Abstract:

This document defines the concept and behavior of a messaging binding, and a concrete JMS-based binding that provides that behavior.

The binding specified in this document applies to an SCA composite's services and references. The binding is especially well suited for use by services and references of composites that are directly deployed, as opposed to composites that are used as implementations of higher-level components. Services and references of deployed composites become system-level services and references, which are intended to be used by non-SCA clients.

The messaging binding describes a common pattern of behavior that may be followed by messaging-related bindings, including the JMS binding. In particular it describes the manner in which operations are selected based on message content, and the manner in which messages are mapped into the runtime representation. These are specified in a language-neutral manner.

The JMS binding provides JMS-specific details of the connection to the required JMS resources. It supports the use of Queue and Topic type destinations.

Status:

This document was last revised or approved by the OASIS Service Component Architecture / Bindings (SCA-Bindings) TC on the above date. The level of approval is also listed above. Check the "Latest Version" or "Latest Approved Version" location noted above for possible later revisions of this document.

Technical Committee members should send comments on this specification to the Technical Committee's email list. Others should send comments to the Technical Committee by using the "Send A Comment" button on the Technical Committee's web page at http://www.oasis-open.org/committees/sca-bindings/.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Technical Committee web page (http://www.oasis-open.org/committees/sca-bindings/ipr.php.

The non-normative errata page for this specification is located at http://www.oasis-open.org/committees/sca-bindings/.

Notices

All capitalized terms in the following text have the meanings assigned to them in the OASIS Intellectual Property Rights Policy (the "OASIS IPR Policy"). The full Policy may be found at the OASIS website.

This document and translations of it may be copied and furnished to others, and derivative works that comment on or otherwise explain it or assist in its implementation may be prepared, copied, published, and distributed, in whole or in part, without restriction of any kind, provided that the above copyright notice and this section are included on all such copies and derivative works. However, this document itself may not be modified in any way, including by removing the copyright notice or references to OASIS, except as needed for the purpose of developing any document or deliverable produced by an OASIS Technical Committee (in which case the rules applicable to copyrights, as set forth in the OASIS IPR Policy, must be followed) or as required to translate it into languages other than English.

The limited permissions granted above are perpetual and will not be revoked by OASIS or its successors or assigns.

This document and the information contained herein is provided on an "AS IS" basis and OASIS DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY WARRANTY THAT THE USE OF THE INFORMATION HEREIN WILL NOT INFRINGE ANY OWNERSHIP RIGHTS OR ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

OASIS requests that any OASIS Party or any other party that believes it has patent claims that would necessarily be infringed by implementations of this OASIS Committee Specification or OASIS Standard, to notify OASIS TC Administrator and provide an indication of its willingness to grant patent licenses to such patent claims in a manner consistent with the IPR Mode of the OASIS Technical Committee that produced this specification.

OASIS invites any party to contact the OASIS TC Administrator if it is aware of a claim of ownership of any patent claims that would necessarily be infringed by implementations of this specification by a patent holder that is not willing to provide a license to such patent claims in a manner consistent with the IPR Mode of the OASIS Technical Committee that produced this specification. OASIS may include such claims on its website, but disclaims any obligation to do so.

OASIS takes no position regarding the validity or scope of any intellectual property or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; neither does it represent that it has made any effort to identify any such rights. Information on OASIS' procedures with respect to rights in any document or deliverable produced by an OASIS Technical Committee can be found on the OASIS website. Copies of claims of rights made available for publication and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementers or users of this OASIS Committee Specification or OASIS Standard, can be obtained from the OASIS TC Administrator. OASIS makes no representation that any information or list of intellectual property rights will at any time be complete, or that any claims in such list are, in fact, Essential Claims.

The names "OASIS", [insert specific trademarked names and abbreviations here] are trademarks of OASIS, the owner and developer of this specification, and should be used only to refer to the organization and its official outputs. OASIS welcomes reference to, and implementation and use of, specifications, while reserving the right to enforce its marks against misleading uses. Please see http://www.oasis-open.org/who/trademark.php for above guidance.

Table of Contents

1 Introduction

This document defines the concept and behavior of a messaging binding, and a concrete Java Message Service [JMS] based binding that provides that behavior. The binding specified in this document applies to an SCA composite's services and references. The binding is especially well suited for use by services and references of composites that are directly deployed, as opposed to composites that are used as implementations of higher-level components. Services and references of deployed composites become system-level services and references, which are intended to be used by non-SCA clients.

The messaging binding describes a common pattern of behavior that may be followed by messaging-related bindings, including the JMS binding. In particular it describes the manner in which operations are selected based on message content, and the manner in which messages are mapped into the runtime representation. These are specified in a language-neutral manner.

The JMS binding provides JMS-specific details of the connection to the required JMS resources. It supports the use of Queue and Topic type destinations.

1.1 Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC Keywords [RFC2119].

This specification uses predefined namespace prefixes throughout; they are given in the following list. Note that the choice of any namespace prefix is arbitrary and not semantically significant.

Table 1-1 Prefixes and Namespaces used in this specification

Prefix	***Namespace***	***Notes***
xs	"http://www.w3.org/2001/XMLSchema"	Defined by XML Schema 1.0 specification
sca	"http://docs.oasis-open.org/ns/opencsa/sca/200903"	Defined by the SCA specifications

1.3 Non-Normative References

TBD	TBD

1.4 Naming Conventions

This specification follows some naming conventions for artifacts defined by the specification. In addition to the conventions defined by section 1.3 of the SCA Assembly Specification [SCA-Assembly], this specification adds three additional conventions:

- Where the names of elements and attributes consist partially or wholly of acronyms, the letters of the acronyms use the same case. When the acronym appears at the start of the name of an element or an attribute, or after a period, it is in lower case. If it appears elsewhere in the name of an element or an attribute, it is in upper case. For example, an attribute might be named "uri" or "jndiURL".
- Where the names of types consist partially or wholly of acronyms, the letters of the acronyms are in all upper case. For example, an XML Schema type might be named "JCABinding" or "MessageID".
- Values, including local parts of QName values, follow the rules for names of elements and attributes as stated above, with the exception that the letters of acronyms are in all upper case. For example, a value might be "JMSDefault" or "namespaceURI".

[1] Note that this URI scheme is currently in draft. The reference for this specification will be updated when the IETF standard is finalized

2 Messaging Bindings

Messaging bindings form a category of SCA bindings that represent the interaction of SCA composites with messaging providers. It is felt that documenting, and following this pattern is beneficial for implementers of messaging bindings, although it is not strictly necessary.

This pattern is embodied in the JMS binding, described later.

Messaging bindings utilize operation selector and wire format elements to provide the mapping from the native messaging format to an invocation on the target component. A default operation selection and data binding behavior is identified, along with any associated properties.

In addition, each operation may have specific properties defined, that may influence the way native messages are processed depending on the operation being invoked.

3 JMS Binding Schema

The JMS binding element is defined by the following schema.

```
<binding.jms correlationScheme="QName"?
             initialContextFactory="xs:anyURI"?
             jndiURL="xs:anyURI"?
             requestConnection="QName"?
             responseConnection="QName"?
             operationProperties="QName"?
             name="NCName"?
             requires="list of QName"?
             policySets="list of QName"?
             uri="xs:anyURI"? >
    <destination jndiName="xs:anyURI" type="queue or topic"?
                 create="always or never or ifNotExist"?>
        <property name="NMTOKEN" type="NMTOKEN"?>*
    </destination>?
    <connectionFactory jndiName="xs:anyURI"
                       create="always or never or ifNotExist"?>
        <property name="NMTOKEN" type="NMTOKEN"?>*
    </connectionFactory>?
    <activationSpec jndiName="xs:anyURI"
                    create="always or never or ifNotExist"?>
        <property name="NMTOKEN" type="NMTOKEN"?>*
    </activationSpec>?

    <response>
        <destination jndiName="xs:anyURI" type="queue or topic"?
                     create="always or never or ifNotExist"?>
            <property name="NMTOKEN" type="NMTOKEN"?>*
        </destination>?
        <connectionFactory jndiName="xs:anyURI"
                           create="always or never or ifNotExist"?>
            <property name="NMTOKEN" type="NMTOKEN"?>*
        </connectionFactory>?
        <activationSpec jndiName="xs:anyURI"
                        create="always or never or ifNotExist"?>
            <property name="NMTOKEN" type="NMTOKEN"?>*
        </activationSpec>?
        <wireFormat/>?
    </response>?

    <resourceAdapter name="NMTOKEN">?
        <property name="NMTOKEN" type="NMTOKEN"?>*
    </resourceAdapter>?

    <headers type="string"?
             deliveryMode="persistent or nonpersistent"?
             timeToLive="long"?
             priority="0 .. 9"?>
        <property name="NMTOKEN" type="NMTOKEN"?>*
    </headers>?

    <messageSelection selector="string"?>
        <property name="NMTOKEN" type="NMTOKEN"?>*
    </headers>?

    <operationProperties name="string" nativeOperation="string"?>
        <property name="NMTOKEN" type="NMTOKEN"?>*
        <headers type="string"?
```

```
                deliveryMode="persistent or nonpersistent"?
                timeToLive="long"?
                priority="0 .. 9"?>
            <property name="NMTOKEN" type="NMTOKEN"?>*
        </headers>?
    </operationProperties>*

    <wireFormat ... />?
    <operationSelector ... />?
</binding.jms>
```

The binding can be used in one of two ways, either identifying existing JMS [JMS] resources using JNDI names, or providing the required information to enable the JMS resources to be created.

The ***binding.jms*** element has the following attributes:

- ***/binding.jms*** – This is the JMS binding element. The element is extensible so that JMS binding implementers can add additional JMS provider-specific attributes and elements although such extensions are not guaranteed to be portable across runtimes.
- ***/binding.jms/@uri*** – as defined in the SCA Assembly Specification [SCA-Assembly]. This attribute identifies the destination, connection factory or activation spec, and other properties to be used to send/receive the JMS message. There is an implicit ***@create="never"*** for the resources referred to in the ***@uri*** attribute.
  The value of the ***@uri*** attribute MUST have the format defined by the IETF URI Scheme for Java™ Message Service 1.0 [IETFJMS] [BJM30001].
  The following illustrates the structure of the URI and the set of property names that have specific semantics - all other property names are treated as user property names:
  - ***jms:jndi:<jms-dest>?***
    jndiURL=<jndi-url> &
    jndiInitialContextFactory=<jndi-initial-context-factory> &
    jndiConnectionFactoryName=<Connection-Factory-Name> &
    deliveryMode=<Delivery-Mode> &
    timeToLive=<Time-To-Live> &
    priority=<Priority> &
    <param-name>=<param-value> & …

  When the ***@uri*** attribute is specified, the SCA runtime MUST raise an error if the referenced resources do not already exist [BJM30002].

  When the ***@uri*** attribute is specified, the ***destination*** element MUST NOT be present [BJM30034].

  An SCA runtime MUST use the values specified in the ***@uri*** attribute in preference to corresponding attributes and elements in the binding [BJM30035].
- ***/binding.jms/@name*** - as defined in the SCA Assembly Specification [SCA-Assembly].
- ***/binding.jms/@requires*** - as defined in the SCA Assembly Specification [SCA-Assembly].
- ***/binding.jms/@policySets*** - as defined in the SCA Assembly Specification [SCA-Assembly].
- ***/binding.jms/@correlationScheme*** – identifies the correlation scheme used when sending reply or callback messages, default value is "sca:messageID".
  If the value of the ***@correlationScheme*** attribute is "***sca:messageID***" the SCA runtime MUST set the correlation ID of replies to the message ID of the corresponding request [BJM30003].
  If the value of the ***@correlationScheme*** attribute is "***sca:correlationID***" the SCA runtime MUST set the correlation ID of replies to the correlation ID of the corresponding request [BJM30004].
  If the value of the ***@correlationScheme*** attribute is "***sca:none***" the SCA runtime MUST NOT set the correlation ID[BJM30005].
  SCA runtimes MAY allow other values of the ***@correlationScheme*** attribute to indicate other correlation schemes [BJM30006].
- ***/binding.jms/@initialContextFactory*** – the name of the JNDI initial context factory.

- ***/binding.jms/@jndiURL*** – the URL for the JNDI provider.
- ***/binding.jms/@requestConnection*** – identifies a ***binding.jms*** element that is present in a definition document, whose ***destination***, ***connectionFactory***, ***activationSpec*** and ***resourceAdapter*** children are used to define the values for this binding.
  If the ***@requestConnection*** attribute is specified, the ***binding.jms*** element MUST NOT contain a ***destination***, ***connectionFactory***, ***activationSpec*** or ***resourceAdapter*** element [BJM30007].
- ***/binding.jms/@responseConnection*** – identifies a ***binding.jms*** element that is present in a definition document, whose ***response*** child element is used to define the values for this binding.
  If the ***@responseConnection*** attribute is specified, the ***binding.jms*** element MUST NOT contain a ***response*** element [BJM30008].
- ***/binding.jms/@operationProperties*** – identifies a ***binding.jms*** element that is present in a definition document, whose ***operationProperties*** children are used to define the values for this binding.
  If the ***@operationProperties*** attribute is specified, the ***binding.jms*** element MUST NOT contain an ***operationProperties*** element [BJM30009].
- ***/binding.jms/destination*** – identifies the destination that is to be used to process requests by this binding.
- ***/binding.jms/destination/@type*** - the type of the request destination. Valid values are "***queue***" and "***topic***". The default value is "***queue***".
  Whatever the value of the ***destination/@type*** attribute, the runtime MUST ensure a single response is delivered for request/response operations [BJM30010].
- ***binding.jms/destination/@jndiName*** – the JNDI name of the JMS Destination that the binding uses to send or receive messages. The behaviour of this attribute is determined by the value of the ***@create*** attribute as follows:
  - If the ***@create*** attribute value for a destination, connectionFactory or activationSpec element is "***always***" then the ***@jndiName*** attribute is optional; if the resource cannot be created at the specified location then the SCA runtime MUST raise an error [BJM30011].
    If the ***@jndiName*** attribute is omitted this specification places no restriction on the JNDI location of the created resource.
  - If the ***@create*** attribute value for a destination, connectionFactory or activationSpec element is "***ifNotExist***" then the ***@jndiName*** attribute MUST specify the location of the possibly existing resource [BJM30012].
    If the destination, connectionFactory or activationSpec does not exist at the location identified by the ***@jndiName*** attribute, but cannot be created there then the SCA runtime MUST raise an error [BJM30013].
    If the destination, connectionFactory or activationSpec's ***@jndiName*** attribute refers to an existing resource that is not a JMS Destination of the approprate type, a JMS connection factory or a JMS activation spec respectively then the SCA runtime MUST raise an error [BJM30014].
  - If the ***@create*** attribute value for a destination, connectionFactory or activationSpec element is "***never***" then the ***@jndiName*** attribute MUST specify the location of the existing resource [BJM30015].
    If the destination, connection factory or activation spec is not present at the location identified by the ***@jndiName*** attribute, or the location refers to a resource of an incorrect type then the SCA runtime MUST raise an error [BJM30016].
- ***/binding.jms/destination/@create*** – indicates whether the destination should be created when the containing composite is deployed. Valid values are "***always***", "***never***" and "***ifNotExist***". The default value is "***ifNotExist***".
- ***/binding.jms/destination/property*** – defines properties to be used to create the destination, if required.
- ***/binding.jms/connectionFactory*** – identifies the connection factory that the binding uses to process request messages. The attributes of this element follow the rules defined for the ***destination*** element.
  A ***binding.jms*** element MUST NOT include both a ***connectionFactory*** element and an

activationSpec element [BJM30017].
When the ***connectionFactory*** element is present, then the destination MUST be defined either by the ***destination*** element or the ***@uri*** attribute [BJM30018].

- ***/binding.jms/activationSpec*** – identifies the activation spec that the binding uses to connect to a JMS destination to process request messages. The attributes of this element follow the rules defined for the ***destination*** element.
  If the ***activationSpec*** element is present and the destination is also specified via a ***destination*** element or the ***@uri*** attribute then it MUST refer to the same JMS destination as the ***activationSpec*** [BJM30019].
  The ***activationSpec*** element MUST NOT be present when the binding is being used for an SCA reference [BJM30020].
- ***/binding.jms/response*** – defines the resources used for handling response messages (receiving responses for a reference, and sending responses from a service).
- ***/binding.jms/response/destination*** – identifies the destination that is to be used to process responses by this binding. Attributes follow the rules defined for the parent's ***destination*** element. For a service, this destination is used to send responses to messages that have a null value for the ***JMSReplyTo*** destination. For a reference, this destination is used to receive reply messages
- ***/binding.jms/response/connectionFactory*** – identifies the connection factory that the binding uses to process response messages. The attributes of this element follow those defined for the ***destination*** element.
  A ***response*** element MUST NOT include both a ***connectionFactory*** element and an ***activationSpec*** element [BJM30021].
- ***/binding.jms/response/activationSpec*** – identifies the activation spec that the binding uses to connect to a JMS destination to process response messages. The attributes of this element follow those defined for the ***destination*** element.
  If a ***response/destination*** and ***response/activationSpec*** element are both specified they MUST refer to the same JMS destination [BJM30022].
  The ***response/activationSpec*** element MUST NOT be present when the binding is being used for an SCA service [BJM30023].
- ***/binding.jms/response/wireFormat*** – identifies the wire format used by responses sent or received by this binding. This value overrides the ***wireFormat*** specifed at the binding level. Wire formats for this binding are described in Section 4.
- ***/binding.jms/headers*** – this element specifies values for standard JMS headers.
  The SCA runtime MUST set JMS headers in messages that it creates to the values specified by the ***headers*** element unless overridden for the operation being invoked. [BJM30024].
  These values apply to requests from a reference and responses from a service.
- ***/binding.jms/headers/@type, @deliveryMode, @timeToLive, @priority*** – specifies the value to use for the JMS header property JMSType, JMSDeliveryMode, JMSTimeToLive or JMSPriority respectively.
  If the ***@uri*** attribute includes values for the type, delivery mode, time to live or priority properties then the @uri values are used and the ***headers*** and ***operationProperties/headers @type***, ***@deliveryMode***, ***@timeToLive*** or ***@priority*** attributes are ignored [BJM30025].
  Valid values for ***@deliveryMode*** are "***persistent***" and "***nonpersistent***"; valid values for ***@priority*** are "***0***" to "***9***".
- ***/binding.jms/headers/property*** – specifies the value for the given JMS user property.
  For each ***header/properties*** element the SCA runtime MUST set the named JMS user property to the given value in messages it creates unless overridden for the operation being invoked [BJM30026].
- ***/binding.jms/messageSelection*** - this element allows JMS message selection options to be set. These values apply to a service receiving messages from the request destination or for a reference receiving messages from the callback or reply-to destination.

- ***/binding.jms/messageSelection/@selector*** - specifies the value to use for the JMS selector. If the ***@uri*** attribute includes a value for the message selector then the ***@uri*** value is used and the ***messageSelection/@selector*** attribute is ignored [BJM30027].
- ***/binding.jms/resourceAdapter*** – specifies name, type and properties of the Resource Adapter Java bean.
  The ***resourceAdapter*** element MUST be present when JMS resources are to be created for a JMS provider that implements the JCA 1.5 Specification [JCA15] specification, and is ignored otherwise [BJM30031].
  SCA runtimes MAY place restrictions on the properties of the resource adapter Java bean that can be set using the ***resourceAdapter*** element [BJM30028].
  For JMS providers that do not implement the JCA 1.5 specification [JCA15], information necessary for resource creation can be added in provider-specific elements or attributes allowed by the extensibility of the ***binding.jms*** element.
- ***/binding.jms/operationProperties*** – specifies various properties that are specific to the processing of a particular operation.
- ***/binding.jms/operationProperties/@name*** – The name of the operation in the interface.
- ***/binding.jms/operationProperties/@selectedOperation*** – The value generated by the ***operationSelector*** that corresponds to the operation in the service or reference interface identified by the ***operationProperties/@name*** attribute. If this attribute is omitted then the value defaults to the value of the ***operationProperties/@name*** attribute.
  The value of the ***operationProperties/@selectedOperation*** attribute MUST be unique across the containing ***binding.jms*** element [BJM30029].
- ***/binding.jms/operationProperties/property*** – specifies properties specific to this operation. These properties are intended to be used to parameterize the ***wireFormat*** identified for the binding for a particular operation.
  The SCA runtime SHOULD make the ***operationProperties*** element corresponding to the ***selectedOperation*** available to the ***wireFormat*** implementation [BJM30030].
- ***/binding.jms/operationProperties/headers*** – this element specifies values for standard JMS headers. These values apply to requests from a reference and responses from a service.
  The SCA runtime MUST set JMS headers in messages it creates when the operation identified by the ***operationProperties/@name*** attribute is invoked to the values specified by the corresponding ***operationProperties/headers*** element [BJM30032].
- ***/binding.jms/operationProperties/headers/@type, @deliveryMode, @timeToLive, @priority*** – specifies the value to use for the JMS header property JMSType, JMSDeliveryMode, JMSTimeToLive or JMSPriority, respectively,
- ***/binding.jms/operationProperties/headers/property*** – specifies the value for the given JMS user property.
  For each ***operationProperties/headers/property*** element the SCA runtime MUST set the named JMS user property to the given value in messages it creates when the operation identified by the ***operationProperties/@name*** attribute is invoked [BJM30033].
- ***/binding.jms/wireFormat*** – identifies the wire format used by requests and responses sent or received by this binding. Wire formats for this binding are described in Section 4.
- ***/binding.jms/operationSelector*** – identifies the operation selector used when receiving requests for a service. If specified for a reference this provides the default operation selector for callbacks if not specified via a callback service element. Operation selectors for this binding are described in Section 4.

The ***binding.jms*** element MUST conform to the XML schema defined in sca-binding-jms.xsd [BJM30036].

Deployers/assemblers can configure ***nonpersistent*** for ***@deliveryMode*** in order to provide higher performance with a decreased quality of service. A ***binding.jms*** element configured in this way cannot satisfy either of the "***atLeastOnce***" and "***exactlyOnce***" policy intents. The SCA Runtime MUST raise an error for this invalid combination at deployment time.

3.1 Extensibility

The JMS binding allows further customization of the binding element and its subelements with vendor specific attributes or elements. This is done by providing extension points in the schema; refer to Appendix A, “JMS XML Binding Schema: sca-binding-jms.xsd” for the locations of these extension points.

4 Operation Selectors and Wire Formats

In general messaging providers deal with message formats and destinations. There is not usually a built-in concept of "operation" that corresponds to that defined in a WSDL [WSDL] portType. Messages have a wire format which corresponds in some way to the schema of an input or output message of an operation in the interface of a service or reference, however additional information is required in order for an SCA runtime to know how to identify the operation and understand the wire format of messages.

The process of identifying the operation to be invoked is *operation selection*; the information that describes the contents of messages is a *wire format*. The ***binding*** element as described in the SCA Assembly Specification [SCA-Assembly] provides the means to identify specific operation selection via the ***operationSelector*** element and the wire format of messages received and to be sent using the ***wireFormat*** element. When the JMS binding receives a message, the ***operationSelector*** is used to generate a selected operation name from the message content. The selected operation name is then mapped to an operation in the service's interface via a matching ***operationProperties*** element in the JMS binding. If there is no matching element, the operation name is assumed to be the same as the selected operation name.

No standard means is provided for linking the ***wireFormat*** or ***operationSelector*** elements with the runtime components that implement their behavior.

The following sections describe the default ***operationSelector*** and ***wireFormat*** for a JMS binding.

The SCA runtime MUST support the default JMS wire format and operation selector behavior, and MAY provide additional means to override it [BJM40001].

4.1 Default Operation Selection

The following defines the **default operation selection algorithm** when receiving a request at a service, or a callback at a reference. When using the default operation selection algorithm, the selected operation name is determined as follows:

- If there is only one operation on the service's interface, then that operation is the selected operation name;
- Otherwise, if the JMS user property "***scaOperationName***" is present, then the value of that user property is used as the selected operation name;
- Otherwise, if the message is a JMS text or bytes message containing XML, then the selected operation name is the local name of the root element of the XML payload;
- Otherwise, the selected operation name is "***onMessage***".

When a ***binding.jms*** element specifies the ***operationSelector.jmsDefault*** element, the SCA runtime MUST use the default operation selection algorithm to determine the selected operation [BJM40008].

If no ***operationSelector*** element is specified then SCA runtimes MUST use ***operationSelector.jmsDefault*** as the default [BJM40002].

4.2 Default Wire Format

The default wire format maps between a ***JMSMessage*** and the object(s) expected by the component implementation. We encourage component implementers to avoid exposure of JMS [JMS] APIs to component implementations, however in the case of an existing implementation that expects a ***JMSMessage***, this provides for simple reuse of that as an SCA component.

When using the default wire format, the message body is mapped to the parameters or return value of the target operation as follows:

- If there is a single parameter that is a ***JMSMessage***, then the ***JMSMessage*** is passed as is.
- Otherwise, if the ***JMSMessage*** is not a JMS text message or bytes message containing XML it is invalid.

- Otherwise if there is a single parameter, or for the return value, the JMS text or bytes XML payload is the XML serialization of that parameter according to the WSDL schema for the message.
- Otherwise the multiple parameters are encoded in XML using the document wrapped style, according to the WSDL schema for the message.

When a ***binding.jms*** element specifies the ***wireFormat.jmsDefault*** element, the SCA runtime MUST use the default wire format [BJM40009].

When using the default wire format to send request messages, if there is a single parameter and the interface includes more than one operation, the SCA runtime MUST set the JMS user property "***scaOperationName***" to the name of the operation being invoked [BJM40003].

When using the default wire format an SCA runtime MUST be able to receive both JMS text and bytes messages [BJM40005].

When using the default wire format an SCA runtime MUST send either a JMS text or a JMS bytes message [BJM40006].

When using the default wire format an SCA runtime MAY provide additional configuration to allow selection between JMS text or bytes messages to be sent [BJM40007].

If no ***wireFormat*** element is specified in a JMS binding then SCA runtimes MUST use ***wireFormat.jmsDefault*** as the default [BJM40004].

4.2.1 Example of default wire format

For the following interface definition:

```
<wsdl:definitions name="Coordinates"
targetNamespace="http://tempuri.org/coordinates"
xmlns:tns="http://tempuri.org/coordinates"
xmlns:wsdl="http://schemas.xmlsoap.org/wsdl/"
xmlns:xsd="http://www.w3.org/2001/XMLSchema">
  <wsdl:types>
    <xsd:schema targetNamespace="http://tempuri.org/coordinates">
      <xsd:element name="setCoordinates">
        <xsd:complexType>
          <xsd:sequence>
            <xsd:element name="x" type="xsd:int"/>
            <xsd:element name="y" type="xsd:int"/>
          </xsd:sequence>
        </xsd:complexType>
      </xsd:element>
    </xsd:schema>
  </wsdl:types>

  <wsdl:message name="setCoordinatesRequestMsg">
    <wsdl:part element="tns:setCoordinates" name="setCoordinatesParameters"/>
  </wsdl:message>

  <wsdl:portType name="Coordinates">
    <wsdl:operation name="setCoordinates">
      <wsdl:input message="tns:setCoordinatesRequestMsg"
name="setCoordinatesRequest"/>
    </wsdl:operation>
  </wsdl:portType>
</wsdl:definitions>
```

When the ***setCoordinates*** operation is invoked via a reference with a JMS binding that uses the default wire format, the message sent from the JMS binding is a JMS text or bytes message with the following content:

```
<setCoordinates xmlns="http://tempuri.org/coordinates">
  <x>10</x>
  <y>5</y>
```

```
</setCoordinates>
```

5 Policy

The JMS binding provides attributes that control the sending of messages, requests from references and replies from services. These values can be set directly on the binding element for a particular service or reference, or they can be set using policy intents. An example of setting these via intents is shown later.

JMS binding implementations MAY support the following standard intents, as defined by the JMS binding's ***bindingType***:

```
<bindingType type="binding.jms"
             alwaysProvides="JMS"
             mayProvide="atLeastOnce atMostOnce ordered"/>
```

The atLeastOnce, atMostOnce and ordered intent are defined in the SCA Policy Specification [SCA-Policy] document in section 8, "Reliability Policy".

6 Message Exchange Patterns

This section describes the message exchange patterns that are possible when using the JMS binding, including one-way, request/response and callbacks. JMS [JMS] has a looser concept of message exchange patterns than WSDL, so this section explains how JMS messages that are sent and received by the SCA runtime relate to the WSDL input/output messages. Each operation in a WSDL interface is either one-way or request/response. Callback interfaces may include both one-way and request/response operations.

6.1 One-way message exchange (no Callbacks)

A one-way message exchange is one where a request message is sent that does not require or expect a corresponding response message. These are represented in WSDL as an operation with an ***input*** element and no ***output*** elements and no ***fault*** elements.

For an SCA reference with a JMS binding, when a request message is sent as part of a one-way MEP, the SCA runtime SHOULD NOT set the ***JMSReplyTo*** destination header in the JMS message that it creates, regardless of whether the JMS binding has a ***response*** element with a ***destination*** defined [BJM60001].

For an SCA service with a JMS binding, when a request message is received as part of a one-way MEP, the SCA runtime MUST ignore the ***JMSReplyTo*** destination header in the JMS message, and not raise an error [BJM60002].

The use of one-way exchanges when using a bidirectional interface is described in section 6.4.

6.2 Request/response message exchange (no Callbacks)

A request/response message exchange is one where a request message is sent and a response message is expected, possibly identified by its correlation identifier. These are represented in WSDL as an operation with an ***input*** element and an ***output*** and/or a ***fault*** element.

For an SCA reference with a JMS binding, when a request message is sent as part of a request/response MEP, the SCA runtime MUST set a non-null value for the ***JMSReplyTo*** header in the JMS message it creates for the request [BJM60003].

For an SCA reference with a JMS binding, when a request message is sent as part of a request/response MEP, and the JMS binding has a ***response*** element with a ***destination*** defined, then the SCA runtime MUST use that destination for the ***JMSReplyTo*** header in the JMS message it creates for the request [BJM60004].

For an SCA reference with a JMS binding, when a request message is sent as part of a request/response MEP, and the JMS binding does not have a ***response*** element with a ***destination*** defined, the SCA runtime MUST provide an appropriate destination on which to receive response messages and use that destination for the ***JMSReplyTo*** header in the JMS message it creates for the request [BJM60005].

For an SCA reference with a JMS binding, the SCA runtime MAY choose to receive response messages on the basis of their correlation ID as defined by the binding's ***@correlationScheme*** attribute, or use a unique destination for each response [BJM60006].

For an SCA service with a JMS binding, when a response message is sent as part of a request/response MEP where the request message included a non-null ***JMSReplyTo*** destination, the SCA runtime MUST send the response message to that destination [BJM60007].

For an SCA service with a JMS binding, when a response message is sent as part of a request/response MEP where the request message included a null ***JMSReplyTo*** destination and the JMS binding includes a ***response/destination*** element the SCA runtime MUST send the response message to that destination [BJM60008].

For an SCA service with a JMS binding, when a response message is sent as part of a request/response MEP where the request message included a null ***JMSReplyTo*** destination and the JMS binding does not include a ***response/destination*** then an error SHOULD be raised by the SCA runtime [BJM60009].

For an SCA service with a JMS binding, when a response message is sent as part of a request/response MEP the SCA runtime MUST set the correlation identifier in the JMS message that it creates for the response as defined by the JMS binding's ***@correlationScheme*** attribute [BJM60010].

The use of request/response exchanges when using a bidirectional interface is described in section 6.4.

6.3 JMS User Properties

This protocol assigns specific behavior to JMS user properties:

- "***scaCallbackDestination***" holds the name of the JMS Destination to which callback messages are sent.

6.4 Callbacks

Callbacks are SCA's way of representing bidirectional interfaces, where messages are sent in both directions between a client and a service. A callback is the invocation of an operation on a service's callback interface. A callback operation can be one-way or request/response. Messages that correspond to one-way or request/response operations on a bidirectional interface use either the ***scaCallbackDestination*** user property or the ***JMSReplyTo*** destination, or both, to identify the destination to which messages are to be sent when operations are invoked on the callback interface. The use of ***JMSReplyTo*** for this purpose is to enable interaction with non-SCA JMS applications, as described below.

SCA runtimes MUST follow the behavior described in section 6.4 and its subsections when ***binding.jms*** is used in both the forward and callback directions [BJM60018].

SCA runtimes can use different bindings for forward calls and callbacks, however the behavior and requirements on messages is vendor-specific.

6.4.1 Invocation of operations on a bidirectional interface

For an SCA reference with a JMS binding and a bidirectional interface, when a request message is sent the SCA runtime MUST set the destination to which callback messages are to be sent as the value of the ***scaCallbackDestination*** user property in the message it creates [BJM60011].

For an SCA reference with a JMS binding and bidirectional interface, when a request message is sent the SCA runtime MAY set the ***JMSReplyTo*** destination to the same value as the scaCallbackDestination user property [BJM60012].

For an SCA reference with a JMS binding and bidirectional interface, when a request message is sent as part of a request/response MEP, the SCA runtime MUST set the ***JMSReplyTo*** header in the message it creates as described in section 6.2 [BJM60013].

For both one-way and request/response operations, the reference's callback service can be used to identify the destination to which callback messages are to be sent.

For an SCA reference with a JMS binding and bidirectional interface, the SCA runtime MUST identify the callback destination from the reference's callback service binding if present, or supply a suitable callback destination if not present [BJM60014].

6.4.2 Invocation of operations on a callback interface

An SCA service with a callback interface can invoke operations on that callback interface by sending messages to the destination identified by the ***scaCallbackDestination*** user property in a message that it has received, the ***JMSReplyTo*** destination of a one-way message that it has received, or the destination identified by the service's callback reference JMS binding.

For an SCA service with a JMS binding, the *callback destination* is identified as follows, in order of priority:

- The ***scaCallbackDestination*** identified by an earlier request, if not null;
- the ***JMSReplyTo*** destination identified by an earlier one-way request, if not null;
- the request destination of the service's callback reference JMS binding, if specified

For an SCA service with a JMS binding, when a callback request message is sent for either a one-way or request/response MEP, the SCA runtime MUST send the callback request message to the callback destination. [BJM60015].

For an SCA service with a JMS binding, when a callback request message is sent and no callback destination can be identified then the SCA runtime SHOULD raise an error, and MUST throw an exception to the caller of the callback operation [BJM60016].

For an SCA service with a JMS binding, when a callback request message is sent the SCA runtime MUST set the ***JMSReplyTo*** destination and correlation identifier in the callback request message as defined in sections 6.1 or 6.2 as appropriate for the type of the callback operation invoked [BJM60017].

6.4.3 Use of JMSReplyTo for callbacks for non-SCA JMS applications

When interacting with non-SCA JMS applications, the assembler can choose to model a request/response message exchange using a bidirectional interface. In this case it is likely that the non-SCA JMS application does not support the use of the ***scaCallbackDestination*** user property. To support this, for one-way messages the ***JMSReplyTo*** header can be used to identify the destination to be used to deliver callback messages, as described in sections 6.4.1 and 6.4.2.

7 Examples

The following snippets show the ***sca.composite*** file for the ***MyValueComposite*** file containing the ***service*** element for the MyValueService and a ***reference*** element for the StockQuoteService. Both the service and the reference use a JMS binding.

7.1 Minimal Binding Example

The following example shows the JMS binding being used with no further attributes or elements. In this case, it is left to the deployer to identify the resources to which the binding is connected.

```
<?xml version="1.0" encoding="UTF-8"?>
<composite xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200903"
           name="MyValueComposite">

    <service name="MyValueService">
        <interface.java interface="services.myvalue.MyValueService"/>
        <binding.jms/>
    </service>

    <reference name="StockQuoteService">
        <interface.java interface="services.stockquote.StockQuoteService"/>
        <binding.jms/>
    </reference>
</composite>
```

7.2 URI Binding Example

The following example shows the JMS binding using the ***@uri*** attribute to specify the connection type and its information:

```
<?xml version="1.0" encoding="UTF-8"?>
<composite xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200903"
           name="MyValueComposite">

    <service name="MyValueService">
        <interface.java interface="services.myvalue.MyValueService"/>
        <binding.jms uri="jms:MyValueServiceQueue?
                           activationSpecName=MyValueServiceAS&
                           ... "/>
    </service>

    <reference name="StockQuoteService">
        <interface.java interface="services.stockquote.StockQuoteService"/>
        <binding.jms uri="jms:StockQuoteServiceQueue?
                           connectionFactoryName=StockQuoteServiceQCF&
                           deliveryMode=1&
                           ... "/>
    </reference>
</composite>
```

7.3 Binding with Existing Resources Example

The following example shows the JMS binding using existing resources:

```
<?xml version="1.0" encoding="UTF-8"?>
<composite xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200903"
           name="MyValueComposite">

```

```
    <service name="MyValueService">
        <interface.java interface="services.myvalue.MyValueService"/>
        <binding.jms>
            <destination jndiName="MyValueServiceQ" create="never"/>
            <activationSpec jndiName="MyValueServiceAS" create="never"/>
        </binding.jms>
    </service>
</composite>
```

7.4 Resource Creation Example

The following example shows the JMS binding providing information to create JMS resources rather than using existing ones:

```
<?xml version="1.0" encoding="UTF-8"?>
<composite xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200903"
           name="MyValueComposite">

    <service name="MyValueService">
        <interface.java interface="services.myvalue.MyValueService"/>
        <binding.jms>
            <destination jndiName="MyValueServiceQueue" create="always">
                <property name="prop1" type="string">XYZ</property>
                <property name="destName" type="string">MyValueDest</property>
            </destination>
            <activationSpec jndiName="MyValueServiceAS" create="always"/>
            <resourceAdapter jndiName="com.example.JMSRA"/>
        </binding.jms>
    </service>

    <reference name="StockQuoteService">
        <interface.java interface="services.stockquote.StockQuoteService"/>
        <binding.jms>
            <destination jndiName="StockQuoteServiceQueue"/>
            <connectionFactory jndiName="StockQuoteServiceQCF"/>
            <resourceAdapter name="com.example.JMSRA"/>
        </binding.jms>
    </reference>
</composite>
```

7.5 Request/Response Example

The following example shows the JMS binding using existing resources to support request/response operations. The service uses the ***JMSReplyTo*** destination to send response messages, and does not specify a response queue:

```
<?xml version="1.0" encoding="UTF-8"?>
<composite xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200903"
           name="MyValueComposite">

    <service name="MyValueService">
        <interface.java interface="services.myvalue.MyValueService"/>
        <binding.jms correlationScheme="sca:messageId">
            <destination jndiName="MyValueServiceQ" create="never"/>
            <activationSpec jndiName="MyValueServiceAS" create="never"/>
        </binding.jms>
    </service>

    <reference name="StockQuoteService">
        <interface.java interface="services.stockquote.StockQuoteService"/>
        <binding.jms correlationScheme="sca:messageId">
            <destination jndiName="StockQuoteServiceQueue"/>
            <connectionFactory jndiName="StockQuoteServiceQCF"/>
```

```
            <response>
                <destination jndiName="MyValueResponseQueue"/>
                <activationSpec jndiName="MyValueResponseAS"/>
            </response>
        </binding.jms>
    </reference>
</composite>
```

7.6 Use of Predefined Definitions Example

This example shows the case where there is common connection information shared by more than one reference.

The common connection information is defined in a separate definitions file:

```
<?xml version="1.0" encoding="UTF-8"?>
<definitions targetNamespace="http://acme.com"
             xmlns="http://docs.oasis-open.org/ns/opencsa/sca/2007903">
    <binding.jms name="StockQuoteService">
        <destination jndiName="StockQuoteServiceQueue" create="never"/>
        <connectionFactory jndiName="StockQuoteServiceQCF" create="never"/>
    </binding.jms>
</definitions>
```

Any ***binding.jms*** element may then refer to that definition:

```
<?xml version="1.0" encoding="UTF-8"?>
<composite xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200903"
           xmlns:acme="http://acme.com"
           name="MyValueComposite">
    <reference name="MyValueService">
        <interface.java interface="services.myvalue.MyValueService"/>
        <binding.jms requestConnection="acme:StockQuoteService"/>
    </reference>
</composite>
```

7.7 Subscription with Selector Example

The following example shows how the JMS binding is used in order to consume messages from existing JMS infrastructure. The JMS binding subscribes using selector:

```
<?xml version="1.0" encoding="UTF-8"?>
<composite xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200903"
           name="MyValueComposite">
    <service name="MyValueService">
        <interface.java interface="services.myvalue.MyValueService"/>
        <binding.jms>
            <destination jndiName="MyValueServiceTopic" create="never"/>
            <connectionFactory jndiName="StockQuoteServiceTCF"
create="never"/>
            <messageSelection selector="Price&gt;1000"/>
        </binding.jms>
    </service>
</composite>
```

7.8 Policy Set Example

A policy set defines the manner in which intents map to JMS binding properties. The following illustrates an example of a policy set that defines values for the ***@priority*** attribute using the "***priority***" intent, and also allows setting of a value for a user JMS property using the "***log***" intent.

```
<policySet name="JMSPolicy"
           provides="priority log"
```

```
            appliesTo="binding.jms">

    <intentMap provides="priority" default="medium">
        <qualifier name="high">
            <headers priority="9"/>
        </qualifier>
        <qualifier name="medium">
            <headers priority="4"/>
        </qualifier>
        <qualifier name="low">
            <headers priority="0"/>
        </qualifier>
    </intentMap>

    <intentMap provides="log">
        <qualifier>
            <headers>
                <property name="user_example_log">logged</property>
            </headers>
        </qualifier>
    </intentMap>
</policySet>
```

Given this policy set, the intents can be required on a service or reference:

```
<reference name="StockQuoteService" requires="priority.high log">
    <interface.java interface="services.stockquote.StockQuoteService"/>
    <binding.jms>
        <destination name="StockQuoteServiceQueue"/>
        <connectionFactory name="StockQuoteServiceQCF"/>
    </binding.jms>
</reference>
```

8 Conformance

The XML schema pointed to by the RDDL document at the namespace URI, defined by this specification, are considered to be authoritative and take precedence over the XML schema defined in the appendix of this document.There are two categories of artifacts for which this specification defines conformance:

a) SCA JMS Binding XML Document

b) SCA Runtime

8.1 SCA JMS Binding XML Document

An SCA JMS Binding XML document is an SCA Composite Document, an SCA Definitions Document or an SCA ComponentType Document, as defined by the SCA Assembly Specification [SCA-Assembly] Section 13.1 that uses the ***binding.jms*** element.

An SCA JMS Binding XML document MUST be a conformant SCA Composite Document, SCA Definitions Document or a SCA ComponentType Document, as defined by the SCA Assembly Specification [SCA-Assembly], and MUST comply with all statements in Appendix B: “Conformance Items” related to elements and attributes in an SCA JMS Binding XML document, notably all "MUST" statements have to be implemented.

8.2 SCA Runtime

An implementation that claims to conform to the requirements of an SCA Runtime defined in this specification has to meet the following conditions:

1. The implementation MUST comply with all statements in Appendix B: “Conformance Items” related to an SCA Runtime, notably all "MUST" statements have to be implemented
2. The implementation MUST conform to the SCA Assembly Model Specification Version 1.1 [SCA-Assembly], and to the SCA Policy Framework Version 1.1 [SCA-Policy]
3. The implementation MUST reject an SCA JMS Binding XML Document that is not conformant per Section 8.1

A. JMS XML Binding Schema: sca-binding-jms.xsd

```
<?xml version="1.0" encoding="UTF-8"?>
<!-- Copyright(C) OASIS(R) 2005,2009. All Rights Reserved.
     OASIS trademark, IPR and other policies apply.  -->
<schema xmlns="http://www.w3.org/2001/XMLSchema"
        targetNamespace="http://docs.oasis-open.org/ns/opencsa/sca/200903"
        xmlns:sca="http://docs.oasis-open.org/ns/opencsa/sca/200903"
        elementFormDefault="qualified">

```

B. Conformance Items

This section contains a list of conformance items for the SCA JMS Binding specification.

Conformance ID	Description
[BJM30001]	The value of the ***@uri*** attribute MUST have the format defined by the IETF URI Scheme for Java™ Message Service 1.0 [IETFJMS]
[BJM30002]	When the ***@uri*** attribute is specified, the SCA runtime MUST raise an error if the referenced resources do not already exist
[BJM30003]	If the value of the ***@correlationScheme*** attribute is "***sca:messageID***" the SCA runtime MUST set the correlation ID of replies to the message ID of the corresponding request
[BJM30004]	If the value of the ***@correlationScheme*** attribute is "***sca:correlationID***" the SCA runtime MUST set the correlation ID of replies to the correlation ID of the corresponding request
[BJM30005]	If the value of the ***@correlationScheme*** attribute is "***sca:none***" the SCA runtime MUST NOT set the correlation ID
[BJM30006]	SCA runtimes MAY allow other values of the ***@correlationScheme*** attribute to indicate other correlation schemes
[BJM30007]	If the ***@requestConnection*** attribute is specified, the ***binding.jms*** element MUST NOT contain a ***destination***, ***connectionFactory***, ***activationSpec*** or ***resourceAdapter*** element
[BJM30008]	If the ***@responseConnection*** attribute is specified, the ***binding.jms*** element MUST NOT contain a ***response*** element
[BJM30009]	If the ***@operationProperties*** attribute is specified, the ***binding.jms*** element MUST NOT contain an ***operationProperties*** element
[BJM30010]	Whatever the value of the ***destination/@type*** attribute, the runtime MUST ensure a single response is delivered for request/response operations
[BJM30011]	If the ***@create*** attribute value for a destination, connectionFactory or activationSpec element is "***always***" then the ***@jndiName*** attribute is optional; if the resource cannot be created at the specified location then the SCA runtime MUST raise an error
[BJM30012]	If the ***@create*** attribute value for a destination, connectionFactory or activationSpec element is "***ifNotExist***" then the ***@jndiName*** attribute MUST specify the location of the possibly existing resource
[BJM30013]	If the destination, connectionFactory or activationSpec does not exist at the location identified by the ***@jndiName*** attribute, but cannot be created there then the SCA runtime MUST raise an error
[BJM30014]	If the destination, connectionFactory or activationSpec's ***@jndiName*** attribute refers to an existing resource that is not a JMS Destination of the approprate type, a JMS connection factory or a JMS activation spec respectively then the SCA runtime MUST raise an error
[BJM30015]	If the ***@create*** attribute value for a destination, connectionFactory or

	activationSpec element is "***never***" then the ***@jndiName*** attribute MUST specify the location of the existing resource
[BJM30016]	If the destination, connection factory or activation spec is not present at the location identified by the ***@jndiName*** attribute, or the location refers to a resource of an incorrect type then the SCA runtime MUST raise an error
[BJM30017]	A ***binding.jms*** element MUST NOT include both a ***connectionFactory*** element and an ***activationSpec*** element
[BJM30018]	When the ***connectionFactory*** element is present, then the destination MUST be defined either by the ***destination*** element or the ***@uri*** attribute
[BJM30019]	If the ***activationSpec*** element is present and the destination is also specified via a ***destination*** element or the ***@uri*** attribute then it MUST refer to the same JMS destination as the ***activationSpec***
[BJM30020]	The ***activationSpec*** element MUST NOT be present when the binding is being used for an SCA reference
[BJM30021]	A ***response*** element MUST NOT include both a ***connectionFactory*** element and an ***activationSpec*** element
[BJM30022]	If a ***response/destination*** and ***response/activationSpec*** element are both specified they MUST refer to the same JMS destination
[BJM30023]	The ***response/activationSpec*** element MUST NOT be present when the binding is being used for an SCA service
[BJM30024]	The SCA runtime MUST set JMS headers in messages that it creates to the values specified by the ***headers*** element unless overridden for the operation being invoked.
[BJM30025]	If the ***@uri*** attribute includes values for the type, delivery mode, time to live or priority properties then the @uri values are used and the ***headers*** and ***operationProperties/headers @type***, ***@deliveryMode***, ***@timeToLive*** or ***@priority*** attributes are ignored
[BJM30026]	For each ***header/properties*** element the SCA runtime MUST set the named JMS user property to the given value in messages it creates unless overridden for the operation being invoked
[BJM30027]	If the ***@uri*** attribute includes a value for the message selector then the ***@uri*** value is used and the ***messageSelection/@selector*** attribute is ignored
[BJM30028]	SCA runtimes MAY place restrictions on the properties of the resource adapter Java bean that can be set using the ***resourceAdapter*** element
[BJM30029]	The value of the ***operationProperties/@selectedOperation*** attribute MUST be unique across the containing ***binding.jms*** element
[BJM30030]	The SCA runtime SHOULD make the ***operationProperties*** element corresponding to the ***selectedOperation*** available to the ***wireFormat*** implementation
[BJM30031]	The ***resourceAdapter*** element MUST be present when JMS resources are to be created for a JMS provider that implements the JCA 1.5 Specification [JCA15] specification, and is ignored otherwise
[BJM30032]	The SCA runtime MUST set JMS headers in messages it creates when the operation identified by the ***operationProperties/@name*** attribute is invoked to

	the values specified by the corresponding ***operationProperties/headers*** element
[BJM30033]	For each ***operationProperties/headers/property*** element the SCA runtime MUST set the named JMS user property to the given value in messages it creates when the operation identified by the ***operationProperties/@name*** attribute is invoked
[BJM30034]	When the ***@uri*** attribute is specified, the ***destination*** element MUST NOT be present
[BJM30035]	An SCA runtime MUST use the values specified in the ***@uri*** attribute in preference to corresponding attributes and elements in the binding
[BJM30036]	The ***binding.jms*** element MUST conform to the XML schema defined in sca-binding-jms.xsd
[BJM40001]	The SCA runtime MUST support the default JMS wire format and operation selector behavior, and MAY provide additional means to override it
[BJM40002]	If no ***operationSelector*** element is specified then SCA runtimes MUST use ***operationSelector.jmsDefault*** as the default
[BJM40003]	When using the default wire format to send request messages, if there is a single parameter and the interface includes more than one operation, the SCA runtime MUST set the JMS user property "***scaOperationName***" to the name of the operation being invoked
[BJM40004]	If no ***wireFormat*** element is specified in a JMS binding then SCA runtimes MUST use ***wireFormat.jmsDefault*** as the default
[BJM40005]	When using the default wire format an SCA runtime MUST be able to receive both JMS text and bytes messages
[BJM40006]	When using the default wire format an SCA runtime MUST send either a JMS text or a JMS bytes message
[BJM40007]	When using the default wire format an SCA runtime MAY provide additional configuration to allow selection between JMS text or bytes messages to be sent
[BJM40008]	When a ***binding.jms*** element specifies the ***operationSelector.jmsDefault*** element, the SCA runtime MUST use the default operation selection algorithm to determine the selected operation
[BJM40009]	When a ***binding.jms*** element specifies the ***wireFormat.jmsDefault*** element, the SCA runtime MUST use the default wire format
[BJM60001]	For an SCA reference with a JMS binding, when a request message is sent as part of a one-way MEP, the SCA runtime SHOULD NOT set the ***JMSReplyTo*** destination header in the JMS message that it creates, regardless of whether the JMS binding has a ***response*** element with a ***destination*** defined
[BJM60002]	For an SCA service with a JMS binding, when a request message is received as part of a one-way MEP, the SCA runtime MUST ignore the ***JMSReplyTo*** destination header in the JMS message, and not raise an error
[BJM60003]	For an SCA reference with a JMS binding, when a request message is sent as part of a request/response MEP, the SCA runtime MUST set a non-null value for the ***JMSReplyTo*** header in the JMS message it creates for the request

[BJM60004]	For an SCA reference with a JMS binding, when a request message is sent as part of a request/response MEP, and the JMS binding has a ***response*** element with a ***destination*** defined, then the SCA runtime MUST use that destination for the ***JMSReplyTo*** header in the JMS message it creates for the request
[BJM60005]	For an SCA reference with a JMS binding, when a request message is sent as part of a request/response MEP, and the JMS binding does not have a ***response*** element with a ***destination*** defined, the SCA runtime MUST provide an appropriate destination on which to receive response messages and use that destination for the ***JMSReplyTo*** header in the JMS message it creates for the request
[BJM60006]	For an SCA reference with a JMS binding, the SCA runtime MAY choose to receive response messages on the basis of their correlation ID as defined by the binding's ***@correlationScheme*** attribute, or use a unique destination for each response
[BJM60007]	For an SCA service with a JMS binding, when a response message is sent as part of a request/response MEP where the request message included a non-null ***JMSReplyTo*** destination, the SCA runtime MUST send the response message to that destination
[BJM60008]	For an SCA service with a JMS binding, when a response message is sent as part of a request/response MEP where the request message included a null ***JMSReplyTo*** destination and the JMS binding includes a ***response/destination*** element the SCA runtime MUST send the response message to that destination
[BJM60009]	For an SCA service with a JMS binding, when a response message is sent as part of a request/response MEP where the request message included a null ***JMSReplyTo*** destination and the JMS binding does not include a ***response/destination*** then an error SHOULD be raised by the SCA runtime
[BJM60010]	For an SCA service with a JMS binding, when a response message is sent as part of a request/response MEP the SCA runtime MUST set the correlation identifier in the JMS message that it creates for the response as defined by the JMS binding's ***@correlationScheme*** attribute
[BJM60011]	For an SCA reference with a JMS binding and a bidirectional interface, when a request message is sent the SCA runtime MUST set the destination to which callback messages are to be sent as the value of the ***scaCallbackDestination*** user property in the message it creates
[BJM60012]	For an SCA reference with a JMS binding and bidirectional interface, when a request message is sent the SCA runtime MAY set the ***JMSReplyTo*** destination to the same value as the scaCallbackDestination user property
[BJM60013]	For an SCA reference with a JMS binding and bidirectional interface, when a request message is sent as part of a request/response MEP, the SCA runtime MUST set the ***JMSReplyTo*** header in the message it creates as described in section 6.2
[BJM60014]	For an SCA reference with a JMS binding and bidirectional interface, the SCA runtime MUST identify the callback destination from the reference's callback service binding if present, or supply a suitable callback destination if not present
[BJM60015]	For an SCA service with a JMS binding, when a callback request message is

	sent for either a one-way or request/response MEP, the SCA runtime MUST send the callback request message to the callback destination.
[BJM60016]	For an SCA service with a JMS binding, when a callback request message is sent and no callback destination can be identified then the SCA runtime SHOULD raise an error, and MUST throw an exception to the caller of the callback operation
[BJM60017]	For an SCA service with a JMS binding, when a callback request message is sent the SCA runtime MUST set the ***JMSReplyTo*** destination and correlation identifier in the callback request message as defined in sections 6.1 or 6.2 as appropriate for the type of the callback operation invoked
[BJM60018]	SCA runtimes MUST follow the behavior described in section 6.4 and its subsections when ***binding.jms*** is used in both the forward and callback directions

D. Revision History

[optional; should not be included in OASIS Standards]

Revision	Date	Editor	Changes Made
1	2007-09-25	Anish Karmarkar	Applied the OASIS template + related changes to the Submission
2	2008-03-12	Simon Holdsworth	Updated text for RFC2119 conformance Updates to resolve following issues: BINDINGS-1 BINDINGS-5 BINDINGS-6 BINDINGS-12 BINDINGS-14 BINDINGS-18 BINDINGS-26 Applied updates discussed at Bindings TC meeting of 27th March
3	2008-06-19	Simon Holdsworth	* Applied most of the editorial changes from Eric Johnson's review
cd01	2008-08-01	Simon Holdsworth	Updates to resolve following issues: BINDINGS-13 (JMS part) BINDINGS-20 (complete) BINDINGS-30 (JMS part) BINDINGS-32 (JMS part) BINDINGS-33 (complete) BINDINGS-34 (complete) BINDINGS-35 (complete) BINDINGS-38 (JMS part)
cd01-rev1	2008-10-16	Simon Holdsworth	Updated text for RFC2119 conformance throughout Updates to resolve following issues: BINDINGS-41 BINDINGS-46 BINDINGS-47
cd01-rev2	2008-12-01	Simon Holdsworth	Added comments identifying those updates that relate to RFC2119 language (issue 52)
cd01-rev3	2008-12-02	Simon Holdsworth	Final RFC2119 language updates BINDINGS-52

cd01-rev4	2009-01-09	Simon Holdsworth	Updates to resolve following issues: BINDINGS-7 BINDINGS-31 BINDINGS-40 BINDINGS-42 BINDINGS-44 BINDINGS-50
cd02	2009-02-16	Simon Holdsworth	Rename and editorial updates
cd02-rev1	2009-05-22	Simon Holdsworth	Updates to resolve issue BINDINGS-62 (conformance statement numbering) Updated assembly namespace to 200903 Fixed errors in schema
cd02-rev2	2009-05-22	Simon Holdsworth	Updates to resolve following issues: BINDINGS-39 BINDINGS-59 BINDINGS-65 BINDINGS-66 BINDINGS-67 BINDINGS-68 BINDINGS-70 BINDINGS-71
cd02-rev3	2009-06-18	Simon Holdsworth	Editorial concerns addressed Added acknowledgements appendix
cd02-rev4	2009-06-19	Simon Holdsworth	Updates to resolve following issues BINDINGS-74 Some editorial updates Fixed normative statement missed in application of BINDINGS-67
cd02-rev5	2009-06-24	Simon Holdsworth	Updates to resolve following issues BINDINGS-77 Renamed document to old form Removed editorial commentary Editorial fixes around external references; changed all links to hyperlinks
cd02-rev6	2009-06-24	Simon Holdsworth	Fixed application of BINDINGS-74 Fixed broken cross reference Changed ASCII to UTF-8 in examples
