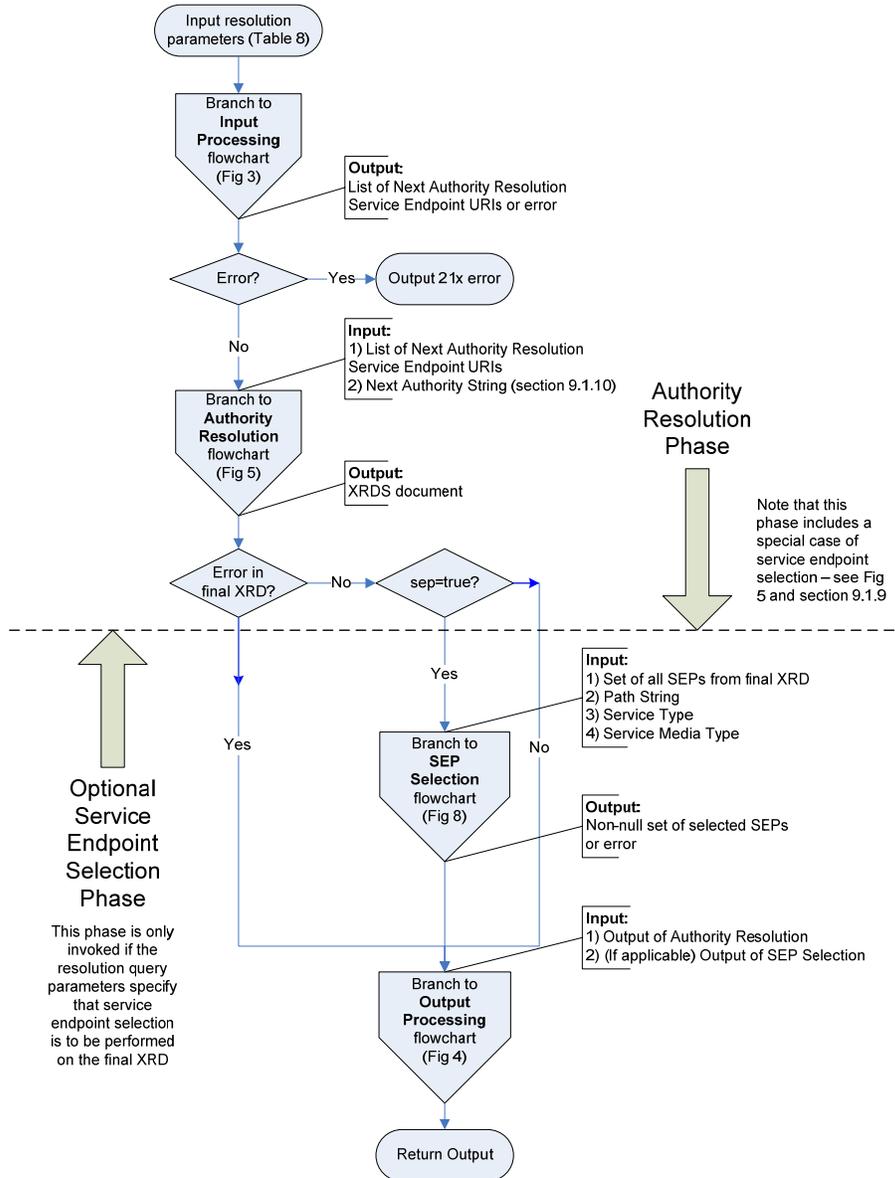

1000 Note: If the XRDS server supports content negotiation, the response SHOULD include a Vary:  
1001 header to allow caches to properly interpret future requests. This header SHOULD be present  
1002 even in the case where the HTML page is returned (instead of an XRDS document).

1003

## 7 XRI Resolution Flow

1004  
1005  
1006  
1007

Logically, XRI resolution is a function invoked by an application to dereference an XRI into a descriptor of the target resource (or in some cases to a representation of the resource itself). Figure 2 is a top-level flowchart of this function highlighting the two major phases: *authority resolution* followed by *optional service endpoint selection*.

1008

1009

Figure 2: Top-level flowchart of XRI resolution phases.

1010 Branches of this top-level flowchart are used throughout the specification to provide a logical  
1011 overview of key components of XRI resolution. The branch flowcharts include:

- 1012 • Figure 3: Input processing (section 8.1).
- 1013 • Figure 4: Output processing (section 8.2).
- 1014 • **Figure 5: Authority resolution (section 9).**
- 1015 • Figure 6: XRDS requests (section 9.1.3).
- 1016 • **Figure 7: Redirect and Ref processing (section 12).**
- 1017 • **Figure 8: Service endpoint selection (section 13).**
- 1018 • Figure 9: Service endpoint selection logic (section 13.2).

1019 **IMPORTANT:** In all cases the flowcharts are informative and the specification text is normative.  
1020 However, the flowcharts are recommended as an aid in reading the specification. In particular,  
1021 those highlighted in **bold** above illustrate the recursive calls for authority resolution and service  
1022 endpoint selection used during Redirect and Ref processing (section 12). Implementers should  
1023 pay special attention to these calls and the guidance in section 12.6, *Recursion and Backtracking*.

1024

## 8 Inputs and Outputs

1025  
1026  
1027  
1028

This section defines the logical inputs and outputs of XRI resolution together with their processing rules. It does not specify a binding to a particular local resolver interface. A binding to an HTTP interface for XRI proxy resolvers is specified in section 11. For purposes of illustration, a binding to a non-normative, language-neutral API is suggested in Appendix F.

1029

### 8.1 Inputs

1030  
1031  
1032  
1033

Table 8 summarizes the logical input parameters to XRI resolution and whether they are applicable in the authority resolution phase or the service endpoint selection phase. In this specification, references to these parameters use the logical names in the first column. Local APIs MAY use different names for these parameters and MAY define additional parameters.

Logical Input Parameter Name	Type	Required/Optional	Default	Resolution Phase	Section
QXRI (query XRI) including Authority String, Path String, and Query String	xs:anyURI	Required	N/A	Authority Resolution (except Path String which is used in Service Endpoint Selection)	8.1.1
Resolution Output Format	xs:string (media type)	Optional	Null	Authority Resolution	8.1.2
Service Type	xs:anyURI	Optional	Null	Service Endpoint Selection	8.1.3
Service Media Type	xs:string (media type)	Optional	Null	Service Endpoint Selection	8.1.4

1034

Table 8: Input parameters for XRI resolution.

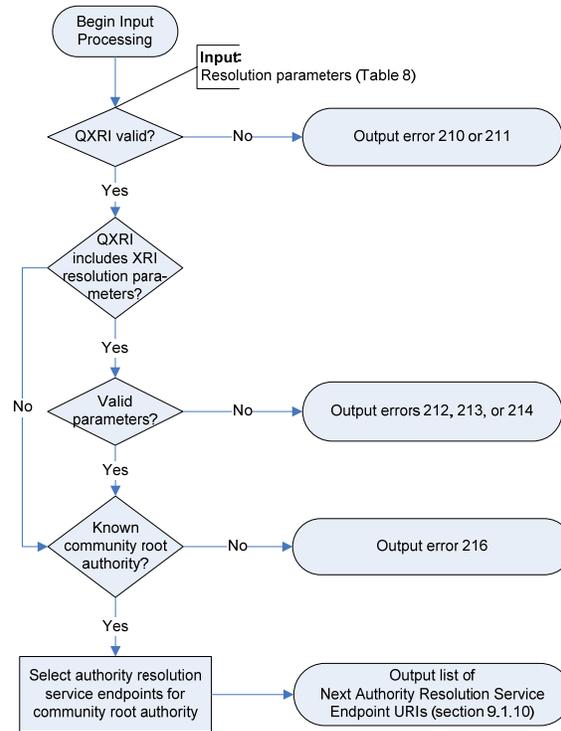

1035  
1036

The following general rules apply to all input parameters as well as to all XRD elements throughout this specification:

1037  
1038  
1039  
1040  
1041  
1042  
1043  
1044  
1045  
1046  
1047

1. The presence of an input parameter, subparameter, or XRD element with an empty value MUST be treated as equivalent to the absence of that input parameter, subparameter, or XRD element. (Note that this rule does not apply to XRD attributes.)
2. From a programmatic standpoint, both conditions above MUST be considered as equivalent to setting the value of that parameter, subparameter, or element to null.
3. In an XRD element, an attribute with an empty value is an error and MUST NOT be interpreted as the default value or any other value of that attribute.
4. As required by **[XMLSchema2]**, for all Boolean subparameters: a) the string values `true` and `false` MUST be considered case-insensitive (lowercase is RECOMMENDED), b) the values `true` and `1` MUST be considered equivalent, b) the values `false` and `0` MUST be considered equivalent.

1048 Figure 3 is a flowchart (non-normative) illustrating the processing of input parameters.

1049

1050 *Figure 3: Input processing flowchart.*

1051 The following sections specify additional validation and usage requirements that apply to  
1052 particular input parameters.

1053 **8.1.1 QXRI (Authority String, Path String, and Query String)**

1054 The QXRI (query XRI) is the only REQUIRED input parameter. Per [XRISyntax], a QXRI consists  
 1055 of three logical subparameters as defined in Table 9.

Logical Parameter Name	Type	Required/Optional	Value
Authority String	xs:string	Required	Contents of the authority component of the QXRI, NOT including the XRI scheme name or leading double forward slashes ("/") or a terminating single forward slash ("/").
Path String	xs:string	Optional	Contents of the path component of the QXRI, NOT including the leading single forward slash ("/") or terminating delimiter (such as "/", "?", "#", whitespace, or CRLF). If the path component is absent or empty, the value is null.
Query String	xs:string	Optional	Contents of the query component of the QXRI, NOT including leading question mark ("?") or terminating delimiter (such as "#", white space, or CRLF). If the query component is absent or empty, the value is null.

1056 *Table 9: Subparameters of the QXRI input parameter.*

1057 The fourth possible component of a QXRI—a fragment—is by definition resolved locally relative  
 1058 to the target resource identified by the combination of the Authority, Path, and Query  
 1059 components, and as such does not play a role in XRI resolution.

1060 Following are the constraints on the value of the QXRI parameter.

- 1061 1. It MUST be a valid absolute XRI according to the ABNF defined in [XRISyntax]. To  
 1062 resolve a relative XRI reference, it must be converted into an absolute XRI using the  
 1063 procedure defined in section 2.4 of [XRISyntax].
- 1064 2. For authority or proxy resolution as defined in this specification, the QXRI MUST be in  
 1065 URI-normal form as defined in section 2.3.1 of [XRISyntax]. A local resolver API MAY  
 1066 support the input of other XRI forms but SHOULD document the normal form(s) it  
 1067 supports and its normalization policies.
- 1068 3. When a QXRI is included as part of an HXRI (section 11.2) for XRI proxy resolution, the  
 1069 QXRI MUST be normalized as specified in section 11.2, and all HXRI query parameters  
 1070 MUST follow the encoding rules specified in sections 11.3 and 11.4.

1071 **8.1.2 Resolution Output Format**

1072 The Resolution Output Format is an OPTIONAL parameter that, together with its subparameters,  
 1073 is used to specify:

- 1074 • The media type for the resolution response.
- 1075 • Whether generic or trusted resolution must be used by the resolver.
- 1076 • Whether Refs should be followed during resolution.
- 1077 • Whether CanonicalID verification should not be performed during resolution.
- 1078 • Whether service endpoint selection should be performed on the final XRD.

- 1079 • Whether default matches should be ignored during service endpoint selection.
- 1080 • Whether URIs should automatically be constructed in the final XRD.

1081 Following are the normative requirements for the use of this parameter.

- 1082 1. The Resolution Output Format MUST be one of the values specified in Table 5 and MAY  
1083 include any of the subparameters specified in Table 6.
- 1084 2. If the value of the `https` subparameter is TRUE, the resolver MUST use the HTTPS  
1085 trusted authority resolution protocol specified in section 10.1 (or return an error indicating  
1086 this is not supported).
- 1087 3. If the value of the `saml` subparameter is TRUE, the resolver MUST use the SAML trusted  
1088 authority resolution protocol specified in section 10.2 (or return an error indicating this is  
1089 not supported).
- 1090 4. If the value of both the `https` and `saml` subparameters are TRUE, the resolver MUST  
1091 use the HTTPS+SAML trusted authority resolution protocol specified in section 10.3 (or  
1092 return an error indicating this is not supported).
- 1093 5. If the value of the `cid` subparameter is TRUE or null, or if the parameter is absent, the  
1094 resolver MUST perform CanonicalID verification as specified in section 14.3. If the value  
1095 of the `cid` subparameter is FALSE, the resolver MUST NOT perform CanonicalID  
1096 verification.
- 1097 6. If the value of the `refs` subparameter is TRUE or null, or if the parameter is absent, the  
1098 resolver MUST perform Ref processing as specified in section 12. If the value of the  
1099 `refs` subparameter is FALSE, the resolver MUST NOT perform Ref processing and  
1100 must return an error if a Ref is encountered as specified in section 12.
- 1101 7. If the value of the `sep` subparameter is TRUE, the resolver MUST perform service  
1102 endpoint selection on the final XRD (even if the values of all service endpoint selection  
1103 parameters are null). If the value of the `sep` subparameter is FALSE or null, or if the  
1104 parameter is absent, the resolver MUST NOT perform service endpoint selection on the  
1105 final XRD unless it is required to produce a URI List or HTTP(S) redirect. See section 8.2.
- 1106 8. If the value of the `nodefault_t`, `nodefault_p`, or `nodefault_m` subparameter is  
1107 TRUE, the resolver MUST ignore default matches on the corresponding service endpoint  
1108 selection element categories as specified in section 13.3.2.
- 1109 9. If the value of the `uric` subparameter is TRUE, the resolver MUST perform service  
1110 endpoint URI construction as specified in section 13.7.1. If the value of the `uric`  
1111 subparameter is FALSE or null, or if the parameter is absent, the resolver MUST NOT  
1112 perform service endpoint URI construction.

1113 Future versions of this specification, or other specifications for XRI resolution, MAY use other  
1114 values for Resolution Output Format or its subparameters.

### 1115 8.1.3 Service Type

1116 The Service Type is an OPTIONAL value of type `xs:anyURI` used to request a specific type of  
1117 service in the service endpoint selection phase (section 11). The value of this parameter MUST  
1118 be a valid absolute XRI, IRI, or URI in URI-normal form as defined by **[XRISyntax]**. (Note that  
1119 URI-normal form is required so this parameter may be passed to a proxy resolver in a QXRI  
1120 query parameter as defined in section 11.) The Service Type values defined for XRI resolution  
1121 services are specified in section 3.1.2. The rules for matching the value of the Service Type  
1122 parameter to the value of the `xrd:XRD/xrd:Service/xrd:Type` element are specified in  
1123 section 13.3.6.

1124 **8.1.4 Service Media Type**

1125 The Service Media Type is an OPTIONAL string used to request a specific media type in the  
1126 service endpoint selection phase (section 11). The value of this parameter MUST be a valid  
1127 media type as defined by [RFC2046]. The Service Media Type values defined for XRI resolution  
1128 services are specified in section 3.3. The rules for matching the value of the Service Media Type  
1129 parameter to the value of the `xrd:XRD/xrd:Service/xrd:MediaType` element are specified  
1130 in section 13.3.8.

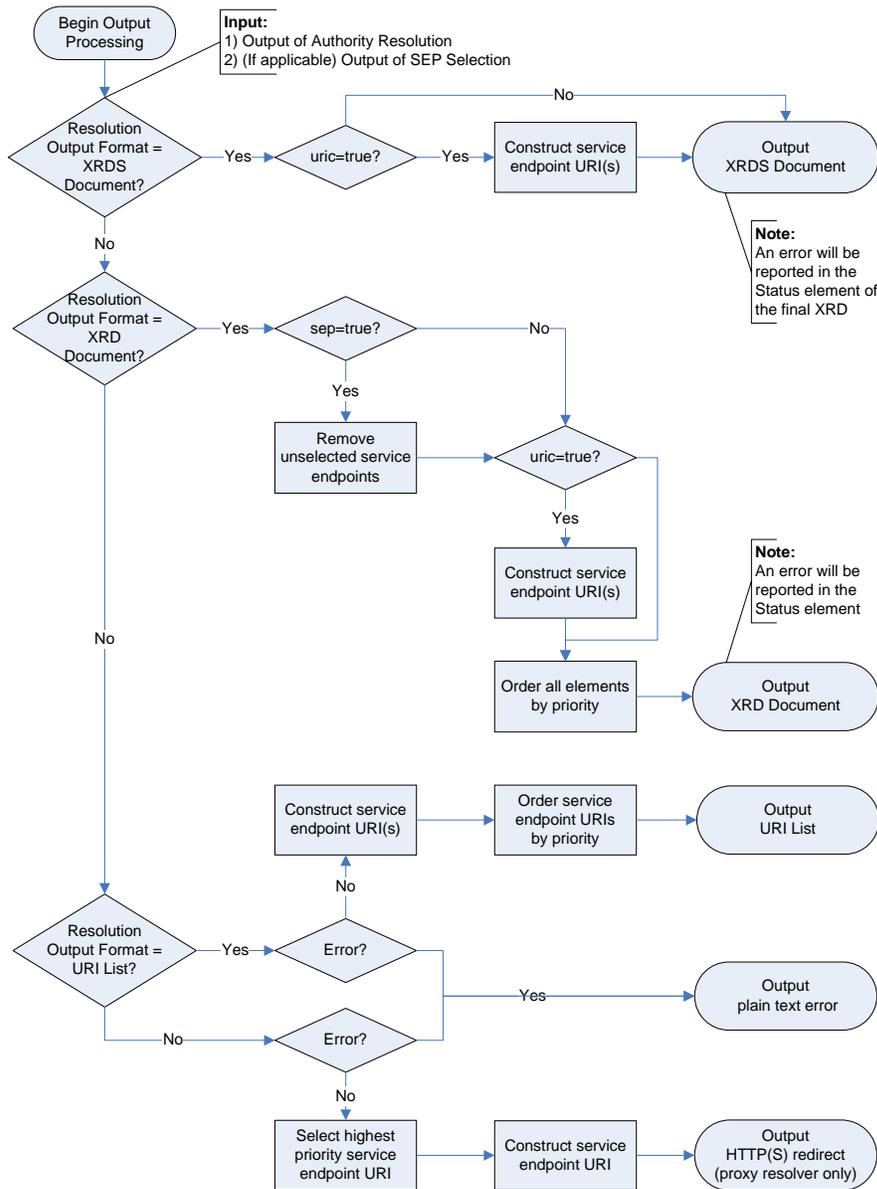

1131 **8.2 Outputs**

1132 Table 10 summarizes the logical outputs of XRI resolution. Note that these are defined in terms of  
1133 media types returned by authority servers and proxy resolvers. A local resolver API MAY  
1134 implement other representations of these media types.

Logical Output Format Name	Media Type Value (when requesting XRI authority resolution only)	Media Type Value (when requesting service endpoint selection)
XRDS Document	application/xrds+xml	application/xrds+xml;sep=true
XRD Element	application/xrd+xml	application/xrd+xml;sep=true
URI List	N/A	text/uri-list
HTTP(S) Redirect	N/A	<i>null</i>

1135 *Table 10: Outputs of XRI resolution.*

1136 Figure 4 is a flowchart illustrating the process of producing these output formats once the auth-  
 1137 ority resolution and optional service endpoint selection phases are complete. Note that in the first  
 1138 two output options, errors are reported directly in the XRDS, so no special error format is needed.

1139  
 1140 *Figure 4: Output processing flowchart.*

1141 The following sections provide additional construction and validation requirements.

## 1142 8.2.1 XRDS Document

1143 If the value of the Resolution Output Format parameter is `application/xrds+xml`, the  
1144 following rules apply.

- 1145 1. The output MUST be a valid XRDS document according to the schema defined in  
1146 Appendix B.
- 1147 2. The XRDS document MUST contain an ordered list of `xrd:XRD` elements—one for each  
1148 authority subsegment successfully resolved by the resolver client. This list MUST appear  
1149 in the same order as the corresponding subsegments in the Authority String.
- 1150 3. Each of the contained XRD elements must be a valid XRD element according to the  
1151 schema defined in Appendix B.
- 1152 4. The XRD elements MUST conform to the additional requirements in section 4.
- 1153 5. If the value of the `saml` subparameter of the Resolution Output Format is TRUE, the  
1154 XRD elements MUST conform to the additional requirements in section 10.2.
- 1155 6. If Redirect or Ref processing is necessary during the authority resolution or service  
1156 endpoint selection process, it MUST result in a valid nested XRDS document as defined  
1157 in section 12.
- 1158 7. If the value of the `sep` subparameter is TRUE, service endpoint selection MUST be  
1159 performed as defined in section 13, even if the values of all three service endpoint  
1160 selection input parameters (Service Type, Path String, and Service Media Type) are null.

1161 **IMPORTANT:** No filtering of the final XRD is performed when returning an XRDS document.  
1162 Filtering is only performed when the requested Resolution Output Format is an XRD element –  
1163 see the next section.

- 1164 8. If the value of the `cid` subparameter is TRUE, synonym verification MUST be reported  
1165 using the `xrd:Status` element of each XRD in the XRDS document as defined in  
1166 section 14.
- 1167 9. If the output is an error, this error MUST be returned using the `xrd:Status` element of  
1168 the final XRD in the XRDS document as defined in section 15.

## 1169 8.2.2 XRD Element

1170 If the value of the Resolution Output Format parameter is `application/xrd+xml`, the following  
1171 rules apply.

- 1172 1. The output MUST be a valid XRD element according to the schema defined in Appendix  
1173 B.
- 1174 2. The XRD elements MUST conform to the additional requirements in section 4.
- 1175 3. If the value of the `saml` subparameter of the Resolution Output Format is TRUE, the  
1176 XRD element MUST conform to the additional requirements in section 10.2.
- 1177 4. If the value of the `sep` subparameter is FALSE or null, or if this parameter is absent, the  
1178 XRD MUST be the final XRD in the XRDS document produced as a result of authority  
1179 resolution. Service endpoint selection or any other filtering of the XRD element MUST  
1180 NOT be performed.
- 1181 5. If the value of the `sep` subparameter is TRUE, service endpoint selection MUST be  
1182 performed as defined in section 13, even if the values of all service endpoint selection  
1183 input parameters are null.
- 1184 6. If service endpoint selection is performed, the only `xrd:Service` elements in the XRD  
1185 element MUST be those selected according to the rules specified in section 13. If no  
1186 service endpoints were selected by those rules, no `xrd:Service` elements will be

1187 present. In addition, all elements within the XRD element that are subject to the global  
1188 `priority` attribute (even if the attribute is absent or null) MUST be returned in order of  
1189 highest to lowest priority as defined in section 4.3.3.

1190 **IMPORTANT:** Any other filtering of the XRD element MUST NOT be performed. Note that this  
1191 means that if the XRD element includes a SAML signature element as defined in section 10.2,  
1192 this element is still returned inside the XRD element even though it may not be able to be verified  
1193 by a consuming application.

- 1194 7. If the value of the `cid` subparameter is TRUE, synonym verification MUST be reported  
1195 using the `xrd:Status` element of each XRD in the XRDS document as defined in  
1196 section 14.
- 1197 8. If the output is an error, this error MUST be returned using the `xrd:Status` element as  
1198 defined in section 15.

### 1199 8.2.3 URI List

1200 If the value of the Resolution Output Format parameter is `text/uri-list`, the following rules  
1201 apply.

- 1202 1. For this output, service endpoint selection is REQUIRED, even if the values of all service  
1203 endpoint selection input parameters are null.
- 1204 2. If authority resolution and service endpoint selection are both successful, the output  
1205 MUST be a valid URI List as defined by section 5 of [RFC2483].
- 1206 3. If, after applying the service endpoint selection rules, more than one service endpoint is  
1207 selected, the highest priority `xrd:XRD/xrd:Service` element MUST be selected as  
1208 defined in section 4.3.3.
- 1209 4. If the final selected `xrd:XRD/xrd:Service` element contains a  
1210 `xrd:XRD/xrd:Service/xrd:Redirect` or `xrd:XRD/xrd:Service/xrd:Ref`  
1211 element, Redirect and Ref processing MUST be performed as described in section 12.  
1212 This rule applies iteratively to each new XRDS document resolved.
- 1213 5. From the final selected `xrd:XRD/xrd:Service` element, the service endpoint URI(s)  
1214 MUST be constructed as defined in section 13.7.1.
- 1215 6. The URIs MUST be returned in order of highest to lowest priority of the source `xrd:URI`  
1216 elements within the selected `xrd:Service` element as defined in section 4.3.3. When  
1217 two or more of the source `xrd:URI` elements have equal priority, their constructed URIs  
1218 SHOULD be returned in random order.

1219 **IMPORTANT:** Any other filtering of the URI list MUST NOT be performed.

- 1220 7. If the output is an error, it MUST be returned with the content type `text/plain` as  
1221 defined in section 15.

### 1222 8.2.4 HTTP(S) Redirect

1223 In XRI proxy resolution, the Resolution Output Format parameter may be null. In this case the  
1224 output of a proxy resolver is an HTTP(S) redirect as defined in section 11.7.

1225

## 9 Generic Authority Resolution Service

1226  
1227  
1228  
1229

As discussed in section 1.1 and illustrated in Figure 2, authority resolution is the first phase of XRI resolution. This phase applies only to resolving the subsegments in the Authority String of the QXRI. The Authority String may identify either an *XRI authority* or an *IRI authority* as described in section 2.2.1 of [XRISyntax].

1230  
1231  
1232  
1233  
1234

XRI authorities and IRI authorities have different syntactic structures, partially due to the higher level of abstraction represented by XRI authorities. For this reason, XRI authorities are resolved to XRDS documents one subsegment at a time as specified in section 9.1. IRI authorities, since they are based on DNS names or IP addresses, are resolved into an XRDS document through a special HTTP(S) request using the entire IRI authority component as specified in section 9.1.11.

1235

### 9.1 XRI Authority Resolution

1236

#### 9.1.1 Service Type and Service Media Type

1237

The protocol defined in this section is identified by the values in Table 11.

Service Type	Service Media Type	Subparameters
xri://\$res*auth*(\$v*2.0)	application/xrds+xml	OPTIONAL (see important note below)

1238

Table 11: Service Type and Service Media Type values for generic authority resolution.

1239  
1240

A generic authority resolution service endpoint advertised in an XRDS document MUST use the Service Type identifier and MAY use the Service Media Type identifier defined in Table 11.

1241  
1242  
1243  
1244  
1245

**BACKWARDS COMPATIBILITY NOTE:** Earlier drafts of this specification used a subparameter called `trust`. This has been deprecated in favor of new subparameters for each trusted resolution option, i.e., `https=true` and `saml=true`. However, implementations SHOULD consider the following values equivalent both for the purpose of service endpoint selection within XRDS documents and as HTTP(S) Accept header values in XRI authority resolution requests:

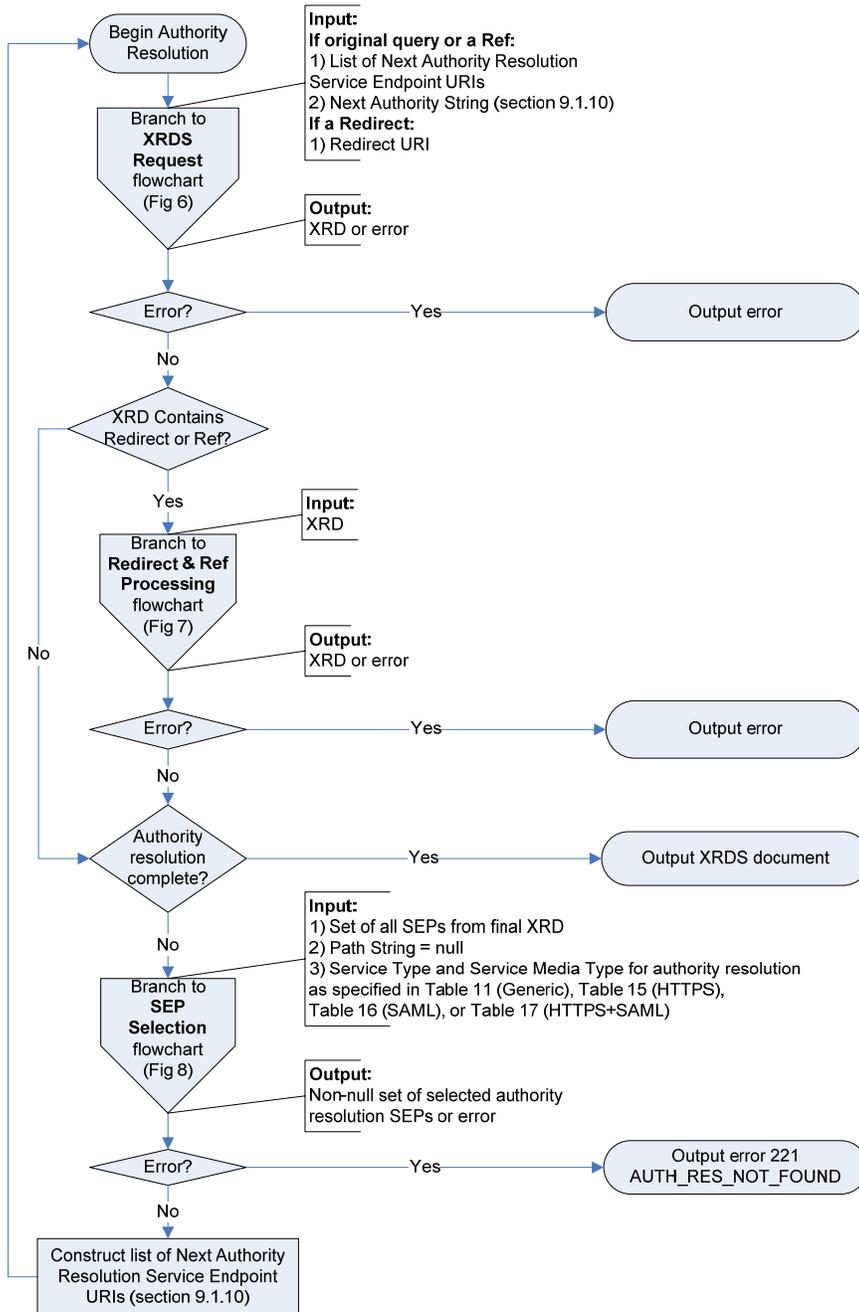

1246  
1247  
1248  
1249  
1250  
1251

```
application/xrds+xml
application/xrds+xml;trust=none
application/xrds+xml;https=false
application/xrds+xml;saml=false
application/xrds+xml;https=false;saml=false
application/xrds+xml;saml=false;https=false
```

1252 **9.1.2 Protocol**

1253 Figure 5 (non-normative) illustrates the overall logical flow of generic authority resolution.

**Comment [DSR7]:** This flowchart revised for improved clarity about Redirect URI as an input and recording of XRD and XRDS documents.

1254  
1255 Figure 5: Authority resolution flowchart.

- 1256 Following are the normative requirements for behavior of an XRI resolver and an XRI authority  
1257 server when performing generic XRI authority resolution:
- 1258 1. Each request for an XRDS document using HTTP(S) MUST conform to the requirements  
1259 in section 9.1.3.
  - 1260 2. For errors in XRDS document resolution requests, a resolver MUST implement failover  
1261 handling as specified in section 9.1.4.
  - 1262 3. The resolver MUST be preconfigured with or have a means of obtaining the XRDS  
1263 document describing the community root authority for the XRI to be resolved as defined  
1264 in section 9.1.5.
  - 1265 4. The resolver MAY obtain the XRDS document describing the community root authority by  
1266 requesting a self-describing XRDS document as defined in section 9.1.6.
  - 1267 5. Resolution of each subsegment in the Authority String after the community root  
1268 subsegment MUST proceed in subsegment order (left-to-right) using fully qualified  
1269 subsegment values as defined in section 9.1.7.
  - 1270 6. Subsegments that use XRI parenthetical cross-reference syntax MUST be resolved as  
1271 defined in section 9.1.8.
  - 1272 7. For each iteration of the authority resolution process, the next authority resolution service  
1273 endpoint MUST be selected as specified in section 9.1.9.
  - 1274 8. For each iteration of the authority resolution process, an HTTP(S) URI (called the Next  
1275 Authority URI) MUST be constructed according to the algorithm specified in section  
1276 9.1.10.
  - 1277 9. A resolver MAY request that a recursing authority server perform resolution of multiple  
1278 subsegments as defined in section 9.1.11.
  - 1279 10. For each iteration of the authority resolution process, a resolver MUST perform Redirect  
1280 and Ref processing as specified in section 12. Note that if Redirect and Ref processing is  
1281 successful, it will result in a nested XRDS document as specified in section 12.5 and  
1282 illustrated in Figure 6.

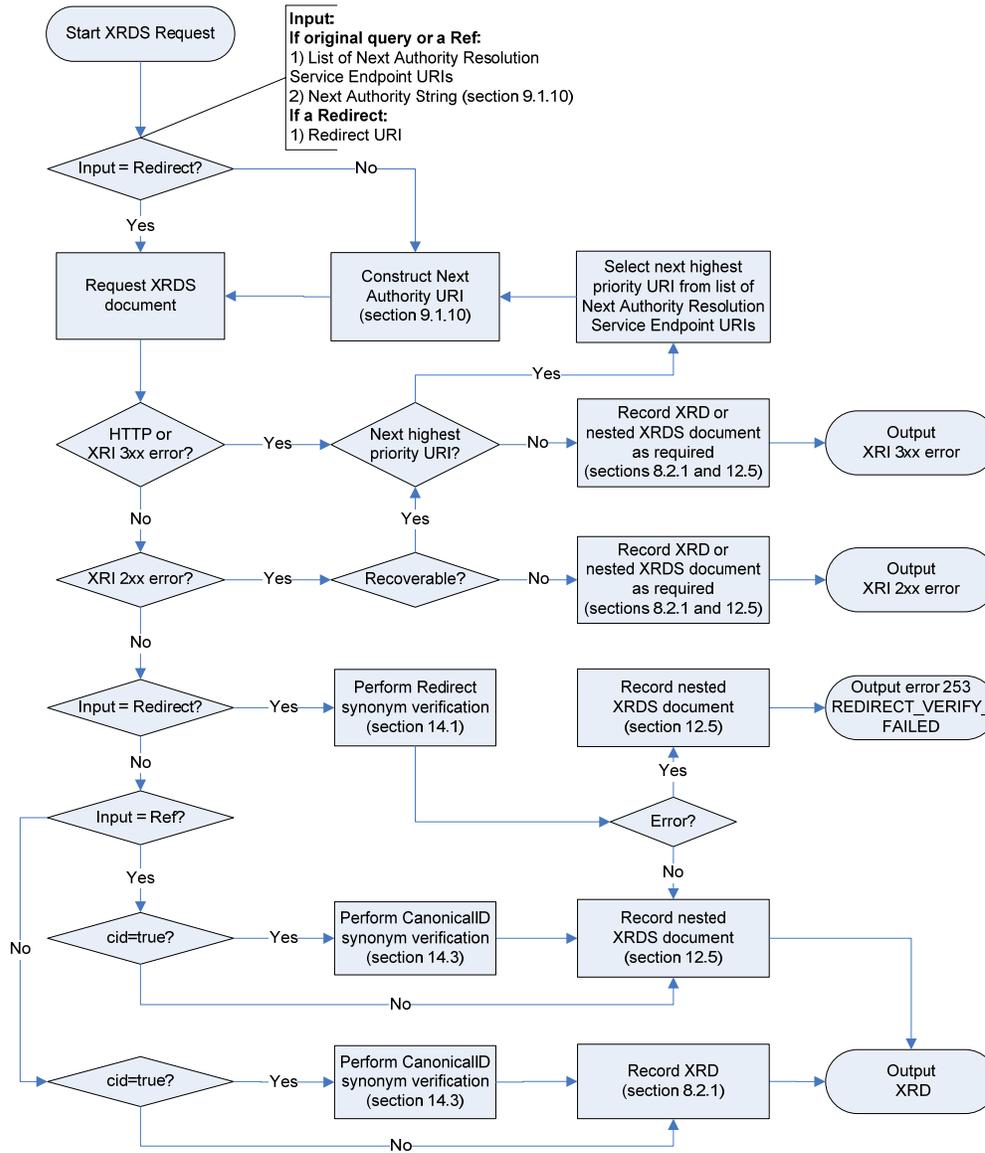

1283

### 9.1.3 Requesting an XRDS Document using HTTP(S)

1284

Figure 6 (non-normative) illustrates the logical flow for requesting an XRDS document.

**Comment [DSR8]:** This flowchart revised for improved clarity about Redirect URI as an input, synonym verification (for both Redirects, Refs, and standard query XRIs), and recording of XRD and XRDS documents.

1285

1286

1287 Figure 6: XRDS request flowchart.

1288

Note that the term “Record” in Figure 6 means that if the Resolution Output Format is an XRDS document, this is the logical operation of appending either an XRD or an XRDS document at the proper nesting level within that output. See the examples in section 12.5.

1290

1291 Following are the normative requirements for an XRI resolver and an XRI authority server when  
1292 requesting an XRDS document:

- 1293 1. Each resolution request MUST be an HTTP(S) GET to the Next Authority URI and MUST  
1294 contain an Accept header with the media type identifier defined in Table 11. Note that in  
1295 XRI authority resolution, this Accept header is NOT interpreted as an XRI resolution input  
1296 parameter, but simply as the media type being requested from the server. This differs  
1297 from XRI proxy resolution, where the Accept header MAY be used to specify the Service  
1298 Media Type resolution parameter. See section 11.5.
- 1299 2. The ultimate HTTP(S) response from an authority server to a successful resolution  
1300 request MUST contain either: a) a 2XX response with a valid XRDS document containing  
1301 an XRD element for each authority subsegment resolved, or b) a 304 response signifying  
1302 that the cached version on the resolver is still valid (depending on the client's HTTP(S)  
1303 request). There is no restriction on intermediate redirects (i.e., 3XX result codes) or other  
1304 result codes (e.g., a 100 HTTP response) that eventually result in a 2XX or 304 response  
1305 through normal operation of [RFC2616].
- 1306 3. The HTTP(S) response from an authority server MUST return the media type requested  
1307 by the resolver. The response SHOULD NOT include any subparameters supplied by the  
1308 resolver in the request. If the resolver receives such parameters in the response, the  
1309 resolver MUST ignore them and do its own independent verification that the response  
1310 fulfills the requested parameters.
- 1311 4. Any ultimate response besides an HTTP 2XX or 304 SHOULD be considered an error in  
1312 the resolution process. In this case, the resolver MUST implement failover handling as  
1313 specified in section 9.1.4.
- 1314 5. If all authority resolution service endpoints fail, the resolver SHOULD return the  
1315 appropriate error code and context message as specified in section 15. In recursing  
1316 resolution, such an error MUST be returned by the recursing authority server to the  
1317 resolver as specified in section 15.5.
- 1318 6. All other uses of HTTP(S) in this protocol MUST comply with the requirements in section  
1319 16. In particular, HTTP caching semantics SHOULD be leveraged to the greatest extent  
1320 possible to maintain the efficiency and scalability of the HTTP-based resolution system.  
1321 The recommended use of HTTP caching headers is described in more detail in section  
1322 16.2.1.

#### 1323 9.1.4 Failover Handling

1324 XRI infrastructure has the same requirements as DNS infrastructure for stability, redundancy, and  
1325 network performance. This means XRI authority and proxy resolution services are subject to the  
1326 same requirements as DNS nameservers. For example:

- 1327 • Critical authority or proxy resolution servers SHOULD be operated from a minimum of two  
1328 physically separate network locations to prevent a single point of failure.
- 1329 • Authority or proxy resolution servers handling heavy loads SHOULD operate from multiple  
1330 servers and take advantage of load balancing technologies.

1331 However, such capabilities are effective only if resolvers or other client applications implement  
1332 proper failover handling. Because XRI resolution takes place at a layer above DNS resolution,  
1333 resolvers have two ways to discover additional network endpoints at which authority or proxy  
1334 resolution services are available.

- 1335 • *DNS round robin/failover*: The domain name of an authority resolution service endpoint URI  
1336 may be associated with more than one IP address.
- 1337 • *XRI round robin/failover*: The XRDS document describing an XRI authority may publish  
1338 multiple URI elements for its authority resolution service endpoint, or multiple authority  
1339 resolution service endpoints, or both.

- 1340 To take advantage of both these options, the following rules apply to failover handling:
- 1341 1. A resolver SHOULD first try an alternate IP address for the current authority resolution  
1342 service endpoint if the endpoint uses DNS round robin.
  - 1343 2. If all alternate IP addresses fail, a resolver MUST try the next highest priority authority  
1344 resolution URI in the current authority resolution service endpoint, if available.
  - 1345 3. If all URIs in the current authority resolution service endpoint fail, a resolver MUST try the  
1346 next highest priority authority resolution service endpoint, if available, until all authority  
1347 resolution service endpoints are exhausted.
  - 1348 4. A resolver SHOULD only return an error if all network endpoints associated with the  
1349 authority resolution service fail to respond.

1350 **IMPORTANT:** These rules also apply to any client of an XRI proxy resolver. Failure to observe  
1351 this warning means the proxy resolver can become a point of failure.

1352 One final consideration: DNS caching mechanisms should respect the TTL (Time To Live)  
1353 settings in DNS records. However, different software languages and frameworks handle DNS  
1354 caching differently. It is RECOMMENDED to check the default settings to ensure that a library or  
1355 application is not caching DNS results indefinitely.

### 1356 9.1.5 Community Root Authorities

1357 Identifier management policies are defined on a community-by-community basis. For XRI  
1358 identifier authorities, the resolution community is specified by the first (leftmost) subsegment of  
1359 the authority component of the XRI. This is referred to as the *community root authority*, and it  
1360 represents the authority server(s) that answer resolution queries at this root. When a resolution  
1361 community chooses to create a new community root authority, it SHOULD define policies for  
1362 assigning and managing identifiers under this authority. Furthermore, it SHOULD define what  
1363 resolution protocol(s) may be used for these identifiers.

1364 For an XRI authority, the community root may be either a global context symbol (GCS) character  
1365 or top-level cross-reference as specified in section 2.2.1.1 of **[XRISyntax]**. In either case, the  
1366 corresponding root XRDS document (or its equivalent) specifies the top-level authority resolution  
1367 service endpoints for that community.

1368 The community root authority SHOULD publish a self-describing XRDS document as defined in  
1369 section 9.1.6. This XRDS document SHOULD be available at the HTTP(S) URI(s) that serve as  
1370 the community's root authority resolution service endpoints. This community root XRDS  
1371 document, or its location, must be known *a priori* and is part of the configuration of an XRI  
1372 resolver, similar to the specification of root DNS servers for a DNS resolver. Note that it is not  
1373 strictly necessary to publish this information in an XRDS document—it may be supplied in any  
1374 format that enables configuration of the XRI resolvers in the community. However, publishing a  
1375 self-describing XRDS document at a known location simplifies this process and enables dynamic  
1376 configuration of community resolvers.

1377 As a best practice, it is RECOMMENDED that community root XRDS document contain:

- 1378 • The root HTTPS resolution service endpoint(s) if HTTPS trusted resolution is supported.
- 1379 • A valid self-signed SAML assertion accessible via HTTPS or other secure means if SAML  
1380 trusted resolution is supported.
- 1381 • Both of the above if HTTPS+SAML trusted resolution is supported.
- 1382 • The service endpoints and supported media types of the community's XRI proxy resolver(s) if  
1383 proxy resolution is supported.

1384 For a list of public community root authorities and the locations of their community root XRDS  
1385 documents, see the Wikipedia entry on XRI **[WikipediaXRI]**.

## 1386 9.1.6 Self-Describing XRDS Documents

1387 An identifier authority MAY publish a self-describing XRDS document, i.e., one produced by the  
1388 same identifier authority that it describes. A resolver MAY request a self-describing XRDS  
1389 document from a target identifier authority using either of two methods:

- 1390 1. If the resolver knows an HTTP(S) URI for the target authority's XRI authority resolution  
1391 service endpoint, it may use the resolution protocol specified in section 6 to request an  
1392 XRDS document directly from this HTTP(S) URI. This HTTP(S) URI may be known a  
1393 priori (as is often the case with community root authorities, above), or it may be  
1394 discovered from other identifier authorities via the resolution protocols defined in this  
1395 specification.
- 1396 2. If the resolver knows: a) an XRI of the target authority as a community root authority, and  
1397 b) an HTTP(S) URI for a proxy resolver configured for this community root authority, it  
1398 may use the proxy resolution protocol specified in section 11 to query the proxy resolver  
1399 for the community root authority XRI. This query MUST include only a single subsegment  
1400 identifying the community root authority and MUST NOT include any additional  
1401 subsegments.

1402 If an identifier authority had an authority resolution service endpoint at  
1403 `http://example.com/auth-res-service/`, an example of the first method would be to  
1404 issue an HTTP(S) GET request to that URI with an Accept header specifying the content type  
1405 `application/xrds+xml`. See section 6.3 for more details.

1406 If an identifier authority with the community root authority identifier `xri://(example)` was  
1407 registered with the XRI proxy resolver `http://xri.example.com/`, an example of the second  
1408 method would be to issue an HTTP(S) GET request to the following URI:

1409 `http://xri.example.com/(example)?_xrd_r=application/xrds+xml`

1410 Note that a proxy resolver may use the first method to publish its own self-describing XRDS  
1411 document at the HTTP(S) URI(s) for its proxy resolution service.

1412 **IMPORTANT:** A self-describing XRDS document MUST only be issued by an identifier authority  
1413 when describing itself. It MUST NOT be included in an XRDS document when describing a  
1414 different identifier authority. In the latter case the self-describing XRDS document for the  
1415 community root authority is implicit.

## 1416 9.1.7 Qualified Subsegments

1417 A qualified subsegment is defined by the productions whose names start with `xri-subseg` in  
1418 section 2.2.3 of **[XRISyntax]** including the leading syntactic delimiter (“\*” or “!”). A qualified  
1419 subsegment MUST include the leading syntactic delimiter even if it was optionally omitted in the  
1420 original XRI (see section 2.2.3 of **[XRISyntax]**).

1421 If the first subsegment of an XRI authority is a GCS character and the following subsegment does  
1422 not begin with a “\*” (indicating a reassignable subsegment) or a “!” (indicating a persistent  
1423 subsegment), then a “\*” is implied and MUST be added when constructing the qualified  
1424 subsegment as specified in section 9.1.7. Table 12 and Table 13 illustrate the differences  
1425 between parsing a reassignable subsegment following a GCS character and parsing a cross-  
1426 reference, respectively.

1427

<b>XRI</b>	xri://@example*internal/foo
<b>XRI Authority</b>	@example*internal
<b>Community Root Authority</b>	@
<b>First Qualified Subsegment Resolved</b>	*example

1428 Table 12: Parsing the first subsegment of an XRI that begins with a global context symbol.

<b>XRI</b>	xri://(http://www.example.com)*internal/foo
<b>XRI Authority</b>	(http://www.example.com)*internal
<b>Community Root Authority</b>	(http://www.example.com)
<b>First Qualified Subsegment Resolved</b>	*internal

1429 Table 13: Parsing the first subsegment of an XRI that begins with a cross-reference.

### 1430 9.1.8 Cross-References

1431 Any subsegment within an XRI authority component may be a cross-reference (see section 2.2.2  
 1432 of [XRISyntax]). Cross-references are resolved identically to any other subsegment because the  
 1433 cross-reference is considered opaque, i.e., the value of the cross-reference (including the  
 1434 parentheses) is the literal value of the subsegment for the purpose of resolution.

1435 Table 14 provides several examples of resolving cross-references. In these examples,  
 1436 subsegment !b resolves to a Next Authority Resolution Service Endpoint URI of  
 1437 http://example.com/xri/ and recursing authority resolution is not being requested.  
 1438

Example XRI	Next Authority URI after resolving
xri://@!a!b!(@!1!2!3)*e/f	xri://@!a!b
xri://@!a!b!(mailto:jd@example.com)*e/f	http://example.com/xri/!(@!1!2!3)
xri://@!a!b*(mailto:jd@example.com)*e/f	http://example.com/xri/*(mailto:jd@example.com)
xri://@!a!b*(\$v*2.0)*e/f	http://example.com/xri/*(\$v*2.0)
xri://@!a!b*(c*d)*e/f	http://example.com/xri/*(c*d)
xri://@!a!b*(foo/bar)*e/f	http://example.com/xri/*(foo%2Fbar)

Comment [DSR9]: Typo found by Wil Tan.

1439 Table 14: Examples of the Next Authority URIs constructed using different types of cross-references.

### 1440 9.1.9 Selection of the Next Authority Resolution Service Endpoint

1441 For each iteration of authority resolution, the resolver MUST select the next authority resolution  
 1442 service endpoint from the current XRD as specified in section 13. For generic authority resolution,  
 1443 this selection process MUST use the parameters specified in Table 11. For trusted authority  
 1444 resolution, this selection process MUST use the parameters specified in Table 15, Table 16, or  
 1445 Table 17. In all cases, an explicit match on the xrd:XRD/xrd:Service/xrd:Type element is  
 1446 REQUIRED, so during authority resolution, a resolver MUST set the nodefault parameter to a  
 1447 value of nodefault=type in order to override selection of a default service endpoint as  
 1448 specified in section 13.3.2.

1449 **9.1.10 Construction of the Next Authority URI**

1450 Once the next authority resolution service endpoint is selected, the resolver MUST construct a  
1451 URI for the next HTTP(S) request, called the *Next Authority URI*, by concatenating two strings as  
1452 specified in this section.

1453 The first string is called the *Next Authority Resolution Service Endpoint URI*. To construct it, the  
1454 resolver MUST:

- 1455 1. Select the highest priority URI of the highest priority authority resolution service endpoint  
1456 selected in section 9.1.9.
- 1457 2. Apply the service endpoint URI construction algorithm based the value of the `append`  
1458 attribute as defined in section 13.7.
- 1459 3. Append a forward slash ("/") if the URI does not already end in a forward slash.

1460 The second string is called the *Next Authority String* and it consists of either:

- 1461 • The next fully qualified subsegment to be resolved (see section 9.1.7), or
- 1462 • In the case of recursing resolution, the next fully qualified subsegment to be resolved plus  
1463 any additional subsegments for which recursing resolution is requested (see section 9.1.11).

1464 The final step is to append the Next Authority String directly to the Next Authority Resolution  
1465 Service Endpoint URI. The resulting URI is called the *Next Authority URI*.

Deleted: to the path component of

1466 BACKWARDS COMPATIBILITY NOTE: Earlier versions of this specification required the Next  
1467 Authority String to be appended to the *path component* of the Next Authority Resolution Service  
1468 Endpoint URI. This rule was changed to give XRI authorities greater control over the structure of  
1469 incoming resolution requests—for example, to enable Next Authority Strings to appear as query  
1470 parameters.

Formatted: Font: Italic

1471 Construction of the Next Authority URI is more formally described in this pseudocode for  
1472 resolving a "next-auth-string" via a "next-auth-res-sep-uri":

Comment [DSR10]: Revised per suggestion from John Bradley and Steve Churchill.

```

1473 if (next-auth-res-sep-uri does not end in "/"):
1474     append "/" to next-auth-res-sep-uri
1475
1476 if (next-auth-string is not preceded with "*" or "!" delimiter):
1477     prepend "*" to next-auth-string
1478
1479 append uri-escape(next-auth-string) to next-auth-res-sep-uri

```

1480 **9.1.11 Recursing Authority Resolution**

1481 If an authority server offers recursing resolution, an XRI resolver MAY request resolution of  
1482 multiple authority subsegments in one transaction. If a resolver makes such a request, the  
1483 responding authority server MAY perform the additional recursing resolution steps requested. In  
1484 this case the recursing authority server acts as a resolver to the other authority resolution service  
1485 endpoints that need to be queried. Alternatively, the recursing authority server may retrieve XRDs  
1486 from its local cache until it reaches a subsegment whose XRD is not locally cached, or it may  
1487 simply recurse only as far as it is authoritative.

1488 If an authority server performs any recursing resolution, it MUST return an ordered list of  
1489 `xrd:XRDS` elements (and nested `xrd:XRDS` elements if Redirects or Refs are followed as  
1490 specified in section 12) in an `xrd:XRDS` document for all subsegments resolved as defined in  
1491 section 8.2.1.

1492 A recursing authority server MAY resolve fewer subsegments than requested by the resolver. The  
1493 recursing authority server is under no obligation to resolve more than the first subsegment (for  
1494 which it is, by definition, authoritative).

1495 If the recursing authority server does not resolve the entire set of subsegments requested, the  
1496 resolver MUST continue the authority resolution process itself. At any stage, however, the  
1497 resolver MAY request recursing resolution of any or all of the remaining authority subsegments.

## 1498 9.2 IRI Authority Resolution

1499 From the standpoint of generic authority resolution, an IRI authority component represents either  
1500 a DNS name or an IP address at which an XRDS document describing the authority may be  
1501 retrieved using HTTP(S). Thus IRI authority resolution simply involves making an HTTP(S) GET  
1502 request to a URI constructed from the IRI authority component. The resulting XRDS document  
1503 can then be consumed in the same manner as one obtained using XRI authority resolution.

1504 While the use of IRI authorities provides backwards compatibility with the large installed base of  
1505 DNS- and IP-identifiable resources, IRI authorities do not support the additional layer of  
1506 abstraction, delegation, and extensibility offered by XRI authority syntax. Therefore IRI authorities  
1507 are NOT RECOMMENDED for new deployments of XRI identifiers.

1508 This section defines IRI authority resolution as a simple extension to the XRI authority resolution  
1509 protocol defined in the preceding section.

### 1510 9.2.1 Service Type and Media Type

1511 Because IRI authority resolution takes place at a level “below” XRI authority resolution, it cannot  
1512 be described in an XRD, and thus there is no corresponding resolution service type. IRI authority  
1513 resolution uses the same media type as generic XRI authority resolution.

### 1514 9.2.2 Protocol

1515 Following are the normative requirements for IRI authority resolution that differ from generic XRI  
1516 authority resolution:

- 1517 1. The Next Authority URI (section 9.1.10) is constructed by extracting the entire IRI  
1518 authority component and prepending the string `http://`. See the exception in section  
1519 9.2.3.
- 1520 2. The HTTP GET request MUST include an HTTP Accept header containing only the  
1521 following:  
1522 

```
Accept: application/xrds+xml
```
- 1523 3. The HTTP GET request MUST have a `Host:` header (as defined in section 14.23 of  
1524 [RFC2616]) containing the value of the IRI authority component. For example:  
1525 

```
Host: example.com
```
- 1526 4. An HTTP server acting as an IRI authority SHOULD respond with an XRDS document  
1527 containing the XRD describing that authority.
- 1528 5. The responding server MUST use the value of the `Host:` header to populate the  
1529 `xrd:XRD/xrd:Query` element in the resulting XRD.

1530 Note that because IRI authority resolution is required to process the entire IRI authority  
1531 component in a single step, recursing authority resolution does not apply.

### 1532 9.2.3 Optional Use of HTTPS

1533 Section 10 of this specification defines trusted resolution only for XRI authorities. Trusted  
1534 resolution is not defined for IRI Authorities. If, however, an IRI authority is known to respond to  
1535 HTTPS requests (by some means outside the scope of this specification), then the resolver MAY  
1536 use HTTPS as the access protocol for retrieving the authority's XRD. If the resolver is satisfied,

1537 via transport level security mechanisms, that the response is from the expected IRI authority, the  
1538 resolver MAY consider this an HTTPS trusted resolution response as defined in section 10.1.

## 1539 10 Trusted Authority Resolution Service

1540 This section defines three options for performing trusted XRI authority resolution as an extension  
1541 of the generic authority resolution protocol defined in section 9.1—one using HTTPS, one using  
1542 SAML assertions, and one using both.

### 1543 10.1 HTTPS

1544 HTTPS authority resolution is a simple extension to generic authority resolution in which all  
1545 communication with authority resolution service endpoints is carried out over HTTPS. This  
1546 provides transport-level security and server authentication, however it does not provide message-  
1547 level security or a means for a responder to provide different responses for different requestors.

#### 1548 10.1.1 Service Type and Service Media Type

1549 The protocol defined in this section is identified by the values in Table 15.

Service Type	Service Media Type	Subparameters
xri://\$res*auth*(\$v*2.0)	application/xrds+xml	https=true

1550 *Table 15: Service Type and Service Media Type values for HTTPS trusted authority resolution.*

1551 An HTTPS trusted resolution service endpoint advertised in an XRDS document **MUST** use the  
1552 Service Type identifier and Service Media Type identifier (including the `https=true` parameter)  
1553 defined in Table 15. In addition, the identifier authority **MUST** use an HTTPS URI as the value of  
1554 the `xrd:URI` element(s) for this service endpoint.

#### 1555 10.1.2 Protocol

1556 Following are the normative requirements for HTTPS trusted authority resolution that differ from  
1557 generic authority resolution (section 9.1):

- 1558 1. All authority resolution service endpoints **MUST** be selected using the values defined in  
1559 Table 15.
- 1560 2. All authority resolution requests, including the starting request to a community root  
1561 authority, **MUST** use the HTTPS protocol as defined in **[RFC2818]**. This includes all  
1562 intermediate redirects, as well as all authority resolution requests resulting from Redirect  
1563 and Ref processing as defined in section 12. A successful HTTPS response **MUST** be  
1564 received from each authority in the resolution chain or the output **MUST** be error.
- 1565 3. All authority resolution requests **MUST** contain an HTTPS Accept header with the media  
1566 type identifier defined in Table 15 (including the `https=true` subparameter).
- 1567 4. If the resolver finds that an authority in the resolution chain does not support HTTPS at  
1568 any of its authority resolution service endpoints, the resolver **MUST** return a 23x error as  
1569 defined in section 15.

## 1570 10.2 SAML

1571 In SAML trusted resolution, the resolver uses the Resolution Output Format subparameter  
1572 `saml=true` and the authority server responds with an XRDS document containing an XRD with  
1573 an additional element—a digitally signed SAML **[SAML]** assertion that asserts the validity of the  
1574 containing XRD. SAML trusted resolution provides message integrity but does not provide  
1575 confidentiality. For this reason is is **RECOMMENDED** to combine SAML trusted resolution with

1576 HTTPS trusted resolution as defined in section 10.3. Message confidentiality may also be  
1577 achieved with other security protocols used in conjunction with this specification. SAML trusted  
1578 resolution also does not provide a means for an authority to provide different responses for  
1579 different requestors; client authentication is explicitly out-of-scope for version 2.0 of XRI  
1580 resolution.

## 1581 10.2.1 Service Type and Service Media Type

1582 The protocol defined in this section is identified by the values in Table 16.

Service Type	Service Media Type	Subparameters
xri://\$res*auth*(\$v*2.0)	application/xrds+xml	saml=true

1583 *Table 16: Service Type and Service Media Type values for SAML trusted authority resolution.*

1584 A SAML trusted resolution service endpoint advertised in an XRDS document MUST use the  
1585 Service Type identifier and Service Media Type identifier defined in Table 16 (including the  
1586 `saml=true` subparameter). In addition, for transport security the identifier authority SHOULD  
1587 offer at least one HTTPS URI as the value of the `xrd:URI` element(s) for this service endpoint.

## 1588 10.2.2 Protocol

### 1589 10.2.2.1 Client Requirements

1590 For a resolver, trusted resolution is identical to the generic resolution protocol (section 9.1) with  
1591 the addition of the following requirements:

- 1592 1. All authority resolution service endpoints MUST be selected using the values defined in  
1593 Table 16. A resolver SHOULD NOT request SAML trusted resolution service from an  
1594 authority unless the authority advertises a resolution service endpoint matching these  
1595 values.
- 1596 2. Authority resolution requests MAY use either the HTTP or HTTPS protocol. The latter is  
1597 RECOMMENDED for confidentiality.
- 1598 3. All authority resolution requests MUST contain an HTTP(S) Accept header with the  
1599 media type identifier defined in Table 16 (including the `saml=true` subparameter). This  
1600 is the media type of the requested response.

1601 **IMPORTANT:** Clients willing to accept either generic or trusted responses MAY use a  
1602 combination of media type identifiers in the Accept header as described in section 14.1 of  
1603 [RFC2616]. Media type identifiers SHOULD be ordered according to the client's preference for  
1604 the media type of the response. If a client performing generic authority resolution receives an  
1605 XRD containing SAML elements, it MAY choose not to validate the signature or perform any  
1606 processing of these elements.

- 1607 4. A resolver MAY request recursing authority resolution of multiple subsegments as  
1608 defined in section 10.2.3.
- 1609 5. The resolver MUST individually validate each XRD it receives in the resolution chain  
1610 according to the rules defined in section 10.2.4. When `xrd:XRD` elements come both  
1611 from freshly-retrieved XRDS documents and from a local cache, a resolver MUST ensure  
1612 that these requirements are satisfied each time a resolution request is performed.

### 1613 10.2.2.2 Server Requirements

1614 For an authority server, trusted resolution is identical to the generic resolution protocol (section  
1615 9.1) with the addition of the following requirements:

- 1616 1. The HTTP(S) response to a trusted resolution request MUST include a content type of  
1617 `application/xrds+xml;saml=true`.
- 1618 2. The XRDS document returned by the resolution service MUST contain a  
1619 `saml:Assertion` element as an immediate child of the `xrd:XRD` element that is valid  
1620 per the processing rules described by [SAML].
- 1621 3. The `saml:Assertion` element MUST contain a valid enveloped digital signature as  
1622 defined by [XMLDSig] and as constrained by section 5.4 of [SAML].
- 1623 4. The signature MUST apply to the `xrd:XRD` element that contains the signed SAML  
1624 assertion. Specifically, the signature MUST contain a single  
1625 `ds:SignedInfo/ds:Reference` element, and the `URI` attribute of this reference  
1626 MUST refer to the `xrd:XRD` element that is the immediate parent of the signed SAML  
1627 assertion. The `URI` reference MUST NOT be empty and it MUST refer to the identifier  
1628 contained in the `xrd:XRD/@xml:id` attribute.
- 1629 5. [SAML] specifies that the digital signature enveloped by the SAML assertion MAY contain  
1630 a `ds:KeyInfo` element. If this element is included, it MUST describe the key used to  
1631 verify the digital signature element. However, because the signing key is known in  
1632 advance by the resolution client, the `ds:KeyInfo` element SHOULD be omitted from the  
1633 `ds:Signature` element of the SAML assertion.
- 1634 6. The `xrd:XRD/xrd:Query` element MUST be present, and the value of this field MUST  
1635 match the XRI authority subsegment requested by the client.
- 1636 7. The `xrd:XRD/xrd:ProviderID` element MUST be present and its value MUST match  
1637 the value of the `xrd:XRD/xrd:Service/xrd:ProviderID` element in an XRD  
1638 advertising availability of trusted resolution service from this authority as required in  
1639 section 10.2.5.
- 1640 8. The `xrd:XRD/saml:Assertion/saml:Subject/saml:NameID` element MUST be  
1641 present and equal to the `xrd:XRD/xrd:Query` element.
- 1642 9. The `NameQualifier` attribute of the  
1643 `xrd:XRD/saml:Assertion/saml:Subject/saml:NameID` element MUST be  
1644 present and MUST be equal to the `xrd:XRD/xrd:ProviderID` element.
- 1645 10. There MUST be exactly one `saml:AttributeStatement` present in the  
1646 `xrd:XRD/saml:Assertion` element. It MUST contain exactly one `saml:Attribute`  
1647 element with a `Name` attribute value of `xri://$xrd*($v*2.0)`. This  
1648 `saml:Attribute` element MUST contain exactly one `saml:AttributeValue`  
1649 element whose text value is a URI reference to the `xml:id` attribute of the `xrd:XRD`  
1650 element that is the immediate parent of the `saml:Assertion` element.

### 1651 10.2.3 Recursing Authority Resolution

1652 If a resolver requests trusted resolution of multiple authority subsegments (see section 9.1.8), a  
1653 recursing authority server SHOULD attempt to perform trusted resolution on behalf of the resolver  
1654 as described in this section. However, if the resolution service is not able to obtain trusted XRDs  
1655 for one or more additional recursing subsegments, it SHOULD return only the trusted XRDs it has  
1656 obtained and allow the resolver to continue.

## 1657 10.2.4 Client Validation of XRDs

1658 For each XRD returned as part of a trusted resolution request, the resolver MUST validate the  
1659 XRD according to the rules defined in this section.

- 1660 1. The `xrd:XRD/saml:Assertion` element MUST be present.
- 1661 2. This assertion MUST be valid per the processing rules described by [SAML].
- 1662 3. The `saml:Assertion` MUST contain a valid enveloped digital signature as defined by  
1663 [XMLDSig] and constrained by Section 5.4 of [SAML].
- 1664 4. The signature MUST apply to the `xrd:XRD` element containing the signed SAML  
1665 assertion. Specifically, the signature MUST contain a single  
1666 `ds:SignedInfo/ds:Reference` element, and the `URI` attribute of this reference  
1667 MUST refer to the `xml:id` attribute of the `xrd:XRD` element that is the immediate parent  
1668 of the signed SAML assertion.
- 1669 5. If the digital signature enveloped by the SAML assertion contains a `ds:KeyInfo`  
1670 element, the resolver MAY reject the signature if this key does not match the signer's  
1671 expected key as specified by the `ds:KeyInfo` element present in the XRD Descriptor  
1672 that was used to describe the current authority. See section 10.2.5.
- 1673 6. The value of the `xrd:XRD/xrd:Query` element MUST match the subsegment whose  
1674 resolution resulted in the current XRD.
- 1675 7. The value of the `xrd:XRD/xrd:ProviderID` element MUST match the value of the  
1676 `xrd:XRD/xrd:Service/xrd:ProviderID` element in any XRD advertising availability  
1677 of trusted resolution service from this authority as required in section 10.2.5.
- 1678 8. The value of the `xrd:XRD/xrd:ProviderID` element MUST match the value of the  
1679 `NameQualifier` attribute of the  
1680 `xrd:XRD/saml:Assertion/saml:Subject/saml:NameID` element.
- 1681 9. The value of the `xrd:XRD/xrd:Query` element MUST match the value of the  
1682 `xrd:XRD/saml:Assertion/saml:Subject/saml:NameID` element.
- 1683 10. There MUST exist exactly one  
1684 `xrd:XRD/saml:Assertion/saml:AttributeStatment` with exactly one  
1685 `saml:Attribute` element that has a `Name` attribute value of `xri://$xrd*($v*2.0)`.  
1686 This `saml:Attribute` element must have exactly one `saml:AttributeValue`  
1687 element whose text value is a URI reference to the `xml:id` attribute of the `xrd:XRD`  
1688 element that is the immediate parent of the signed SAML assertion.

1689 If any of the above requirements are not met for an XRD in the trusted resolution chain, the result  
1690 MUST NOT be considered a valid trusted resolution response as defined by this specification.  
1691 Note that this does not preclude a resolver from considering alternative resolution paths. For  
1692 example, if an XRD advertising SAML trusted resolution service has two or more  
1693 `xrd:XRD/xrd:Service/xrd:URI` elements and the response from one service endpoint fails  
1694 to meet the requirements above, the client MAY repeat the validation process using the second  
1695 URI. If the second URI passes the tests, it MUST be considered a trusted resolution response as  
1696 defined by this document and SAML trusted resolution may continue.

1697 If the above requirements are met, and the `code` attribute of the `xrd:XRD/xrd:ServerStatus`  
1698 element is 100 (SUCCESS), the resolver MUST add an `xrd:XRD/xrd:Status` element  
1699 reporting a status of 100 (SUCCESS) as specified in section 15. Note that this added element  
1700 MUST be disregarded if a consuming application wishes to verify the SAML signature itself. (If  
1701 necessary, the consuming application may request the XRDS document it wishes to verify directly  
1702 from the SAML authority resolution server.)

1703 If all SAML trusted resolution paths fail, the resolver MUST return the appropriate 23x trusted  
1704 resolution error as defined in section 15.

1705 **10.2.5 Correlation of ProviderID and KeyInfo Elements**

1706 Each XRI authority participating in SAML trusted authority resolution MUST be associated with at  
1707 least one unique persistent identifier expressed in the

1708 `xrd:XRD/xrd:Service/xrd:ProviderID` element of any XRD advertising trusted authority  
1709 resolution service. This ProviderID value MUST NOT ever be reassigned to another XRI  
1710 authority. While a ProviderID may be any valid URI that meets these requirements, it is  
1711 STRONGLY RECOMMENDED to use a persistent identifier such as a persistent XRI  
1712 **[XRI Syntax]** or a URN **[RFC2141]**.

1713 The purpose of ProviderIDs in XRI resolution is to enable resolvers to correlate the metadata in  
1714 an XRD advertising SAML trusted authority resolution service with the response received from a  
1715 SAML trusted resolution service endpoint. If the signed XRD response contains the same  
1716 ProviderID as the XRD used to advertise a service, and the resolver has reason to trust the  
1717 signature, the resolver can trust that the XRD response has not been maliciously replaced with  
1718 another XRD.

1719 There is no defined discovery process for the ProviderID for a community root authority; it must  
1720 be published in a self-describing XRDS document (or other equivalent description—see sections  
1721 9.1.5 and 9.1.6) and verified independently. Once the community root XRDS document is known,  
1722 the ProviderID for delegated XRI authorities within this community MAY be discovered using the  
1723 `xrd:XRD/xrd:Service/xrd:ProviderID` element of authority resolution service endpoints.  
1724 This trust mechanism MAY also be used for other services offered by an authority.

1725 In addition, the metadata necessary for SAML trusted authority resolution or other SAML **[SAML]**  
1726 interactions MAY be discovered using the `ds:KeyInfo` element (section 4.2.) Again, if this  
1727 element is present in an XRD advertising SAML authority resolution service (or any other  
1728 service), and the client has reason to trust this XRD, the client MAY use the associated  
1729 ProviderID to correlate the contents of this element with a signed response.

1730 To assist resolvers in using this key discovery mechanism, it is important that trusted authority  
1731 servers be configured to sign responses in such a way that the signature can be verified using the  
1732 correlated `ds:KeyInfo` element. For more information, see **[SAML]**.

1733 **10.3 HTTPS+SAML**

1734 **10.3.1 Service Type and Service Media Type**

1735 The protocol defined in this section is identified by the values in Table 17.

Service Type	Service Media Type	Subparameters
<code>xri://\$res*auth*(\$v*2.0)</code>	<code>application/xrds+xml</code>	<code>https=true</code> <code>saml=true</code>

1736 *Table 17: Service Type and Service Media Type values for HTTPS+SAML trusted authority resolution.*

1737 An HTTPS+SAML trusted resolution service endpoint advertised in an XRDS document MUST  
1738 use the Service Type identifier and Service Media Type identifier defined in Table 17 (including  
1739 the `https=true` and `saml=true` subparameters). In addition, the identifier authority MUST use  
1740 an HTTPS URI as the value of the `xrd:URI` element(s) for this service endpoint.

1741 **10.3.2 Protocol**

1742 Following are the normative requirements for HTTPS+SAML trusted authority resolution.

- 1743 1. All authority resolution service endpoints MUST be selected using the values defined in  
1744 Table 17.
- 1745 2. All authority resolution requests and responses, including the starting request to a  
1746 community root authority, MUST conform to both the requirements of the HTTPS trusted  
1747 resolution protocol defined in section 10.1 and the SAML trusted resolution protocol  
1748 defined in section 10.2.
- 1749 3. All authority resolution requests MUST contain an HTTPS Accept header with the media  
1750 type identifier defined in Table 17 (including both the `https=true` and `saml=true`  
1751 parameters). This MUST be interpreted as the value of the Resolution Output Format  
1752 input parameter.
- 1753 4. If the resolver finds that an authority in the resolution chain does not support both HTTPS  
1754 and SAML, the resolver MUST return a 23x error as defined in section 15.

## 11 Proxy Resolution Service

The preceding sections have defined XRI resolution as a set of logical functions. This section defines a mapping of these functions to an HTTP(S) interface for remote invocation. This mapping is based on a standard syntax for expressing an XRI as an HTTP URI, called an *HXRI*, as defined in section 11.2. HXRIs also enable XRI resolution input parameters to be encoded as query parameters in the HXRI.

Proxy resolution is useful for:

- Offloading XRI resolution and service endpoint selection processing from a client to an HTTP(S) server.
- Optimizing XRD caching for a resolution community (a *caching proxy resolver*). Proxy resolvers SHOULD use caching to resolve the same QXRIs or QXRI components for multiple clients as defined in section 16.4.
- Returning HTTP(S) redirects to clients such as browsers that have no native understanding of XRIs but can process HXRIs. This provides backwards compatibility with the large installed base of existing HTTP clients.

### 11.1 Service Type and Media Types

The protocol defined in this section is identified by the values in Table 18.

Service Type	Service Media Types	Subparameters
xri://\$res*proxy*(\$v*2.0)	application/xrds+xml application/xrd+xml text/uri-list	All subparameters specified in Table 6

Table 18: Service Type and Service Media Type values for proxy resolution.

A proxy resolution service endpoint advertised in an XRDS document MUST use the Service Type identifier and Service Media Type identifiers defined in Table 18. In addition:

- An HTTPS proxy resolver MUST specify the media type parameter `https=true` and MUST offer at least one HTTPS URI as the value of the `xrd:URI` element(s) for this service endpoint.
- A SAML proxy resolver MUST specify the media type parameter `saml=true` and SHOULD offer at least one HTTPS URI as the value of the `xrd:URI` element(s) for this service endpoint.

It may appear to be of limited value to advertise proxy resolution service in an XRDS document if a resolver must already know how to perform local XRI resolution in order to retrieve this document. However, advertising a proxy resolution service in the XRDS document for a community root authority (sections 9.1.3 and 9.1.6) can be very useful for applications that need to consume XRI proxy resolution services or automatically generate HXRIs for resolution by non-XRI-aware clients in that community. Those applications may discover the current URI(s) and resolution capabilities of a proxy resolver from this source.

### 11.2 HXRIs

The first step in an HTTP binding of the XRI resolution interface is to specify how the QXRI parameter is passed within an HTTP(S) URI. Besides providing a binding for proxy resolution, defining a standard syntax for expressing an XRI as an HTTP XRI (HXRI) has two other benefits:

- 1792 • It allows XRIs to be used anywhere an HTTP URI can appear, including in Web pages,  
1793 electronic documents, email messages, instant messages, etc.
- 1794 • It allows XRI-aware processors and search agents to recognize an HXRI and extract the  
1795 embedded XRI for direct resolution, processing, and indexing.

1796 To make this syntax as simple as possible for XRI-aware processors or search agents to  
1797 recognize, an HXRI consists of a fully qualified HTTP or HTTPS URI authority component that  
1798 begins with the domain name segment "xri.". The QXRI is then appended as the entire local  
1799 path (and query component, if present). The QXRI MUST NOT include the xri:// prefix and  
1800 MUST be in URI-normal form as defined in [XRISyntax]. (If a proxy resolver receives an HXRI  
1801 containing a QXRI beginning with an xri:// prefix, it SHOULD remove it before continuing.) In  
1802 essence, the proxy resolver URI (including the forward slash after the domain name) serves as a  
1803 machine-readable alternate prefix for an absolute XRI in URI-normal form.

1804 The normative ABNF for an HXRI is defined below based on the ireg-name, xri-hier-part,  
1805 and iquery productions defined in [XRISyntax]. XRIs that need to be understood by non-XRI-  
1806 aware clients SHOULD be published as HTTP URIs conforming to this HXRI production.

```
1807 HXRI           = proxy-resolver "/" QXRI
1808 proxy-resolver = ( "http://" / "https://" ) proxy-reg-name
1809 proxy-reg-name = "xri." ireg-name
1810 QXRI           = xri-hier-part [ "?" i-query ]
```

1811 URI processors that recognize XRIs SHOULD interpret the local part of an HTTP or HTTPS URI  
1812 (the path segment(s) and optional query segment) as an XRI provided that: a) it conforms to this  
1813 ABNF, and b) the first segment of the path conforms to the xri-authority or iauthority productions  
1814 in [XRISyntax].

1815 For references to communities that offer public XRI proxy resolution services, see the Wikipedia  
1816 entry on XRI [WikipediaXRI].

## 1817 11.3 HXRI Query Parameters

1818 In proxy resolution, the XRI resolution input parameters defined in section 8.1 are bound to an  
1819 HTTP(S) interface using the conventional web model of encoding them in an HTTP(S) URI, which  
1820 in this case is an HXRI. The binding of the logical parameter names to HXRI component parts is  
1821 defined in Table 19.

Logical Parameter Name	HXRI Component	HXRI Query Parameter Name
QXRI	Entire path and query string of HXRI (exclusive of HXRI query parameters listed below)	N/A
Resolution Output Format	HXRI query parameter	_xrd_r
Service Type	HXRI query parameter	_xrd_t
Service Media Type	HXRI query parameter	_xrd_m

1822 Table 19: Binding of logical XRI resolution parameters to QXRI query parameters.

- 1823 Following are the rules for the use of the parameters specified in Table 19.
- 1824 1. The QXRI MUST be normalized as specified in section 11.2.
- 1825 2. If the original QXRI has an existing query component, the HXRI query parameters MUST
- 1826 be appended to that query component.
- 1827 **IMPORTANT:** The query parameter names in Table 19 were chosen to minimize the probability of
- 1828 collision with any pre-existing query parameter names in the QXRI. If there is any conflict, the
- 1829 pre-existing query parameter names MUST be percent-encoded prior to transformation into an
- 1830 HXRI.
- 1831 3. After proxy resolution, the HXRI query parameters MUST subsequently be removed from
- 1832 the QXRI query component. The existing QXRI query component MUST NOT be altered
- 1833 in any other way, i.e., it must be passed through with no changes in parameter order,
- 1834 escape encoding, etc.
- 1835 4. If the original QXRI does not have a query component, one MUST be added to pass any
- 1836 HXRI query parameters. After proxy resolution, this query component MUST be entirely
- 1837 removed.
- 1838 5. If the original QXRI had a null query component (only a leading question mark), or a
- 1839 query component consisting of only question marks, *one additional leading question mark*
- 1840 MUST be added before adding any HXRI query parameters. After proxy resolution, any
- 1841 HXRI query parameters and exactly one leading question mark MUST be removed. See
- 1842 the URI construction steps defined in section 13.6.
- 1843 6. Each HXRI query parameter MUST be delimited from other parameters by an ampersand
- 1844 (“&”).
- 1845 7. Each HXRI query parameter MUST be delimited from its value by an equals sign (“=”).
- 1846 8. If an HXRI query parameter includes one of the media type parameters defined in Table
- 1847 6, it MUST be delimited from the HXRI query parameter with a semicolon (“;”).
- 1848 9. The fully-composed HXRI MUST be encoded and decoded as specified in section 11.4.
- 1849 10. If any HXRI query parameter name is included but its value is empty, the value of the
- 1850 parameter MUST be considered null.

#### 1851 11.4 HXRI Encoding/Decoding Rules

1852 To conform with the typical requirements of web server URI parsing libraries, HXRIs MUST be

1853 encoded prior to input to a proxy resolver and decoded prior to output from a proxy resolver.

1854 Because web server libraries typically perform some of these decoding functions automatically,

1855 implementers MUST ensure that a proxy resolver, when used in conjunction with a specific web

1856 server, accomplishes the full set of HXRI decoding steps specified in this section. In particular,

1857 these decoding steps MUST be performed prior to any comparison operations defined in this

1858 specification.

1859 Before any HXRI-specific encoding steps are performed, the QXRI portion of the HXRI (including

1860 all HXRI query parameters) MUST be transformed into URI-normal form as defined in section 2.3

1861 of **[XRISyntax]**. This means characters not allowed in URIs, such as SPACE, or characters that

1862 are valid only in IRIs, such as UCS characters above the ASCII range, MUST be percent

1863 encoded. Also, the plus sign character (“+”) MUST NOT be used to encode the SPACE character

1864 because in decoding the percent-encoded sequence %2B MUST be interpreted as the plus sign

1865 character (“+”).

1866 Once the HXRI is in URI-normal form, the following sequence of encoding steps MUST be

1867 performed in the order specified before an HXRI is submitted to a proxy resolver.

1868 **IMPORTANT:** this sequence of steps is not idempotent, so it MUST be performed only once.

- 1869 1. First, in order to preserve percent-encoding when the HXRI is passed through a web  
 1870 server, all percent signs MUST be themselves percent-encoded, i.e., a SPACE encoded  
 1871 as %20 will become %2520.
- 1872 2. Second, to prevent misinterpretation of HXRI query parameters, any occurrences of the  
 1873 ampersand character (“&”) within an HXRI query parameter that are NOT used to delimit  
 1874 it from another query parameter MUST be percent encoded using the sequence %26.
- 1875 3. Third, to prevent misinterpretation of the semicolon character by the web server, any  
 1876 semicolon used to delimit one of the media type parameters defined in Table 6 from the  
 1877 media type value MUST be percent-encoded using the sequence %3B.

1878 To decode an encoded HXRI back into URI-normal form, the above sequence of steps MUST be  
 1879 performed in reverse order. Again, the sequence is not idempotent so it MUST be performed only  
 1880 once.

1881 Table 20 illustrates the components of an example HXRI before transformation to URI-normal  
 1882 form. The characters requiring percent encoding are highlighted in **red**. Note the space in the  
 1883 string `hello planète`. Also, for purposes of illustration, the Type component contains a query  
 1884 string (which would not normally appear in a Type identifier).

QXRI	<code>https://xri.example.com/=example*r<sup>E</sup>sum<sup>E</sup>/path?query</code>
<code>_xrd_r</code>	<code>_xrd_r=application/xrds+xml;https=true;sep=true</code>
<code>_xrd_t</code>	<code>_xrd_t=http://example.org/test?a=1&amp;b=hello planète</code>
<code>_xrd_m</code>	<code>_xrd_m=application/atom+xml</code>

1885 *Table 20: Example of HXRI components prior to transformation to URI-normal form.*

1886 Table 21 illustrates these components after transformation to URI-normal form. Characters that  
 1887 have been percent-encoded are in **blue**. Characters still requiring percent encoding according to  
 1888 the rules defined in this section are highlighted in **red**.

QXRI	<code>https://xri.example.com/=example*r<sup>E9</sup>sum<sup>E9</sup>/path?query</code>
<code>_xrd_r</code>	<code>_xrd_r=application/xrds+xml;https=true;sep=true</code>
<code>_xrd_t</code>	<code>_xrd_t=http://example.org/test?a=1&amp;b=hello%20plan<sup>E8</sup>te</code>
<code>_xrd_m</code>	<code>_xrd_m=application/atom+xml</code>

1889 *Table 21: Example of HXRI components after transformation to URI-normal form.*

1890 Table 22 illustrates the components after all encoding rules defined in this section are applied.

QXRI	<code>https://xri.example.com/=example*r<sup>25E9</sup>sum<sup>25E9</sup>/path?query</code>
<code>_xrd_r</code>	<code>_xrd_r=application/xrds+xml<sup>3B</sup>https=true<sup>3B</sup>sep=true</code>
<code>_xrd_t</code>	<code>_xrd_t=http://example.org/test?a=1<sup>26</sup>b=hello%2520plan<sup>25E8</sup>te</code>
<code>_xrd_m</code>	<code>_xrd_m=application/atom+xml</code>

1891 *Table 22: Example of HXRI components after application of the required encoding rules.*

1892 Following is the fully-encoded HXRI:

```
1893 https://xri.example.com/=example*r%25E9sum%25E9/path?query
1894 &_xrd_r=application/xrds+xml%3Bhttps=true%3Bsep=true
1895 &_xrd_t=http://example.org/test?a=1%26b=hello%2520plan%25E8te
1896 &_xrd_m=application/atom+xml
```

1897 Following is the fully decoded HXRI returned to URI-normal form. Note that the proxy resolver  
1898 MUST leave the HXRI in URI-normal form for any further processing.

```
1899 https://xri.example.com/=example*r%E9sum%E9/path?query
1900 &_xrd_r=application/xrds+xml;https=true;sep=true
1901 &_xrd_t=http://example.org/test?a=1&b=hello%20plan%E8te
1902 &_xrd_m=application/atom+xml
```

## 1903 11.5 HTTP(S) Accept Headers

1904 In proxy resolution, one XRI resolution input parameter, the Service Media Type (section 8.1.4)  
1905 MAY be passed to a proxy resolver via the HTTP(S) Accept header of a resolution request. The  
1906 following rules apply to this input:

- 1907 1. As described in section 14.1 of **[RFC2616]**, the Accept header content type MAY consist  
1908 of multiple media type identifiers. If so, the proxy resolver MUST choose only one to  
1909 accept. A proxy resolver client SHOULD order media type identifiers according to the  
1910 client's preference and a proxy resolver server SHOULD choose the client's highest  
1911 preference.
- 1912 2. If the value of the Accept header content type is null, this MUST be interpreted as the  
1913 value of the Service Media Type parameter.
- 1914 3. If the value of the Service Media Type parameter is explicitly set via the `_xrd_m` query  
1915 parameter in the HXRI (including to a null value), this MUST take precedence over any  
1916 value set via an HTTP(S) Accept header.

## 1917 11.6 Null Resolution Output Format

1918 Unlike authority resolution as defined in the preceding sections, a proxy resolver MAY receive a  
1919 resolution request where the Resolution Output Format input parameter value is null—either  
1920 because this parameter is absent or because it was explicitly set to null using the `_xrd_r` query  
1921 parameter.

1922 If the value of the Resolution Output Format value is null, a resolver MUST proceed as if the  
1923 following media type parameters had the following values: `https=false`, `saml=false`,  
1924 `refs=true`, `sep=true`, `nodefault_t=false`, `nodefault_p=false`,  
1925 `nodefault_m=false`, and `uric=false`. In addition, the output MUST be an HTTP(S) redirect  
1926 as defined in the following section.

## 1927 11.7 Outputs and HTTP(S) Redirects

1928 For all values of the Resolution Output Format parameter except null, a proxy resolver MUST  
1929 follow the output rules defined in section 8.2.

1930 If the value of the Resolution Output Format is null, and the output is not an error, a proxy  
1931 resolver MUST follow the rules for output of a URI List as defined in section 8.2.3. However,  
1932 instead of returning a URI list, it MUST return the highest priority URI (the first one in the list) as  
1933 an HTTP(S) 3XX redirect with the Accept header content type set to the value of the Service  
1934 Media Type parameter.

1935 If the output is an error, a proxy resolver SHOULD return a human-readable error message as  
1936 specified in section 15.4.

1937 These rules enable XRI proxy resolvers to serve clients that do not understand XRI syntax or  
1938 resolution (such as non-XRI-enabled browsers) by automatically returning a redirect to the  
1939 service endpoint identified by a combination of the QXRI and the value of the HTTP(S) Accept  
1940 header (if any).

## 1941 **11.8 Differences Between Proxy Resolution Servers**

1942 An XRI proxy resolution request MAY be sent to any proxy resolver that will accept it. All XRI  
1943 proxy resolvers SHOULD deliver uniform responses given the same QXRI and other input  
1944 parameters. However, because proxy resolvers may potentially need to make decisions about  
1945 network errors, Redirect and Ref processing, and trust policies on behalf of the client they are  
1946 proxying, and these decisions may be based on local policy, in some cases different proxy  
1947 resolvers may return different results.

## 1948 **11.9 Combining Authority and Proxy Resolution Servers**

1949 The majority of DNS nameservers are recursing nameservers that answer both queries for which  
1950 they are authoritative and queries which they must forward to other nameservers. The same rule  
1951 applies in XRI architecture: in many cases the optimum configuration will be combining an  
1952 authority server and proxy resolver in the same server. This server can publish a self-describing  
1953 XRDS document (section 9.1.6) that advertises both its authority resolution and proxy resolution  
1954 service endpoints. It can also optimize caching of XRDs for clients in its resolution community  
1955 (see section 16.4).

1956

## 12 Redirect and Ref Processing

1957

The purpose of the `xrd:Redirect` and `xrd:Ref` elements is to enable identifier authorities to distribute and delegate management of XRDS documents. There are two primary use cases for using multiple XRDS documents to describe the same resource:

1958

1959

1960

- One identifier authority needs to manage descriptions of the resource from different physical locations on the network, e.g., registry, directory, webserver, blog, etc. This is the purpose of the `xrd:Redirect` element.

1961

1962

1963

- One identifier authority needs to delegate all or part of resource description to a different identifier authority, e.g., an individual might delegate responsibility for different aspects of an XRDS to his/her spouse, school, employer, doctor, etc. This is the purpose of the `xrd:Ref` element.

1964

1965

1966

1967

Table 23 summarizes the similarities and differences between the `xrd:Redirect` and `xrd:Ref` elements.

1968

Requirement	Redirect	Ref
Must contain	HTTP(S) URI	XRI
Accepts the same <code>append</code> attribute as the <code>xrd:URI</code> element	Yes	No
Delegates to a different identifier authority	No	Yes
Must include a subset of the synonyms available in the source XRD	Yes	No
Available at both XRD level and SEP level	Yes	Yes
Processed automatically if present at the XRD level	Yes	Yes
Always results in nested XRDS document, even if only to report an error	Yes	Yes
Required attribute of XRDS element for nested XRDS document	<code>redirect</code>	<code>ref</code>
Number of XRDS in nested XRDS document	1	1 or more

1969

Table 23: Comparison of Redirect and Ref elements.

1970

The combination of Redirect and Ref elements should enable identifier authorities to implement a wide variety of distributed XRDS management policies.

1971

1972

**IMPORTANT:** Since they involve recursive calls, XRDS authors SHOULD use Redirects and Refs carefully and SHOULD perform special testing on XRDS documents containing Redirects and/or Refs to ensure they yield expected results. In particular implementers should study the recursive calls between authority resolution and service endpoint selection illustrated in Figure 2, Figure 5, Figure 7, and Figure 8 and see the guidance in section 12.6, *Recursion and Backtracking*.

1973

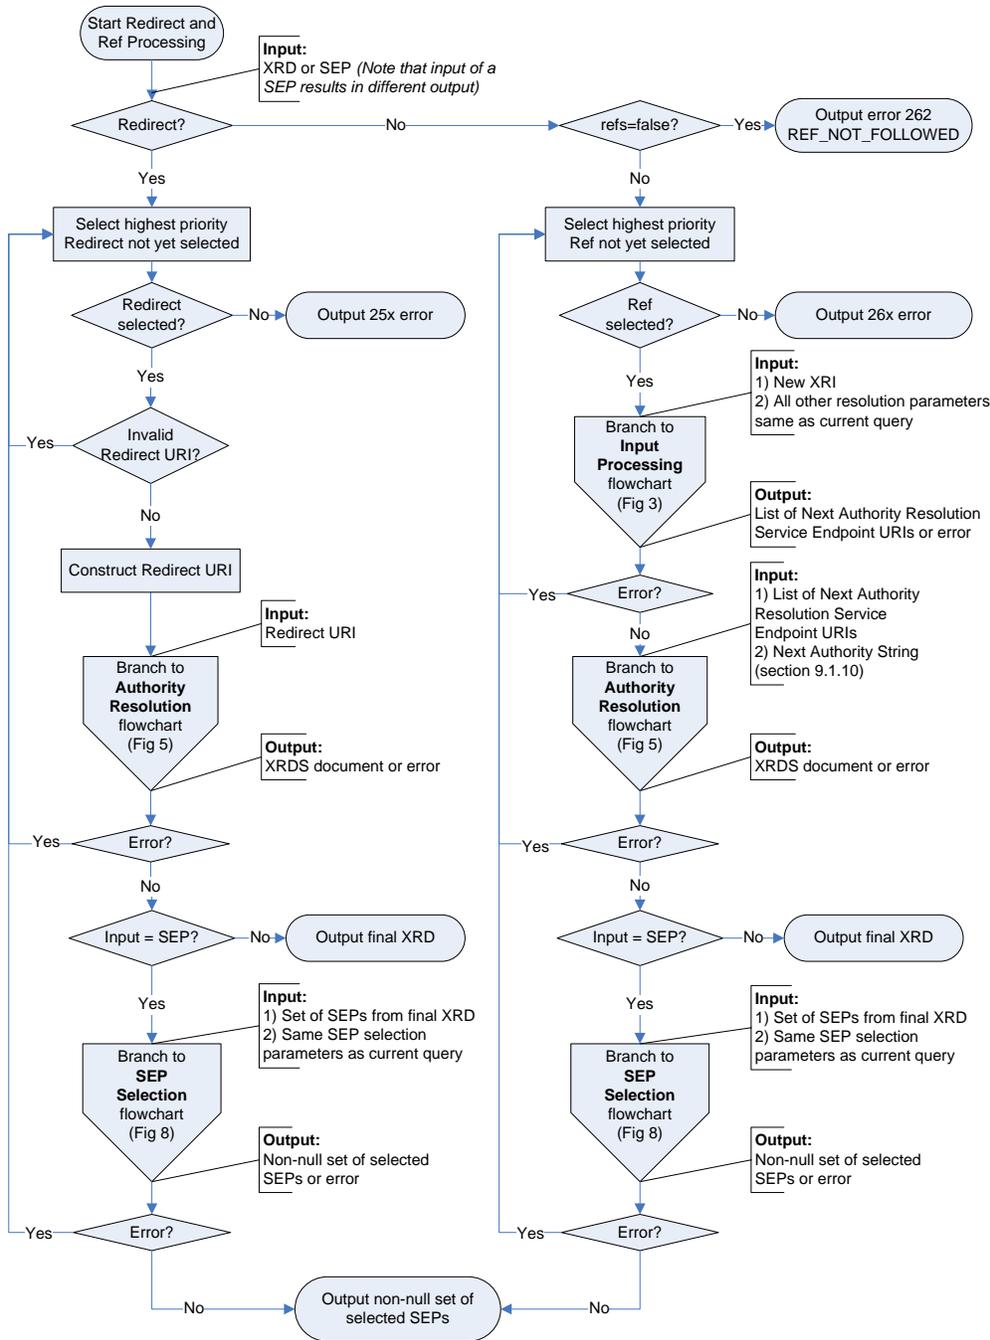

1974

1975

1976

Figure 7 (non-normative) illustrates the logical flow of Redirect and Ref processing.

**Comment [DSR11]:** This flowchart revised for improved clarity about Redirect URI as an input, outputs, and recording of XRD and XRDS documents.

1978  
1979

1980 Figure 7: Redirect and Ref processing flowchart.

## 1981 12.1 Cardinality

1982 Redirect and Ref elements may be used both at the XRD level (as a child of the `xrd:XRD`  
1983 element) and the SEP level (as a child of the `xrd:XRD/xrd:Service` element) within an XRD.  
1984 In both cases, to simplify processing, the XRD schema (Appendix B) enforces the following rules:

- 1985 • At the XRD level, an XRD MAY contain only one of the following: zero-or-more  
1986 `xrd:Redirect` or zero-or-more `xrd:Ref` elements.
- 1987 • At the SEP level, a SEP MAY contain only one of the following: zero-or-more `xrd:URI`  
1988 elements, zero-or-more `xrd:Redirect` elements, or zero-or-more `xrd:Ref` elements.

Comment [DSR12]: Clarified wording per comment from Eran Hammer-Lahav.

## 1989 12.2 Precedence

1990 XRDS authors should take special note of the following precedence rules for Redirect and Refs.

- 1991 1. If a Redirect or Ref element is present at the XRD level, it MUST be processed  
1992 immediately before a resolver continues with authority resolution, performs service  
1993 endpoint selection (required or optional), or returns its final output. This rule applies  
1994 recursively to all XRDS documents resolved as a result of Redirect or Ref processing.
- 1995 2. If a Redirect or Ref element is not present at the XRD level, but is present in the highest  
1996 priority service endpoint selected by the rules in section 13, it MUST be processed  
1997 immediately before a resolver completes service endpoint selection (required or optional),  
1998 or returns its final output. This rule also applies recursively to all XRDS documents  
1999 resolved as a result of Redirect or Ref processing.

2000 **IMPORTANT:** Due to these rules, even if a resolver has resolved the final subsegment of an XRI,  
2001 the authority resolution phase is still not complete as long as the final XRD has a Redirect or Ref  
2002 at the XRD level. This Redirect or Ref MUST be resolved until it returns an XRD that does not  
2003 contain an Redirect or Ref at the XRD level. The same rule applies to the optional service  
2004 endpoint selection phase: it is not complete until it locates a final XRD that contains the requested  
2005 SEP but: a) the XRD does not contain an Redirect or Ref at the XRD level, and b) the highest  
2006 priority selected SEP does not contain a Redirect or Ref.

2007 Based on these rules, the following best practices are recommended.

- 2008 1. XRDS authors SHOULD NOT put any service endpoints in an XRD that contains a  
2009 Redirect or Ref at the XRD level because by definition these service endpoints will be  
2010 ignored.
- 2011 2. XRDS authors SHOULD use a Redirect or Ref element at the XRD level if they wish to  
2012 relocate or delegate resolution behavior regardless of any service endpoint query.
- 2013 3. XRDS authors SHOULD use a Redirect or Ref element in a service endpoint for which  
2014 they expect a POSITIVE match as defined in section 13.4.1 if they wish to control  
2015 resolution behavior based an explicit service endpoint match.
- 2016 4. XRDS authors SHOULD use a Redirect or Ref element in a service endpoint for which  
2017 they expect a DEFAULT match as defined in section 13.4.1 if they wish to control  
2018 resolution behavior based on the absence of an explicit service endpoint match.
- 2019 5. XRDS authors SHOULD NOT include two or more SEPs of equal priority in an XRD if  
2020 they contain Redirects or Refs that will make resolution ambiguous or non-deterministic.

2021 Also note that, during the authority resolution phase, a Redirect or Ref placed in the highest  
2022 priority authority resolution SEP of an XRD will have effectively the same result as a Redirect or  
2023 Ref placed at the XRD level. The first option (placement in the SEP) SHOULD be used if the XRD  
2024 contains other service endpoints or metadata describing the resource. The second option  
2025 (placement at the XRD level) SHOULD be used only if the XRD contains no service endpoints.

## 2026 12.3 Redirect Processing

2027 The purpose of the `xrd:Redirect` element is to enable an authority to redirect from an XRDS  
2028 document managed in one network location (e.g., a registry) to a different XRDS document  
2029 managed in a different network location by the same authority (e.g., a web server, blog, etc.) It is  
2030 similar to an HTTP(S) redirect; however, it is managed at the XRDS document level rather than  
2031 HTTP(S) transport level. Note that unlike a Ref, a Redirect does NOT delegate to a different XRI  
2032 authority, but only to the same authority at a different network location.

2033 Following are the normative rules for processing of the `xrd:Redirect` element.

- 2034 1. To process a Redirect at either the XRD or SEP level, the resolver MUST begin by  
2035 selecting the highest priority `xrd:XRD/xrd:Redirect` element in the XRD or SEP.
- 2036 2. If the value of the resolution subparameter `https` is FALSE, or the subparameter is  
2037 absent or empty, the value of the selected `xrd:Redirect` element MUST be EITHER a  
2038 valid HTTP URI or a valid HTTPS URI. If not, the resolver MUST select the next highest  
2039 priority `xrd:Redirect` element. If all instances of this element fail, the resolver MUST  
2040 stop and return the error 251 `INVALID_REDIRECT` in the XRD containing the Redirect  
2041 or as a plain text error message as specified in section 15.
- 2042 3. If the value of the resolution subparameter `https` is TRUE, the value of the selected  
2043 `xrd:Redirect` element MUST be a valid HTTPS URI. If not, the resolver MUST select  
2044 the next highest priority `xrd:Redirect` element. If all instances of this element fail, the  
2045 resolver MUST stop and return the error 252 `INVALID_HTTPS_REDIRECT` in the XRD  
2046 containing the Redirect or as a plain text error message as specified in section 15.
- 2047 4. Once a valid `xrd:Redirect` element has been selected, if the  
2048 `xrd:XRD/xrd:Redirect` element includes the `append` attribute, the resolver MUST  
2049 construct the final HTTP(S) URI as defined in section 13.7.
- 2050 5. The resolver MUST request a new XRDS document from the final HTTP(S) URI using the  
2051 protocol defined in section 9.1.3. If the Resolution Output Format is an XRDS document,  
2052 the resolver MUST embed a nested XRDS document containing an XRD representing  
2053 the Redirect as specified in section 12.5.
- 2054 6. If resolution of an `xrd:Redirect` element fails during the authority resolution phase of  
2055 the original resolution query, or if resolution of an `xrd:Redirect` element fails during  
2056 the optional service endpoint selection phase OR the final XRD does not contain the  
2057 requested SEP, then the resolver MUST report the error in the final XRD of the nested  
2058 XRDS document using the status codes defined in section 15. (One nested XRDS  
2059 document will be added for each Redirect attempted by the resolver.) The resolver MUST  
2060 then select the next highest priority `xrd:Redirect` element from the original XRD or  
2061 SEP and repeat rule 7. For more details, see section 12.6, *Recursion and Backtracking*.
- 2062 7. If resolution of all `xrd:Redirect` elements in the XRD or SEP that originally triggered  
2063 Redirect processing fails, the resolver MUST stop and return a 25x error in the XRD  
2064 containing the Redirect or as a plain text error message as specified in section 15. The  
2065 resolver MUST NOT try any other SEPs even if multiple SEPs were selected as specified  
2066 in section 13.
- 2067 8. If resolution succeeds, the resolver MUST verify the synonym elements in the new XRD  
2068 as specified in section 14.1. If synonym verification fails, the resolver MUST stop and  
2069 return the error specified in that section.
- 2070 9. If the value of the resolution subparameter `saml` is TRUE, the resolver MUST verify the  
2071 signature on the XRD as specified in section 10.2.4. If signature verification fails, the  
2072 resolver MUST stop and return the error specified in that section.
- 2073 10. If Redirect resolution succeeds, further authority resolution or service endpoint selection  
2074 MUST continue based on the new XRD.

Comment [DSR13]: Corrected  
reference from section 6.3 to 9.1.3  
(caught by Wil Tan).

## 2075 12.4 Ref Processing

2076 | The purpose of the `xrd:Ref` element is to enable one authority to delegate management of all or  
2077 | part of an XRDS document to another authority. For example, an individual might delegate  
2078 | management of all or portions of an XRDS document to his/her spouse, school, employer, doctor,  
2079 | etc. This delegation may cover the entire document (an XRD level Ref), or only one or more  
2080 | specific service endpoints within the document (a SEP level Ref).

Comment [DSR14]: Typo caught by Wil Tan.

Deleted: Redirect

2081 | Following are the normative rules for processing of the `xrd:Ref` element.

- 2082 | 1. Ref processing is only performed if the value of the `refs` subparameter (Table 6) is  
2083 | TRUE or it is absent or empty. If the value is FALSE and the XRD contains at least one  
2084 | `xrd:Ref` element that could be followed to complete the resolution query, the resolver  
2085 | MUST stop and return the error 262 `REF_NOT_FOLLOWED` in the XRD containing the  
2086 | Ref or as a plain text error message as defined in section 15. The rules below presume  
2087 | that `refs=true`.
- 2088 | 2. To process a Ref at either the XRD or SEP level, the resolver MUST begin by selecting  
2089 | the highest priority `xrd:XRD/xrd:Ref` element from the XRD or SEP.
- 2090 | 3. The value of the selected `xrd:Ref` element MUST be a valid absolute XRI. If not, the  
2091 | resolver MUST select the next highest priority `xrd:Ref` element. If all instances of this  
2092 | element fail, the resolver MUST stop and return the error 261 `INVALID_REF` in the XRD  
2093 | containing the Ref or as a plain text error message as defined in section 15.
- 2094 | 4. Once a valid `xrd:XRD/xrd:Ref` value is selected, the resolver MUST begin resolution  
2095 | of a new XRDS document from this XRI using the protocols defined in this specification.  
2096 | Other than the QXRI, the resolver MUST use the same resolution query parameters as  
2097 | the original query. If the Resolution Output Format is an XRDS document, the resolver  
2098 | MUST embed a nested XRDS document containing an XRD representing the Ref as  
2099 | defined in section 12.5.
- 2100 | 5. If resolution of an `xrd:Ref` element fails during the authority resolution phase of the  
2101 | original resolution query, or if resolution of an `xrd:Ref` element fails during the optional  
2102 | service endpoint selection phase OR the final XRD does not contain the requested  
2103 | service endpoint, then the resolver MUST record the nested XRDS document as far as  
2104 | resolution was successful, including the relevant status codes for each XRD as specified  
2105 | in section 15. The resolver MUST then select the next highest priority `xrd:Ref` element  
2106 | as specified above and repeat rule 5. For more details, see section 12.6, *Recursion and*  
2107 | *Backtracking*.
- 2108 | 6. If resolution of all `xrd:Ref` elements in the XRD or SEP originating Ref processing fails,  
2109 | the resolver MUST stop and return a 26x error in the XRD containing the Ref or as a  
2110 | plain text error message as specified in section 15. The resolver MUST NOT try any  
2111 | other SEPs even if multiple SEPs were selected as specified in section 13.
- 2112 | 7. If resolution of an `xrd:Ref` element succeeds and `cid=true`, the resolver MUST  
2113 | perform CanonicalID verification across all XRDs in the nested XRDS document as  
2114 | specified in section 14.3. Note that each set of XRDs in each new nested XRDS  
2115 | document produced as a result of Redirect or Ref processing constitutes its own  
2116 | CanonicalID verification chain. *CanonicalID verification never crosses between XRDS*  
2117 | *documents*. See section 12.5 for examples.
- 2118 | 8. If resolution of an `xrd:Ref` element succeeds and the final XRD contains the service  
2119 | endpoint(s) necessary to continue or complete the original resolution query, further  
2120 | authority resolution or service endpoint selection MUST continue based on the final XRD.

Comment [DSR15]: Typo caught by Wil Tan.

Deleted: be

## 2121 12.5 Nested XRDS Documents

2122 Processing of a Redirect or Ref ALWAYS produces a new XRDS document that describes the  
2123 Redirect or Ref that was followed, even if the result was an error. If the final requested Resolution  
2124 Output Format is NOT an XRDS document, this new XRDS document is only needed to obtain  
2125 the metadata necessary to continue or complete resolution. However, if the final requested  
2126 Resolution Output Format is an XRDS document, each XRDS document produced as a result of  
2127 Redirect or Ref processing MUST be nested inside the outer XRDS document immediately  
2128 following the `xrd:XRD` element containing the `xrd:Redirect` or `xrd:Ref` element being  
2129 followed. If more than one Redirect or Ref element is resolved due to an error, the corresponding  
2130 nested XRDS documents MUST be included in the same order as the Redirect or Ref elements  
2131 that were followed to produce them.

2132 Each new XRDS document is a recursive authority resolution call and MUST conform to all  
2133 authority resolution requirements. In addition, the following rules apply:

- 2134 • For a Redirect, the `xrds:XRDS/@redirect` attribute of the nested XRDS document MUST  
2135 contain the fully-constructed HTTP(S) URI it describes as specified in section 12.3.
- 2136 • For a Ref, the `xrds:XRDS/@ref` attribute of the nested XRDS document MUST contain the  
2137 exact value of the `xrd:XRD/xrd:Ref` element it describes.

2138 This allows a consuming application to verify the complete chain of XRDs obtained to resolve the  
2139 original query identifier even if resolution traverses multiple Redirects or Refs, and even if errors  
2140 were encountered. Like the outer XRDS document, nested XRDS documents MUST NOT include  
2141 an XRD for the community root subsegment because this is part of the configuration of the  
2142 resolver.

2143 In addition, during SAML trusted resolution, if a nested XRDS document includes an XRD with an  
2144 `xml:id` attribute value matching the `xml:id` attribute value of any previous XRD in the chain of  
2145 resolution requests beginning with the original QXRI, the resolver MUST replace this XRD with an  
2146 empty XRD element. The resolver MUST set this empty element's `idref` attribute value to the  
2147 value of the `xml:id` attribute of the matched XRD element. This prevents conflicting `xml:id`  
2148 values.

### 2149 12.5.1 Redirect Examples

#### 2150 Example #1:

2151 In this example the original query identifier is `xri://@a`. The first XRD contains an XRD-level  
2152 Redirect to `http://a.example.com/`. The elements and attributes specific to Redirect  
2153 processing are shown in **bold**. CanonicalIDs are included to illustrate the synonym verification  
2154 rule in section 12.3.

```
2155 <XRDS xmlns="xri://$xrds" ref="xri://@a">
2156   <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">
2157     <Query>*a</Query>
2158     <ProviderID>xri://@</ProviderID>
2159     <CanonicalID>xri://@!1</CanonicalID> ;XRDS #1 CID #1
2160     <Redirect>http://a.example.com/</Redirect>
2161     ...
2162   </XRD>
2163   <XRDS redirect="http://a.example.com/">
2164     <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">
2165       <ProviderID>xri://@</ProviderID>
2166       <CanonicalID>xri://@!1</CanonicalID> ;SAME AS XRDS #1 CID #1
2167       ...
2168     <Service>
2169       <Type>http://openid.net/signon/1.0</Type>
2170       <URI>http://openid.example.com/</URI>
```

2171  
2172  
2173  
2174

```
    </Service>  
  </XRD>  
</XRDS>  
</XRDS>
```

2175 **Example #2:**

2176 In this example the original query identifier is `xri://@a*b*c`. The second XRD contains a SEP-  
2177 level Redirect in its authority resolution SEP to `http://other.example.com/`. Note that  
2178 because authority resolution is not complete when this Redirect is encountered, it continues in the  
2179 outer XRDS after the nested XRDS representing the Redirect is complete. Again, CanonicalIDs  
2180 are included to illustrate the synonym verification rule.

2181

  </XRD>  
</XRDS>  
  <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">  
    <Query>*c</Query>  
    <ProviderID>xri://@!1!2</ProviderID>  
    <CanonicalID>xri://@!1!2!3</CanonicalID> ;XRDS #1 CID #3  
    ...  
    <Service>  
      ...final service endpoints described here...  
    </Service>  
  </XRD>  
</XRDS>
```

2225 **Example #3:**

2226 In this example the original query identifier is again `xri://@a*b*c`. This time the final XRD  
2227 contains a SEP-level Redirect to `http://other.example.com/`. Because authority resolution  
2228 is complete, the outer XRDS ends with a nested XRDS representing the SEP-level Redirect.

```
2229 <XRDS xmlns="xri://$xrds" ref="xri://@a*b*c">
2230   <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">
2231     <Query>*a</Query>
2232     <ProviderID>xri://@</ProviderID>
2233     <CanonicalID>xri://@!1</CanonicalID> ;XRDS #1 CID #1
2234     ...
2235     <Service>
2236       <Type>xri://$res*auth*($v*2.0)</Type>
2237       <URI>http://a.example.com/</URI>
2238     </Service>
2239   </XRD>
2240   <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">
2241     <Query>*b</Query>
2242     <ProviderID>xri://@!1</ProviderID>
2243     <CanonicalID>xri://@!1!2</CanonicalID> ;XRDS #1 CID #2
2244     ...
2245     <Service>
2246       <Type>xri://$res*auth*($v*2.0)</Type>
2247       <URI>http://b.example.com/</URI>
2248     </Service>
2249   </XRD>
2250   <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">
2251     <Query>*c</Query>
2252     <ProviderID>xri://@!1!2</ProviderID>
2253     <CanonicalID>xri://@!1!2!3</CanonicalID> ;XRDS #1 CID #3
2254     ...
2255     <Service>
2256       <Type>http://openid.net/signon/1.0</Type>
2257       <Redirect>http://r.example.com/openid</Redirect>
2258     </Service>
2259   </XRD>
2260   <XRDS redirect="http://r.example.com/openid">
2261     <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">
2262       <ProviderID>xri://@!1!2</ProviderID>
2263       <CanonicalID>xri://@!1!2!3</CanonicalID> ;SAME AS XRDS #1 CID #3
2264       ...
2265       <Service>
2266         <Type>http://openid.net/signon/1.0</Type>
2267         <URI>http://openid.example.com/</URI>
2268       </Service>
2269     </XRD>
2270   </XRDS>
2271 </XRDS>
```

2272

**Example #4:**

2273

In this final example the query identifier is `xri://@a*b`. The first XRD contains an XRD-level

2274

Redirect to `http://a.example.com/`, and this XRDS document in turn contains a second

2275

redirect to `http://b.example.com/`. Chaining redirects in this manner is NOT

2276

RECOMMENDED but is shown here to clarify how XRDS document nesting works.

Comment [DSR16]: Added in Revision 02 per suggestion from Wil Tan to clarify how double-nested XRDS documents work.

2277

```

<XRDS xmlns="xri://$xrds" ref="xri://@a*b">
  <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">
    <Query>*a</Query>
    <ProviderID>xri://@</ProviderID>
    <CanonicalID>xri://@!1</CanonicalID> ;XRDS #1 CID #1
    <Redirect>http://a.example.com/</Redirect>
    ...
  </XRD>
  <XRDS redirect="http://a.example.com/">
    <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">
      <ProviderID>xri://@</ProviderID>

## 2316 12.5.2 Ref Examples

### 2317 Example #1:

2318 In this example the original query identifier is `xri://@a`. The first XRD contains an XRD-level  
2319 Ref to `xri://@x*y`. The CanonicalID values are included to illustrate the CanonicalID  
2320 verification rules in section 14.3.

```
2321 <XRDS xmlns="xri://$xrds" ref="xri://@a">
2322   <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">
2323     <Query>*a</Query>
2324     <ProviderID>xri://@</ProviderID>
2325     <CanonicalID>xri://!1</CanonicalID> ;XRDS #1 CID #1
2326     <Ref>xri://@x*y</Ref>
2327   </XRD>
2328   <XRDS ref="xri://@x*y">
2329     <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">
2330       <Query>*x</Query>
2331       <ProviderID>xri://@</ProviderID>
2332       <CanonicalID>xri://!7</CanonicalID> ;XRDS #2 CID #1
2333       ...
2334       <Service>
2335         <Type>xri://$res*auth*($v*2.0)</Type>
2336         <URI>http://x.example.com/</URI>
2337       </Service>
2338     </XRD>
2339     <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">
2340       <Query>*y</Query>
2341       <ProviderID>xri://!7</ProviderID>
2342       <CanonicalID>xri://!7!8</CanonicalID> ;XRDS #2 CID #2
2343       ...
2344       <Service>
2345         <Type>xri://$res*auth*($v*2.0)</Type>
2346         <URI>http://y.example.com/</URI>
2347       </Service>
2348       <Service>
2349         <Type>http://openid.net/signon/1.0</Type>
2350         <URI>http://openid.example.com/</URI>
2351       </Service>
2352     </XRD>
2353   </XRDS>
2354 </XRDS>
```

### 2355 Example #2:

2356 In this example the original query identifier is `xri://@a*b*c`. The second XRD contains a SEP-  
2357 level Ref in its authority resolution SEP to `xri://@x*y`. Note that because authority resolution is  
2358 not complete when this Ref is encountered, it continues in the outer XRDS after the nested XRDS  
2359 representing the Ref. *Note especially how the CanonicalIDs progress to satisfy the CanonicalID*  
2360 *verification rules specified in section 14.3.*

```
2361 <XRDS xmlns="xri://$xrds" ref="xri://@a*b*c">
2362   <XRD xmlns="xri://$xrd*($v*2.0)" version="2.0">
2363     <Query>*a</Query>

2477

## 12.6 Recursion and Backtracking

2478

Redirect and Ref processing triggers recursive calls to authority resolution that produce nested XRDS documents. This recursion can continue to any depth, i.e., a Redirect may contain another Redirect or a Ref, and a Ref may contain another Ref or a Redirect. To avoid confusion, either in resolver implementations or in XRDS documents, it is important to clarify the “backtracking” rules. The following should be read in conjunction with the flowcharts in Figure 2, Figure 5, Figure 7, and Figure 8.

2484

- *Separation of phases.* Redirect and Ref processing invoked during the authority resolution phase is separate and distinct from Redirect and Ref processing invoked during the optional service endpoint selection phase (see Figure 2). Redirect or Ref processing during the former MUST successfully complete authority resolution or else return an error. Redirect or Ref processing during the latter MUST successfully locate the requested service endpoint or else return an error, i.e., it MUST NOT backtrack into the authority resolution phase.

2490

- *First recursion point.* The first time a resolver encounters a Redirect or a Ref within a phase is called the *first recursion point*. There MUST be at most one first recursion point during the authority resolution phase and at most one first recursion point during the optional service endpoint selection phase. During the authority resolution phase, the first recursion point MAY be either an XRD or a service endpoint (SEP). During the optional service endpoint selection phase, the first recursion point MUST be a SEP.

2496

- *Priority order.* As specified in sections 12.3 and 12.4, once a resolver reaches a first recursion point during the authority resolution stage, it MUST process Redirects or Refs in priority order until either it successfully completes authority resolution (and the final XRD does not contain an XRD-level Redirect or Ref), or until all Redirects or Refs have failed. Similarly, once a resolver reaches a first recursion point during the optional service endpoint selection phase, it MUST process Redirect or Ref in priority order until either it successfully locates the requested SEP (and that SEP does not contain a Redirect or Ref), or until all Redirects or Refs have failed.

2504

- *Next recursion point.* If a Redirect or Ref leads to another Redirect or Ref, this is called the *next recursion point*. The same rules apply to the next recursion point as apply to the first recursion point, except that if all attempts to resolve a Redirect or Ref at a next recursion point fail, the resolver MUST return to the previous recursion point and continue trying any untried Redirects or Refs until either it is successful or all Redirects or Refs have failed.

2509

- *Termination.* If the resolver returns to the first recursion point and all of its Redirects or Refs have failed, the resolver MUST stop and return an error.

2511

To avoid excessive recursion and inefficient resolution responses, XRDS authors are RECOMMENDED to use as few Redirects or Refs in a resolution chain as possible.

2512

Deleted: ny
Deleted: point completely fail
Deleted: s
Comment [DSR17]: Improved wording suggested by Wil Tan.

2513

## 13 Service Endpoint Selection

2514

The second phase of XRI resolution is called *service endpoint selection*. As noted in Figure 2, this

2515

phase is invoked automatically for each iteration of authority resolution after the first in order to

2516

select the Next Authority Resolution Service Endpoint as defined in section 9.1.9. It is also

2517

performed after authority resolution is complete if optional service endpoint selection is

2518

requested.

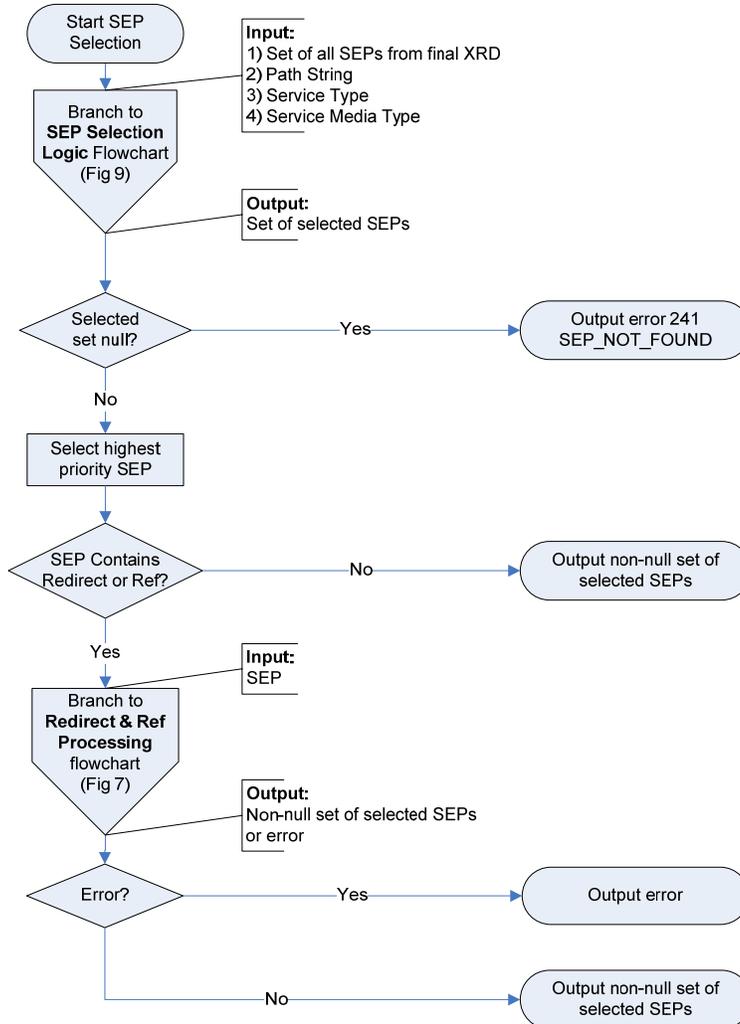

2519

### 13.1 Processing Rules

2520

Figure 8 (non-normative) shows the overall logical flow of the service endpoint selection process.

**Comment [DSR18]:** This flowchart revised for improved clarity about outputs and recording of XRD and XRDS documents.

2521

2522

Figure 8: Service endpoint (SEP) selection flowchart.

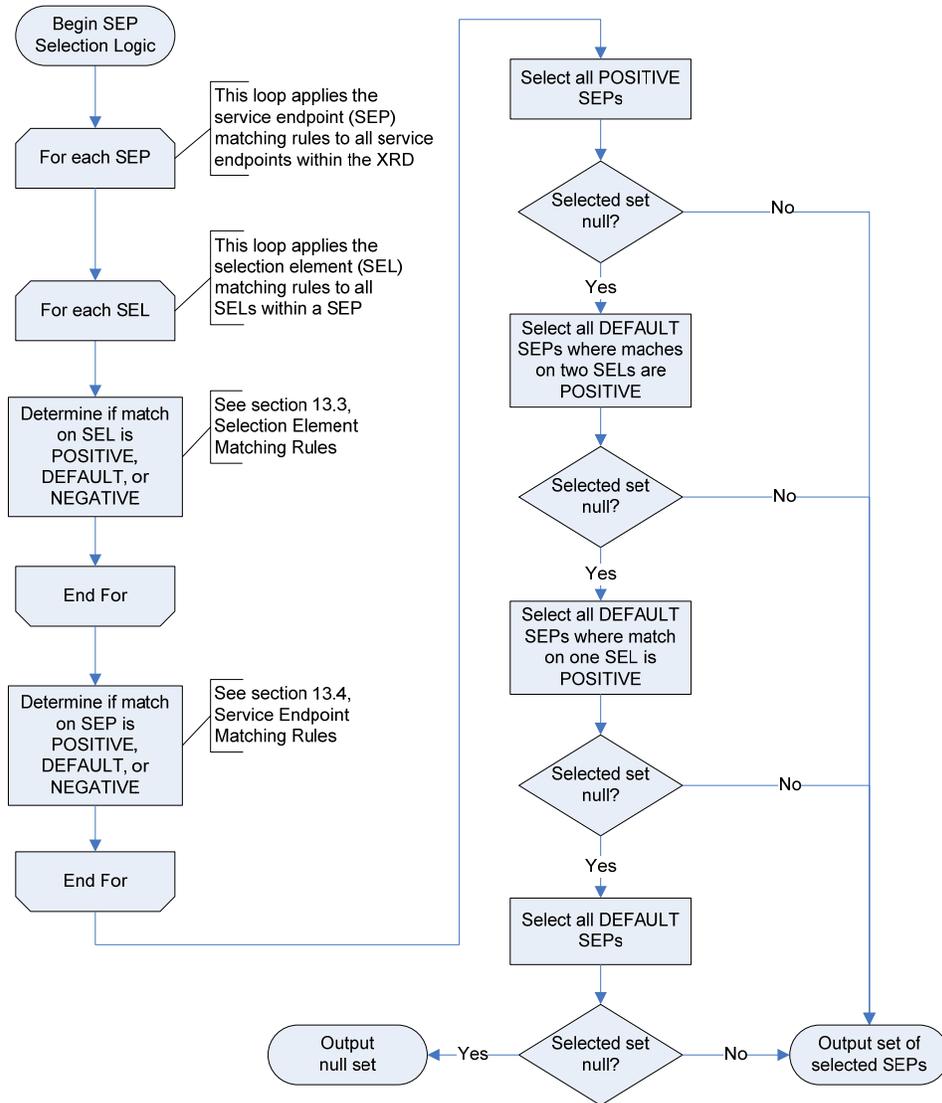

- 2523 Following are the normative rules for the overall service endpoint selection process:
- 2524 1. The inputs for service endpoint selection are defined in Table 8.
- 2525 2. For the set of all service endpoints (`xrd:XRD/xrd:Service` elements) in the XRD,  
2526 service endpoint selection **MUST** follow the logic defined in section 13.2. The output of  
2527 this process **MUST** be either the null set or a selected set of one or more service  
2528 endpoints.
- 2529 3. If, after applying the service endpoint selection logic, the selected set is null, this function  
2530 **MUST** return the error 241 `SEP_NOT_FOUND`.
- 2531 4. If, after applying the service endpoint selection logic, the selected set is not null and the  
2532 highest priority selected service endpoint contains an  
2533 `xrd:XRD/xrd:Service/xrd:Redirect` or `xrd:XRD/xrd:Service/xrd:Ref`  
2534 element, it **MUST** first be processed as specified in section 12. This is a recursive call  
2535 that will produce a nested XRDS document as defined in section 12.5.

2536

### 13.2 Service Endpoint Selection Logic

2537  
2538  
2539  
2540  
2541

Selection of service endpoints (SEPs) within an XRD is managed using service endpoint selection elements (SEs). As shown in Figure 9 (non-normative), the selection process first applies SEL matching rules (section 13.3), followed by SEP matching rules (section 13.4), to the set of all SEPs in the XRD. It then applies SEP selection rules (section 13.5) to determine the final output.

2542

2543 *Figure 9: Service endpoint (SEP) selection logic flowchart.*

2544 The following sections provide the normative rules for each section of this flowchart.

2545 **13.3 Selection Element Matching Rules**

2546 The first set of rules govern the matching of selection elements.

2547 **13.3.1 Selection Element Match Options**

2548 As defined in section 4.2.6, there are three categories of service endpoint selection elements:  
2549 `xrd:Type`, `xrd:Path`, and `xrd:MediaType`. Within each service endpoint, there is a match  
2550 option for each of the three categories of selection elements. Matches are tri-state: the three  
2551 options and their corresponding precedence order are defined in Table 24:

Match Option	Match Condition	Precedence
POSITIVE	A successful match based on the value of the <code>match</code> attribute as defined in 13.3.2 OR a successful match based the contents of the selection element as defined in sections 13.3.6 - 13.3.8.	1
DEFAULT	The value of the <code>match</code> attribute is <code>default</code> OR there is no instance of this type of selection element contained in the service endpoint as defined in section 13.3.3.	0
NEGATIVE	The selection element does not satisfy either condition above.	-1

2552 *Table 24: Match options for selection elements.*

2553 The Precedence order is used in the Multiple Selection Element Matching Rule (section 13.3.5).

2554 **IMPORTANT:** Failure of a POSITIVE match does not necessarily mean a NEGATIVE match; it  
2555 may still qualify as a DEFAULT match.

2556 **13.3.2 The Match Attribute**

2557 All three service endpoint selection elements accept the optional `match` attribute. This attribute  
2558 gives XRDS authors precise control over selection of SEPs based on the QXRI and other service  
2559 endpoint selection parameters. An enumerated list of the values for the `match` attribute is defined  
2560 in Table 25. If the `match` attribute is present with one of these values, the contents of the  
2561 selection element **MUST** be ignored, and the corresponding matching rule **MUST** be applied. If  
2562 the `match` attribute is absent or has any other value, the rules in this section do not apply.

Value	Matching Rule Applied to Corresponding Input Parameter
any	Automatically a POSITIVE match (i.e., input parameter is ignored).
default	Automatically a DEFAULT match (i.e., input parameter is ignored) UNLESS the value of the Resolution Output Format <code>nodefault_t</code> , <code>nodefault_p</code> or <code>nodefault_m</code> subparameter is set to TRUE for the applicable category of selection element, in which case it is a NEGATIVE match.
non-null	Any input value except null is a POSITIVE match. An input value of null is a NEGATIVE match.
null	An input value of null is a POSITIVE match. Any other input value is a NEGATIVE match.

2563 *Table 25: Enumerated values of the global match attribute and corresponding matching rules.*

2564 BACKWARDS COMPATIBILITY NOTE: earlier working drafts of this specification included the  
2565 values `match="none"` and `match="contents"`. Both are deprecated. The former is no longer  
2566 supported and the latter is now the default behaviour of any selection element that does not  
2567 include the `match` attribute. Implementers SHOULD accept these values accordingly.

### 2568 13.3.3 Absent Selection Element Matching Rule

2569 If a service endpoint does not contain at least one instance of a particular category of selection  
2570 element, it MUST be considered equivalent to the service endpoint having a DEFAULT match on  
2571 that category of selection element UNLESS overridden by a `nodefault_*` parameter as specified  
2572 in Table 25.

### 2573 13.3.4 Empty Selection Element Matching Rule

2574 If a selection element is present in a service endpoint but the element is empty, and if the element  
2575 does not contain a `match` attribute, it MUST be considered equivalent to having a `match`  
2576 attribute with a value of `null`.

### 2577 13.3.5 Multiple Selection Element Matching Rule

2578 Each service endpoint has only one match option for each category of selection element.  
2579 Therefore if a service endpoint contains more than one instance of the same category of selection  
2580 element (i.e., more than one `xrd:Type`, `xrd:Path`, or `xrd:MediaType` element), the match for  
2581 that category of selection element MUST be the match for the selection element(s) with the  
2582 highest precedence match option as defined in Table 24.

### 2583 13.3.6 Type Element Matching Rules

2584 The following rules apply to matching the value of the input Service Type parameter with the  
2585 contents of a non-empty `xrd:XRD/xrd:Service/xrd:Type` element when its `match` attribute  
2586 is absent.

- 2587 1. If the value is an XRI or IRI, it MUST be in URI-normal form as defined in section 4.4.
- 2588 2. Prior to comparison (and only for the purpose of comparison), the values of the Service  
2589 Type parameter and the `xrd:XRD/xrd:Service/xrd:Type` element SHOULD be  
2590 normalized according to the requirements of their identifier scheme. In particular, if an  
2591 XRI, IRI, or URI uses hierarchical syntax and does not include a local part (a path and/or  
2592 query component) after the authority component, a trailing forward slash after the  
2593 authority component MUST NOT be considered significant in comparisons. In all other  
2594 cases, a trailing forward slash MUST be considered significant in comparisons unless this  
2595 rule is overridden by scheme-specific comparison rules.
- 2596 3. To result in a POSITIVE match on this selection element, the values MUST be equivalent  
2597 according to the equivalence rules of the applicable identifier scheme. Any other result is  
2598 a NEGATIVE match on this selection element.

2599 As a best practice, service architects SHOULD assign identifiers for service types that are in URI-  
2600 normal form, do not require further normalization, and are easy to match.

### 2601 13.3.7 Path Element Matching Rules

2602 The following rules apply to matching the value of the input Path String (the path portion of the  
2603 QXRI as defined in section 8.1.1) with the contents of a non-empty

2604 `xrd:XRD/xrd:Service/xrd:Path` element when its `match` attribute is absent.

- 2605 1. If the value is a relative XRI or an IRI it MUST be in URI-normal form as defined in  
2606 section 4.4.
- 2607 2. Prior to comparison, the leading forward slash separating an XRI authority component  
2608 from the path component MUST be prepended to the Path String. Any subsequent  
2609 forward slash, including trailing forward slashes, MUST be significant in comparisons.
- 2610 3. The contents of the `xrd:XRD/xrd:Service/xrd:Path` element SHOULD include the  
2611 leading forward slash separating the XRI authority component from the path. If it does  
2612 not, one MUST be prepended prior to comparison.
- 2613 4. Equivalence comparison SHOULD be performed using Caseless Matching as defined in  
2614 section 3.13 of **[Unicode]**.
- 2615 5. To result in a POSITIVE match on this selection element, the value of the Path String  
2616 MUST be a *subsegment stem match* with the contents of the  
2617 `xrd:XRD/xrd:Service/xrd:Path` element. A subsegment stem match is defined as  
2618 the entire Path String being character-for-character equivalent with any continuous  
2619 sequence of subsegments or segments (including empty subsegments and empty  
2620 segments) in the contents of the Path element beginning from the most significant  
2621 (leftmost) subsegment. Subsegments and segments are formally defined in **[XRISyntax]**.  
2622 Any other result MUST be a NEGATIVE match on this selection element.

2623 Examples of this rule are shown in Table 26.

<b>QXRI (Path in bold)</b>	<b>XRD Path Element</b>	<b>Match</b>

@example/ <b>foo*bar/</b>	<Path>/ <b>foo*bar/baz</b> </Path>	POSITIVE
@example/ <b>foo*bar/</b>	<Path>/ <b>foo*bar*baz</b> </Path>	NEGATIVE
@example/ <b>foo!bar</b>	<Path>/ <b>foo*bar</b> </Path>	NEGATIVE
@example/ <b>foo!bar</b>	<Path>/ <b>foo!bar*baz</b> </Path>	POSITIVE
@example/( <b>+foo</b> )	<Path>/( <b>+foo</b> )</Path>	POSITIVE
@example/( <b>+foo</b> )*bar	<Path>/( <b>+foo</b> )</Path>	NEGATIVE
@example/( <b>+foo</b> )*bar	<Path>/( <b>+foo</b> )*bar</Path>	POSITIVE
@example/( <b>+foo</b> )*bar	<Path>/( <b>+foo</b> )*bar*baz</Path>	POSITIVE
@example/( <b>+foo</b> )!bar	<Path>/( <b>+foo</b> )*bar</Path>	NEGATIVE

2624 Table 26: Examples of applying the Path element matching rules.

### 2625 13.3.8 MediaType Element Matching Rules

2626 The following rules apply to matching the value of the input Service Media Type parameter with  
2627 the contents of of a non-empty `xrd:XRD/xrd:Service/xrd:MediaType` element when its  
2628 `match` attribute is absent.

- 2629 1. The values of the Service Media Type parameter and the `xrd:MediaType` element  
2630 SHOULD be normalized according to the rules for media types in section 3.7 of  
2631 [RFC2616] prior to input. (The rules are that media type and media type parameter  
2632 names are case-insensitive, but parameter values may or may not be case-sensitive  
2633 depending on the semantics of the parameter name. XRI Resolution Output Format  
2634 parameters and subparameters are all case-insensitive.) XRI resolvers MAY perform  
2635 normalization of these values but MUST NOT be required to do so.
- 2636 2. To be a POSITIVE match on this selection element, the values MUST be character-for-  
2637 character equivalent. Any other result is a NEGATIVE match on this selection element.

### 2638 13.4 Service Endpoint Matching Rules

2639 The next set of matching rules govern the matching of service endpoints based on the matches of  
2640 the selection elements they contain.

#### 2641 13.4.1 Service Endpoint Match Options

2642 For each service endpoint in an XRD, there are three match options as defined in Table 27:

Match Option	Condition
POSITIVE	Meets the Select Attribute Match Rule (section 13.4.2) or the All Positive Match Rule (section 13.4.3).
DEFAULT	Meets the Default Match Rule (section 13.4.4).
NEGATIVE	The service endpoint does not satisfy either condition above.

2643 *Table 27: Match options for service endpoints.*

#### 2644 13.4.2 Select Attribute Match Rule

2645 All three service endpoint selection elements accept the optional `select` attribute. This attribute  
2646 is a Boolean value used to govern matching of the containing service endpoint according to the  
2647 following rule. If service endpoint contains a selection element with a POSITIVE match as defined  
2648 in section 13.3, and the value of this selection element's `select` attribute is TRUE, the service  
2649 endpoint automatically MUST be a POSITIVE match, i.e., all other selection elements for this  
2650 service endpoint MUST be ignored.

#### 2651 13.4.3 All Positive Match Rule

2652 If a service endpoint has a POSITIVE match on all three categories of selection elements  
2653 (`xrd:Type`, `xrd:MediaType`, and `xrd:Path`) as defined in section 13.3, the service endpoint  
2654 MUST be a POSITIVE match. If even one of the three selection element match types is not  
2655 POSITIVE, this rule fails.

#### 2656 13.4.4 Default Match Rule

2657 If a service endpoint fails the Select Attribute Match Rule and the All Positive Match Rule, but  
2658 none of the three categories of selection elements has a NEGATIVE match as defined in section  
2659 13.3, the service endpoint MUST be a DEFAULT match.

## 2660 13.5 Service Endpoint Selection Rules

2661 The final set of rules governs the selection of service endpoints based on their matches.

### 2662 13.5.1 Positive Match Rule

2663 After applying the matching rules to service endpoints in section 13.4, all service endpoints that  
2664 have a POSITIVE match MUST be selected. Only if there are no service endpoints with a  
2665 POSITIVE match is the Default Match Rule invoked.

### 2666 13.5.2 Default Match Rule

2667 If the Positive Match Rule above fails, then the service endpoints with a DEFAULT match that  
2668 have the highest number of POSITIVE matches on each category of selection element MUST be  
2669 selected. This means:

- 2670 1. The service endpoints in the DEFAULT set that have two POSITIVE selection element  
2671 matches MUST be selected.
- 2672 2. If the previous set is empty, the service endpoints in the DEFAULT set that have one  
2673 POSITIVE selection element match MUST be selected.
- 2674 3. If the previous set is empty, all service endpoints in the DEFAULT set MUST be selected.
- 2675 4. If the previous set is empty, no service endpoint is selected and the return set is null.

## 2676 13.6 Pseudocode

2677 The following pseudocode provides a precise description of the service endpoint selection logic.  
2678 The pseudocode is normative, however if there is a conflict between it and the rules stated in the  
2679 preceding sections, the preceding sections shall prevail.

2680 The pseudocode uses nine Boolean flags to record the match state for each category of selection  
2681 element (SEL) in a service endpoint (SEP):

- 2682 • `Positive.x` (where `x` = Type, Path, or MediaType)
- 2683 • `Default.x` (where `x` = Type, Path, or MediaType)
- 2684 • `Present.x` (where `x` = Type, Path, or MediaType)

2685 The variable `Nodefault.x` refers to the value of the `nodefault_t` (Type), `nodefault_p`  
2686 (Path), and `nodefault_m` (MediaType) subparameters as explained in Table 25.

2687 Note that the complete set of nine SEL match flags is needed for each SEP. The pseudocode first  
2688 does a loop through all SEPs in the XRD to:

- 2689 1. Set the SEL match flags according to the rules specified in section 13.3;
- 2690 2. Process the SEL match flags to apply the SEP matching rules specified in section 13.4;
- 2691 3. Apply the positive SEP selection rule specified in section 13.5.1.

2692 After this loop is complete, the pseudocode tests to see if default SEP selection processing is  
2693 required. If so, it performs a second loop applying the default SEP selection rules specified in  
2694 section 13.5.2.

2695 NOTE: In this pseudocode, when the words POSITIVE, DEFAULT, or NEGATIVE appear in  
2696 UPPERCASE, they refer to the SEL match type or SEP match type as defined in Table 24 and  
2697 Table 27. When they appear in First Letter Caps, they refer to the Boolean flags defined above.

Comment [DSR19]: Rewritten per Gabe Wachob's suggestion to make the pseudocode clearer.

Comment [DSR20]: Added per Gabe Wachob's suggestion to make the pseudocode clearer.

2698

```
2699 FOR EACH SEP
2700 CREATE set of nine SEL match flags (see text above)
2701 SET all flags to FALSE
2702 FOR EACH SEL of category x (where x=Type, Path, or Mediatype)
2703 SET Present.x=TRUE
2704 IF match type on this SEL is POSITIVE
2705     IF select="true" ;see 13.4.2
2706         ADD SEP TO SELECTED SET
2707     NEXT SEP
2708     ELSE
2709         SET Positive.x=TRUE
2710     ENDIF
2711 ELSEIF match="default" ;see 13.3.2
2712     IF Positive.x != TRUE AND ;see 13.3.5
2713     Nodefault.x != TRUE ;see 13.3.2
2714         SET Default.x=TRUE
2715     ENDIF
2716 ENDIF
2717 ENDFOR
2718 FOR EACH category x (where x=Type, Path, or Mediatype)
2719     IF Present.x=FALSE ;see 13.3.3
2720     IF Nodefault.x != TRUE ;see 13.3.2
2721         SET Default.x=TRUE
2722     ENDIF
2723 ENDIF
2724 ENDFOR
2725 IF Positive.Type=TRUE AND
2726     Positive.Path=TRUE AND
2727     Positive.Mediatype=TRUE ;see 13.4.3
2728     ADD SEP TO SELECTED SET
2729     NEXT SEP
2730 ELSEIF SELECTED SET != EMPTY ;see 13.5.1
2731     NEXT SEP
2732 ELSEIF (Positive.Type=TRUE OR Default.Type=TRUE) AND
2733     (Positive.Path=TRUE OR Default.Path=TRUE) AND
2734     (Positive.Mediatype=TRUE OR Default.Mediatype=TRUE)
2735     ADD SEP TO DEFAULT SET ;see 13.4.4
2736 ENDIF
2737 ENDFOR

2740     IF (Positive.Type=TRUE AND Positive.Path=TRUE) OR
2741     (Positive.Type=TRUE AND Positive.Mediatype=TRUE) OR
2742     (Positive.Path=TRUE AND Positive.Mediatype=TRUE)
2743         ADD SEP TO SELECTED SET
2744     ENDIF
2745 ENDFOR
2746 IF SELECTED SET = EMPTY
2747     FOR EACH SEP IN DEFAULT SET ;see 13.5.2
2748     IF Positive.Type=TRUE OR
2749     Positive.Path=TRUE OR
2750     Positive.Mediatype=TRUE
2751         ADD SEP TO SELECTED SET
2752     ENDIF
2753 ENDFOR
2754 ENDIF
2755 ENDIF
2756 IF SELECTED SET != EMPTY
2757     RETURN SELECTED SET
2758 ELSE
2759     RETURN DEFAULT SET
2760 ENDIF
```

**Comment [DSR21]:** Changed so this variable appears the same as other pseudocode variables per Gabe Wachob's suggestion.

**Comment [DSR22]:** Explicit FOR loop added for consistency per Gabe Wachob's suggestion.

2761 **13.7 Construction of Service Endpoint URIs**

2762 The final step in the service endpoint selection process is construction of the service endpoint  
2763 URI(s). This step is necessary if either:

- 2764 • The resolution output format is a URI List.
- 2765 • Automatic URI construction is requested using the `uric` parameter.

2766 **13.7.1 The append Attribute**

2767 The `append` attribute of a `xrd:XRD/xrd:Service/xrd:URI` element is used to specify how  
2768 the final URI is constructed. The values of this attribute are shown in Table 28.

Value	Component of QXRI to Append
none	None. This is the default if the <code>append</code> attribute is absent
local	The entire local part of the QXRI, defined as being one of three cases: a) If only a path is present, the Path String <i>including the leading forward slash</i> b) If only a query is present, the Query String <i>including the leading question mark</i> c) If both a path and a query are present, the entire combination of the Path String <i>including the leading forward slash</i> and the Query String <i>plus the leading question mark</i> Note that as defined in section 8.1.1, a fragment is never part of a QXRI.
authority	Authority String only (including the community root subsegment) <i>not including the trailing forward slash</i>
path	Path String <i>including the leading forward slash</i>
query	Query String <i>including the leading question mark</i>
qxri	Entire QXRI

2769 Table 28: Values of the `append` attribute and the corresponding QXRI component to append.

2770 If the `append` attribute is absent, the default value is `none`. Following are the rules for  
2771 construction of the final service endpoint URI based on the value of the `append` attribute.

2772 **IMPORTANT:** Implementers must follow these rules exactly in order to give XRDS authors  
2773 precise control over construction of service endpoint URIs.

- 2774 1. If the value is `none`, the exact contents of the `xrd:URI` element **MUST** be returned  
2775 directly without any further processing.
- 2776 2. For any other value, the exact value in URI-normal form of the QXRI component specified  
2777 in Table 28, *including any leading delimiter(s) and without any additional escaping or*  
2778 *percent encoding* **MUST** be appended directly to the exact contents of the `xrd:URI`  
2779 element *including any trailing delimiter(s)*. If the value of the QXRI component specified in  
2780 Table 28 consists of only a leading delimiter, then this value **MUST** be appended  
2781 according to these rules. If the value of the QXRI component specified in Table 28 is null,  
2782 then the contents of the `xrd:URI` element **MUST** be returned directly exactly as if the  
2783 value of the `append` attribute was `none`.

2784 3. If any HXRI query parameters for proxy resolution were added to an existing QXRI query  
2785 component as defined in section 11.3, these query parameters MUST be removed prior  
2786 to performing the append operation as also defined in section 11.3. In particular, if after  
2787 removal of these query parameters the QXRI query component consists of only a *string*  
2788 of one or more question marks (the delimiting question mark plus zero or more additional  
2789 question marks) then *exactly one question mark* MUST also be removed. This preserves  
2790 the query component of the original QXRI if it was null or contained only question marks.

2791 **IMPORTANT:** Construction of HTTP(S) URIs for authority resolution service endpoints is defined  
2792 in section 9.1.10. Note that this involves an additional step taken after all URI construction steps  
2793 specified in this section are complete. In other words, if the URI element of an authority resolution  
2794 service endpoint includes an `append` attribute, the Next Authority Resolution Service URI MUST  
2795 be fully constructed according to the algorithm in this section before appending the Next Authority  
2796 String as defined in section 9.1.10.

2797 **WARNING:** Use of any value of the `append` attribute other than `authority` on the URI element  
2798 for an authority resolution service endpoint is NOT RECOMMENDED due to the complexity it  
2799 introduces.

## 2800 13.7.2 The `uric` Parameter

2801 The `uric` subparameter of the Resolution Output Format is used to govern whether a resolver  
2802 should perform construction of the URI automatically on behalf of a consuming application.

2803 Following are the processing rules for this parameter:

- 2804 1. If `uric=true`, a resolver MUST apply the URI construction rules specified in section  
2805 13.7.1 to each `xrd:XRD/xrd:Service/xrd:URI` element in the final XRD in the  
2806 resolution chain. Note that this step is identical to the processing a resolver must perform  
2807 to output a URI list.
- 2808 2. The resolver MUST replace the value of each `xrd:XRD/xrd:Service/xrd:URI`  
2809 element in the final XRD with the fully constructed URI value.
- 2810 3. The resolver MUST subsequently remove the `append` attribute from each  
2811 `xrd:XRD/xrd:Service/xrd:URI` element in the final XRD.
- 2812 4. If `uric=false` or the parameter is absent or empty, a resolver MUST NOT perform any  
2813 of the processing specified in this section.

2814

## 14 Synonym Verification

2815 As described in section 5, a consuming application must be able to verify the security of the  
2816 binding between the fully-qualified query identifier (the identifier resolved to an XRDS document)  
2817 and any synonyms asserted in the final XRD. This section defines synonym verification rules.

### 14.1 Redirect Verification

2819 As specified in section 12.3, XRI resolvers MUST verify the synonyms asserted in the XRD  
2820 obtained by following a Redirect element. These rules are:

- 2821 1. If resolution of the Redirect succeeds, the resolver MUST first verify that the set of XRD  
2822 synonym elements (as specified in section 5.2) contained in the new XRD are *equivalent*  
2823 *to or a subset of* those contained in the XRD containing the Redirect.
- 2824 2. Secondly, the resolver MUST verify that the content of each synonym element contained  
2825 in the new XRD is exactly equivalent to the content of the corresponding element in the  
2826 XRD containing the Redirect.
- 2827 3. If either rule above fails, the resolver MUST stop and return the error 253  
2828 REDIRECT\_VERIFY\_FAILED in the XRD where the error occurred or as a plain text error  
2829 message as defined in section 15.

2830 For examples see section 12.5.1.

### 14.2 EquivID Verification

2832 Although XRI resolvers do not automatically perform EquivID synonym verification, a consuming  
2833 application can easily request it using the following steps:

- 2834 1. First request resolution for the original query identifier with CanonicalID verification  
2835 enabled (`cid=true`).
- 2836 2. From the final XRD in the resolution chain, select the EquivID for which verification is  
2837 desired.
- 2838 3. Request resolution of the EquivID identifier.
- 2839 4. From the final XRD in this second resolution chain, determine if there is either: a) a  
2840 `xrd:XRD/xrd:EquivID` element, or b) a `xrd:XRD/xrd:CanonicalEquivID` element  
2841 whose value matches the verified CanonicalID of the original query identifier. If there is a  
2842 match, the EquivID is verified; otherwise it is not verified.

#### Example:

- 2844 • Fully-Qualified Query Identifier: `http://example.com/user`
- 2845 • Asserted EquivID: `xri://=!1000.c78d.402a.8824.bf20`

2846 First XRDS (for `http://example.com/user` — simplified for illustration purposes):

```
2847 <XRDS>  
2848 <XRD>  
2849 <EquivID>xri://=!1000.c78d.402a.8824.bf20</EquivID>  
2850 <CanonicalID>http://example.com/user</CanonicalID>  
2851 <Service priority="10">  
2852 ...  
2853 </Service>  
2854 ...  
2855 </XRD>  
2856 </XRDS>
```

2857 Second XRDS (for `xri://=!1000.c78d.402a.8824.bf20`):

```
2858 <XRDS>
2859 <XRD>
2860 <Query>!1000.c78d.402a.8824.bf20</Query>
2861 <ProviderID>xri://= </ProviderID>
2862 <EquivID>http://example.com/user</EquivID>
2863 <CanonicalID>xri://=!1000.c78d.402a.8824.bf20</CanonicalID>
2864 <Service priority="10">
2865   ...
2866 </Service>
2867   ...
2868 </XRD>
2869 </XRDS>
```

2870 The EquivID is verified because the XRD in the second XRDS asserts an EquivID backpointer to  
2871 the CanonicalID of the XRD in the first XRDS.

## 2872 14.3 CanonicalID Verification

2873 XRI resolvers automatically perform verification of CanonicalID and CanonicalEquivID synonyms  
2874 unless this function is explicitly turned off using the Resolution Output Format subparameter `cid`.  
2875 The following synonym verification MUST be applied by an XRI resolver if `cid=true` or the  
2876 parameter is absent or empty, and MUST NOT be applied if `cid=false`.

- 2877 1. If the value of the `xrd:XRD/xrd:CanonicalID` element is an HTTP(S) URI, it MUST  
2878 be verified as specified in section 14.3.1.
- 2879 2. If the value of the `xrd:XRD/xrd:CanonicalID` element is an XRI, it MUST be verified  
2880 as specified in section 14.3.2.
- 2881 3. If the value of the `xrd:XRD/xrd:CanonicalID` element is any other identifier,  
2882 CanonicalID verification fails and the resolver MUST return the CanonicalID verification  
2883 status specified in section 14.3.4.
- 2884 4. If CanonicalID verification succeeds but the final XRD in the resolution chain also  
2885 contains a `xrd:XRD/xrd:CanonicalEquivID` element, it MUST also be verified as  
2886 specified in section 14.3.3, and the resolver MUST return the CanonicalEquivID  
2887 verification status as specified in section 14.3.4.
- 2888 5. In all cases, since synonym verification depends on trusting each authority in the  
2889 resolution chain, trusted resolution (section 10) SHOULD be used with either  
2890 `https=true` or `saml=true` or both to provide additional assurance of the authenticity of  
2891 the results.

2892 **IMPORTANT:** There is no guarantee that all XRDS that describe the same target resource will  
2893 return the same verified CanonicalID or CanonicalEquivID. Different parent authorities may assert  
2894 different CanonicalIDs or CanonicalEquivIDs for the same target resource and all of these may all  
2895 be verifiable. In addition, due to Redirect and Ref processing, the verified CanonicalID or  
2896 CanonicalEquivID returned for an XRI MAY differ depending on the resolution input parameters.  
2897 For example, as described in section 12, a request for a specific service endpoint type may  
2898 trigger processing of a Redirect or Ref resulting in a nested XRDS document. The final XRD in  
2899 the nested XRDS document may come from a different parent authority and have a different but  
2900 still verifiable CanonicalID or CanonicalEquivID.

### 2901 14.3.1 HTTP(S) URI Verification Rules

2902 To verify that an HTTP(S) URI is a valid CanonicalID synonym for a fully-qualified query identifier  
2903 (defined in section 5.1), a resolver MUST verify that all the following tests are successful:

- 2904 1. The fully-qualified query identifier MUST also be an HTTP(S) URI.
- 2905 2. The query identifier MUST be resolved as specified in section 6.
- 2906 3. The asserted CanonicalID synonym MUST be an HTTP(S) URI equivalent to: a) the fully-  
2907 qualified query identifier, or b) the fully-qualified query identifier plus a valid fragment as  
2908 defined by [RFC3986].

2909 See the example in section 14.3.5.

### 2910 14.3.2 XRI Verification Rules

2911 To verify that an XRI is a valid CanonicalID synonym for a fully-qualified query identifier (defined  
2912 in section 5.1), a resolver MUST verify that all the following tests are successful.

- 2913 1. In the first XRD in the resolution chain, the value of the `xrd:XRD/xrd:CanonicalID`  
2914 element MUST consist of two parts:
  - 2915 1) The value of the `xrd:XRD/xrd:CanonicalID` element for the community root  
2916 authority as configured in the XRI resolver or asserted in a self-describing XRD  
2917 from the community root authority (or via another equivalent mechanism as  
2918 described in section 9.1.6).
  - 2919 2) One additional XRI subsegment as defined in [XRISyntax]. For example, if the  
2920 value of the `xrd:XRD/xrd:CanonicalID` element for the community root  
2921 authority was `@`, then the following would all be verified values for the  
2922 `xrd:XRD/xrd:CanonicalID` element in the first XRD in the resolution chain:  
2923 `@!1, @!1234, @!example, @example` (note that `@example` is not  
2924 recommended because it is not a persistent identifier).
- 2925 2. For each subsequent XRD in the resolution chain, the value of the  
2926 `xrd:XRD/xrd:CanonicalID` element MUST consist of the value the  
2927 `xrd:XRD/xrd:CanonicalID` element of the preceding XRD in the same XRDS  
2928 document plus one additional XRI subsegment. For example, if the value of the  
2929 `xrd:XRD/xrd:CanonicalID` element asserted in an XRD is `@!1!2!3`, then the value  
2930 of the `xrd:XRD/xrd:CanonicalID` element in the immediately preceding XRD in the  
2931 same XRDS document must be `@!1!2`.
- 2932 3. If Redirect or Ref processing is required during resolution as specified in section 12, the  
2933 rules above MUST also apply for each nested XRDS document.

Comment [DSR23]: Revised to remove ProviderID correlation requirement (deemed unnecessary) per suggestion from Wil Tan.

2934 **IMPORTANT:** Each set of XRDs in each new nested XRDS document produced as a result of  
2935 Redirect or Ref processing constitutes its own CanonicalID verification chain. *CanonicalID*  
2936 *verification never crosses between XRDS documents.* See the examples in section 12.5.

### 2937 14.3.3 CanonicalEquivID Verification

2938 CanonicalID verification also requires verification of a CanonicalEquivID *only if it is present in the*  
2939 *final XRD in the resolution chain.* Since CanonicalEquivID verification typically requires an extra  
2940 resolution cycle, restricting automatic verification to the final XRD in the resolution chain ensures  
2941 it will add at most one additional resolution cycle.

2942 CanonicalEquivID verification MUST NOT be performed unless CanonicalID verification as  
2943 specified in section 14.3 has completed successfully. The resulting value is called the *verified*  
2944 *CanonicalID*.

2945 To verify that a CanonicalEquivID is an authorized synonym for a verified CanonicalEquivID, a  
2946 resolver MUST verify that either: a) the value of the CanonicalEquivID element is character-by-  
2947 character equivalent to the verified CanonicalID (since both appear in the same XRD, all other  
2948 normalization rules are waived), or b) that all the following tests are successful:

- 2949 1. The asserted CanonicalEquivID value MUST be a valid HTTP(S) URI or XRI.
- 2950 2. The asserted CanonicalEquivID value MUST resolve successfully to an XRDS document  
2951 according to the rules in this specification *using the same resolution parameters as in the*  
2952 *original resolution request.*
- 2953 3. The CanonicalID in the final XRD of the resolved XRDS document MUST be verified and  
2954 MUST be equivalent to the asserted CanonicalEquivID.
- 2955 4. The final XRD in the resolved XRDS document MUST contain either an EquivID or a  
2956 CanonicalEquivID "backpointer" whose value is equivalent to the verified CanonicalID in  
2957 the XRD asserting the CanonicalEquivID.

2958 SPECIAL SECURITY CONSIDERATION: See section 5.2.2 regarding the rules for provisioning  
2959 of `xrd:XRD/xrd:EquivID` and `xrd:XRD/xrd:CanonicalEquivID` elements in an XRD.

### 2960 14.3.4 Verification Status Attributes

2961 If CanonicalID verification is performed, an XRI resolver MUST return the CanonicalID and  
2962 CanonicalEquivID verification status using an attribute of the `xrd:XRD/xrd:Status` element in  
2963 each XRD in the output as follows:

- 2964 1. CanonicalID verification MUST be reported using the `cid` attribute.
- 2965 2. CanonicalEquivID verification MUST be reported using the `ceid` attribute.
- 2966 3. Both attributes accept four enumerated values: `absent` if the element is not present, `off`  
2967 if verification is not performed, `verified` if the element is verified, and `failed` if  
2968 verification fails.
- 2969 4. The `off` value applies to both elements if CanonicalID verification is not performed  
2970 (`cid=false`).
- 2971 5. The `off` value applies to the CanonicalEquivID element in any XRD before the final XRD  
2972 if CanonicalID verification is performed (`cid=true`), because a resolver only verifies this  
2973 element in the final XRD.
- 2974 6. If `cid=true` and verification of any CanonicalID element fails, *verification of all*  
2975 *CanonicalIDs in all subsequent XRDs in the same XRDS document MUST fail.*

2976 From these verification status attributes, a consuming application can confirm on every XRD in  
2977 the XRDS document whether the CanonicalID is present and has been verified. In addition, for  
2978 the final XRD in the XRDS document, it can confirm whether the CanonicalEquivID element is  
2979 present and has been verified.

## 2980 14.3.5 Examples

### 2981 Example #1:

- 2982 • Fully-Qualified Query Identifier: `http://example.com/user`
- 2983 • Asserted CanonicalID: `http://example.com/user#1234`

2984 XRDS (simplified for illustration purposes):

```
2985 <XRDS ref="http://example.com/user">
2986   <XRD>
2987     <CanonicalID>http://example.com/user#1234</CanonicalID>
2988     <Service priority="10">
2989       ...
2990     </Service>
2991     ...
2992   </XRD>
2993 </XRDS>
```

2994 The asserted CanonicalID satisfies the HTTP(S) URI verification rules in section 14.3.1.

2995

---

### 2996 Example #2:

- 2997 • Fully-Qualified Query Identifier: `=example.name*delegate.name`
- 2998 • Asserted CanonicalID: `!=1000.62b1.44fd.2855!1234`

2999 XRDS (for `=example.name*delegate.name`):

```
3000 <XRDS ref="xri://example.name*delegate.name">
3001   <XRD>
3002     <Query>*example.name</Query>
3003     <ProviderID>xri://=</ProviderID>
3004     <LocalID>!1000.62b1.44fd.2855</LocalID>
3005     <CanonicalID>xri://=!1000.62b1.44fd.2855</CanonicalID>
3006     <Service>
3007       <ProviderID>xri://=!1000.62b1.44fd.2855</ProviderID>
3008       <Type>xri://$res*auth*($v*2.0)</Type>
3009       <MediaType>application/xrds+xml</MediaType>
3010       <URI priority="10">http://resolve.example.com</URI>
3011       <URI priority="15">http://resolve2.example.com</URI>
3012       <URI>https://resolve.example.com</URI>
3013     </Service>
3014     ...
3015   </XRD>
3016   <XRD>
3017     <Query>*delegate.name</Query>
3018     <ProviderID>xri://=!1000.62b1.44fd.2855</ProviderID>
3019     <LocalID>!1234</LocalID>
3020     <CanonicalID>xri://=!1000.62b1.44fd.2855!1234</CanonicalID>
3021     <Service priority="1">
3022       ...
3023     </Service>
3024     ...
3025   </XRD>
3026 </XRDS>
```

3027 The asserted CanonicalID satisfies the XRI verification rules in section 14.3.2.

3028

---

3029 **Example #3:**

- 3030 • Fully-Qualified Query Identifier: `http://example.com/user`
- 3031 • Asserted CanonicalID: `http://example.com/user`
- 3032 • Asserted CanonicalEquivID: `https://different.example.net/path/user`

3033 First XRDS (for `http://example.com/user`):

```
3034 <XRDS ref="http://example.com/user">
3035 <XRD>
3036 <CanonicalID>http://example.com/user</CanonicalID>
3037 <CanonicalEquivID>
3038 https://different.example.net/path/user
3039 </CanonicalEquivID>
3040 <Service priority="10">
3041 ...
3042 </Service>
3043 ...
3044 </XRD>
3045 </XRDS>
```

3046 Second XRDS (for `https://different.example.net/path/user`):

```
3047 <XRDS ref="https://different.example.net/path/user">
3048 <XRD>
3049 <EquivID>http://example.com/user</EquivID>
3050 <CanonicalID>https://different.example.net/path/user</CanonicalID>
3051 <Service priority="10">
3052 ...
3053 </Service>
3054 ...
3055 </XRD>
3056 </XRDS>
```

3057 The CanonicalEquivID asserted in the first XRDS satisfies the verification rules in section 14.3.3  
3058 because it resolves to a second XRDS that asserts an EquivID backpointer to the CanonicalID of  
3059 the first XRDS.

3060

---

3061 **Example #4:**

- 3062 • Fully-Qualified Query Identifier: `http://example.com/user`
- 3063 • Asserted CanonicalID: `http://example.com/user`
- 3064 • Asserted CanonicalEquivID: `!=1000.62b1.44fd.2855`

3065 XRDS (for `http://example.com/user`):

```
3066 <XRDS ref="http://example.com/user">
3067 <XRD>
3068 <CanonicalID>http://example.com/user</CanonicalID>
3069 <CanonicalEquivID>xri://!=1000.62b1.44fd.2855</CanonicalEquivID>
3070 <Service priority="10">
3071 ...
3072 </Service>
3073 ...
3074 </XRD>
3075 </XRDS>
```

3076 XRDS (for xri://=!1000.62b1.44fd.2855):

```
3077 <XRDS ref="xri://=!1000.62b1.44fd.2855">
3078   <XRD>
3079     <Query>!1000.62b1.44fd.2855</Query>
3080     <ProviderID>xri://=</ProviderID>
3081     <EquivID>http://example.com/user</EquivID>
3082     <CanonicalID>xri://=!1000.62b1.44fd.2855</CanonicalID>
3083     <Service priority="10">
3084       ...
3085     </Service>
3086     ...
3087   </XRD>
3088 </XRDS>
```

3089 The CanonicalEquivID asserted in the first XRDS satisfies the verification rules in section 14.3.3  
3090 because it resolves to a second XRDS that asserts an EquivID backpointer to the CanonicalID of  
3091 the first XRDS.

3092

---

3093 **Example #5:**

- 3094 • Fully-Qualified Query Identifier: =example.name
- 3095 • Asserted CanonicalID: xri://=!1000.62b1.44fd.2855
- 3096 • Asserted CanonicalEquivID: https://example.com/user

3097 First XRDS (for =example.name):

```
3098 <XRDS ref="xri://=example.name">
3099   <XRD>
3100     <Query>*example.name</Query>
3101     <ProviderID>xri://=</ProviderID>
3102     <LocalID>!1000.62b1.44fd.2855</LocalID>
3103     <CanonicalID>xri://=!1000.62b1.44fd.2855</CanonicalID>
3104     <CanonicalEquivID>https://example.com/user</CanonicalEquivID>
3105     <Service priority="10">
3106       ...
3107     </Service>
3108     ...
3109   </XRD>
3110 </XRDS>
```

3111 Second XRDS (for https://example.com/user):

```
3112 <XRDS ref="https://example.com/user">
3113   <XRD>
3114     <EquivID>xri://=!1000.62b1.44fd.2855</EquivID>
3115     <CanonicalID>https://example.com/user</CanonicalID>
3116     <Service priority="10">
3117       ...
3118     </Service>
3119     ...
3120   </XRD>
3121 </XRDS>
```

3122 The CanonicalEquivID asserted in the first XRDS satisfies the verification rules in section 14.3.3  
3123 because it resolves to a second XRDS that asserts an EquivID backpointer to the CanonicalID of  
3124 the first XRDS.

3125

3126 **Example #6:**

- 3127 • Fully-Qualified Query Identifier: =example.name\*delegate.name
- 3128 • Asserted CanonicalID: xri://=!1000.62b1.44fd.2855!1234
- 3129 • Asserted CanonicalEquivID: @!1000.f3da.9056.aca3!5555

3130 First XRDS (for =example.name\*delegate.name):

```
3131 <XRDS ref="xri://=example.name*delegate.name">
3132   <XRD>
3133     <Query>*example.name</Query>
3134     <ProviderID>xri://=</ProviderID>
3135     <LocalID>!1000.62b1.44fd.2855</LocalID>
3136     <CanonicalID>xri://=!1000.62b1.44fd.2855</CanonicalID>
3137     <Service>
3138       <ProviderID>xri://=!1000.62b1.44fd.2855</ProviderID>
3139       <Type>xri://$res*auth*($v*2.0)</Type>
3140       <MediaType>application/xrds+xml</MediaType>
3141       <URI priority="10">http://resolve.example.com</URI>
3142       <URI priority="15">http://resolve2.example.com</URI>
3143       <URI>https://resolve.example.com</URI>
3144     </Service>
3145     ...
3146   </XRD>
3147   <XRD>
3148     <Query>*delegate.name</Query>
3149     <ProviderID>xri://=!1000.62b1.44fd.2855</ProviderID>
3150     <LocalID>!1234</LocalID>
3151     <CanonicalID>xri://=!1000.62b1.44fd.2855!1234</CanonicalID>
3152     <CanonicalEquivID>
3153       xri://@1000.f3da.9056.aca3!5555
3154     </CanonicalEquivID>
3155     <Service priority="1">
3156       ...
3157     </Service>
3158     ...
3159   </XRD>
3160 </XRDS>
```

3161 • Second XRDS (for @!1000.f3da.9056.aca3!5555):

```
3162 <XRDS ref="xri://@!1000.f3da.9056.aca3!5555">
3163   <XRD>
3164     <Query>!1000.f3da.9056.aca3</Query>
3165     <ProviderID>xri://@</ProviderID>
3166     <CanonicalID>xri://@!1000.f3da.9056.aca3</CanonicalID>
3167     <Service>
3168       <ProviderID>xri://@!1000.f3da.9056.aca3</ProviderID>
3169       <Type>xri://$res*auth*($v*2.0)</Type>
3170       <MediaType>application/xrds+xml</MediaType>
3171       <URI priority="10">http://resolve.example.com</URI>
3172       <URI priority="15">http://resolve2.example.com</URI>
3173       <URI>https://resolve.example.com</URI>
3174     </Service>
3175     ...
3176   </XRD>
3177   <XRD>
3178     <Query>!5555</Query>
3179     <ProviderID>xri://@!1000.f3da.9056.aca3</ProviderID>
3180     <LocalID>!5555</LocalID>
3181     <EquivID>xri://=!1000.62b1.44fd.2855!1234</EquivID>
```

```
3182 <CanonicalID>xri://@!1000.f3da.9056.aca3!5555</CanonicalID>
3183 <Service priority="1">
3184   ...
3185 </Service>
3186   ...
3187 </XRD>
3188 </XRDS>
```

3189 The CanonicalEquiVID asserted in the final XRD of the first XRDS satisfies the verification rules  
3190 in section 14.3.3 because it resolves to a second XRDS whose final XRD asserts an EquiVID  
3191 backpointer to the CanonicalID of the final XRD in the first XRDS.

---

## 3192 15 Status Codes and Error Processing

### 3193 15.1 Status Elements

3194 XRDS architecture uses two XRD elements for status reporting:

- 3195 • The `xrd:XRD/xrd:ServerStatus` element is used by an authority server to report the  
3196 server-side status of a resolution query to a resolver.
- 3197 • The `xrd:XRD/xrd:Status` element is used by a resolver to report the client-side status of  
3198 a resolution query to a consuming application. Note that attributes and contents of this  
3199 element MAY differ from those of the `xrd:XRD/xrd:ServerStatus` element due to either  
3200 client-side error detection or reporting of CanonicalID verification status (section 14.3.4).

3201 Following are the normative rules that apply to usage of these elements:

- 3202 1. For XRDS servers and clients, each of these elements is OPTIONAL.
- 3203 2. An XRI authority server is REQUIRED to include an `xrd:XRD/xrd:ServerStatus`  
3204 element for each XRD in a resolution response.

3205 **BACKWARDS COMPATIBILITY NOTE:** The `xrd:XRD/xrd:ServerStatus` element was not  
3206 included in earlier versions of this specification. If an older authority resolution server does not  
3207 produce this element in generic or HTTPS trusted resolution, a resolver SHOULD generate it. For  
3208 SAML trusted resolution, a resolver MUST NOT generate it.

- 3209 3. An XRI resolver is REQUIRED to add an `xrd:XRD/xrd:Status` element to each XRD  
3210 If the Resolution Output Format is an XRDS document or an XRD element.
- 3211 4. In SAML trusted resolution, a resolver MUST verify the SAML signature on the XRD  
3212 received from the server as specified in section 10.2.4 before adding the  
3213 `xrd:XRD/xrd:Status` element to the XRD. Because this modifies the XRD, a  
3214 consuming application may not be able to easily verify the SAML signature itself. Should  
3215 this be necessary, the consuming application may request the XRD it wishes to verify  
3216 directly from an authority server using the SAML trusted resolution protocol in section  
3217 10.2.
- 3218 5. These elements MUST include the status codes specified in section 15.2 as the value of  
3219 the required `code` attribute.
- 3220 6. These elements SHOULD contain the status context strings specified in section 15.3.  
3221 Authority servers or resolvers MAY add additional information to status context strings.

### 3222 15.2 Status Codes

3223 XRI resolution status codes are patterned after the HTTP model. They are broken into three  
3224 major categories:

- 3225 • 1xx: Success—the requested resolution operation was completed successfully.
- 3226 • 2xx: Permanent errors—the resolver encountered an error from which it could not recover.
- 3227 • 3xx: Temporary errors—the resolver encountered an error condition that may be only  
3228 temporary.

3229 The 2xx and 3xx categories are broken into seven minor categories:

3230 • x0x: General error that may take place during any phase of resolution.

3231 • x1x: Input error

3232 • x2x: Generic authority resolution error.

3233 • x3x: Trusted authority resolution error.

3234 • x4x: Service endpoint (SEP) selection error.

3235 • x5x: Redirect error.

3236 • x6x: Ref error.

3237 The full list of XRI resolution status codes is defined in Table 29.

3238

Code	Symbolic Status	Phase(s)	Description
100	SUCCESS	Any	Operation was successful.
200	PERM_FAIL	Any	Generic permanent failure.
201	NOT_IMPLEMENTED	Any	The requested function (trusted resolution, service endpoint selection) is not implement by the resolver.
202	LIMIT_EXCEEDED	Any	A locally configured resource limit was exceeded. Examples: number of Redirect or Refs to follow, number of XRD elements that can be handled, size of an XRDS document.
210	INVALID_INPUT	Input	Generic input error.
211	INVALID_QXRI	Input	Input QXRI does not conform to XRI syntax.
212	INVALID_OUTPUT_FORMAT	Input	Input Resolution Output Format is invalid.
213	INVALID_SEP_TYPE	Input	Input Service Type is invalid.
214	INVALID_SEP_MEDIA_TYPE	Input	Input Service Media Type is invalid.
215	UNKNOWN_ROOT	Input	Community root specified in QXRI is not configured in the resolver.
220	AUTH_RES_ERROR	Authority resolution	Generic authority resolution error.
221	AUTH_RES_NOT_FOUND	Authority resolution	The subsegment cannot be resolved due to a missing authority resolution service endpoint in an XRD.
222	QUERY_NOT_FOUND	Authority resolution	Responding authority does not have an XRI matching the query.
223	UNEXPECTED_XRD	Authority resolution	Value of the <code>xrd:Query</code> element does not match the subsegment requested.
224	INACTIVE	Authority resolution	The query XRI has been assigned but the authority does not provide resolution metadata.

230	TRUSTED_RES_ERROR	Trusted resolution	Generic trusted resolution error.
231	HTTPS_RES_NOT_FOUND	Trusted resolution	The resolver was unable to locate an HTTPS authority resolution endpoint.
232	SAML_RES_NOT_FOUND	Trusted resolution	The resolver was unable to locate a SAML authority resolution endpoint.
233	HTTPS+SAML_RES_NOT_FOUND	Trusted resolution	The resolver was unable to locate an HTTPS+SAML authority resolution endpoint.
234	UNVERIFIED_SIGNATURE	Trusted resolution	Signature verification failed.
240	SEP_SELECTION_ERROR	SEP selection	Generic service endpoint selection error.
241	SEP_NOT_FOUND	SEP selection	The requested service endpoint could not be found in the current XRD or via Redirect or Ref processing.
250	REDIRECT_ERROR	Redirect Processing	Generic Redirect error.
251	INVALID_REDIRECT	Redirect Processing	At least one Redirect element was found but resolution failed.
252	INVALID_HTTPS_REDIRECT	Redirect Processing	<code>https=true</code> but a Redirect element containing an HTTPS URI was not found.
253	REDIRECT_VERIFY_FAILED	Redirect Processing	Synonym verification failed in an XRD after following a redirect. See section 12.3
260	REF_ERROR	Ref Processing	Generic Ref processing error.
261	INVALID_REF	Ref Processing	A valid Ref XRI was not found.
262	REF_NOT_FOLLOWED	Ref Processing	At least one Ref was present but the <code>refs</code> parameter was set to <code>false</code> .
300	TEMPORARY_FAIL	Any	Generic temporary failure.
301	TIMEOUT_ERROR	Any	Locally-defined timeout limit has lapsed during an operation (e.g. network latency).
320	NETWORK_ERROR	Authority resolution	Generic error during authority resolution phase (includes uncaught exception, system error, network error).
321	UNEXPECTED_RESPONSE	Authority resolution	When querying an authority server, the server returned a non-200 HTTP status.
322	INVALID_XRDS	Authority resolution	Invalid XRDS received from an authority server (includes malformed XML, truncated content, or wrong content type).

3240 Table 29: Error codes for XRI resolution.

### 3241 **15.3 Status Context Strings**

3242 Each status code in Table 29 MAY be returned with an optional status context string that provides  
3243 additional human-readable information about the status or error condition. When the Resolution  
3244 Output Format is an XRDS document or XRD element, this string is returned as the contents of  
3245 the `xrd:XRD/xrd:ServerStatus` and `xrd:XRD/xrd:Status` elements. When the  
3246 Resolution Output Format is a URI List, this string MUST be returned as specified in section 15.4.  
3247 Implementers SHOULD provide error context strings with additional information about an error  
3248 and possible solutions whenever it can be helpful to developers or end users.

### 3249 **15.4 Returning Errors in Plain Text or HTML**

3250 If the Resolution Output Format is a URI List as defined in section 8.2, an error MUST be  
3251 returned with the content type `text/plain`. In this content:

- 3252 • The first line MUST consist of only the numeric error code as defined in section 15.2 followed  
3253 by a CRLF.
- 3254 • The second line is RECOMMENDED; if present it MUST contain the error context string as  
3255 defined in section 15.3.

3256 The same rules apply if the Resolution Output Format is an HTTP(S) Redirect as defined in  
3257 section 8.2, except the media type MAY also be `text/html`. It is particularly important in this  
3258 case to return an error message that will be understandable to an end-user who may have no  
3259 knowledge of XRI resolution or the fact that the error is coming from an XRI proxy resolver.

### 3260 **15.5 Error Handling in Recursing and Proxy Resolution**

3261 In recursing and proxy resolution (sections 9.1.8 and 11), a server is acting as a client resolver for  
3262 other authority resolution service endpoints. If in this intermediary capacity it receives an  
3263 unrecoverable error, it MUST return the error to the originating client in the output format  
3264 specified by the value of the requested Resolution Output Format as defined in section 8.2.

3265 If the output format is an XRDS document, it MUST contain `xrd:XRD` elements for all  
3266 subsegments successfully resolved or retrieved from cache prior to the error. Each XRD MUST  
3267 include the `xrd:ServerStatus` element as reported by the authoritative server. The final  
3268 `xrd:XRD` element MUST include the `xrd:Query` element that produced the error and the  
3269 `xrd:Status` element that describes the error as defined above.

3270 If the output format is an XRD element, it MUST include the `xrd:Query` element that produced  
3271 the error, the `xrd:ServerStatus` element as reported by the authoritative server, and the  
3272 `xrd:Status` element that describes the error as defined above.

3273 If this output format is a URI List or an HTTP(S) redirect, a proxy resolver SHOULD return a  
3274 human-readable error message as specified in section 15.4.

---

## 3275 16 Use of HTTP(S)

### 3276 16.1 HTTP Errors

3277 When a resolver encounters fatal HTTP(S) errors during the resolution process, it **MUST** return  
3278 the appropriate XRI resolution error code and error message as defined in section 15. In this way  
3279 calling applications do not have to deal separately with XRI and HTTP error messages.

### 3280 16.2 HTTP Headers

#### 3281 16.2.1 Caching

3282 The HTTP caching capabilities described by **[RFC2616]** should be leveraged for all XRDS and  
3283 XRI resolution protocols. Specifically, implementations **SHOULD** implement the caching model  
3284 described in section 13 of **[RFC2616]**, and in particular, the “Expiration Model” of section 13.2, as  
3285 this requires the fewest round-trip network connections.

3286 All XRI resolution servers **SHOULD** send the Cache-Control or Expires headers in their  
3287 responses per section 13.2 of **[RFC2616]** unless there are overriding security or policy reasons to  
3288 omit them.

3289 Note that HTTP Cache headers **SHOULD NOT** conflict with expiration information in an XRD.  
3290 That is, the expiration date specified by HTTP caching headers **SHOULD NOT** be later than any  
3291 of the expiration dates for any of the `xrd:Expires` elements returned in the HTTP response.  
3292 This implies that recursing and proxy resolvers **SHOULD** compute the “soonest” expiration date  
3293 for the XRDs in a resolution chain and ensure a later date is not specified by the HTTP caching  
3294 headers for the HTTP response.

#### 3295 16.2.2 Location

3296 During HTTP interaction, “Location” headers may be present per **[RFC2616]** (i.e., during 3XX  
3297 redirects). Redirects **SHOULD** be made cacheable through appropriate HTTP headers, as  
3298 specified in section 16.2.1.

#### 3299 16.2.3 Content-Type

3300 For authority resolution, the Content-Type header in the 2XX responses **MUST** contain the media  
3301 type identifier values specified in Table 11 (for generic resolution), Table 15 (for HTTPS trusted  
3302 resolution), Table 16 (for SAML trusted resolution), or Table 17 (or HTTPS+SAML trusted  
3303 resolution).

3304 Following the optional service endpoint selection phase, clients and servers **MAY** negotiate  
3305 content type using standard HTTP content negotiation features. Regardless of whether this  
3306 feature is used, however, the server **MUST** respond with an appropriate media type in the  
3307 Content-Type header if the resource is found and an appropriate content type is returned.

### 3308 16.3 Other HTTP Features

3309 HTTP provides a number of other features including transfer-coding, proxying, validation-model  
3310 caching, and so forth. All these features may be used insofar as they do not conflict with the  
3311 required uses of HTTP described in this document.

## 3312 16.4 Caching and Efficiency

### 3313 16.4.1 Resolver Caching

3314 In addition to HTTP-level caching, resolution clients are encouraged to perform caching at the  
3315 application level. For best results, however, resolution clients SHOULD be conservative with  
3316 caching expiration semantics, including cache expiration dates. This implies that in a series of  
3317 HTTP redirects, for example, the results of the entire process SHOULD only be cached as long  
3318 as the shortest period of time allowed by any of the intermediate HTTP responses.

3319 Because not all HTTP client libraries expose caching expiration to applications, identifier  
3320 authorities SHOULD NOT use cacheable redirects with expiration times sooner than the  
3321 expiration times of other HTTP responses in the resolution chain. In general, all XRI deployments  
3322 should be mindful of limitations in current HTTP clients and proxies.

3323 The cache expiration time of an XRD may also be explicitly limited by the parent authority. If the  
3324 expiration time in the `xrd:Expires` element is sooner than the expiration time calculated from  
3325 the HTTP caching semantics, the XRD MUST be discarded before the expiration time in  
3326 `xrd:Expires`. Note also that a `saml:Assertion` element returned during SAML trusted  
3327 resolution has its own signature expiration semantics as defined in [SAML]. While this may  
3328 invalidate the SAML signature, a resolver MAY still use the balance of the contents of the XRD if  
3329 it is not expired by HTTP caching semantics or the `xrd:Expires` element.

3330 With both application-level and HTTP-level caching, the resolution process is designed to have  
3331 minimal overhead. Resolution of each qualified subsegment of an XRI authority component is a  
3332 separate step described by a separate XRD, so intermediate results can typically be cached in  
3333 their entirety. For this reason, resolution of higher-level (i.e., further to the left) qualified  
3334 subsegments, which are common to more identifiers, will naturally result in a greater number of  
3335 cache hits than resolution of lower-level subsegments.

### 3336 16.4.2 Synonyms

3337 The publication of synonyms in XRDS documents (section 5) can further increase cache  
3338 efficiency. If an XRI resolution request produces a cache hit on a synonym, the following rules  
3339 apply:

- 3340 1. If the cache hit is on a LocalID synonym, the resolver MAY return the cached XRD  
3341 element if: a) it is from the correct ProviderID, b) it has not expired, and c) it was obtained  
3342 using the same trusted resolution and synonym verification parameters as the current  
3343 resolution request.
- 3344 2. If the cache hit is on a CanonicalID synonym, the resolver MAY return the entire cached  
3345 XRDS document if: a) it has not expired, and b) it was obtained using the same trusted  
3346 resolution and synonym verification parameters as the current resolution request.

3347 **IMPORTANT:** The effect of these rules is that the application calling an XRI resolver MAY receive  
3348 back an XRD element, or an XRDS document containing XRD element(s), in which the value of  
3349 the `<xrd:Query>` element does not match the resolution request, but in which the value of an  
3350 `<xrd:LocalID>` element does match the resolution request. This is acceptable for the generic  
3351 and HTTPS trusted resolution protocols but not the SAML trusted resolution protocol, where the  
3352 value of the `<xrd:Query>` element MUST match the resolution request as specified in section  
3353 10.2.4.

---

## 3354 17 Extensibility and Versioning

### 3355 17.1 Extensibility

#### 3356 17.1.1 Extensibility of XRDs

3357 The XRD schema in Appendix B use an an open-content model that is designed to be extended  
3358 with other metadata. In most places, extension elements and attributes from namespaces other  
3359 than `xri://$xrd*($v*2.0)` are explicitly allowed. These extension points are designed to  
3360 simplify default processing using a “Must Ignore” rule. The base rule is that unrecognized  
3361 elements and attributes, and the content and child elements of unrecognized elements, MUST be  
3362 ignored. As a consequence, elements that would normally be recognized by a processor MUST  
3363 be ignored if they appear as descendants of an unrecognized element.

3364 Extension elements MUST NOT require new interpretation of elements defined in this document.  
3365 If an extension element is present, a processor MUST be able to ignore it and still correctly  
3366 process the XRDS document.

3367 Extension specifications MAY simulate “Must Understand” behavior by applying an “enclosure”  
3368 pattern. Elements defined by the XRD schema in Appendix B whose meaning or interpretation is  
3369 modified by extension elements can be wrapped in an extension container element defined by the  
3370 extension specification. This extension container element SHOULD be in the same namespace  
3371 as the other extension elements defined by the extension specification.

3372 Using this design, all elements whose interpretations are modified by the extension will now be  
3373 contained in the extension container element and thus will be ignored by clients or other  
3374 applications unable to process the extension. The following example illustrates this pattern using  
3375 an extension container element from an extension namespace (`other:SuperService`) that  
3376 contains an extension element (`other:ExtensionElement`):

```
3377 <XRD>  
3378   <Service>  
3379     ...  
3380   </Service>  
3381   <other:SuperService>  
3382     <Service>  
3383       ...  
3384       <other:ExtensionElement>...</other:ExtensionElement>  
3385     </Service>  
3386   </other:SuperService>  
3387 </XRD>
```

3388 In this example, the `other:ExtensionElement` modifies the interpretation or processing rules  
3389 for the parent `xrd:Service` element and therefore must be understood by the consumer for the  
3390 proper interpretation of the parent `xrd:Service` element. To preserve the correct interpretation  
3391 of the `xrd:Service` element in this context, the `xrd:Service` element is “wrapped” in the  
3392 `other:SuperService` element so only consumers that understand elements in the  
3393 `other:SuperService` namespace will attempt to process the `xrd:Service` element.

3394 The addition of extension elements does not change the requirement for SAML signatures to be  
3395 verified across all elements, whether recognized or not.

3396 Specifications extending XRDs MAY use the `xrd:XRD/xrd:Type` element to indicate to an XRD  
3397 processor that an XRD conforms to the requirements of the extension specification. Such  
3398 specification SHOULD be dereferenceable from the URI, IRI, or XRI used as the value of the

3399 `xrd:XRD/xrd:Type` element. However XRD processors MAY ignore instances of this element  
3400 and process the XRD as specified in this document.

Comment [DSR24]: Added to support addition of `xrd:XRD/xrd:Type` element to 4.2.1.

## 3401 17.1.2 Other Points of Extensibility

3402 The use of HTTP(S), XML, XRI, and URIs in the design of XRDS documents, XRD elements,  
3403 and XRI resolution architecture provides additional specific points of extensibility:

- 3404 • Specification of new resolution service types or other service types using XRI, IRIs, or URIs  
3405 as values of the `xrd:Type` element.
- 3406 • Specification of new resolution output formats or features using media types and media type  
3407 parameters as values of the `xrd:MediaType` element as defined in [RFC2045] and  
3408 [RFC2046].
- 3409 • HTTP negotiation of content types, language, encoding, etc. as defined by [RFC2616].
- 3410 • Use of HTTP redirects (3XX) or other response codes defined by [RFC2616].
- 3411 • Use of cross-references within XRI, particularly for associating new types of metadata with a  
3412 resource. See [XRISyntax] and [XRIMetadata].

## 3413 17.2 Versioning

3414 Versioning of the XRI specification set is expected to occur infrequently. Should it be necessary,  
3415 this section describes versioning guidelines.

3416 In general, this specification follows the same versioning guidelines as established in section  
3417 4.2.1 of [SAML]:

3418 *In general, maintaining namespace stability while adding or changing the content of a*  
3419 *schema are competing goals. While certain design strategies can facilitate such changes,*  
3420 *it is complex to predict how older implementations will react to any given change, making*  
3421 *forward compatibility difficult to achieve. Nevertheless, the right to make such changes in*  
3422 *minor revisions is reserved, in the interest of namespace stability. Except in special*  
3423 *circumstances (for example, to correct major deficiencies or to fix errors),*  
3424 *implementations should expect forward-compatible schema changes in minor revisions,*  
3425 *allowing new messages to validate against older schemas.*

3426 *Implementations SHOULD expect and be prepared to deal with new extensions and*  
3427 *message types in accordance with the processing rules laid out for those types. Minor*  
3428 *revisions MAY introduce new types that leverage the extension facilities described in [this*  
3429 *section]. Older implementations SHOULD reject such extensions gracefully when they*  
3430 *are encountered in contexts that dictate mandatory semantics.*

### 3431 17.2.1 Version Numbering

3432 Specifications from the OASIS XRI Technical Committee use a Major and Minor version number  
3433 expressed in the form Major.Minor. The version number MajorB.MinorB is higher than the version  
3434 number  $Major_A.Minor_A$  if and only if:

3435  $Major_B > Major_A$  OR (  $Major_B = Major_A$  ) AND  $Minor_B > Minor_A$  )

### 3436 17.2.2 Versioning of the XRI Resolution Specification

3437 New releases of the XRI Resolution specification may specify changes to the resolution protocols  
3438 and/or the XRD schema in Appendix B. When changes affect either of these, the resolution  
3439 service type version number will be changed. Where changes are purely editorial, the version  
3440 number will not be changed.

3441 In general, if a change is backward-compatible, the new version will be identified using the  
3442 current major version number and a new minor version number. If the change is not backward-  
3443 compatible, the new version will be identified with a new major version number.

### 3444 **17.2.3 Versioning of Protocols**

3445 The protocols defined in this document may also be versioned by future releases of the XRI  
3446 Resolution specification. If these protocols are not backward-compatible with older  
3447 implementations, they will be assigned a new XRI with a new version identifier for use in  
3448 identifying their service type in XRDs. See section 3.1.2.

3449 Note that it is possible for version negotiation to happen in the protocol itself. For example, HTTP  
3450 provides a mechanism to negotiate the version of the HTTP protocol being used. If and when an  
3451 XRI resolution protocol provides its own version-negotiation mechanism, the specification is likely  
3452 to continue to use the same XRI to identify the protocol as was used in previous versions of the  
3453 XRI Resolution specification.

### 3454 **17.2.4 Versioning of XRDs**

3455 The `xrd:XRDS` document element is intended to be a completely generic container, i.e., to have  
3456 no specific knowledge of the elements it may contain. Therefore it has no version indicator, and  
3457 can remain stable indefinitely because there is no need to version its namespace.

3458 The `xrd:XRD` element has a `version` attribute. This attribute is OPTIONAL for this version of  
3459 the XRI resolution specification (version 2.0). This attribute will be REQUIRED for all future  
3460 versions of this specification. When used, the value of this attribute MUST be the exact numeric  
3461 version value of the XRI Resolution specification to which its containing elements conform.

3462 When new versions of the XRI Resolution specification are released, the namespace for the XRD  
3463 schema may or may not be changed. If there is a major version number change, the namespace  
3464 for the `xrd:XRD` schema is likely to change. If there is only a minor version number change, the  
3465 namespace for the `xrd:XRD` schema may remain unchanged.

3466 Note that conformance to a specific XRD version does not preclude an author from including  
3467 extension elements from a different namespace in the XRD. See section 17.1 above.

3468

---

## 18 Security and Data Protection

3469  
3470  
3471  
3472

Significant portions of this specification deal directly with security issues; these will not be summarized again here. In addition, basic security practices and typical risks in resolution protocols are well-documented in many other specifications. Only security considerations directly relevant to XRI resolution are included here.

3473

### 18.1 DNS Spoofing or Poisoning

3474  
3475  
3476  
3477  
3478  
3479  
3480  
3481  
3482

When XRI resolution is deployed to use HTTP URIs or other URIs which include DNS names, the accuracy of the XRI resolution response may be dependent on the accuracy of DNS queries. For those deployments where DNS is not trusted, the resolution infrastructure may be deployed with HTTP URIs that use IP addresses in the authority portion of HTTP URIs and/or with the trusted resolution mechanisms defined by this specification. Resolution results obtained using trusted resolution can be evaluated independently of DNS resolution results. While this does not solve the problem of DNS spoofing, it does allow the client to detect an error condition and reject the resolution result as untrustworthy. In addition, **[DNSSEC]** may be considered if DNS names are used in HTTP URIs.

3483

### 18.2 HTTP Security

3484  
3485  
3486  
3487

Many of the security considerations set forth in HTTP/1.1 **[RFC2616]** apply to XRI Resolution protocols defined here. In particular, confidentiality of the communication channel is not guaranteed by HTTP. Server-authenticated HTTPS should be used in cases where confidentiality of resolution requests and responses is desired.

3488  
3489  
3490  
3491

Special consideration should be given to proxy and caching behaviors to ensure accurate and reliable responses from resolution requests. For various reasons, network topologies increasingly have transparent proxies, some of which may insert VIA and other headers as a consequence, or may even cache content without regard to caching policies set by a resource's HTTP authority.

3492  
3493

Implementations of XRI Proxies and caching authorities should also take special note of the security recommendations in HTTP/1.1 **[RFC2616]** section 15.7.

3494

### 18.3 SAML Considerations

3495  
3496  
3497

SAML trusted authority resolution must adhere to the rules defined by the SAML 2.0 Core Specification **[SAML]**. Particularly noteworthy are the XML Transform restrictions on XML Signature and the enforcement of the SAML Conditions element regarding the validity period.

3498

### 18.4 Limitations of Trusted Resolution

3499  
3500  
3501  
3502  
3503

While the trusted resolution protocols specified in this document provide a way to verify the integrity of a successful XRI resolution, it may not provide a way to verify the integrity of a resolution failure. Reasons for this limitation include the prevalence of non-malicious network failures, the existence of denial-of-service attacks, and the ability of a man-in-the-middle attacker to modify HTTP responses when resolution is not performed over HTTPS.

3504  
3505  
3506

Additionally, there is no revocation mechanism for the keys used in trusted resolution. Therefore, a signed resolution's validity period should be limited appropriately to mitigate the risk of an incorrect or invalid resolution.

## 3507 **18.5 Synonym Verification**

3508 As discussed in section 5, XRI and XRDS infrastructure has rich support for identifier synonyms,  
3509 including synonyms that cross security domains. For this reason it is particularly important that  
3510 identifier authorities, including registries, registrars, directory administrators, identity providers,  
3511 and other parties who issue XRIs and manage XRDS documents, enforce the security policies  
3512 highlighted in section 5 regarding registration and management of XRDS synonym elements.

## 3513 **18.6 Redirect and Ref Management**

3514 As discussed in sections 5.3 and 12, XRI and XRDS infrastructure includes the capability to  
3515 distribute and delegate XRDS document management across multiple network locations or  
3516 identifier authorities. Identifier authorities should follow the security precautions highlighted in  
3517 section 5.3 to ensure Redirects and Refs are properly authorized and represent the intended  
3518 delegation policies.

## 3519 **18.7 Community Root Authorities**

3520 The XRI authority information for a community root needs to be well-known to the clients that  
3521 request resolution within that community. For trusted resolution, this includes the authority  
3522 resolution service endpoint URIs, the `xrd:XRD/xrd:ProviderID`, and the `ds:KeyInfo`  
3523 information. An acceptable means of providing this information is for the community root authority  
3524 to produce a self-signed XRD and publish it to a server-authenticated HTTPS endpoint. Special  
3525 care should be taken to ensure the correctness of such an XRD; if this information is incorrect, an  
3526 attacker may be able to convince a client of an incorrect result during trusted resolution.

## 3527 **18.8 Caching Authorities**

3528 In addition to traditional HTTP caching proxies, XRI proxy resolvers may be a part of the  
3529 resolution topology. Such proxy resolvers should take special precautions against cache  
3530 poisoning, as these caching entities may represent trusted decision points within a deployment's  
3531 resolution architecture.

## 3532 **18.9 Recursing and Proxy Resolution**

3533 During recursing resolution, subsegments of the XRI authority component for which the resolving  
3534 network endpoint is not authoritative may be revealed to that service endpoint. During proxy  
3535 resolution, some or all of an XRI is provided to the proxy resolver.

3536 In both cases, privacy considerations should be evaluated before disclosing such information.

## 3537 **18.10 Denial-Of-Service Attacks**

3538 XRI Resolution, including trusted resolution, is vulnerable to denial-of-service (DOS) attacks  
3539 typical of systems relying on DNS and HTTP(S).

3540

---

## A. Acknowledgments

3541 The editors would like to thank the following current and former members of the OASIS XRI TC  
3542 for their particular contributions to this and previous versions of this specification:

- 3543 • William Barnhill, Booz Allen and Hamilton
- 3544 • Dave McAlpin, Epok
- 3545 • Chetan Sabnis, Epok
- 3546 • Peter Davis, Neustar
- 3547 • Victor Grey, PlaNetwork
- 3548 • Mike Lindelsee, Visa International
- 3549 • Markus Sabadello, XDI.org
- 3550 • John Bradley
- 3551 • Kermit Snelson

3552 The editors would also like to acknowledge the contributions of the other members of the OASIS  
3553 XRI Technical Committee, whose other voting members at the time of publication were:

- 3554 • Geoffrey Strongin, Advanced Micro Devices
- 3555 • Ajay Madhok, AmSoft Systems
- 3556 • Dr. XiaoDong Lee, China Internet Network Information
- 3557 • Nat Sakimura, Nomura Research
- 3558 • Owen Davis, PlaNetwork
- 3559 • Fen Labalme, PlaNetwork
- 3560 • Marty Schleiff, The Boeing Company
- 3561 • Dave Wentker, Visa International
- 3562 • Paul Trevithick

3563 The editors also would like to acknowledge the following people for their contributions to previous  
3564 versions of OASIS XRI specifications (affiliations listed for OASIS members):

3565 Marc Le Maitre, Cordance Corporation; Thomas Bikeev, EAN International; Krishna Sankar,  
3566 Cisco; Winston Bumpus, Dell; Joseph Moeller, EDS; Steve Green, Epok; Lance Hood, Jerry  
3567 Kindall, Adarbad Master, Davis McPherson, Chetan Sabnis, and Loren West, Epok; Phillipe  
3568 LeBlanc, Jim Schreckengast, and Xavier Serret, Gemplus; John McGarvey, IBM; Reva Modi,  
3569 Infosys; Krishnan Rajagopalan, Novell; Masaki Nishitani, Tomonori Seki, and Tetsu Watanabe,  
3570 Nomura Research Institute; James Bryce Clark, OASIS; Marc Stephenson, TSO; Mike Mealling,  
3571 Verisign; Rajeev Maria, Terence Spielman, and John Veizades, Visa International; Lark Allen and  
3572 Michael Willett, Wave Systems; Matthew Dovey; Eamonn Neylon; Mary Nishikawa; Lars Marius  
3573 Garshol; Norman Paskin; and Bernard Vatant.

3574

## B. RelaxNG Schema for XRDS and XRD

3575

Following are the locations of the normative RelaxNG compact schema files for XRDS and XRD

3576

as defined by this specification:

3577

- **xrds.rnc**: <http://www.oasis-open.org/committees/download.php/27422/xrds.rnc>

3578

- **xrd.rnc**: <http://www.oasis-open.org/committees/download.php/27421/xrd.rnc>

**Comment [DSR25]:** Links to the updated files in Kavi; these will need to be updated after the CD03 vote.

3579

**IMPORTANT:** The **xrd.rnc** schema does NOT include deprecated attribute values that are recommended for backwards compatibility. See the highlighted Backwards Compatibility notes in sections 9.1.1 and 13.3.2 for more details.

3581

3582

Listings of these files are provided in this appendix for reference but are non-normative.

## C. XML Schema for XRDS and XRD

3768 Following are the locations of the non-normative W3C XML Schema files for XRDS and XRD as  
3769 defined by this specification. Note that these are provided for reference only as they are not able  
3770 to fully express the extensibility semantics of the RelaxNG versions.

- 3771 • **xrds.xsd**: <http://docs.oasis-open.org/xri/2.0/specs/cd02/xrds.xsd>
- 3772 • **xrd.xsd**: <http://docs.oasis-open.org/xri/2.0/specs/cd02/xrd.xsd>

3773 **IMPORTANT:** The **xrd.xsd** schema does NOT include deprecated attribute values that are  
3774 recommended for backwards compatibility. See the highlighted Backwards Compatibility notes in  
3775 sections 9.1.1 and 13.3.2 for more details.

**Comment [DSR31]:** After the CD03 vote this reference should be changed to <http://www.oasis-open.org/committees/download.php/27430/xrd-v2.0.xsd> to reflect the changes below.

3776 Listings of these files are provided in this appendix for reference.

### 3777 **xrds.xsd**

```
3778 <?xml version="1.0" encoding="UTF-8"?>
3779 <xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema" xmlns:xrds="xri://$xrds"
3780 targetNamespace="xri://$xrds" elementFormDefault="qualified">
3781   <!-- Utility patterns -->
3782   <xs:attributeGroup name="otherattribute">
3783     <xs:anyAttribute namespace="##other" processContents="lax"/>
3784   </xs:attributeGroup>
3785   <xs:group name="otherelement">
3786     <xs:choice>
3787       <xs:any namespace="##other" processContents="lax"/>
3788       <xs:any namespace="##local" processContents="lax"/>
3789     </xs:choice>
3790   </xs:group>
3791   <!-- Patterns for elements -->
3792   <xs:element name="XRDS">
3793     <xs:complexType>
3794       <xs:sequence>
3795         <xs:group ref="xrds:otherelement" minOccurs="0" maxOccurs="unbounded"/>
3796       </xs:sequence>
3797       <xs:attributeGroup ref="xrds:otherattribute"/>
3798       <!--XML Schema does not currently offer a means to express that only one of
3799 the following two attributes may be used in any XRDS element, i.e., an XRDS document may
3800 describe EITHER a redirect identifier or a ref identifier but not both.-->
3801       <xs:attribute name="redirect" type="xs:anyURI" use="optional"/>
3802       <xs:attribute name="ref" type="xs:anyURI" use="optional"/>
3803     </xs:complexType>
3804   </xs:element>
3805 </xs:schema>
```

### 3808 **xrd.xsd**

```

## D. Media Type Definition for application/xrds+xml

4024 This section is prepared in anticipation of filing a media type registration meeting the  
4025 requirements of [RFC4288].

4026 **Type name:** application

4027 **Subtype name:** xrds+xml

4028 **Required parameters:** None

4029 **Optional parameters:** See Table 6 of this document.

4030 **Encoding considerations:** Identical to those of "application/xml" as described in [RFC3023],  
4031 Section 3.2.

4032 **Security considerations:** As defined in this specification. In addition, as this media type uses the  
4033 "+xml" convention, it shares the same security considerations as described in [RFC3023],  
4034 Section 10.

4035 **Interoperability considerations:** There are no known interoperability issues.

4036 **Published specification:** This specification.

4037 **Applications that use this media type:** Applications conforming to this specification use this  
4038 media type.

4039 **Person & email address to contact for further information:** Drummond Reed, OASIS XRI  
4040 Technical Committee Co-Chair, drummond.reed@cordance.net

4041 **Intended usage:** COMMON

4042 **Restrictions on usage:** None

4043 **Author:** OASIS XRI TC

4044 **Change controller:** OASIS XRI TC

4045

## E. Media Type Definition for application/xrd+xml

4046 This section is prepared in anticipation of filing a media type registration meeting the  
4047 requirements of [RFC4288].

4048 **Type name:** application

4049 **Subtype name:** xrd+xml

4050 **Required parameters:** None

4051 **Optional parameters:** See Table 6 of this document.

4052 **Encoding considerations:** Identical to those of "application/xml" as described in [RFC3023],  
4053 Section 3.2.

4054 **Security considerations:** As defined in this specification. In addition, as this media type uses the  
4055 "+xml" convention, it shares the same security considerations as described in [RFC3023],  
4056 Section 10.

4057 **Interoperability considerations:** There are no known interoperability issues.

4058 **Published specification:** This specification.

4059 **Applications that use this media type:** Applications conforming to this specification use this  
4060 media type.

4061 **Person & email address to contact for further information:** Drummond Reed, OASIS XRI  
4062 Technical Committee Co-Chair, drummond.reed@cordance.net

4063 **Intended usage:** COMMON

4064 **Restrictions on usage:** None

4065 **Author:** OASIS XRI TC

4066 **Change controller:** OASIS XRI TC

4067

## F. Example Local Resolver Interface Definition

4068

Following is a non-normative language-neutral example interface definition for a XRI resolver consistent with the requirements of this specification.

4069

4070

The interface definition is provided as five operations where each operation takes two or more of the following input parameters. These input parameters correspond to the normative text in section 8.1. In all of these parameters, the value empty string ("") is interpreted the same as the value null.

4071

4072

4073

4074

Parameter name	Description
QXRI	Query XRI as defined in section 8.1.1.
sepType	Service Types as defined in section 8.1.3
sepMediaType	Service Media Type as defined in section 8.1.4
flags	Language binding-specific representation of resolution flags defined in the following table.

4075

4076

The `flags` parameter is a binding-specific container data structure that encapsulates the following subparameters of the Resolution Output Format parameter. All of these are Boolean parameters defined in Table 6 in section 3.3.

4077

4078

4079

Subparameter	Description
https, saml	Specifies use of HTTPS or SAML trusted resolution as defined in sections 10.1 and 10.2.
refs	Specifies whether Refs should be followed during resolution as defined in section 12.4.
nodefault_t, nodefault_p, nodefault_m	Specifies whether a default match is allowed on the Type, Path, or MediaType elements respectively during service endpoint selection as defined in section 13.3.
uric	Specifies whether a resolver should automatically construct service endpoint URIs as defined in section 13.7.1.
cid	Specifies whether automatic canonical ID verification should performed as defined in section 14.3.

4080

4081

Note that one subparameter defined in in Table 6, `sep` (service endpoint), is not included in this flags table because it is implicitly represented in the operation being called. The five operations shown in the table below correspond to the five possible combinations of the value of the Resolution Output Format parameter and the `sep` subparameter. (Note that if the Resolution Output Format is URI List, the `sep` subparameter MUST be considered to be TRUE, so there is no `resolveAuthToURIList` operation.)

4082

4083

4084

4085

4086

4087

	Operation name	Resolution Output Format Parameter Value	sep Subparameter Value
1	resolveAuthToXRDS	application/xrds+xml	false
2	resolveAuthToXRD	application/xrd+xml	false
3	resolveSepToXRDS	application/xrds+xml	true
4	resolveSepToXRD	application/xrd+xml	true
5	resolveSepToURIList	text/uri-list	ignored

4088 Following is the API and descriptions of the five operations.

4089 **1. Resolve Authority to XRDS**

```
4090 Result resolveAuthToXRDS(  
4091     in string QXRI, in Flags flags);
```

- 4092
- 4093 • Performs authority resolution only (sections 9 and 10) and outputs an XRDS document as specified in section 8.2.1 when the `sep` subparameter is `FALSE`.
  - 4094 • Only the authority component of the QXRI is processed by this function. If the QXRI contains a path or query component, it is ignored.
  - 4096 • Returns a binding-specific representation of the resolution result which may include, but is not limited to, XRDS output, success/failure code, exceptions and error context.
  - 4098 • The XRD element(s) in the output XRDS will be signed or not depending on the value of the `saml` flag.
- 4099

4100

4101 **2. Resolve Authority to XRD**

```
4102 Result resolveAuthToXRD(  
4103     in string QXRI, in Flags flags);
```

- 4104
- 4105 • Performs authority resolution only (sections 9 and 10) and outputs an XRD element as specified in section 8.2.2 when the `sep` subparameter is `FALSE`.
  - 4106 • Only the authority component of the QXRI is processed by this function. If the QXRI contains a path or query component, it is ignored.
  - 4108 • Returns a binding-specific representation of the resolution result which may include, but is not limited to, XRD output, success/failure code, exceptions and error context.
  - 4110 • The output XRD will be signed or not depending on the value of the `saml` flag.
- 4111

### 4112 3. Resolve Service Endpoint to XRDS

```
4113 Result resolveSEPToXRDS (  
4114     in string QXRI, in string sepType,  
4115     in string sepMediaType, in Flags flags);
```

- 4116 • Performs authority resolution (sections 9 and 10) and service endpoint selection (section 13)  
4117 and outputs the XRDS as specified in section 8.2.1 when the `sep` subparameter is TRUE.
- 4118 • Returns a binding-specific representation of the resolution result which may include, but is not  
4119 limited to, XRDS output, success/failure code, exceptions and error context.
- 4120 • The final XRD in the output XRDS will either contain at least one instance of the requested  
4121 service endpoint or an error. *IMPORTANT: Although the resolver will perform service*  
4122 *selection, the final XRD is NOT filtered when the Resolution Output Format is an XRDS*  
4123 *document. Filtering is only performed when the Resolution Output Format is an XRD*  
4124 *document (below).*
- 4125 • The XRD element(s) in the output XRDS will be signed or not depending on the value of  
4126 `saml` flag.

4127

### 4128 4. Resolve Service Endpoint to XRD

```
4129 Result resolveSEPToXRD (  
4130     in string QXRI, in string sepType,  
4131     in string sepMediaType, in Flags flags);
```

- 4132 • Performs authority resolution (sections 9 and 10) and service endpoint selection (section 13)  
4133 and outputs an XRD as specified in section 8.2.2 when the `sep` subparameter is TRUE.
- 4134 • Returns a binding-specific representation of the resolution result which may include, but is not  
4135 limited to, XRD output, success/failure code, exceptions and error context.
- 4136 • The output XRD will contain at least one instance of the requested service endpoint or an  
4137 error. Also, all elements in the output XRD subject to the global `priority` attribute will be  
4138 returned in order of highest to lowest priority. See section 8.2.2 for details.
- 4139 • The XRD element will be signed or not depending on the value of `saml` flag, however that  
4140 signature may not be able to be independently verified because the XRD has been filtered to  
4141 contain only the selected service endpoints.

4142

4143 **5. Resolve Service Endpoint to URI List**

```
4144 Result resolveSepToURIList(  
4145     in string QXRI, in string sepType,  
4146     in string sepMediaType, in Flags flags);
```

- 4147
- 4148 • Performs authority resolution (sections 9 and 10) and service endpoint selection (section 13) and outputs a non-empty URI List or an error as specified in section 8.2.3.
  - 4149 • Returns a binding-specific representation of the resolution result which may include, but not  
4150 limited to, URI-list output, success/failure code, exceptions and error context.
  - 4151 • If successful, the output URI-list will contain zero or more elements. It is possible that the  
4152 selected service contains no URI element and it is up to the consuming application to  
4153 interpret such a result.
- 4154

4155

## G. Revision History

4156 Committee Draft 01 of this specification was published in March 2005 and is available at:

- 4157
- <http://www.oasis-open.org/committees/download.php/11853>

4158 Significant changes were made based on implementation feedback, resulting in a new  
4159 implementers draft (Working Draft 10) published in March 2006:

- 4160
- <http://www.oasis-open.org/committees/download.php/17293>

4161 All revisions since Working Draft 10 have been tracked on the XRI Technical Committee wiki  
4162 page for Working Draft 11:

- 4163
- <http://wiki.oasis-open.org/xri/Xri2Cd02/ResWorkingDraft11>

4164 A copy of this wiki page as of the date of this specification has been archived at:

- 4165
- <http://www.oasis-open.org/committees/download.php/26277>

4166 Due to the extent of the revisions from Committee Draft 01, Committee Draft 02 should be  
4167 considered a new document.

4168 Committee Draft 03 includes the following revisions based on comments received during the  
4169 public review of Committee Draft 02:

- 4170
- The reference to the XRI Syntax 2.0 specification in section 1.5 was updated.
  - 4171 • The XRD elements in sections 4.2.1 – 4.2.6 were reformatted to include attribute definitions  
4172 as separate bullet points (per comment received from Eran Hammer-Lahav).
  - 4173 • The `xrd:XRD/xrd:Type` element was added to the XRD schema (section 4.2.1 and  
4174 Appendix B and C) to reuse the `xrd:XRD/xrd:Service/xrd:Type` element at the XRD  
4175 level in order to support extension specifications (per comment received from Eran Hammer-  
4176 Lahav). A reference to this change was added in section 17.1.1
  - 4177 • The flowcharts in Figures 5, 6, 7, and 8 were edited for improved clarity about recording  
4178 XRDs and nested XRDS documents and clarify using a Redirect URI as an input.
  - 4179 • The Next Authority URI construction algorithm in section 9.1.10 was revised slightly to  
4180 accommodate using query strings.
  - 4181 • The wording of the bullet points in section 12.1 were clarified (per comment received from  
4182 Eran Hammer-Lahav).
  - 4183 • A fourth example was added in section 12.5.1 to illustrate double XRDS nesting.
  - 4184 • Clarifications were made to the pseudocode in section 13.6.
  - 4185 • The CanonicalID verification rule for XRIs was simplified to eliminate the need to involve the  
4186 `xrd:XRD/xrd:ProviderID` element (per suggestion from editor William Tan).
  - 4187 • Several typos and incorrect internal references were fixed.
  - 4188 • Several errors were fixed in the RNC schema.
  - 4189

Comment [DSR34]: The bullet points below summarize the changes.
