Abstract:

The SCA Java Common Annotation and APIs specify a Java syntax for programming concepts defined in the SCA Assembly Model Specification. It specifies a set of APIs and annotations that may be used by Java-based SCA specifications.

Specifically, this specification covers:

1. Implementation metadata for specifying component services, references, and properties
2. A client and component API
3. Metadata for asynchronous and conversational services
4. Metadata for callbacks
5. Definitions of standard component implementation scopes
6. Java to WSDL and WSDL to Java mappings
7. Security policy annotations

Note that individual programming models may chose to implement their own mappings of assembly model concepts using native APIs and idioms when appropriate.

Status:

This document was last revised or approved by the OASIS Service Component Architecture / J (SCA-J) TC on the above date. The level of approval is also listed above. Check the "Latest Version" or "Latest Approved Version" location noted above for possible later revisions of this document.

Technical Committee members should send comments on this specification to the Technical Committee's email list. Others should send comments to the Technical Committee by using the "Send A Comment" button on the Technical Committee's web page at <http://www.oasis-open.org/committees/sca-j/>.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Technical Committee web page (<http://www.oasis-open.org/committees/sca-j/ipr.php>).

The non-normative errata page for this specification is located at <http://www.oasis-open.org/committees/sca-j/>.

1 Introduction

The SCA Common Annotation, APIs, Client and Implementation Model specifies a Java syntax for programming concepts defined in the SCA Assembly Model Specification ~~[ASSEMBLY]~~. It specifies a set of APIs and annotations that may be used by Java-based SCA specifications.

Deleted: [1].

Specifically, this specification covers:

1. Implementation metadata for specifying component services, references, and properties
2. A client and component API
3. Metadata for asynchronous and conversational services
4. Metadata for callbacks
5. Definitions of standard component implementation scopes
6. Java to WSDL and WSDL to Java mappings
7. Security policy annotations

Note that individual programming models may chose to implement their own mappings of assembly model concepts using native APIs and idioms when appropriate.

The goal of specifying the annotations, APIs, client and implementation model in this specification is to promote consistency and reduce duplication across various Java-related component implementation type specifications. The annotations, APIs, client and implementation model defined in this specification are designed to be used by other SCA Java-related specifications in either a partial or complete fashion.

This document defines implementation metadata using the annotation capability from Java™ 2 Standard Edition (J2SE) 5. However, SCA also allows service clients and implementations to be written using J2SE 1.4. All metadata that is represented by annotations can also be expressed using a component type side file, as defined in the SCA Assembly Specification ~~[ASSEMBLY]~~.

1.1 Terminology

The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described in [\[RFC2119\]](#).

1.2 Normative References

47 2 Implementation Metadata

48 This section describes SCA Java-based metadata, which applies to Java-based implementation
49 types.

50 2.1 Service Metadata

51 2.1.1 @Service

52
53 The **@Service annotation** is used on a Java class to specify the interfaces of the services
54 implemented by the implementation. Service interfaces are defined in one of the following ways:

- 55 • As a Java interface
- 56 • As a Java class
- 57 • As a Java interface generated from a Web Services Description Language [\(WSDL\)](#)
58 (WSDL) portType (Java interfaces generated from a WSDL portType are always
59 **remotable**)

Deleted: [4]

60 2.1.2 Java Semantics of a Remotable Service

61 A **remotable service** is defined using the @Remotable annotation on the Java interface that
62 defines the service. Remotable services are intended to be used for **coarse grained** services, and
63 the parameters are passed **by-value**. Remotable Services are not allowed to make use of method
64 **overloading**.

65 The following snippet shows an example of a Java interface for a remote service:

```
66 package services.hello;  
67 @Remotable  
68 public interface HelloService {  
69     String hello(String message);  
70 }  
71
```

72 2.1.3 Java Semantics of a Local Service

73 A **local service** can only be called by clients that are deployed within the same address space as
74 the component implementing the local service.

75 A local interface is defined by a Java interface with no @Remotable annotation or it is defined by a
76 Java class.

77 The following snippet shows an example of a Java interface for a local service:

```
78  
79 package services.hello;  
80 public interface HelloService {  
81     String hello(String message);  
82 }  
83
```

84 The style of local interfaces is typically **fine grained** and is intended for **tightly coupled**
85 interactions.

Deleted: 2

Deleted: 2

Inserted: 2

Deleted: WD05

Inserted: 2

Deleted: 03

Deleted: October

86 The data exchange semantic for calls to local services is **by-reference**. This means that code must
87 be written with the knowledge that changes made to parameters (other than simple types) by
88 either the client or the provider of the service are visible to the other.

89 2.1.4 @Reference

90 Accessing a service using reference injection is done by defining a field, a setter method
91 parameter, or a constructor parameter typed by the service interface and annotated with a
92 **@Reference** annotation.

Deleted: n

93 2.1.5 @Property

94 Implementations can be configured with data values through the use of properties, as defined in
95 the SCA Assembly specification [\[ASSEMBLY\]](#). The **@Property** annotation is used to define an SCA
96 property.

Deleted: [1].

Deleted:

97 2.2 Implementation Scopes: @Scope, @Init, @Destroy

98 Component implementations can either manage their own state or allow the SCA runtime to do so.
99 In the latter case, SCA defines the concept of **implementation scope**, which specifies a visibility
100 and lifecycle contract an implementation has with the SCA runtime. Invocations on a service
101 offered by a component will be dispatched by the SCA runtime to an **implementation instance**
102 according to the semantics of its implementation scope.

103 Scopes are specified using the **@Scope** annotation on the implementation class.

104 This document defines three scopes:

Deleted: four

- 105 • STATELESS
- 106 • CONVERSATION
- 107 • COMPOSITE

Deleted: 11

Deleted: REQUEST

108 Java-based implementation types can choose to support any of these scopes, and they may define
109 new scopes specific to their type.

110 An implementation type may allow component implementations to declare **lifecycle methods** that
111 are called when an implementation is instantiated or the scope is expired.

112 **@Init** denotes a method called upon first use of an instance during the lifetime of the scope
113 (except for composite scoped implementation marked to eagerly initialize, see [section Composite](#)
114 [Scope](#)).

115 **@Destroy** specifies a method called when the scope ends.

116 Note that only no argument methods with a void return type can be annotated as lifecycle
117 methods.

Deleted: Note that only no-argument methods may be annotated as lifecycle methods.

118 The following snippet is an example showing a fragment of a service implementation annotated
119 with lifecycle methods:

```
120  
121 @Init  
122 public void start() {  
123     ...  
124 }  
125  
126 @Destroy  
127 public void stop() {  
128     ...
```

Deleted: 2

Deleted: 2

Inserted: 2

Deleted: WD05

Inserted: 2

Deleted: 03

Deleted: October

129 }

130

131 The following sections specify four standard scopes, which a Java-based implementation type may
132 support.

133 2.2.1 Stateless scope

134 For stateless scope components, there is no implied correlation between implementation instances
135 used to dispatch service requests.

Deleted:

136 The concurrency model for the stateless scope is single threaded. This means that the SCA
137 runtime MUST ensure that a stateless scoped implementation instance object is only ever
138 dispatched on one thread at any one time. In addition, within the SCA lifecycle of an instance, the
139 SCA runtime MUST only make a single invocation of one business method. Note that the SCA
140 lifecycle might not correspond to the Java object lifecycle due to runtime techniques such as
141 pooling.

142 2.2.2 Composite scope

143 All service requests are dispatched to the same implementation instance for the lifetime of the
144 containing composite. The lifetime of the containing composite is defined as the time it becomes
145 active in the runtime to the time it is deactivated, either normally or abnormally.

146 A composite scoped implementation may also specify eager initialization using the **@EagerInit**
147 annotation. When marked for eager initialization, the composite scoped instance is created when
148 its containing component is started. If a method is marked with the @Init annotation, it is called
149 when the instance is created.

150 The concurrency model for the composite scope is multi-threaded. This means that the SCA
151 runtime MAY run multiple threads in a single composite scoped implementation instance object
152 and it MUST NOT perform any synchronization.

Deleted: **<#>Request scope¶**
The lifecycle of request scope extends from the point a request on a remotable interface enters the SCA runtime and a thread processes that request until the thread completes synchronously processing the request. During that time, all service requests are delegated to the same implementation instance of a request-scoped component.¶ There are times when a local request scoped service is called without there being a remotable service earlier in the call stack, such as when a local service is called from a non-SCA entity. In these cases, a remote request is always considered to be present, but the lifetime of the request is implementation dependent. For example, a timer event could be treated as a remote request.¶

Formatted: Bullets and Numbering

Formatted: Bullets and Numbering

153 2.2.3 Conversation scope

154 A **conversation** is defined as a series of correlated interactions between a client and a target
155 service. A conversational scope starts when the first service request is dispatched to an
156 implementation instance offering a conversational service. A conversational scope completes after
157 an end operation defined by the service contract is called and completes processing or the
158 conversation expires. A conversation may be long-running (for example, hours, days or weeks)
159 and the SCA runtime may choose to passivate implementation instances. If this occurs, the
160 runtime must guarantee that implementation instance state is preserved.

161 Note that in the case where a conversational service is implemented by a Java class marked as
162 conversation scoped, the SCA runtime will transparently handle implementation state. It is also
163 possible for an implementation to manage its own state. For example, a Java class having a
164 stateless (or other) scope could implement a conversational service.

165 A conversational scoped class MUST NOT expose a service using a non-conversational interface.
166 When a service has a conversational interface it MUST be implemented by a conversation-scoped
167 component. If no scope is specified on the implementation, then conversation scope is implied.

168 The concurrency model for the conversation scope is multi-threaded. This means that the SCA
169 runtime MAY run multiple threads in a single conversational scoped implementation instance
170 object and it MUST NOT perform any synchronization.

171 3 Interface

172 This section describes the SCA Java interface element and the SCA metadata for Java interfaces.

173 3.1 Java interface element ("interface.java")

174 The following snippet shows the schema for the Java interface element.

```
176 <interface.java interface="NCName" ... />  
177
```

178 The interface.java element has the following attributes:

- 179 • **interface** – the fully qualified name of the Java interface

181 The following snippet shows an example of the Java interface element:

```
183 <interface.java interface="services.stockquote.StockQuoteService"/>  
184
```

185 Here, the Java interface is defined in the Java class file
186 ./services/stockquote/StockQuoteService.class, where the root directory is defined by the
187 contribution in which the interface exists.

188 For the Java interface type system, **parameters and return types** of the service methods are
189 described using Java classes or simple Java types. **Service Data Objects [SDO]** are the preferred
190 form of Java class because of their integration with XML technologies.

191

192 3.2 @Remotable

193 The **@Remotable** annotation on a Java interface indicates that the interface is designed to be
194 used for remote communication. Remotable interfaces are intended to be used for **coarse**
195 **grained** services. Operations' parameters and return values are passed **by-value**. Remotable
196 Services are not allowed to make use of method **overloading**.

197 3.3 @Conversational

198 Java service interfaces may be annotated to specify whether their contract is conversational as
199 described in the Assembly Specification **[ASSEMBLY]** by using the **@Conversational** annotation. A
200 conversational service indicates that requests to the service are correlated in some way.

201 When @Conversational is not specified on a service interface, the service contract is **stateless**.

202 3.4 @Callback

203 A callback interface is declared by using a @Callback annotation on a Java service interface, with
204 the Java Class object of the callback interface as a parameter. There is another form of the
205 @Callback annotation, without any parameters, that specifies callback injection for a setter method
206 or a field of an implementation.

207 4 Client API

208 This section describes how SCA services may be programmatically accessed from components and
209 also from non-managed code, i.e. code not running as an SCA component.

210 4.1 Accessing Services from an SCA Component

211 An SCA component may obtain a service reference either through injection or programmatically
212 through the **ComponentContext** API. Using reference injection is the recommended way to
213 access a service, since it results in code with minimal use of middleware APIs. The
214 ComponentContext API is provided for use in cases where reference injection is not possible.

215 4.1.1 Using the Component Context API

216 When a component implementation needs access to a service where the reference to the service is
217 not known at compile time, the reference can be located using the component's
218 ComponentContext.

219 4.2 Accessing Services from non-SCA component implementations

220 This section describes how Java code not running as an SCA component that is part of an SCA
221 composite accesses SCA services via references.

222 4.2.1 ComponentContext

223 Non-SCA client code can use the ComponentContext API to perform operations against a
224 component in an SCA domain. How client code obtains a reference to a ComponentContext is
225 runtime specific.

226 The following example demonstrates the use of the component Context API by non-SCA code:

227

```
228 ComponentContext context = // obtained through host environment-specific means  
229 HelloService helloService =  
230     context.getService(HelloService.class, "HelloService");  
231 String result = helloService.hello("Hello World!");
```

232

5 Error Handling

233

Clients calling service methods may experience business exceptions and SCA runtime exceptions.

234

Business exceptions are thrown by the implementation of the called service method, and are

235

defined as checked exceptions on the interface that types the service.

236

SCA runtime exceptions are raised by the SCA runtime and signal problems in management of

237

component execution or problems interacting with remote services. The SCA runtime exceptions

238

are [defined in the Java API section](#).

239 6 Asynchronous and Conversational Programming

240 Asynchronous programming of a service is where a client invokes a service and carries on
241 executing without waiting for the service to execute. Typically, the invoked service executes at
242 some later time. Output from the invoked service, if any, must be fed back to the client through a
243 separate mechanism, since no output is available at the point where the service is invoked. This is
244 in contrast to the call-and-return style of synchronous programming, where the invoked service
245 executes and returns any output to the client before the client continues. The SCA asynchronous
246 programming model consists of:

- 247 • support for non-blocking method calls
- 248 • conversational services
- 249 • callbacks

250 Each of these topics is discussed in the following sections.

251 Conversational services are services where there is an ongoing sequence of interactions between
252 the client and the service provider, which involve some set of state data – in contrast to the
253 simple case of stateless interactions between a client and a provider. Asynchronous services may
254 often involve the use of a conversation, although this is not mandatory.

255 6.1 @OneWay

256 **Nonblocking calls** represent the simplest form of asynchronous programming, where the client of
257 the service invokes the service and continues processing immediately, without waiting for the
258 service to execute.

259 Any method with a void return type and has no declared exceptions may be marked with a
260 **@OneWay** annotation. This means that the method is non-blocking and communication with the
261 service provider may use a binding that buffers the requests and sends it at some later time.

262 For a Java client to make a non-blocking call to methods that either return values or which throw
263 exceptions, a Java client can use the JAX-WS asynchronous client API model that is described in
264 section 9. It is considered to be a best practice that service designers define one-way methods as
265 often as possible, in order to give the greatest degree of binding flexibility to deployers.

Deleted: n

266 6.2 Conversational Services

267 A service may be declared as conversational by marking its Java interface with a
268 **@Conversational** annotation. If a service interface is not marked with **a @Conversational**, it is
269 stateless.

Deleted: n

270 6.2.1 ConversationAttributes

271 A Java-based implementation class may be marked with a **@ConversationAttributes** annotation,
272 which is used to specify the expiration rules for conversational implementation instances.

Deleted: n

273 An example of **the @ConversationAttributes** is shown below:

```
274 package com.bigbank;  
275 import org.osoa.sca.annotations.ConversationAttributes;  
276  
277 @ConversationAttributes(maxAge="30 days");  
278 public class LoanServiceImpl implements LoanService {  
279  
280 }
```

281 6.2.2 @EndsConversation

282 A method of a conversational interface may be marked with an @EndsConversation annotation.
283 Once a method marked with @EndsConversation has been called, the conversation between client
284 and service provider is at an end, which implies no further methods may be called on that service
285 within the same conversation. This enables both the client and the service provider to free up
286 resources that were associated with the conversation.

287 It is also possible to mark a method on a callback interface (described later) with
288 @EndsConversation, in order for the service provider to be the party that chooses to end the
289 conversation.

290 If a conversation is ended with an explicit outbound call to an @EndsConversation method or
291 through a call to the ServiceReference.endConversation() method, then any subsequent call to an
292 operation on the service reference will start a new conversation. If the conversation ends for any
293 other reason (e.g. a timeout occurred), then until ServiceReference.getConversation().end() is
294 called, the ConversationEndedException is thrown by any conversational operation.

295 6.3 Passing Conversational Services as Parameters

296 The service reference which represents a single conversation can be passed as a parameter to
297 another service, even if that other service is remote. This may be used to allow one component to
298 continue a conversation that had been started by another.

299 A service provider may also create a service reference for itself that it can pass to other services.
300 A service implementation does this with a call to the createSelfReference(...) method:

```
301     interface ComponentContext{  
302         ...  
303         <B> ServiceReference<B> createSelfReference(Class  
304             businessInterface);  
305         <B> ServiceReference<B> createSelfReference(Class  
306             businessInterface, String serviceName);  
307     }
```

308
309 The second variant, which takes an additional **serviceName** parameter, must be used if the
310 component implements multiple services.

311 This capability may be used to support complex callback patterns, such as when a callback is
312 applicable only to a subset of a larger conversation. Simple callback patterns are handled by the
313 built-in callback support described later.

314 6.4 Conversational Client

315 The client of a conversational service does not need to be coded in a special way. The client can
316 take advantage of the conversational nature of the interface through the relationship of the
317 different methods in the interface and any data they may share in common. If the service is
318 asynchronous, the client may like to use a feature such as the conversationID to keep track of any
319 state data relating to the conversation.

320 The developer of the client knows that the service is conversational by introspecting the service
321 contract. The following shows how a client accesses the conversational service described above:

```
322  
323 @Reference  
324 LoanService loanService;  
325 // Known to be conversational because the interface is marked as  
326 // conversational
```

341     return ...;
342 }

```

6.5 Conversation Lifetime Summary

Starting conversations

Conversations start on the client side when one of the following occur:

- A @Reference to a conversational service is injected
- A call is made to CompositeContext.getServiceReference and then a method of the service is called.

Continuing conversations

The client can continue an existing conversation, by:

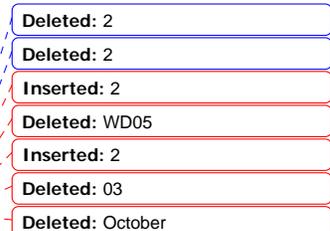

- Holding the service reference that was created when the conversation started
- Getting the service reference object passed as a parameter from another service, even remotely
- Loading a service reference that had been written to some form of persistent storage

Ending conversations

A conversation ends, and any state associated with the conversation is freed up, when:

- A service operation that has been annotated @EndsConversation has been called
- The server calls an @EndsConversation method on the @Callback reference
- The server's conversation lifetime timeout occurs
- The client calls Conversation.end()
- Any non-business exception is thrown by a conversational operation

If a method is invoked on a service reference after an @EndsConversation method has been called then a new conversation will automatically be started. If ServiceReference.getConversationID() is called after the @EndsConversation method is called, but before the next conversation has been started, it returns null.

369 If a service reference is used after the service provider's conversation timeout has caused the
370 conversation to be ended, then ConversationEndedException is thrown. In order to use that
371 service reference for a new conversation, its endConversation () method must be called.
372

373 6.6 Conversation ID

374 Every conversation has a **conversation ID**. The conversation ID can be generated by the system,
375 or it can be supplied by the client component.

376 If a field or setter method is annotated with **@ConversationID**, then the conversation ID for the
377 conversation is injected. The type of the field is not necessarily String. System generated
378 conversation IDs are always strings, but application generated conversation IDs may be other
379 complex types.

380 6.6.1 Application Specified Conversation IDs

381 It is possible to take advantage of the state management aspects of conversational services while
382 using a client-provided conversation ID. To do this, the client does not use reference injection,
383 but uses the **ServiceReference.setConversationID()** API.

384 The conversation ID that is passed into this method should be an instance of either a String or of
385 an object that is serializable into XML. The ID must be unique to the client component over all
386 time. If the client is not an SCA component, then the ID must be globally unique.

387 Not all conversational service bindings support application-specified conversation IDs or may only
388 support application-specified conversation IDs that are Strings.

389 6.6.2 Accessing Conversation IDs from Clients

390 Whether the conversation ID is chosen by the client or is generated by the system, the client may
391 access the conversation ID by calling `getConversationID()` on the current conversation
392 object.

393 If the conversation ID is not application specified, then the
394 `ServiceReference.getConversationID()` method is only guaranteed to return a valid value
395 after the first operation has been invoked, otherwise it returns null.

396 6.7 Callbacks

397 A **callback service** is a service that is used for **asynchronous** communication from a service
398 provider back to its client, in contrast to the communication through return values from
399 synchronous operations. Callbacks are used by **bidirectional services**, which are services that
400 have two interfaces:

- 401 • an interface for the provided service
- 402 • a callback interface that must be provided by the client

403 Callbacks may be used for both remotable and local services. Either both interfaces of a
404 bidirectional service must be remotable, or both must be local. It is illegal to mix the two. There
405 are two basic forms of callbacks: stateless callbacks and stateful callbacks.

406 A callback interface is declared by using a **@Callback** annotation on a service interface, with the
407 Java Class object of the interface as a parameter. The annotation may also be applied to a method
408 or to a field of an implementation, which is used in order to have a callback injected, as explained
409 in the next section.

410 6.7.1 Stateful Callbacks

411 A **stateful** callback represents a specific implementation instance of the component that is the
412 client of the service. The interface of a stateful callback should be marked as **conversational**.

Deleted: Conversation

Deleted: n

Deleted: 2

Deleted: 2

Inserted: 2

Deleted: WD05

Deleted: 03

Deleted: October

413 The following example interfaces show an interaction over a stateful callback.

```
414 package somepackage;
415 import org.osoa.sca.annotations.Callback;
416 import org.osoa.sca.annotations.Conversational;
417 import org.osoa.sca.annotations.Remotable;
418 @Remotable
419 @Conversational
420 @Callback(MyServiceCallback.class)
421 public interface MyService {
422
423     void someMethod(String arg);
424 }
425
426 @Remotable
427 @Conversational
428 public interface MyServiceCallback {
429
430     void receiveResult(String result);
431 }
432
```

433 An implementation of the service in this example could use the @Callback annotation to request
434 that a stateful callback be injected. The following is a fragment of an implementation of the
435 example service. In this example, the request is passed on to some other component, so that the
436 example service acts essentially as an intermediary. If the example service is conversation
437 scoped, the callback will still be available when the backend service sends back its asynchronous
438 response.

439 When an interface and its callback interface are both marked as conversational, then there is only
440 one conversation that applies in both directions and it has the same lifetime. In this case, if both
441 interfaces declare a @ConversationAttributes annotation, then only the annotation on the main
442 interface applies.

```
443 @Callback
444 protected MyServiceCallback callback;
445
446 @Reference
447 protected MyService backendService;
448
449 public void someMethod(String arg) {
450     backendService.someMethod(arg);
451 }
452
453 public void receiveResult(String result) {
454     callback.receiveResult(result);
455 }
456
```

458 This fragment must come from an implementation that offers two services, one that it offers to its
459 clients (MyService) and one that is used for receiving callbacks from the back end
460 (MyServiceCallback). The code snippet below is taken from the client of this service, which also
461 implements the methods defined in MyServiceCallback.

462

Deleted: 2
Deleted: 2
Inserted: 2
Deleted: WD05
Inserted: 2
Deleted: 03
Deleted: October

```

463
464     private MyService myService;
465
466     @Reference
467     public void setMyService(MyService service) {
468         myService = service;
469     }
470
471     public void aClientMethod() {
472         ...
473         myService.someMethod(arg);
474     }
475
476     public void receiveResult(String result) {
477         // code to process the result
478     }
479

```

480 Stateful callbacks support some of the same use cases as are supported by the ability to pass
481 service references as parameters. The primary difference is that stateful callbacks do not require
482 any additional parameters be passed with service operations. This can be a great convenience. If
483 the service has many operations and any of those operations could be the first operation of the
484 conversation, it would be unwieldy to have to take a callback parameter as part of every
485 operation, just in case it is the first operation of the conversation. It is also more natural than
486 requiring application developers to invoke an explicit operation whose only purpose is to pass the
487 callback object that should be used.

488 6.7.2 Stateless Callbacks

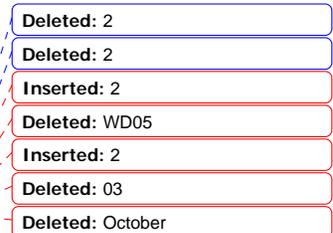

489 A stateless callback interface is a callback whose interface is not marked as **conversational**.
490 Unlike stateful services, a client that uses stateless callbacks will not have callback methods
491 routed to an instance of the client that contains any state that is relevant to the conversation. As
492 such, it is the responsibility of such a client to perform any persistent state management itself.
493 The only information that the client has to work with (other than the parameters of the callback
494 method) is a callback ID object that is passed with requests to the service and is guaranteed to be
495 returned with any callback.

496 The following is a repeat of the client code fragment above, but with the assumption that in this
497 case the MyServiceCallback is stateless. The client in this case needs to set the callback ID before
498 invoking the service and then needs to get the callback ID when the response is received.

```

499
500     private ServiceReference<MyService> myService;
501
502     @Reference
503     public void setMyService(ServiceReference<MyService> service) {
504         myService = service;
505     }
506
507     public void aClientMethod() {
508         String someKey = "1234";
509         ...
510
511         myService.setCallbackID(someKey);
512         myService.getService().someMethod(arg);
513     }
514
515     @Context RequestContext context;
516
517     public void receiveResult(String result) {

```

```

518 |         Object key = context.getServiceReference().getCallbackID();
519 |         // Lookup any relevant state based on "key"
520 |         // code to process the result
521 |     }

```

Deleted: myService

522
523 Just as with stateful callbacks, a service implementation gets access to the callback object by
524 annotating a field or setter method with the @Callback annotation, such as the following:

```

525 @Callback
526 protected MyServiceCallback callback;

```

527
528
529 The difference for stateless services is that the callback field would not be available if the
530 component is servicing a request for anything other than the original client. So, the technique
531 used in the previous section, where there was a response from the backendService which was
532 forwarded as a callback from MyService would not work because the callback field would be null
533 when the message from the backend system was received.

534 6.7.3 Implementing Multiple Bidirectional Interfaces

535 Since it is possible for a single implementation class to implement multiple services, it is also
536 possible for callbacks to be defined for each of the services that it implements. The service
537 implementation can include an injected field for each of its callbacks. The runtime injects the
538 callback onto the appropriate field based on the type of the callback. The following shows the
539 declaration of two fields, each of which corresponds to a particular service offered by the
540 implementation.

```

541 @Callback
542 protected MyService1Callback callback1;
543
544 @Callback
545 protected MyService2Callback callback2;

```

546
547
548 If a single callback has a type that is compatible with multiple declared callback fields, then all of
549 them will be set.

550 6.7.4 Accessing Callbacks

551 In addition to injecting a reference to a callback service, it is also possible to obtain a reference to
552 a Callback instance by annotating a field or method with the **@Callback** annotation.

553
554 A reference implementing the callback service interface may be obtained using
555 `CallableReference.getService()`.

556 The following example fragments come from a service implementation that uses the callback API:

```

557 @Callback
558 protected CallableReference<MyCallback> callback;
559
560 public void someMethod() {
561     MyCallback myCallback = callback.getCallback();    ...
562
563     myCallback.receiveResult(theResult);
564 }

```

Deleted: 2

Deleted: 2

Inserted: 2

Deleted: WD05

Inserted: 2

Deleted: 03

Deleted: October

568 Alternatively, a callback may be retrieved programmatically using the **RequestContext** API. The
569 snippet below shows how to retrieve a callback in a method programmatically:

570

```
571 public void someMethod() {  
572     MyCallback myCallback =  
573         ComponentContext.getRequestContext().getCallback();  
574     ...  
575     ...  
576     myCallback.receiveResult(theResult);  
577 }  
578 }  
579 }  
580 }
```

581 On the client side, the service that implements the callback can access the callback ID that was
582 returned with the callback operation by accessing the request context, as follows:

Deleted: (i.e., reference parameters)

583

```
584 @Context  
585 protected RequestContext requestContext;  
586  
587 void receiveResult(Object theResult) {  
588     Object refParams =  
589         requestContext.getServiceReference().getCallbackID();  
590     ...  
591 }  
592 }
```

593

594 On the client side, the object returned by the `getServiceReference()` method represents the
595 service reference for the callback. The object returned by `getCallbackID()` represents the
596 identity associated with the callback, which may be a single String or may be an object (as
597 described below in “Customizing the Callback Identity”).

Deleted: that was used to send the original request

598 6.7.5 Customizing the Callback

599 By default, the client component of a service is assumed to be the callback service for the
600 bidirectional service. However, it is possible to change the callback by using the
601 **ServiceReference.setCallback()** method. The object passed as the callback should implement
602 the interface defined for the callback, including any additional SCA semantics on that interface
603 such as whether or not it is remotable.

604 Since a service other than the client can be used as the callback implementation, SCA does not
605 generate a deployment-time error if a client does not implement the callback interface of one of its
606 references. However, if a call is made on such a reference without the `setCallback()` method
607 having been called, then a **NoRegisteredCallbackException** is thrown on the client.

608 A callback object for a stateful callback interface has the additional requirement that it must be
609 serializable. The SCA runtime may serialize a callback object and persistently store it.

610 A callback object may be a service reference to another service. In that case, the callback
611 messages go directly to the service that has been set as the callback. If the callback object is not
612 a service reference, then callback messages go to the client and are then routed to the specific
613 instance that has been registered as the callback object. However, if the callback interface has a
614 stateless scope, then the callback object **must** be a service reference.

615 6.7.6 Customizing the Callback Identity

616 The identity that is used to identify a callback request is initially generated by the system.
617 However, it is possible to provide an application-specified identity to identify the callback by calling

618 the **ServiceReference.setCallbackID()** method. This can be used both for stateful and for
619 stateless callbacks. The identity is sent to the service provider, and the binding must guarantee
620 that the service provider will send the ID back when any callback method is invoked.

621 The callback identity has the same restrictions as the conversation ID. It should either be a string
622 or an object that can be serialized into XML. Bindings determine the particular mechanisms to use
623 for transmission of the identity and these may lead to further restrictions when using a given
624 binding.

625 **6.7.7 Bindings for Conversations and Callbacks**

626 There are potentially many ways of representing the conversation ID for conversational services
627 depending on the type of binding that is used. For example, it may be possible WS-RM sequence
628 ids for the conversation ID if reliable messaging is used in a Web services binding. WS-Eventing
629 uses a different technique (the wse:Identity header). There is also a WS-Context OASIS TC that
630 is creating a general purpose mechanism for exactly this purpose.

631 SCA's programming model supports conversations, but it leaves up to the binding the means by
632 which the conversation ID is represented on the wire.

633 7 Java API

634 This section provides a reference for the Java API offered by SCA.

635 7.1 Component Context

636 The following Java code defines the **ComponentContext** interface:

```
637  
638 package org.osoa.sca;  
639  
640 public interface ComponentContext {  
641     String getURI();  
642  
643     <B> B getService(Class<B> businessInterface, String referenceName);  
644  
645     <B> ServiceReference<B> getServiceReference(Class<B> businessInterface,  
646                                             String referenceName);  
647  
648     <B> Collection<B> getServices(Class<B> businessInterface,  
649                               String referenceName);  
650  
651     <B> Collection<ServiceReference<B>> getServiceReferences(Class<B>  
652                                                         businessInterface, String referenceName);  
653  
654     <B> ServiceReference<B> createSelfReference(Class<B>  
655                                               businessInterface);  
656  
657     <B> ServiceReference<B> createSelfReference(Class<B> businessInterface,  
658                                               String serviceName);  
659  
660     <B> B getProperty(Class<B> type, String propertyName);  
661  
662     <B, R extends CallableReference<B>> R cast(B target)  
663                                     throws IllegalArgumentException;  
664  
665     RequestContext getRequestContext();  
666  
667 }  
668
```

- 669 • **getURI()** - returns the absolute URI of the component within the SCA domain
- 670 • **getService(Class businessInterface, String referenceName)** – Returns a proxy for
671 the reference defined by the current component. The getService() method takes as its
672 input arguments the Java type used to represent the target service on the client and the
673 name of the service reference. It returns an object providing access to the service. The
674 returned object implements the Java interface the service is typed with. This method
675 MUST throw an IllegalArgumentException if the reference has multiplicity greater than
676 one.
677
- 678 • **getServiceReference(Class businessInterface, String referenceName)** – Returns a
679 ServiceReference defined by the current component. This method MUST throw an
680 IllegalArgumentException if the reference has multiplicity greater than one.

Deleted:
ServiceReference cast(B
target) throws
IllegalArgumentException;

Deleted: 2

Deleted: 2

Inserted: 2

Deleted: WD05

Inserted: 2

Deleted: 03

Deleted: October

- 681 • **getServices(Class businessInterface, String referenceName)** – Returns a list of
682 typed service proxies for a business interface type and a reference name.
- 683 • **getServiceReferences(Class businessInterface, String referenceName)** –Returns a
684 list typed service references for a business interface type and a reference name.
- 685 • **createSelfReference(Class businessInterface)** – Returns a ServiceReference that can
686 be used to invoke this component over the designated service.
- 687 • **createSelfReference(Class businessInterface, String serviceName)** – Returns a
688 ServiceReference that can be used to invoke this component over the designated service.
689 Service name explicitly declares the service name to invoke
- 690 • **getProperty (Class type, String propertyName)** - Returns the value of an SCA
691 property defined by this component.
- 692 • **getRequestContext()** - Returns the context for the current SCA service request, or null if
693 there is no current request or if the context is unavailable. This method MUST return non-
694 null when invoked during the execution of a Java business method for a service operation
695 or callback operation, on the same thread that the SCA runtime provided, and MUST
696 return null in all other cases.
- 697 • **cast(B target)** - Casts a type-safe reference to a CallableReference

698 A component may access its component context by defining a field or setter method typed by
699 **org.osoa.sca.ComponentContext** and annotated with **@Context**. To access the target service,
700 the component uses **ComponentContext.getService(..)**.

701
702 The following shows an example of component context usage in a Java class using the @Context
703 annotation.

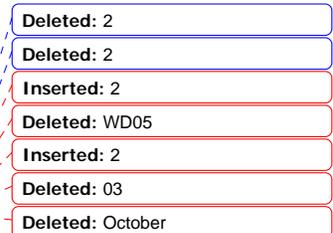

```
704 private ComponentContext componentContext;
705
706 @Context
707 public void setContext(ComponentContext context) {
708     componentContext = context;
709 }
710
711 public void doSomething() {
712     HelloWorld service =
713     componentContext.getService(HelloWorld.class, "HelloWorldComponent");
714     service.hello("hello");
715 }
716
```

717 Similarly, non-SCA client code can use the ComponentContext API to perform operations against a
718 component in an SCA domain. How the non-SCA client code obtains a reference to a
719 ComponentContext is runtime specific.

720 7.2 Request Context

721 The following shows the **RequestContext** interface:

```
722
723 package org.osoa.sca;
724
725 import javax.security.auth.Subject;
726
727 public interface RequestContext {
728
729     Subject getSecuritySubject();
730
```

```

731     String getServiceName();
732     <CB> CallableReference<CB> getCallbackReference();
733     <CB> CB getCallback();
734     <B> CallableReference<B> getServiceReference();
735
736 }
737

```

738 The RequestContext interface has the following methods:

- 739 • **getSecuritySubject()** – Returns the JAAS Subject of the current request
- 740 • **getServiceName()** – Returns the name of the service on the Java implementation the
741 request came in on
- 742 • **getCallbackReference()** – Returns a callable reference to the callback as specified by the
743 caller
- 744 • **getCallback()** – Returns a proxy for the callback as specified by the caller
- 745 • **getServiceReference()** – When invoked during the execution of a service operation, this
746 method MUST return a CallableReference that represents the service that was invoked.
747 When invoked during the execution of a callback operation, this method MUST return a
748 CallableReference that represents the callback that was invoked.

749 7.3 CallableReference

750 The following Java code defines the **CallableReference** interface:

```

751
752 package org.osoa.sca;
753
754 public interface CallableReference<B> extends java.io.Serializable {
755
756     B getService();
757     Class<B> getBusinessInterface();
758     boolean isConversational();
759     Conversation getConversation();
760     Object getCallbackID();
761 }
762

```

763 The CallableReference interface has the following methods:

- 764
- 765 • **getService()** - Returns a type-safe reference to the target of this reference. The instance
766 returned is guaranteed to implement the business interface for this reference. The value
767 returned is a proxy to the target that implements the business interface associated with this
768 reference.
- 769 • **getBusinessInterface()** – Returns the Java class for the business interface associated with
770 this reference.
- 771 • **isConversational()** – Returns true if this reference is conversational.
- 772 • **getConversation()** – Returns the conversation associated with this reference. Returns null if
773 no conversation is currently active.
- 774 • **getCallbackID()** – Returns the callback ID.

775 7.4 ServiceReference

776

Deleted: 2
Deleted: 2
Inserted: 2
Deleted: WD05
Inserted: 2
Deleted: 03
Deleted: October

777 ServiceReferences may be injected using the @Reference annotation on a field, a setter method,
778 or constructor parameter taking the type ServiceReference. The detailed description of the usage
779 of these methods is described in the section on Asynchronous Programming in this document.

780 The following Java code defines the ServiceReference interface:

```
781  
782 package org.osoa.sca;  
783  
784 public interface ServiceReference<B> extends CallableReference<B> {  
785  
786     Object getConversationID();  
787     void setConversationID(Object conversationId) throws  
788         IllegalStateException;  
789     void setCallbackID(Object callbackID);  
790     Object getCallback();  
791     void setCallback(Object callback);  
792 }  
793
```

794 The ServiceReference interface has the methods of CallableReference plus the following:

- 795
796 • **getConversationID()** - Returns the id supplied by the user that will be associated with
797 future conversations initiated through this reference, or null if no ID has been set by the
798 user.
- 799 • **setConversationID(Object conversationId)** – Set the ID, supplied by the user, to associate
800 with any future conversation started through this reference. If the value supplied is null then
801 the id will be generated by the implementation. Throws an IllegalStateException if a
802 conversation is currently associated with this reference.
- 803 • **setCallbackID(Object callbackID)** – Sets the callback ID.
- 804 • **getCallback()** – Returns the callback object.
- 805 • **setCallback(Object callback)** – Sets the callback object.

806 7.5 Conversation

807 The following snippet defines Conversation:

```
808  
809 package org.osoa.sca;  
810  
811 public interface Conversation {  
812     Object getConversationID();  
813     void end();  
814 }  
815
```

816 The Conversation interface has the following methods:

- 817 • **getConversationID()** – Returns the identifier for this conversation. If a user-defined identity
818 had been supplied for this reference then its value will be returned; otherwise the identity
819 generated by the system when the conversation was initiated will be returned.
- 820 • **end()** – Ends this conversation.

821 7.6 ServiceRuntimeException

822 The following snippet shows the **ServiceRuntimeException**.

Deleted: 2
Deleted: 2
Inserted: 2
Deleted: WD05
Inserted: 2
Deleted: 03
Deleted: October

823

```
824 package org.osoa.sca;
825
826 public class ServiceRuntimeException extends RuntimeException {
827     ...
828 }
829
830 This exception signals problems in the management of SCA component execution.
```

831 7.7 NoRegisteredCallbackException

832 The following snippet shows the **NoRegisteredCallbackException**.

```
833 package org.osoa.sca;
834
835 public class NoRegisteredCallbackException extends
836     ServiceRuntimeException {
837     ...
838 }
839
```

840 This exception signals a problem where an attempt is made to invoke a callback when a client does not implement the Callback interface and no valid custom Callback has been specified via a call to **ServiceReference.setCallback()**.

843 7.8 ServiceUnavailableException

844 The following snippet shows the **ServiceUnavailableException**.

```
845 package org.osoa.sca;
846
847 public class ServiceUnavailableException extends ServiceRuntimeException {
848     ...
849 }
850
851
```

852 This exception signals problems in the interaction with remote services. These are exceptions that may be transient, so retrying is appropriate. Any exception that is a ServiceRuntimeException that is *not* a ServiceUnavailableException is unlikely to be resolved by retrying the operation, since it most likely requires human intervention

856 7.9 InvalidServiceException

857 The following snippet shows the **InvalidServiceException**.

```
858 package org.osoa.sca;
859
860 public class InvalidServiceException extends ServiceRuntimeException {
861     ...
862 }
863
864
```

865 This exception signals that the ServiceReference is no longer valid. This can happen when the target of the reference is undeployed. This exception is not transient and therefore is unlikely to be resolved by retrying the operation and will most likely require human intervention.

868 7.10 ConversationEndedException

869 The following snippet shows the **ConversationEndedException**.

```
870
871 package org.osoa.sca;
872
873 public class ConversationEndedException extends ServiceRuntimeException {
874     ...
875 }
876
```

- Deleted: October

877 8 Java Annotations

878 This section provides definitions of all the Java annotations which apply to SCA.

879 8.1 @AllowsPassByReference

880 The following Java code defines the **@AllowsPassByReference** annotation:

```
881
882 package org.osoa.sca.annotations;
883
884 import static java.lang.annotation.ElementType.TYPE;
885 import static java.lang.annotation.ElementType.METHOD;
886 import static java.lang.annotation.RetentionPolicy.RUNTIME;
887 import java.lang.annotation.Retention;
888 import java.lang.annotation.Target;
889
890 @Target({TYPE, METHOD})
891 @Retention(RUNTIME)
892 public @interface AllowsPassByReference {
893
894 }
895
```

896 The **@AllowsPassByReference** annotation is used on implementations of remotable interfaces to
897 indicate that interactions with the service from a client within the same address space are allowed
898 to use pass by reference data exchange semantics. The implementation promises that its by-value
899 semantics will be maintained even if the parameters and return values are actually passed by-
900 reference. This means that the service will not modify any operation input parameter or return
901 value, even after returning from the operation. Either a whole class implementing a remotable
902 service or an individual remotable service method implementation can be annotated using the
903 **@AllowsPassByReference** annotation.

904 **@AllowsPassByReference** has no attributes

905

906 The following snippet shows a sample where **@AllowsPassByReference** is defined for the
907 implementation of a service method on the Java component implementation class.

908

```
909 @AllowsPassByReference
910 public String hello(String message) {
911     ...
912 }
```

913 8.2 @Callback

914 The following Java code defines shows the **@Callback** annotation:

915

```
916 package org.osoa.sca.annotations;
917
918 import static java.lang.annotation.ElementType.TYPE;
919 import static java.lang.annotation.ElementType.METHOD;
920 import static java.lang.annotation.ElementType.FIELD;
921 import static java.lang.annotation.RetentionPolicy.RUNTIME;
922 import java.lang.annotation.Retention;
```

Deleted: 2
Deleted: 2
Inserted: 2
Deleted: WD05
Inserted: 2
Deleted: 03
Deleted: October

```
923 import java.lang.annotation.Target;
924
925 @Target(TYPE, METHOD, FIELD)
926 @Retention(RUNTIME)
927 public @interface Callback {
928
929     Class<?> value() default Void.class;
930 }
931
932
```

The @Callback annotation is used to annotate a service interface with a callback interface, which takes the Java Class object of the callback interface as a parameter.

The @Callback annotation has the following attribute:

- **value** – the name of a Java class file containing the callback interface

The @Callback annotation may also be used to annotate a method or a field of an SCA implementation class, in order to have a callback object injected

The following snippet shows a @Callback annotation on an interface:

Deleted: c

```
943 @Remotable
944 @Callback(MyServiceCallback.class)
945 public interface MyService {
946
947     void someAsyncMethod(String arg);
948 }
949
```

An example use of the @Callback annotation to declare a callback interface follows:

```
951
952 package somepackage;
953 import org.osoa.sca.annotations.Callback;
954 import org.osoa.sca.annotations.Remotable;
955 @Remotable
956 @Callback(MyServiceCallback.class)
957 public interface MyService {
958
959     void someMethod(String arg);
960 }
961
962 @Remotable
963 public interface MyServiceCallback {
964
965     void receiveResult(String result);
966 }
967
```

In this example, the implied component type is:

```
968
969
970 <componentType xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200712" >
971     <service name="MyService">
972         <interface.java interface="somepackage.MyService"
973
```

- Deleted: 2
- Deleted: 2
- Inserted: 2
- Deleted: WD05
- Inserted: 2
- Deleted: 03
- Deleted: October

```

974         callbackInterface="somepackage.MyServiceCallback"/>
975     </service>
976 </componentType>

```

977 8.3 @ComponentName

978 The following Java code defines the **@ComponentName** annotation:

```

979
980 package org.osoa.sca.annotations;
981
982 import static java.lang.annotation.ElementType.METHOD;
983 import static java.lang.annotation.ElementType.FIELD;
984 import static java.lang.annotation.RetentionPolicy.RUNTIME;
985 import java.lang.annotation.Retention;
986 import java.lang.annotation.Target;
987
988 @Target({METHOD, FIELD})
989 @Retention(RUNTIME)
990 public @interface ComponentName {
991
992 }
993

```

994 The @ComponentName annotation is used to denote a Java class field or setter method that is
995 used to inject the component name.

996
997 The following snippet shows a component name field definition sample.

```

998
999 @ComponentName
1000 private String componentName;
1001

```

1002 The following snippet shows a component name setter method sample.

```

1003
1004 @ComponentName
1005 public void setComponentName(String name) {
1006     //...
1007 }

```

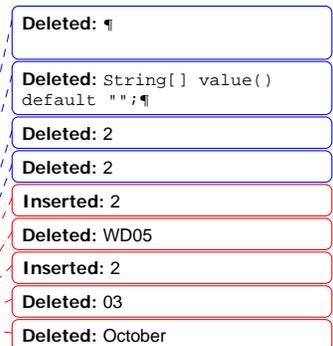

1008 8.4 @Constructor

1009 The following Java code defines the **@Constructor** annotation:

```

1010
1011 package org.osoa.sca.annotations;
1012
1013 import static java.lang.annotation.ElementType.CONSTRUCTOR;
1014 import static java.lang.annotation.RetentionPolicy.RUNTIME;
1015 import java.lang.annotation.Retention;
1016 import java.lang.annotation.Target;
1017
1018 @Target(CONSTRUCTOR)
1019 @Retention(RUNTIME)
1020 public @interface Constructor {
1021

```

1022 The @Constructor annotation is used to mark a particular constructor to use when instantiating a
1023 Java component implementation. [If this constructor has parameters, each of these parameters](#)
1024 [MUST have either a @Property annotation or a @Reference annotation.](#)

1025 [The following snippet shows a sample for the @Constructor annotation.](#)

```
1026  
1027 public class HelloServiceImpl implements HelloService {  
1028  
1029     public HelloServiceImpl(){  
1030         ...  
1031     }  
1032  
1033     @Constructor  
1034     public HelloServiceImpl(@Property\(name="someProperty"\) String  
1035     someProperty ){  
1036         ...  
1037     }  
1038  
1039     public String hello(String message) {  
1040         ...  
1041     }  
1042 }
```

Deleted: The @Constructor annotation has the following attribute: ¶
<#> **value (optional)** – identifies the property/reference names that correspond to each of the constructor arguments. The position in the array determines which of the arguments are being named. ¶

1043 8.5 @Context

1044 The following Java code defines the **@Context** annotation:

```
1045  
1046 package org.osoa.sca.annotations;  
1047  
1048 import static java.lang.annotation.ElementType.METHOD;  
1049 import static java.lang.annotation.ElementType.FIELD;  
1050 import static java.lang.annotation.RetentionPolicy.RUNTIME;  
1051 import java.lang.annotation.Retention;  
1052 import java.lang.annotation.Target;  
1053  
1054 @Target({METHOD, FIELD})  
1055 @Retention(RUNTIME)  
1056 public @interface Context {  
1057  
1058 }  
1059
```

1060 The @Context annotation is used to denote a Java class field or a setter method that is used to
1061 inject a composite context for the component. The type of context to be injected is defined by the
1062 type of the Java class field or type of the setter method input argument; the type is either
1063 **ComponentContext** or **RequestContext**.

1064 The @Context annotation has no attributes.

1065
1066 The following snippet shows a ComponentContext field definition sample.

```
1067  
1068 @Context  
1069 protected ComponentContext context;  
1070
```

1071 The following snippet shows a RequestContext field definition sample:

Deleted: 2

Deleted: 03
Deleted: October

1072

1073 @Context
1074 **protected** RequestContext context;

1075 8.6 @Conversational

1076 The following Java code defines the **@Conversational** annotation:

1077

```
1078 package org.osoa.sca.annotations;
1079
1080 import static java.lang.annotation.ElementType.TYPE;
1081 import static java.lang.annotation.RetentionPolicy.RUNTIME;
1082 import java.lang.annotation.Retention;
1083 import java.lang.annotation.Target;
1084 @Target(TYPE)
1085 @Retention(RUNTIME)
1086 public @interface Conversational {
1087 }
1088
```

1089 The @Conversational annotation is used on a Java interface to denote a conversational service contract.

1091 The @Conversational annotation has no attributes.

1092 The following snippet shows a sample for the **@Conversational** annotation.

```
1093 package services.hello;
1094
1095 import org.osoa.sca.annotations.Conversational;
1096
1097 @Conversational
1098 public interface HelloService {
1099     void setName(String name);
1100     String sayHello();
1101 }
```

1102 8.7 @ConversationAttributes

1103 The following Java code defines the **@ConversationAttributes** annotation:

1104

```
1105 package org.osoa.sca.annotations;
1106
1107 import static java.lang.annotation.ElementType.TYPE;
1108 import static java.lang.annotation.RetentionPolicy.RUNTIME;
1109 import java.lang.annotation.Retention;
1110 import java.lang.annotation.Target;
1111
1112 @Target(TYPE)
1113 @Retention(RUNTIME)
1114 public @interface ConversationAttributes {
1115
1116     String maxIdleTime() default "";
1117     String maxAge() default "";
1118     boolean singlePrincipal() default false;
1119 }
1120
```

Deleted: 2
Deleted: 2
Inserted: 2
Deleted: WD05

Deleted: 03
Deleted: October

1121 The @ConversationAttributes annotation is used to define a set of attributes which apply to
1122 conversational interfaces of services or references of a Java class. The annotation has the following
1123 attributes:

- 1124 • **maxIdleTime (optional)** - The maximum time that can pass between successive
1125 operations within a single conversation. If more time than this passes, then the container
1126 may end the conversation.
- 1127 • **maxAge (optional)** - The maximum time that the entire conversation can remain active.
1128 If more time than this passes, then the container may end the conversation.
- 1129 • **singlePrincipal (optional)** – If true, only the principal (the user) that started the
1130 conversation has authority to continue the conversation. The default value is false.

1131
1132 The two attributes that take a time express the time as a string that starts with an integer, is
1133 followed by a space and then one of the following: "seconds", "minutes", "hours", "days" or
1134 "years".

1135
1136 Not specifying timeouts means that timeouts are defined by the SCA runtime implementation,
1137 however it chooses to do so.

1138
1139 The following snippet shows the use of the @ConversationAttributes annotation to set the
1140 maximum age for a Conversation to be 30 days.

```
1141  
1142 package service.shoppingcart;  
1143  
1144 import org.osoa.sca.annotations.ConversationAttributes;  
1145  
1146 @ConversationAttributes (maxAge="30 days");  
1147 public class ShoppingCartServiceImpl implements ShoppingCartService {  
1148     ...  
1149 }
```

1150 8.8 @ConversationID

1151 The following Java code defines the @ConversationID annotation:

```
1152  
1153 package org.osoa.sca.annotations;  
1154  
1155 import static java.lang.annotation.ElementType.METHOD;  
1156 import static java.lang.annotation.ElementType.FIELD;  
1157 import static java.lang.annotation.RetentionPolicy.RUNTIME;  
1158 import java.lang.annotation.Retention;  
1159 import java.lang.annotation.Target;  
1160  
1161 @Target({METHOD, FIELD})  
1162 @Retention(RUNTIME)  
1163 public @interface ConversationID {  
1164  
1165 }  
1166
```

1167 The @ConversationID annotation is used to annotate a Java class field or setter method that is
1168 used to inject the conversation ID. System generated conversation IDs are always strings, but
1169 application generated conversation IDs may be other complex types.

Deleted: 2
Deleted: 2

Deleted: October

1170 The following snippet shows a conversation ID field definition sample.

1171

```
1172 @ConversationID  
1173 private String conversationID;
```

1174

1175 The type of the field is not necessarily String.

1176

1177 8.9 @Destroy

1178 The following Java code defines the **@Destroy** annotation:

1179

```
1180 package org.osoa.sca.annotations;  
1181  
1182 import static java.lang.annotation.ElementType.METHOD;  
1183 import static java.lang.annotation.RetentionPolicy.RUNTIME;  
1184 import java.lang.annotation.Retention;  
1185 import java.lang.annotation.Target;
```

1186

```
1187 @Target(METHOD)  
1188 @Retention(RUNTIME)  
1189 public @interface Destroy {  
1190  
1191 }  
1192
```

1193 The @Destroy annotation is used to denote a single Java class method that will be called when the
1194 scope defined for the implementation class ends. The method MAY have any access modifier and
1195 MUST have a void return type and no arguments.

Deleted: value

1196 If there is a method that matches these criteria, the SCA runtime MUST call the annotated method
1197 when the scope defined for the implementation class ends. If the implementation class has a
1198 method with an @Destroy annotation that does not match these criteria, the SCA runtime MUST
1199 NOT instantiate the implementation class.

1200

1201 The following snippet shows a sample for a destroy method definition.

1202

```
1203 @Destroy  
1204 public void myDestroyMethod() {  
1205     ...  
1206 }
```

1207 8.10 @EagerInit

1208 The following Java code defines the **@EagerInit** annotation:

1209

```
1210 package org.osoa.sca.annotations;  
1211  
1212 import static java.lang.annotation.ElementType.TYPE;  
1213 import static java.lang.annotation.RetentionPolicy.RUNTIME;  
1214 import java.lang.annotation.Retention;  
1215 import java.lang.annotation.Target;
```

1216

Deleted: 2

Deleted: 2

Inserted: 2

8.11 @EndsConversation

The following Java code defines the **@EndsConversation** annotation:

```
1229 package org.osoa.sca.annotations;
1230
1231 import static java.lang.annotation.ElementType.METHOD;
1232 import static java.lang.annotation.RetentionPolicy.RUNTIME;
1233 import java.lang.annotation.Retention;
1234 import java.lang.annotation.Target;
1235
1236 @Target(METHOD)
1237 @Retention(RUNTIME)
1238 public @interface EndsConversation {
1239
1240 }
1241
1242
```

The **@EndsConversation** annotation is used to denote a method on a Java interface that is called to end a conversation.

The **@EndsConversation** annotation has no attributes.

The following snippet shows a sample using the **@EndsConversation** annotation.

```
1247 package services.shoppingbasket;
1248
1249 import org.osoa.sca.annotations.EndsConversation;
1250
1251 public interface ShoppingBasket {
1252     void addItem(String itemID, int quantity);
1253
1254     @EndsConversation
1255     void buy();
1256 }

```

8.12 @Init

The following Java code defines the **@Init** annotation:

```
1259 package org.osoa.sca.annotations;
1260
1261 import static java.lang.annotation.ElementType.METHOD;
1262 import static java.lang.annotation.RetentionPolicy.RUNTIME;
1263 import java.lang.annotation.Retention;
1264 import java.lang.annotation.Target;
1265 import java.lang.annotation.Target;
1266
```

- Deleted: 2
- Deleted: 2
- Inserted: 2
- Deleted: WD05
- Inserted: 2
- Deleted: 03
- Deleted: October

```

1267 @Target(METHOD)
1268 @Retention(RUNTIME)
1269 public @interface Init {
1270
1271
1272 }
1273

```

1274 The @Init annotation is used to denote a single Java class method that is called when the scope
1275 defined for the implementation class starts. The method MAY have any access modifier and MUST
1276 have a void return type and no arguments.

Deleted: value

1277 If there is a method that matches these criteria, the SCA runtime MUST call the annotated method
1278 after all property and reference injection is complete. If the implementation class has a method
1279 with an @Init annotation that does not match these criteria, the SCA runtime MUST NOT
1280 instantiate the implementation class.

1281 The following snippet shows an example of an init method definition.

```

1282
1283 @Init
1284 public void myInitMethod() {
1285     ...
1286 }

```

1287 8.13 @OneWay

1288 The following Java code defines the **@OneWay** annotation:

```

1289
1290 package org.osoa.sca.annotations;
1291
1292 import static java.lang.annotation.ElementType.METHOD;
1293 import static java.lang.annotation.RetentionPolicy.RUNTIME;
1294 import java.lang.annotation.Retention;
1295 import java.lang.annotation.Target;
1296
1297 @Target(METHOD)
1298 @Retention(RUNTIME)
1299 public @interface OneWay {
1300
1301
1302 }
1303

```

1304 The @OneWay annotation is used on a Java interface or class method to indicate that invocations
1305 will be dispatched in a non-blocking fashion as described in the section on Asynchronous
1306 Programming.

1307 The @OneWay annotation has no attributes.

1308 The following snippet shows the use of the @OneWay annotation on an interface.

```

1309 package services.hello;
1310
1311 import org.osoa.sca.annotations.OneWay;
1312
1313 public interface HelloService {
1314     @OneWay
1315     void hello(String name);
1316 }

```

1317 8.14 @Property

1318 The following Java code defines the **@Property** annotation:

1319

```
1320 package org.osoa.sca.annotations;
1321
1322 import static java.lang.annotation.ElementType.METHOD;
1323 import static java.lang.annotation.ElementType.FIELD;
1324 import static java.lang.annotation.ElementType.PARAMETER;
1325 import static java.lang.annotation.RetentionPolicy.RUNTIME;
1326 import java.lang.annotation.Retention;
1327 import java.lang.annotation.Target;
1328
1329 @Target({METHOD, FIELD, PARAMETER})
1330 @Retention(RUNTIME)
1331 public @interface Property {
1332
1333     String name() default "";
1334     boolean required() default true;
1335 }
1336
```

Deleted: false

1337

1338 The @Property annotation is used to denote a Java class field, a setter method, or a constructor
1339 parameter that is used to inject an SCA property value. The type of the property injected, which
1340 can be a simple Java type or a complex Java type, is defined by the type of the Java class field or
1341 the type of the input parameter of the setter method or constructor.

Deleted: The @Property annotation is used to denote a Java class field or a setter method that is used to inject an SCA property value. The type of the property injected, which can be a simple Java type or a complex Java type, is defined by the type of the Java class field or the type of the setter method input argument.

1342 The @Property annotation may be used on fields, on setter methods or on a constructor method
1343 parameter.

1344 Properties may also be injected via setter methods even when the @Property annotation is not
1345 present. However, the @Property annotation must be used in order to inject a property onto a
1346 non-public field. In the case where there is no @Property annotation, the name of the property is
1347 the same as the name of the field or setter.

1348 Where there is both a setter method and a field for a property, the setter method is used.

1349

1350 The @Property annotation has the following attributes:

- 1351 • **name (optional)** – the name of the property. For a field annotation, the default is the
1352 name of the field of the Java class. For a setter method annotation, the default is the
1353 JavaBeans property name corresponding to the setter method name. For a constructor
1354 parameter annotation, there is no default and the name attribute MUST be present.
- 1355 • **required (optional)** – specifies whether injection is required, defaults to true. For a
1356 constructor parameter annotation, this attribute MUST have the value true.

Deleted: the name of the property, defaults to the name of the field of the Java class

Deleted: false

1357

1358 The following snippet shows a property field definition sample.

1359

```
1360 @Property(name="currency", required=true)
1361 protected String currency;
```

Deleted: 2

Deleted: 2

Inserted: 2

Deleted: WD05

Deleted: October

1362

1363 The following snippet shows a property setter sample

1364

```

1365 @Property(name="currency", required=true)
1366 public void setCurrency( String theCurrency ) {
1367     ....
1368 }

```

1370 If the property is defined as an array or as any type that extends or implements
1371 **java.util.Collection**, then the implied component type has a property with a **many** attribute set to
1372 true.

1373
1374 The following snippet shows the definition of a configuration property using the @Property
1375 annotation for a collection.

```

1376  

1377 ...
1378 private List<String> helloConfigurationProperty;
1379  

1380 @Property(required=true)
1381 public void setHelloConfigurationProperty(List<String> property) {
1382     helloConfigurationProperty = property;
1383 }
1384 ...

```

1385 8.15 @Reference

1386 The following Java code defines the **@Reference** annotation:

```

1387  

1388 package org.osoa.sca.annotations;
1389  

1390 import static java.lang.annotation.ElementType.METHOD;
1391 import static java.lang.annotation.ElementType.FIELD;
1392 import static java.lang.annotation.ElementType.PARAMETER;
1393 import static java.lang.annotation.RetentionPolicy.RUNTIME;
1394 import java.lang.annotation.Retention;
1395 import java.lang.annotation.Target;
1396 @Target({METHOD, FIELD, PARAMETER})
1397 @Retention(RUNTIME)
1398 public @interface Reference {
1399  

1400     String name() default "";
1401     boolean required() default true;
1402 }
1403

```

1404 The @Reference annotation type is used to annotate a Java class field, a setter method, or a
1405 constructor parameter that is used to inject a service that resolves the reference. The interface of
1406 the service injected is defined by the type of the Java class field or the type of the input parameter
1407 of the setter method or constructor.

1408 References may also be injected via setter methods even when the @Reference annotation is not
1409 present. However, the @Reference annotation must be used in order to inject a reference onto a
1410 non-public field. In the case where there is no @Reference annotation, the name of the reference
1411 is the same as the name of the field or setter.

1412 Where there is both a setter method and a field for a reference, the setter method is used.

1413 The @Reference annotation has the following attributes:

- Deleted: denote
- Deleted: input argument
- Deleted: 2
- Deleted: 2
- Inserted: 2
- Deleted: WD05
- Inserted: 2
- Deleted: 03
- Deleted: October

- 1414 • **name (optional)** – the name of the reference. For a field annotation, the default is the
 1415 name of the field of the Java class. For a setter method annotation, the default is the
 1416 JavaBeans property name corresponding to the setter method name. For a constructor
 1417 parameter annotation, there is no default and the name attribute MUST be present.
- 1418 • **required (optional)** – whether injection of service or services is required. Defaults to true.
 1419 For a constructor parameter annotation, this attribute MUST have the value true.

Deleted: , defaults to the name of the field of the Java class

1420
1421 The following snippet shows a reference field definition sample.

```
1422 @Reference(name="stockQuote", required=true)
1423 protected StockQuoteService stockQuote;
```

1424
1425
1426 The following snippet shows a reference setter sample

```
1427 @Reference(name="stockQuote", required=true)
1428 public void setStockQuote( StockQuoteService theSQService ) {
1429     ...
1430 }
1431 }
```

Formatted: Complex Script Font: Bold

Deleted: ;

1432
1433 The following fragment from a component implementation shows a sample of a service reference
 1434 using the @Reference annotation. The name of the reference is "helloService" and its type is
 1435 HelloService. The clientMethod() calls the "hello" operation of the service referenced by the
 1436 helloService reference.

```
1437 package services.hello;
1438
1439 private HelloService helloService;
1440
1441 @Reference(name="helloService", required=true)
1442 public setHelloService(HelloService service) {
1443     helloService = service;
1444 }
1445
1446 public void clientMethod() {
1447     String result = helloService.hello("Hello World!");
1448     ...
1449 }
1450 }
1451
```

1452 The presence of a @Reference annotation is reflected in the componentType information that the
 1453 runtime generates through reflection on the implementation class. The following snippet shows
 1454 the component type for the above component implementation fragment.

```
1455 <?xml version="1.0" encoding="ASCII"?>
1456 <componentType xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200712">
1457     <!-- Any services offered by the component would be listed here -->
1458     <reference name="helloService" multiplicity="1..1">
1459         <interface.java interface="services.hello.HelloService"/>
1460     </reference>
```

Deleted: 2

Deleted: 2

Inserted: 2

Deleted: WD05

Inserted: 2

Deleted: 03

Deleted: October

1463
1464 </componentType>
1465

1466 If the reference is not an array or collection, then the implied component type has a reference
1467 with a multiplicity of either 0..1 or 1..1 depending on the value of the @Reference **required**
1468 attribute – 1..1 applies if required=true.

1469
1470 If the reference is defined as an array or as any type that extends or implements **java.util.Collection**,
1471 then the implied component type has a reference with a **multiplicity** of either **1..n** or **0..n**, depending
1472 on whether the **required** attribute of the @Reference annotation is set to true or false – 1..n applies if
1473 required=true.

1474
1475 The following fragment from a component implementation shows a sample of a service reference
1476 definition using the @Reference annotation on a java.util.List. The name of the reference is
1477 "helloServices" and its type is HelloService. The clientMethod() calls the "hello" operation of all the
1478 services referenced by the helloServices reference. In this case, at least one HelloService should
1479 be present, so **required** is true.

```
1480 @Reference(name="helloServices", required=true)  
1481 protected List<HelloService> helloServices;  
1482  
1483 public void clientMethod() {  
1484     ...  
1485     for (int index = 0; index < helloServices.size(); index++) {  
1486         HelloService helloService =  
1487             (HelloService)helloServices.get(index);  
1488         String result = helloService.hello("Hello World!");  
1489     }  
1490     ...  
1491 }  
1492 }  
1493 }  
1494 }
```

1495 The following snippet shows the XML representation of the component type reflected from for the
1496 former component implementation fragment. There is no need to author this component type in
1497 this case since it can be reflected from the Java class.

```
1498  
1499 <?xml version="1.0" encoding="ASCII"?>  
1500 <componentType xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200712">  
1501     <!-- Any services offered by the component would be listed here -->  
1502     <reference name="helloServices" multiplicity="1..n">  
1503         <interface.java interface="services.hello.HelloService"/>  
1504     </reference>  
1505 </componentType>  
1506  
1507 </componentType>
```

1508
1509 At runtime, the representation of an unwired reference depends on the reference's multiplicity. An
1510 unwired reference with a multiplicity of 0..1 must be null. An unwired reference with a multiplicity
1511 of 0..N must be an empty array or collection.

1512 **8.15.1 Reinjection**

1513 References MAY be reinjected after the initial creation of a component if the reference target
 1514 changes due to a change in wiring that has occurred since the component was initialized. In order
 1515 for reinjection to occur, the following MUST be true:

- 1516 1. The component MUST NOT be STATELESS ~~scoped~~. Deleted: or REQUEST
- 1517 2. The reference MUST use either field-based injection or setter injection. References that are
 1518 injected through constructor injection MUST NOT be changed. Setter injection allows for
 1519 code in the setter method to perform processing in reaction to a change.
- 1520 3. If the reference has a conversational interface, then reinjection MUST NOT occur while the
 1521 conversation is active.

1522 If a reference target changes and the reference is not reinjected, the reference MUST continue to
 1523 work as if the reference target was not changed.

1524 If an operation is called on a reference where the target of that reference has been undeployed,
 1525 the SCA runtime SHOULD throw InvalidServiceException. If an operation is called on a reference
 1526 where the target of the reference has become unavailable for some reason, the SCA runtime
 1527 SHOULD throw ServiceUnavailableException. If the target of the reference is changed, the
 1528 reference MAY continue to work, depending on the runtime and the type of change that was made.
 1529 If it doesn't work, the exception thrown will depend on the runtime and the cause of the failure.

1530 A ServiceReference that has been obtained from a reference by ComponentContext.cast()
 1531 corresponds to the reference that is passed as a parameter to cast(). If the reference is
 1532 subsequently reinjected, the ServiceReference obtained from the original reference MUST continue
 1533 to work as if the reference target was not changed. If the target of a ServiceReference has been
 1534 undeployed, the SCA runtime SHOULD throw InvalidServiceException when an operation is
 1535 invoked on the ServiceReference. If the target of a ServiceReference has become unavailable, the
 1536 SCA runtime SHOULD throw ServiceUnavailableException when an operation is invoked on the
 1537 ServiceReference. If the target of a ServiceReference is changed, the reference MAY continue to
 1538 work, depending on the runtime and the type of change that was made. If it doesn't work, the
 1539 exception thrown will depend on the runtime and the cause of the failure.

1540 A reference or ServiceReference accessed through the component context by calling getService()
 1541 or getServiceReference() MUST correspond to the current configuration of the domain. This
 1542 applies whether or not reinjection has taken place. If the target has been undeployed or has
 1543 become unavailable, the result SHOULD be a reference to the undeployed or unavailable service,
 1544 and attempts to call business methods SHOULD throw an exception as described above. If the
 1545 target has changed, the result SHOULD be a reference to the changed service.

1546 The rules for reference reinjection also apply to references with a multiplicity of 0..N or 1..N. This
 1547 means that in the cases listed above where reference reinjection is not allowed, the array or
 1548 Collection for the reference MUST NOT change its contents. In cases where the contents of a
 1549 reference collection MAY change, then for references that use setter injection, the setter method
 1550 MUST be called for any change to the contents. The reinjected array or Collection MUST NOT be
 1551 the same array or Collection object previously injected to the component.

1552

Change event	Effect on		
	Reference	Existing ServiceReference Object	Subsequent invocations of ComponentContext.getServiceReference() or getService()
Change to the target of the reference	MAY be reinjected (if other conditions* apply). If not reinjected, then it MUST continue to work as if the reference target was not changed.	MUST continue to work as if the reference target was not changed.	Result corresponds to the current configuration of the domain.

1553

1554 8.16 @Remotable

1555 The following Java code defines the **@Remotable** annotation:

1556

```
1557 package org.osoa.sca.annotations;
1558
1559 import static java.lang.annotation.ElementType.TYPE;
1560 import static java.lang.annotation.RetentionPolicy.RUNTIME;
1561 import java.lang.annotation.Retention;
1562 import java.lang.annotation.Target;
```

1563

```
1564
1565 @Target(TYPE)
1566 @Retention(RUNTIME)
1567 public @interface Remotable {
1568
1569 }
1570
```

1571 The @Remotable annotation is used to specify a Java service interface as remotable. A remotable service can be published externally as a service and must be translatable into a WSDL portType.

1572 The @Remotable annotation has no attributes.

1573

1574 The following snippet shows the Java interface for a remotable service with its @Remotable annotation.

```
1575 package services.hello;
1576
1577 import org.osoa.sca.annotations.*;
1578
1579 @Remotable
```

1580

1581

Deleted: 2

Deleted: 2

Inserted: 2

Deleted: WD05

Inserted: 2

Deleted: 03

Deleted: October

```

1582 public interface HelloService {
1583     String hello(String message);
1584 }
1585
1586

```

1587 The style of remotable interfaces is typically **coarse grained** and intended for **loosely coupled**
1588 interactions. Remotable service interfaces are not allowed to make use of method **overloading**.

1589

1590 Complex data types exchanged via remotable service interfaces MUST be compatible with the
1591 marshalling technology used by the service binding. For example, if the service is going to be
1592 exposed using the standard Web Service binding, then the parameters MAY be JAXB [JAX-B] types
1593 or Service Data Objects (SDOs) [SDO].

1594 Independent of whether the remotable service is called from outside of the composite that
1595 contains it or from another component in the same composite, the data exchange semantics are
1596 **by-value**.

1597 Implementations of remotable services may modify input data during or after an invocation and
1598 may modify return data after the invocation. If a remotable service is called locally or remotely,
1599 the SCA container is responsible for making sure that no modification of input data or post-
1600 invocation modifications to return data are seen by the caller.

1601

1602 The following snippet shows a remotable Java service interface.

1603

```

1604 package services.hello;
1605
1606 import org.osoa.sca.annotations.*;
1607
1608 @Remotable
1609 public interface HelloService {
1610     String hello(String message);
1611 }
1612
1613
1614 package services.hello;
1615
1616 import org.osoa.sca.annotations.*;
1617
1618 @Service(HelloService.class)
1619 public class HelloServiceImpl implements HelloService {
1620     public String hello(String message) {
1621         ...
1622     }
1623 }
1624

```

1625 8.17 @Scope

1626 The following Java code defines the **@Scope** annotation:

1627

```

1628 package org.osoa.sca.annotations;
1629
1630 import static java.lang.annotation.ElementType.TYPE;
1631 import static java.lang.annotation.RetentionPolicy.RUNTIME;
1632 import java.lang.annotation.Retention;

```

Deleted: must
Deleted:
Deleted: w
Deleted: s
Deleted: must
Deleted: 2.0 or 2.1
Deleted: or JAXB 2.0 [3] types

Deleted: 2
Deleted: 2
Inserted: 2
Deleted: WD05
Inserted: 2
Deleted: 03
Deleted: October

1633 `import java.lang.annotation.Target;`

Formatted: English U.S.

```
1634
1635 @Target(TYPE)
1636 @Retention(RUNTIME)
1637 public @interface Scope {
1638
1639     String value() default "STATELESS";
1640 }
```

1641 The @Scope annotation may only be used on a service's implementation class. It is an error to use
1642 this annotation on an interface.

1643 The @Scope annotation has the following attribute:

- 1644 • **value** – the name of the scope.
1645 For 'STATELESS' implementations, a different implementation instance may be used to
1646 service each request. Implementation instances may be newly created or be drawn from a
1647 pool of instances.
1648 SCA defines the following scope names, but others can be defined by particular Java-
1649 based implementation types:
1650 STATELESS
1651 COMPOSITE
1652 CONVERSATION

Deleted: The default value is 'STATELESS'.

Deleted: REQUEST .

1653 [The default value is STATELESS, except for an implementation offering a @Conversational service,](#)
1654 [which has a default scope of CONVERSATION. See section 2.2 for more details of the SCA-defined](#)
1655 [scopes.](#)

1656 The following snippet shows a sample for a CONVERSATION scoped service implementation:

```
1657 package services.hello;
1658
1659 import org.osoa.sca.annotations.*;
1660
1661 @Service(HelloService.class)
1662 @Scope("CONVERSATION")
1663 public class HelloServiceImpl implements HelloService {
1664
1665     public String hello(String message) {
1666         ...
1667     }
1668 }
1669
```

1670 8.18 @Service

1671 The following Java code defines the @Service annotation:

```
1672
1673 package org.osoa.sca.annotations;
1674
1675 import static java.lang.annotation.ElementType.TYPE;
1676 import static java.lang.annotation.RetentionPolicy.RUNTIME;
1677 import java.lang.annotation.Retention;
1678 import java.lang.annotation.Target;
1679
1680 @Target(TYPE)
1681 @Retention(RUNTIME)
1682 public @interface Service {
1683
1684     Class<?>[] interfaces() default {};
1685     Class<?> value() default Void.class;
```

Deleted: 2

Deleted: 2

Inserted: 2

Deleted: WD05

Inserted: 2

Deleted: 03

Deleted: October

1686 }
1687

1688 The @Service annotation is used on a component implementation class to specify the SCA services
1689 offered by the implementation. The class need not be declared as implementing all of the
1690 interfaces implied by the services, but all methods of the service interfaces must be present. A
1691 class used as the implementation of a service is not required to have a @Service annotation. If a
1692 class has no @Service annotation, then the rules determining which services are offered and what
1693 interfaces those services have are determined by the specific implementation type.

Deleted: n

1694 The @Service annotation has the following attributes:

- 1695 • **interfaces** – The value is an array of interface or class objects that should be exposed as
1696 services by this component.
- 1697 • **value** – A shortcut for the case when the class provides only a single service interface.

1698 Only one of these attributes should be specified.

1700 A @Service annotation with no attributes is meaningless, it is the same as not having the
1701 annotation there at all.

1702 The **service names** of the defined services default to the names of the interfaces or class, without
1703 the package name.

1704 [A component MUST NOT have two services with the same Java simple name. If a Java
1705 implementation needs to realize two services with the same Java simple name then this can be
1706 achieved through subclassing of the interface.](#)

Deleted: If a Java implementation needs to realize two services with the same interface, then this is achieved through subclassing of the interface. The subinterface must not add any methods. Both interfaces are listed in the @Service annotation of the Java implementation class.

1707 The following snippet shows an implementation of the HelloService marked with the @Service
1708 annotation.

```
1709 package services.hello;  
1710  
1711 import org.osoa.sca.annotations.Service;  
1712  
1713 @Service(HelloService.class)  
1714 public class HelloServiceImpl implements HelloService {  
1715  
1716     public void hello(String name) {  
1717         System.out.println("Hello " + name);  
1718     }  
1719 }  
1720
```

1721

9 WSDL to Java and Java to WSDL

1722
1723
1724

The SCA Client and Implementation Model for Java applies the WSDL to Java and Java to WSDL mapping rules as defined by the JAX-WS specification [\[JAX-WS\]](#) for generating remotable Java interfaces from WSDL portTypes and vice versa.

Deleted: [7]

1725
1726
1727
1728
1729

For the purposes of the Java-to-WSDL mapping algorithm, the interface is treated as if it had a @WebService annotation on the class, even if it doesn't, and the @org.osoa.annotations.OneWay annotation should be treated as a synonym for [the @javax.jws.OneWay annotation](#). For the WSDL-to-Java mapping, the generated @WebService annotation implies that the interface is @Remotable.

1730
1731
1732
1733
1734

For the mapping from Java types to XML schema types, SCA [permits both the JAXB 2.1 \[JAX-B\] mapping and the SDO 2.1 \[SDO\] mapping](#), [SCA runtimes MUST support the JAXB 2.1 mapping and MAY support the SDO 2.1 mapping](#). Having a choice of binding technologies is allowed, as noted in the first paragraph of section 5 of the JSR 181 (version 2) specification, which is referenced by the JAX-WS specification.

Deleted: supports

Deleted: [2]

Deleted: and the JAXB 2.0 [3] mapping

1735

The JAX-WS mappings are applied with the following restrictions:

1736

- No support for holders

1737

1738
1739

Note: This specification needs more examples and discussion of how JAX-WS's client asynchronous model is used.

1740

9.1 JAX-WS Client Asynchronous API for a Synchronous Service

1741

The JAX-WS specification defines a mapping of a synchronous service invocation, which provides a client

1742
1743
1744
1745

application with a means of invoking that service asynchronously, so that the client can invoke a service operation and proceed to do other work without waiting for the service operation to complete its processing. The client application can retrieve the results of the service either through a polling mechanism or via a callback method which is invoked when the operation completes.

1746
1747
1748
1749
1750

For SCA reference interfaces defined using interface.java, the Java interface MAY contain the additional client-side asynchronous polling and callback methods defined by JAX-WS. For SCA service interfaces defined using interface.java, the Java interface MUST NOT contain these methods. If these methods are present, SCA Runtimes MUST NOT include them in the SCA reference interface as defined by the Assembly specification. These methods are recognized as follows.

1751

For each method M in the interface, if another method P in the interface has

1752

a. a method name that is M's method name with the characters "Async" appended, and

1753

b. the same parameter signature as M, and

1754

c. a return type of Response<R> where R is the return type of M

1755

then P is a JAX-WS polling method that isn't part of the SCA interface contract.

1756

For each method M in the interface, if another method C in the interface has

1757

a. a method name that is M's method name with the characters "Async" appended, and

1758

b. a parameter signature that is M's parameter signature with an additional final parameter of type AsyncHandler<R> where R is the return type of M, and

1760

c. a return type of Future<?>

1761

then C is a JAX-WS callback method that isn't part of the SCA interface contract.

1762

As an example, an interface may be defined in WSDL as follows:

1763
1764

```
<!-- WSDL extract -->
<message name="getPrice">
```

Deleted: 2

Deleted: 2

Inserted: 2

Deleted: WD05

Inserted: 2

Deleted: 03

Deleted: October

```
1765 <part name="ticker" type="xsd:string"/>
1766 </message>
1767
1768 <message name="getPriceResponse">
1769 <part name="price" type="xsd:float"/>
1770 </message>
1771
1772 <portType name="StockQuote">
1773 <operation name="getPrice">
1774 <input message="tns:getPrice"/>
1775 <output message="tns:getPriceResponse"/>
1776 </operation>
1777 </portType>
```

1778
1779 The JAX-WS asynchronous mapping will produce the following Java interface:

```
1780 // asynchronous mapping
1781 @WebService
1782 public interface StockQuote {
1783     float getPrice(String ticker);
1784     Response<Float> getPriceAsync(String ticker);
1785     Future<?> getPriceAsync(String ticker, AsyncHandler<Float>);
1786 }
```

1787
1788 For SCA interface definition purposes, this is treated as equivalent to the following:

```
1789 // synchronous mapping
1790 @WebService
1791 public interface StockQuote {
1792     float getPrice(String ticker);
1793 }
```

1794
1795 SCA runtimes MUST support the use of the JAX-WS client asynchronous model. In the above
1796 example, if the client implementation uses the asynchronous form of the interface, the two
1797 additional getPriceAsync() methods can be used for polling and callbacks as defined by the JAX-
1798 WS specification.

1799

10 Policy Annotations for Java

1800
1801
1802
1803
1804

SCA provides facilities for the attachment of policy-related metadata to SCA assemblies, which influence how implementations, services and references behave at runtime. The policy facilities are described in [the SCA Policy Framework specification \[POLICY\]](#). In particular, the facilities include Intents and Policy Sets, where intents express abstract, high-level policy requirements and policy sets express low-level detailed concrete policies.

Deleted: [5]

1805
1806
1807
1808

Policy metadata can be added to SCA assemblies through the means of declarative statements placed into Composite documents and into Component Type documents. These annotations are completely independent of implementation code, allowing policy to be applied during the assembly and deployment phases of application development.

1809
1810
1811
1812
1813
1814
1815
1816

However, it can be useful and more natural to attach policy metadata directly to the code of implementations. This is particularly important where the policies concerned are relied on by the code itself. An example of this from the Security domain is where the implementation code expects to run under a specific security Role and where any service operations invoked on the implementation must be authorized to ensure that the client has the correct rights to use the operations concerned. By annotating the code with appropriate policy metadata, the developer can rest assured that this metadata is not lost or forgotten during the assembly and deployment phases.

1817
1818
1819
1820
1821

The SCA Java Common Annotations specification provides a series of annotations which provide the capability for the developer to attach policy information to Java implementation code. The annotations concerned first provide general facilities for attaching SCA Intents and Policy Sets to Java code. Secondly, there are further specific annotations that deal with particular policy intents for certain policy domains such as Security.

1822
1823
1824
1825

The SCA Java Common Annotations specification supports using [the Common Annotation for Java Platform specification \(JSR-250\) \[JSR-250\]](#). An implication of adopting the common annotation for Java platform specification is that the SCA Java specification support consistent annotation and Java class inheritance relationships.

Deleted: [6]

1826

10.1 General Intent Annotations

1828
1829

SCA provides the annotation **@Requires** for the attachment of any intent to a Java class, to a Java interface or to elements within classes and interfaces such as methods and fields.

1830

The @Requires annotation can attach one or multiple intents in a single statement.

1831
1832
1833

Each intent is expressed as a string. Intents are XML QNames, which consist of a Namespace URI followed by the name of the Intent. The precise form used follows the string representation used by the javax.xml.namespace.QName class, which is as follows:

1834

```
"{" + Namespace URI + "}" + intentname
```

1835
1836

Intents may be qualified, in which case the string consists of the base intent name, followed by a ".", followed by the name of the qualifier. There may also be multiple levels of qualification.

1837
1838
1839

This representation is quite verbose, so we expect that reusable String constants will be defined for the namespace part of this string, as well as for each intent that is used by Java code. SCA defines constants for intents such as the following:

1840
1841

```
public static final String SCA_PREFIX="{http://docs.oasis-  
open.org/ns/opencsa/sca/200712}";
```

1842

```
public static final String CONFIDENTIALITY = SCA_PREFIX + "confidentiality";
```

1843

```
public static final String CONFIDENTIALITY_MESSAGE = CONFIDENTIALITY + ".message";
```

Deleted: 2
Deleted: 2
Inserted: 2
Deleted: WD05
Inserted: 2
Deleted: 03
Deleted: October

1844 Notice that, by convention, qualified intents include the qualifier as part of the name of the
1845 constant, separated by an underscore. These intent constants are defined in the file that defines
1846 an annotation for the intent (annotations for intents, and the formal definition of these constants,
1847 are covered in a following section).

1848 Multiple intents (qualified or not) are expressed as separate strings within an array declaration.

1849 An example of the @Requires annotation with 2 qualified intents (from the Security domain)
1850 follows:

```
1851 @Requires({CONFIDENTIALITY_MESSAGE, INTEGRITY_MESSAGE})
```

1853 This attaches the intents "confidentiality.message" and "integrity.message".
1854 The following is an example of a reference requiring support for confidentiality:

```
1855 package org.osoa.sca.annotation;
```

```
1856  
1857 import static org.osoa.sca.annotation.Confidentiality.*;
```

```
1859  
1860 public class Foo {  
1861     @Requires(CONFIDENTIALITY)  
1862     @Reference  
1863     public void setBar(Bar bar) {  
1864         ...  
1865     }  
1866 }
```

1867 Users may also choose to only use constants for the namespace part of the QName, so that they
1868 may add new intents without having to define new constants. In that case, this definition would
1869 instead look like this:

```
1870 package org.osoa.sca.annotation;  
1871  
1872 import static org.osoa.sca.Constants.*;  
1873  
1874 public class Foo {  
1875     @Requires(SCA_PREFIX+"confidentiality")  
1876     @Reference  
1877     public void setBar(Bar bar) {  
1878         ...  
1879     }  
1880 }
```

1882 The formal syntax for the @Requires annotation follows:

```
1883 @Requires("qualifiedIntent" | {"qualifiedIntent" [, "qualifiedIntent"]}
```

1884 where

Deleted: 2
Deleted: 2
Inserted: 2
Deleted: WD05
Inserted: 2
Deleted: 03
Deleted: October

1885 qualifiedIntent ::= QName | QName.qualifier | QName.qualifier1.qualifier2

1886

1887 The following shows the formal definition of the @Requires annotation:

1888

```
1889 package org.oesa.sca.annotation;  
1890 import static java.lang.annotation.ElementType.TYPE;  
1891 import static java.lang.annotation.ElementType.METHOD;  
1892 import static java.lang.annotation.ElementType.FIELD;  
1893 import static java.lang.annotation.ElementType.PARAMETER;  
1894 import static java.lang.annotation.RetentionPolicy.RUNTIME;  
1895 import java.lang.annotation.Retention;  
1896 import java.lang.annotation.Target;  
1897 import java.lang.annotation.Inherited;
```

1898

```
1899 @Inherited  
1900 @Retention(RUNTIME)  
1901 @Target({TYPE, METHOD, FIELD, PARAMETER})
```

1902

```
1903 public @interface Requires {  
1904     String[] value() default "";  
1905 }
```

1906 The SCA_NS constant is defined in the Constants interface:

1907

1908

```
1909 public interface Constants {  
1910     String SCA_NS="http://docs.oasis-open.org/ns/opencsa/sca/200712";  
1911     String SCA_PREFIX = {"+SCA_NS+"};  
1912 }
```

1913

1914 10.2 Specific Intent Annotations

1915 In addition to the general intent annotation supplied by the @Requires annotation described
1916 above, it is also possible to have Java annotations that correspond to specific policy intents. SCA
1917 provides a number of these specific intent annotations and it is also possible to create new specific
1918 intent annotations for any intent.

1919 The general form of these specific intent annotations is an annotation with a name derived from
1920 the name of the intent itself. If the intent is a qualified intent, qualifiers are supplied as an
1921 attribute to the annotation in the form of a string or an array of strings.

1922 For example, the SCA confidentiality intent described in [the section on General Intent Annotations](#)
1923 using the @Requires(CONFIDENTIALITY) intent can also be specified with the specific
1924 @Confidentiality intent annotation. The specific intent annotation for the "integrity" security intent
1925 is:

Deleted: 2
Deleted: 2
Inserted: 2
Deleted: WD05
Inserted: 2
Deleted: 03
Deleted: October

1926 @Integrity

1927 An example of a qualified specific intent for the "authentication" intent is:

1928 @Authentication({ "message", "transport" })

1929 This annotation attaches the pair of qualified intents: "authentication.message" and
 1930 "authentication.transport" (the sca: namespace is assumed in this both of these cases –
 1931 "http://docs.oasis-open.org/ns/opencsa/sca/200712").

1932 The general form of specific intent annotations is:

1933 @<Intent>[(qualifiers)]

1934 where Intent is an NCName that denotes a particular type of intent.

1935 Intent ::= NCName

1936 qualifiers ::= "qualifier" | { "qualifier" [, "qualifier"] }

1937 qualifier ::= NCName | NCName/qualifier

1938

1939 **10.2.1 How to Create Specific Intent Annotations**

1940 SCA identifies annotations that correspond to intents by providing an @Intent annotation which
 1941 must be used in the definition of an intent annotation.

1942 The @Intent annotation takes a single parameter, which (like the @Requires annotation) is the
 1943 String form of the QName of the intent. As part of the intent definition, it is good practice
 1944 (although not required) to also create String constants for the Namespace, the Intent and for
 1945 Qualified versions of the Intent (if defined). These String constants are then available for use with
 1946 the @Requires annotation and it should also be possible to use one or more of them as
 1947 parameters to the @Intent annotation.

1948 Alternatively, the QName of the intent may be specified using separate parameters for the
 1949 targetNamespace and the localPart for example:

1950 @Intent(targetNamespace=SCA_NS, localPart="confidentiality").

1951 The definition of the @Intent annotation is the following:

```

1952           package org.osoa.sca.annotation;
1953           import static java.lang.annotation.ElementType.ANNOTATION_TYPE;
1954           import static java.lang.annotation.RetentionPolicy.RUNTIME;
1955           import java.lang.annotation.Retention;
1956           import java.lang.annotation.Target;
1957           import java.lang.annotation.Inherited;
1958           import java.lang.annotation.Inherited;
1959
1960           @Retention(RUNTIME)
1961           @Target(ANNOTATION_TYPE)
1962           public @interface Intent {
1963               String value() default "";
1964               String targetNamespace() default "";
1965               String localPart() default "";
1966           }

```

1967 When an intent can be qualified, it is good practice for the first attribute of the annotation to be a
1968 string (or an array of strings) which holds one or more qualifiers.

1969 In this case, the attribute's definition should be marked with the @Qualifier annotation. The
1970 @Qualifier tells SCA that the value of the attribute should be treated as a qualifier for the intent
1971 represented by the whole annotation. If more than one qualifier value is specified in an
1972 annotation, it means that multiple qualified forms are required. For example:

1973 `@Confidentiality({"message", "transport"})`

1974 implies that both of the qualified intents "confidentiality.message" and "confidentiality.transport"
1975 are set for the element to which the confidentiality intent is attached.

1976 The following is the definition of the @Qualifier annotation.

1977

```
1978 package org.osoa.sca.annotation;  
1979 import static java.lang.annotation.ElementType.METHOD;  
1980 import static java.lang.annotation.RetentionPolicy.RUNTIME;  
1981 import java.lang.annotation.Retention;  
1982 import java.lang.annotation.Target;  
1983 import java.lang.annotation.Inherited;  
1984  
1985 @Retention(RetentionPolicy.RUNTIME)  
1986 @Target(ElementType.METHOD)  
1987 public @interface Qualifier {  
1988     }  
1989
```

1990 Examples of the use of the @Intent and [the @Qualifier](#) annotations in the definition of specific
1991 intent annotations are shown in [the section dealing with Security Interaction Policy](#).

1992

1993 10.3 Application of Intent Annotations

1994 The SCA Intent annotations can be applied to the following Java elements:

- 1995 • Java class
- 1996 • Java interface
- 1997 • Method
- 1998 • Field

1999 Where multiple intent annotations (general or specific) are applied to the same Java element, they
2000 are additive in effect. An example of multiple policy annotations being used together follows:

```
2001 @Authentication  
2002 @Requires({CONFIDENTIALITY_MESSAGE, INTEGRITY_MESSAGE})
```

2003 In this case, the effective intents are "authentication", "confidentiality.message" and
2004 "integrity.message".

2005 If an annotation is specified at both the class/interface level and the method or field level, then
2006 the method or field level annotation completely overrides the class level annotation of the same
2007 type.

Deleted: October

2008 The intent annotation can be applied either to classes or to class methods when adding annotated
2009 policy on SCA services. Applying an intent to the setter method in a reference injection approach
2010 allows intents to be defined at references.

2011 10.3.1 Inheritance And Annotation

2012 The inheritance rules for annotations are consistent with the common annotation specification, JSR
2013 250.

2014 The following example shows the inheritance relations of intents on classes, operations, and super
2015 classes.

```
2016
2017 package services.hello;
2018 import org.osoa.sca.annotations.Remotable;
2019 import org.osoa.sca.annotations.Integrity;
2020 import org.osoa.sca.annotations.Authentication;
2021
2022 @Integrity("transport")
2023 @Authentication
2024 public class HelloService {
2025     @Integrity
2026     @Authentication("message")
2027     public String hello(String message) {...}
2028
2029     @Integrity
2030     @Authentication("transport")
2031     public String helloThere() {...}
2032 }
2033
2034 package services.hello;
2035 import org.osoa.sca.annotations.Remotable;
2036 import org.osoa.sca.annotations.Confidentiality;
2037 import org.osoa.sca.annotations.Authentication;
2038
2039 @Confidentiality("message")
2040 public class HelloChildService extends HelloService {
2041     @Confidentiality("transport")
2042     public String hello(String message) {...}
2043     @Authentication
2044     String helloWorld() {...}
2045 }
```

2046 Example 2a. Usage example of annotated policy and inheritance.

2047
2048 The effective intent annotation on the helloWorld method is Integrity("transport"),
2049 @Authentication, and @Confidentiality("message").

Deleted: 2
Deleted: 2

Deleted: WD05
Inserted: 2
Deleted: 03
Deleted: October

2050 The effective intent annotation on the hello method of the HelloChildService is
 2051 @Integrity("transport"), @Authentication, and @Confidentiality("transport"),

2052 The effective intent annotation on the helloThere method of the HelloChildService is @Integrity
 2053 and @Authentication("transport"), the same as in HelloService class.

2054 The effective intent annotation on the hello method of the HelloService is @Integrity and
 2055 @Authentication("message")

2056

2057 The listing below contains the equivalent declarative security interaction policy of the HelloService
 2058 and HelloChildService implementation corresponding to the Java interfaces and classes shown in
 2059 Example 2a.

```

2060
2061 <?xml version="1.0" encoding="ASCII"?>
2062
2063 <composite xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200712"
2064           name="HelloServiceComposite" >
2065   <service name="HelloService" requires="integrity/transport
2066           authentication">
2067     ...
2068   </service>
2069   <service name="HelloChildService" requires="integrity/transport
2070           authentication confidentiality/message">
2071     ...
2072   </service>
2073   ...
2074
2075   <component name="HelloServiceComponent">*
2076     <implementation.java class="services.hello.HelloService"/>
2077     <operation name="hello" requires="integrity
2078           authentication/message"/>
2079     <operation name="helloThere"
2080 requires="integrity
2081           authentication/transport"/>
2082   </component>
2083   <component name="HelloChildServiceComponent">*
2084     <implementation.java
2085 class="services.hello.HelloChildService" />
2086     <operation name="hello"
2087 requires="confidentiality/transport"/>
2088     <operation name="helloThere" requires=" integrity/transport
2089           authentication"/>
2090     <operation name="helloWorld" requires="authentication"/>
2091   </component>
2092   ...
2093   ...
2094
2095 </composite>
  
```

2096 Example 2b. Declaratives intents equivalent to annotated intents in Example 2a.

2099 10.4 Relationship of Declarative And Annotated Intents

2100 Annotated intents on a Java class cannot be overridden by declarative intents either in a
 2101 composite document which uses the class as an implementation or by statements in a component

- Deleted: 2
- Deleted: 2
- Inserted: 2
- Deleted: WD05
- Inserted: 2
- Deleted: 03
- Deleted: October

2102 Type document associated with the class. This rule follows the general rule for intents that they
2103 represent fundamental requirements of an implementation.

2104 An unqualified version of an intent expressed through an annotation in the Java class may be
2105 qualified by a declarative intent in a using composite document.

2106

2107 10.5 Policy Set Annotations

2108 The SCA Policy Framework uses Policy Sets to capture detailed low-level concrete policies (for
2109 example, a concrete policy is the specific encryption algorithm to use when encrypting messages
2110 when using a specific communication protocol to link a reference to a service).

2111 Policy Sets can be applied directly to Java implementations using the **@PolicySets** annotation.

2112 The **@PolicySets** annotation either takes the QName of a single policy set as a string or the name
2113 of two or more policy sets as an array of strings:
2114

```
2115     @PolicySets( "<policy set QName>" |  
2116                 { "<policy set QName>" [, "<policy set QName>" ] })
```

2117

2118 As for intents, PolicySet names are QNames – in the form of "{Namespace-URI}localPart".

2119 An example of the **@PolicySets** annotation:

2120

```
2121     @Reference(name="helloService", required=true)  
2122     @PolicySets({ MY_NS + "WS_Encryption_Policy",  
2123                 MY_NS + "WS_Authentication_Policy" })  
2124     public setHelloService(HelloService service) {  
2125         . . .  
2126     }
```

2127 In this case, the Policy Sets WS_Encryption_Policy and WS_Authentication_Policy are applied, both
2128 using the namespace defined for the constant MY_NS.

2129 PolicySets must satisfy intents expressed for the implementation when both are present, according
2130 to the rules defined in the [Policy Framework specification \[POLICY\]](#).

Deleted: [5]

2131 The SCA Policy Set annotation can be applied to the following Java elements:

- 2132 • Java class
- 2133 • Java interface
- 2134 • Method
- 2135 • Field

2136

2137 10.6 Security Policy Annotations

2138 This section introduces annotations for SCA's security intents, as defined in the [SCA Policy
2139 Framework specification \[POLICY\]](#).

2140

2141 10.6.1 Security Interaction Policy

2142 The following interaction policy Intents and qualifiers are defined for Security Policy, which apply
2143 to the operation of services and references of an implementation:

Deleted: [5]

Deleted: 2

Deleted: 2

Inserted: 2

Deleted: WD05

Inserted: 2

Deleted: 03

Deleted: October

- 2144 • @Integrity
- 2145 • @Confidentiality
- 2146 • @Authentication

2147 All three of these intents have the same pair of Qualifiers:

- 2148 • message
- 2149 • transport

2150 The following snippets shows the @Integrity, @Confidentiality and @Authentication annotations:

```

2151 package org.osoa.sca.annotation;
2152
2153 import java.lang.annotation.*;
2154 import static org.osoa.sca.Constants.SCA_NS;
2155
2156 @Inherited
2157 @Retention(RetentionPolicy.RUNTIME)
2158 @Target({ElementType.TYPE, ElementType.METHOD,
2159         ElementType.FIELD, ElementType.PARAMETER})
2160 @Intent(Integrity.INTEGRITY)
2161 public @interface Integrity {
2162     String INTEGRITY = SCA_NS+"integrity";
2163     String INTEGRITY_MESSAGE = INTEGRITY+".message";
2164     String INTEGRITY_TRANSPORT = INTEGRITY+".transport";
2165     @Qualifier
2166     String[] value() default "";
2167 }
2168
2169
2170 package org.osoa.sca.annotation;
2171
2172 import java.lang.annotation.*;
2173 import static org.osoa.sca.Constants.SCA_NS;
2174
2175 @Inherited
2176 @Retention(RetentionPolicy.RUNTIME)
2177 @Target({ElementType.TYPE, ElementType.METHOD,
2178         ElementType.FIELD, ElementType.PARAMETER})
2179 @Intent(Confidentiality.CONFIDENTIALITY)
2180 public @interface Confidentiality {
2181     String CONFIDENTIALITY = SCA_NS+"confidentiality";
2182     String CONFIDENTIALITY_MESSAGE = CONFIDENTIALITY+".message";

```

Deleted: 2
Deleted: 2
Inserted: 2
Deleted: WD05
Inserted: 2
Deleted: 03
Deleted: October

```

2183     String CONFIDENTIALITY_TRANSPORT = CONFIDENTIALITY+".transport";
2184     @Qualifier
2185     String[] value() default "";
2186 }
2187
2188
2189 package org.osoa.sca.annotation;
2190
2191 import java.lang.annotation.*;
2192 import static org.osoa.sca.Constants.SCA_NS;
2193
2194 @Inherited
2195 @Retention(RetentionPolicy.RUNTIME)
2196 @Target({ElementType.TYPE,ElementType.METHOD,
2197         ElementType.FIELD, ElementType.PARAMETER})
2198 @Intent(Authentication.AUTHENTICATION)
2199 public @interface Authentication {
2200     String AUTHENTICATION = SCA_NS+"authentication";
2201     String AUTHENTICATION_MESSAGE = AUTHENTICATION+".message";
2202     String AUTHENTICATION_TRANSPORT = AUTHENTICATION+".transport";
2203     @Qualifier
2204     String[] value() default "";
2205 }
2206
2207

```

The following example shows an example of applying an intent to the setter method used to inject a reference. Accessing the hello operation of the referenced HelloService requires both "integrity.message" and "authentication.message" intents to be honored.

```

2211
2212 //Interface for HelloService
2213 public interface service.hello.HelloService {
2214     String hello(String helloMsg);
2215 }
2216
2217 // Interface for ClientService
2218 public interface service.client.ClientService {
2219     public void clientMethod();
2220 }
2221
2222 // Implementation class for ClientService
2223 package services.client;

```

Formatted: English U.S.

```

2224
2225     import services.hello.HelloService;
2226
2227     import org.osoa.sca.annotations.*;
2228
2229     @Service(ClientService.class)
2230     public class ClientServiceImpl implements ClientService {
2231
2232
2233         private HelloService helloService;
2234
2235         @Reference(name="helloService", required=true)
2236         @Integrity("message")
2237         @Authentication("message")
2238         public void setHelloService(HelloService service) {
2239             helloService = service;
2240         }
2241
2242         public void clientMethod() {
2243             String result = helloService.hello("Hello World!");
2244             ...
2245         }
2246     }

```

2248 Example 1. Usage of annotated intents on a reference.

2249

2250 10.6.2 Security Implementation Policy

2251 SCA defines a number of security policy annotations that apply as policies to implementations
2252 themselves. These annotations mostly have to do with authorization and security identity. The
2253 following authorization and security identity annotations (as defined in JSR 250) are supported:

- 2254 • RunAs
 - 2255 Takes as a parameter a string which is the name of a Security role.
 - 2256 eg. @RunAs("Manager")
- 2258 • Code marked with this annotation will execute with the Security permissions of the
2259 identified role.
- 2260 • RolesAllowed
 - 2261 Takes as a parameter a single string or an array of strings which represent one or more
2262 role names. When present, the implementation can only be accessed by principals whose
2263 role corresponds to one of the role names listed in the @roles attribute. How role names
2264 are mapped to security principals is implementation dependent (SCA does not define this).
2265 eg. @RolesAllowed({"Manager", "Employee"})
- 2267 • PermitAll
 - 2268 No parameter.
 - 2269 When present, grants access to all roles.

- 2270 • DenyAll
- 2271
- 2272 No parameters. When present, denies access to all roles.
- 2273 • DeclareRoles
- 2274 Takes as a parameter a string or an array of strings which identify one or more role names
- 2275 that form the set of roles used by the implementation.
- 2276 eg. @DeclareRoles({ "Manager", "Employee", "Customer" })

2277 (all these are declared in the Java package javax.annotation.security)

2278 For a full explanation of these intents, see [the Policy Framework specification \[POLICY\]](#).

Deleted: [5]

2279 10.6.2.1 Annotated Implementation Policy Example

2280 The following is an example showing annotated security implementation policy:

```
2281
2282 package services.account;
2283 @Remotable
2284 public interface AccountService {
2285     AccountReport getAccountReport(String customerID);
2286 }
```

2288 The following is a full listing of the AccountServiceImpl class, showing the Service it implements,
2289 plus the service references it makes and the settable properties that it has, along with a set of
2290 implementation policy annotations:

```
2291
2292 package services.account;
2293 import java.util.List;
2294 import commonj.sdo.DataFactory;
2295 import org.osoa.sca.annotations.Property;
2296 import org.osoa.sca.annotations.Reference;
2297 import org.osoa.sca.annotations.RolesAllowed;
2298 import org.osoa.sca.annotations.RunAs;
2299 import org.osoa.sca.annotations.PermitAll;
2300 import services.accountdata.AccountDataService;
2301 import services.accountdata.CheckingAccount;
2302 import services.accountdata.SavingsAccount;
2303 import services.accountdata.StockAccount;
2304 import services.stockquote.StockQuoteService;
2305 @RolesAllowed("customers")
2306 @RunAs("accountants")
2307 public class AccountServiceImpl implements AccountService {
2308
2309     @Property
2310     protected String currency = "USD";
2311
2312     @Reference
2313     protected AccountDataService accountDataService;
```

Deleted: 2

Deleted: October

```

2314     @Reference
2315     protected StockQuoteService stockQuoteService;
2316
2317     @RolesAllowed({"customers", "accountants"})
2318     public AccountReport getAccountReport(String customerID) {
2319
2320         DataFactory dataFactory = DataFactory.INSTANCE;
2321         AccountReport accountReport =
2322             (AccountReport) dataFactory.create(AccountReport.class);
2323         List accountSummaries = accountReport.getAccountSummaries();
2324
2325         CheckingAccount checkingAccount =
2326             accountDataService.getCheckingAccount(customerID);
2327         AccountSummary checkingAccountSummary =
2328             (AccountSummary) dataFactory.create(AccountSummary.class);
2329
2330         checkingAccountSummary.setAccountNumber(checkingAccount.getAccountNumber()
2331             );
2332         checkingAccountSummary.setAccountType("checking");
2333         checkingAccountSummary.setBalance(fromUSDollarToCurrency
2334             (checkingAccount.getBalance()));
2335         accountSummaries.add(checkingAccountSummary);
2336
2337         SavingsAccount savingsAccount =
2338             accountDataService.getSavingsAccount(customerID);
2339         AccountSummary savingsAccountSummary =
2340             (AccountSummary) dataFactory.create(AccountSummary.class);
2341
2342         savingsAccountSummary.setAccountNumber(savingsAccount.getAccountNumber());
2343         savingsAccountSummary.setAccountType("savings");
2344         savingsAccountSummary.setBalance(fromUSDollarToCurrency
2345             (savingsAccount.getBalance()));
2346         accountSummaries.add(savingsAccountSummary);
2347
2348         StockAccount stockAccount =
2349             accountDataService.getStockAccount(customerID);
2350         AccountSummary stockAccountSummary =
2351             (AccountSummary) dataFactory.create(AccountSummary.class);
2352         stockAccountSummary.setAccountNumber(stockAccount.getAccountNumber());
2353         stockAccountSummary.setAccountType("stock");
2354         float balance = (stockQuoteService.getQuote(stockAccount.getSymbol())) *
2355             stockAccount.getQuantity();
2356         stockAccountSummary.setBalance(fromUSDollarToCurrency(balance));
2357         accountSummaries.add(stockAccountSummary);

```

Deleted: 2
Deleted: 2
Inserted: 2
Deleted: WD05
Inserted: 2
Deleted: 03
Deleted: October

```

2358
2359     return accountReport;
2360 }
2361
2362 @PermitAll
2363 public float fromUSDollarToCurrency(float value) {
2364
2365     if (currency.equals("USD")) return value; else
2366     if (currency.equals("EURO")) return value * 0.8f; else
2367     return 0.0f;
2368 }
2369 }

```

2370 Example 3. Usage of annotated security implementation policy for the java language.

2371 In this example, the implementation class as a whole is marked:

- 2372 • @RolesAllowed("customers") - indicating that customers have access to the
- 2373 implementation as a whole
- 2374 • @RunAs("accountants") – indicating that the code in the implementation runs with the
- 2375 permissions of accountants

2376 The getAccountReport(..) method is marked with @RolesAllowed({"customers", "accountants"}),
2377 which indicates that this method can be called by both customers and accountants.

2378 The fromUSDollarToCurrency() method is marked with @PermitAll, which means that this method
2379 can be called by any role.

2417

D. Revision History

2418 [optional; should not be included in OASIS Standards]

2419

Revision	Date	Editor	Changes Made
1	2007-09-26	Anish Karmarkar	Applied the OASIS template + related changes to the Submission
2	2008-02-28	Anish Karmarkar	Applied resolution of issues: 4, 11, and 26
3	2008-04-17	Mike Edwards	Ed changes
4	2008-05-27	Anish Karmarkar David Booz Mark Combella	Added InvalidServiceException in Section 7 Various editorial updates
WD04	2008-08-15	Anish Karmarkar	* Applied resolution of issue 9 (it was applied before, not sure by whom, but it was applied incorrectly) * Applied resolution of issue 12, 22, 23, 29, 31, 35, 36, 37, 44, 45 * Note that issue 33 was applied, but not noted, in a previous version * Replaced the osoa.org NS with the oasis-open.org NS
WD05	2008-10-03	Anish Karmarkar	* Fixed the resolution of issue 37 but re-adding the sentence: "However, the @... annotation must be used in order to inject a property onto a non-public field. -- in the @Property and @Reference section * resolution of issue 9 was applied incorrectly. Fixed that -- removed the requirement for throwing an exception on ComponentContext.getServiceReferences() when multiplicity of references > 1 * minor ed changes
cd01-rev1	2008-12-11	Anish Karmarkar	* Fixed reference style to [RFC2119] instead of [1]. * Applied resolutions of issues 20, 21, 41, 42, 43, 47, 48, 49.
cd01-rev2	2008-12-12	Anish Karmarkar	* Applied resolutions of issues 61, 71, 72, 73, 79, 81, 82, 84, 112
cd01-rev3	2008-12-16	David Booz	* Applied resolution of issues 56, 75, 111

1	Introduction.....	7
1.1	Terminology.....	7
1.2	Normative References.....	7
1.3	Non-Normative References	8
2	Implementation Metadata	9
2.1	Service Metadata.....	9
2.1.1	@Service.....	9
2.1.2	Java Semantics of a Remotable Service.....	9
2.1.3	Java Semantics of a Local Service.....	9
2.1.4	@Reference.....	10
2.1.5	@Property	10
2.2	Implementation Scopes: @Scope, @Init, @Destroy.....	10
2.2.1	Stateless scope	11
2.2.2	Request scope.....	11
2.2.3	Composite scope	11
2.2.4	Conversation scope	11
3	Interface	12
3.1	Java interface element ("interface.java")	12
3.2	@Remotable.....	12
3.3	@Conversational.....	12
4	Client API	13
4.1	Accessing Services from an SCA Component.....	13
4.1.1	Using the Component Context API	13
4.2	Accessing Services from non-SCA component implementations	13
4.2.1	ComponentContext	13
5	Error Handling	14
6	Asynchronous and Conversational Programming	15
6.1	@OneWay.....	15
6.2	Conversational Services.....	15
6.2.1	ConversationAttributes	15
6.2.2	@EndsConversation.....	16
6.3	Passing Conversational Services as Parameters	16
6.4	Conversational Client	16
6.5	Conversation Lifetime Summary	17
6.6	Conversation ID.....	18
6.6.1	Application Specified Conversation IDs	18

6.6.2 Accessing Conversation IDs from Clients	18
6.7 Callbacks	18
6.7.1 Stateful Callbacks	18
6.7.2 Stateless Callbacks	20
6.7.3 Implementing Multiple Bidirectional Interfaces	21
6.7.4 Accessing Callbacks	21
6.7.5 Customizing the Callback	22
6.7.6 Customizing the Callback Identity	22
6.7.7 Bindings for Conversations and Callbacks	23
7 Java API	24
7.1 Component Context	24
7.2 Request Context	25
7.3 CallableReference	26
7.4 ServiceReference	26
7.5 Conversation	27
7.6 ServiceRuntimeException	27
7.7 NoRegisteredCallbackException	28
7.8 ServiceUnavailableException	28
7.9 InvalidServiceException	28
7.10 ConversationEndedException	28
8 Java Annotations	30
8.1 @AllowsPassByReference	30
8.2 @Callback	30
8.3 @ComponentName	32
8.4 @Constructor	32
8.5 @Context	33
8.6 @Conversational	34
8.7 @ConversationAttributes	34
8.8 @ConversationID	35
8.9 @Destroy	36
8.10 @EagerInit	36
8.11 @EndsConversation	37
8.12 @Init	37
8.13 @OneWay	38
8.14 @Property	39
8.15 @Reference	40
8.15.1 ReInjection	42
8.16 @Remotable	44
8.17 @Scope	45
8.18 @Service	46
9 WSDL to Java and Java to WSDL	48
9.1 JAX-WS Client Asynchronous API for a Synchronous Service	48
10 Policy Annotations for Java	50
10.1 General Intent Annotations	50
10.2 Specific Intent Annotations	52
10.2.1 How to Create Specific Intent Annotations	53

10.3 Application of Intent Annotations	54
10.3.1 Inheritance And Annotation.....	55
10.4 Relationship of Declarative And Annotated Intents	56
10.5 Policy Set Annotations.....	57
10.6 Security Policy Annotations	57
10.6.1 Security Interaction Policy.....	57
10.6.2 Security Implementation Policy.....	60
A. Acknowledgements.....	64
B. Non-Normative Text.....	65
C. Revision History	66
