Abstract:

This document is intended for developers and architects who wish to design systems and applications that interoperate using the Key Management Interoperability Protocol specification.

Status:

This document was last revised or approved by the Key Management Interoperability Protocol TC on the above date. The level of approval is also listed above. Check the "Latest Version" or "Latest Approved Version" location noted above for possible later revisions of this document.

Technical Committee members should send comments on this specification to the Technical Committee's email list. Others should send comments to the Technical Committee by using the

“Send A Comment” button on the Technical Committee’s web page at <http://www.oasis-open.org/committees/kmip/>.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Technical Committee web page (<http://www.oasis-open.org/committees/kmip/ipr.php>).

The non-normative errata page for this specification is located at <http://www.oasis-open.org/committees/kmip/>.

Copyright © OASIS® 2009. All Rights Reserved.

All capitalized terms in the following text have the meanings assigned to them in the OASIS Intellectual Property Rights Policy (the "OASIS IPR Policy"). The full Policy may be found at the OASIS website.

This document and translations of it may be copied and furnished to others, and derivative works that comment on or otherwise explain it or assist in its implementation may be prepared, copied, published, and distributed, in whole or in part, without restriction of any kind, provided that the above copyright notice and this section are included on all such copies and derivative works. However, this document itself may not be modified in any way, including by removing the copyright notice or references to OASIS, except as needed for the purpose of developing any document or deliverable produced by an OASIS Technical Committee (in which case the rules applicable to copyrights, as set forth in the OASIS IPR Policy, must be followed) or as required to translate it into languages other than English.

The limited permissions granted above are perpetual and will not be revoked by OASIS or its successors or assigns.

This document and the information contained herein is provided on an "AS IS" basis and OASIS DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY WARRANTY THAT THE USE OF THE INFORMATION HEREIN WILL NOT INFRINGE ANY OWNERSHIP RIGHTS OR ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

OASIS requests that any OASIS Party or any other party that believes it has patent claims that would necessarily be infringed by implementations of this OASIS Committee Specification or OASIS Standard, to notify OASIS TC Administrator and provide an indication of its willingness to grant patent licenses to such patent claims in a manner consistent with the IPR Mode of the OASIS Technical Committee that produced this specification.

OASIS invites any party to contact the OASIS TC Administrator if it is aware of a claim of ownership of any patent claims that would necessarily be infringed by implementations of this specification by a patent holder that is not willing to provide a license to such patent claims in a manner consistent with the IPR Mode of the OASIS Technical Committee that produced this specification. OASIS may include such claims on its website, but disclaims any obligation to do so.

OASIS takes no position regarding the validity or scope of any intellectual property or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; neither does it represent that it has made any effort to identify any such rights. Information on OASIS' procedures with respect to rights in any document or deliverable produced by an OASIS Technical Committee can be found on the OASIS website. Copies of claims of rights made available for publication and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementers or users of this OASIS Committee Specification or OASIS Standard, can be obtained from the OASIS TC Administrator. OASIS makes no representation that any information or list of intellectual property rights will at any time be complete, or that any claims in such list are, in fact, Essential Claims.

The names "OASIS", [insert specific trademarked names and abbreviations here] are trademarks of OASIS, the owner and developer of this specification, and should be used only to refer to the organization and its official outputs. OASIS welcomes reference to, and implementation and use of, specifications, while reserving the right to enforce its marks against misleading uses. Please see <http://www.oasis-open.org/who/trademark.php> for above guidance.

1 Introduction

This document is intended as a specification of the protocol used for the communication between clients and servers to perform certain management operations on objects stored and maintained by a key management system. These objects are referred to as *Managed Objects* in this specification. They include symmetric and asymmetric cryptographic keys, digital certificates, and templates used to simplify the creation of objects and control their use. Managed Objects are managed with *operations* that include the ability to generate cryptographic keys, register objects with the key management system, obtain objects from the system, destroy objects from the system, and search for objects maintained by the system. Managed Objects also have associated *attributes*, which are named values stored by the key management system and are obtained from the system via operations. Certain attributes are added, modified, or deleted by operations.

The protocol specified in this document includes several certificate-related functions for which there are a number of existing protocols – namely Validate (e.g., SVP or XKMS), Certify (e.g. CMP, CMC, SCEP) and Re-certify (e.g. CMP, CMC, SCEP). The protocol does not attempt to define a comprehensive certificate management protocol such as would be REQUIRED for a certification authority. However, it does include functions that are needed to allow a key server to provide a proxy for certificate management functions.

In addition to the normative definitions for managed objects, operations and attributes, this specification also includes normative definitions for the following aspects of the protocol:

- The expected behavior of the server and client as a result of operations
- Message contents and formats
- Authentication profiles for clients and servers
- Message encoding (including enumerations)
- Error handling

This specification is complemented by two other documents. The Usage Guide provides illustrative information on using the protocol. The Test Specification provides samples of protocol messages corresponding to a set of defined test cases.

1.1 Document Roadmap

TBD

1.2 Goals and Requirements

TBD

1.3 Notational Conventions

TBD

1.4 Namespaces

TBD

1.5 Terminology

TBD

37 **1.6 Normative References**

38 TBD

39 RFC 2119, "Key words for use in RFCs to Indicate Requirement Levels", S. Bradner, March 1997.

40 **1.7 Non-normative References**

41 TBD

42 **1.8 Compliance**

43 TBD

44 The key words "SHALL", "SHALL NOT", "REQUIRED", "SHOULD", "SHOULD NOT",

45 "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC

46 2119. The words 'must', 'can', and 'will' are forbidden.

47 2 Objects

48 The following subsections describe the objects that are passed between the clients and servers of the key
49 management system. Some of these object types, called *Base Objects*, are used only in the protocol
50 itself, and are not considered Managed Objects. Key management systems MAY choose to support a
51 subset of the Managed Objects. The object descriptions refer to the primitive data types of which they are
52 composed. These primitive data types are

- 53 • Integer
- 54 • Long Integer
- 55 • Big Integer
- 56 • Enumeration – choices from a predefined list of values
- 57 • Boolean
- 58 • Text String – string of characters representing human-readable text
- 59 • Octet String – sequence of unencoded byte values
- 60 • Date-Time – date and time, with a granularity of one second
- 61 • Interval – time interval expressed in seconds

62 Structures are composed of ordered lists of primitive data types or structures.

63 2.1 Base Objects

64 These objects are used within the messages of the protocol, but are not objects managed by the key
65 management system. They are components of Managed Objects.

66 2.1.1 Attribute

67 An Attribute object is a structure (see [Table 1](#)) used for sending and receiving Managed Object attributes.
68 The *Attribute Name* is a text-string that is used to identify the attribute. The *Attribute Index* is an index
69 number assigned by the key management server when a specified named attribute is allowed to have
70 multiple instances. The Attribute Index is used to identify the particular instance. Attribute Indices SHALL
71 start with 0. The Attribute Index of an attribute SHALL NOT change when other instances are added or
72 deleted. For example, if a particular attribute has 4 instances with Attribute Indices 0, 1, 2 and 3, and the
73 instance with Attribute Index 2 is deleted, then the Attribute Index of instance 3 is not changed. Attributes
74 that have a single instance have an Attribute Index of 0, which is assumed if the Attribute Index is not
75 specified. The *Attribute Value* is either a primitive data type or structured object, depending on the
76 attribute.

Deleted: Table 1

| Object | Encoding | REQUIRED |
|-----------------|---|----------|
| Attribute | Structure | Yes |
| Attribute Name | Text String | Yes |
| Attribute Index | Integer | No |
| Attribute Value | Varies, depending on attribute. See Section 3 | Yes |

Deleted: Yes

77 **Table 1: Attribute Object Structure**

78 2.1.2 Credential

79 A credential is a structure (see [Table 2](#)) used for client identification purposes and is not managed by the
80 key management system (e.g., user id/password pairs, Kerberos tokens, etc). See Section 8 .

Deleted: Table 2

| Object | Encoding | REQUIRED |
|------------------|--------------|----------|
| Credential | Structure | Yes |
| Credential Type | Enumeration | Yes |
| Credential Value | Octet String | Yes |

Deleted: Yes

Table 2: Credential Object Structure

2.1.3 Key Block

A *Key Block* object is a structure (see [Table 3](#)) used to encapsulate all of the information that is closely associated with a cryptographic key. It contains a Key Value of one of the following *Key Format Types*:

Deleted: Table 3

Deleted: Value

- *Raw* – This is a key that contains only cryptographic key material, encoded as a string of bytes.
- *Opaque* – This is an encoded key for which the encoding is unknown to the key management system. It is encoded as a string of bytes.
- *PKCS1* – This is an encoded private key, expressed as a DER-encoded ASN.1 PKCS#1 object.
- *PKCS8* – This is an encoded private key, expressed as a DER-encoded ASN.1 PKCS#8 object, supporting both RSAPrivateKey syntax and EncryptedPrivateKey.
- Several *Transparent Key* types – These are algorithm-specific structures containing defined values for the various key types, as defined in Section [2.1.7](#).
- [ECPrivateKey](#) – This is an ASN.1 encoded elliptic curve private key.
- *Extensions* – These are vendor-specific extensions to allow for proprietary or legacy key formats.

Deleted: 2.1.7.

Inserted: .

Deleted: .

Formatted: Indent: Left: 0.25", Outline numbered + Level: 1 + Numbering Style: Bullet + Aligned at: 0.5" + Tab after: 0.75" + Indent at: 0.75", Tabs: 0.5", List tab + Not at 0.75"

The Key Block MAY contain the Key Compression Type, which indicates the format of the elliptic curve public key. By default, the public key is uncompressed.

The Key Block also contains the Cryptographic Algorithm and the Cryptographic Length of the key contained in the Key Value field. Some example values are:

- RSA keys are typically 1024, 2048 or 3072 bits in length
- 3DES keys are typically 168 bits in length
- AES keys are typically 128 or 256 bits in length

Deleted: optionally

The Key Block SHALL contain a Key Wrapping Data structure if the key in the Key Value field is wrapped (i.e., encrypted, or MACed/signed, or both).

| Object | Encoding | REQUIRED |
|--------------------------------------|---|---|
| Key Block | Structure | Yes |
| Key Format Type | Enumeration | Yes |
| Key Compression Type | Enumeration | No |
| Key Value | Octet String: for wrapped Key Value; Structure: for plaintext Key Value | Yes |
| Cryptographic Algorithm | Enumeration | Yes, MAY be omitted only if this information is available from the Key Value. Does not apply to Secret Data or Opaque Objects. If present, Cryptographic Length SHALL also be present. |
| Cryptographic Length | Integer | Yes, MAY be omitted only if this information is available from the Key Value. Does not apply to Secret Data or Opaque Objects. If present, Cryptographic Algorithm SHALL also be present. |
| Key Wrapping Data | Structure | No, SHALL only be present if the key is wrapped. |

Deleted: Yes

Deleted: Value

104

Table 3: Key Block Object Structure

105 2.1.4 Key Value

106 The *Key Value* is used only inside a Key Block and is either an Octet String or a structure (see [Table 4](#)):

Deleted: Table 4

- 107 • The Key Value structure contains the key material, either as an octet string or as a Transparent
- 108 Key structure (see Section 2.1.7), and OPTIONAL attribute information that is associated and
- 109 encapsulated with the key material. This attribute information differs from the attributes
- 110 associated with Managed Objects, and which is obtained via the Get Attributes operation, only by
- 111 the fact that it is encapsulated with (and possibly wrapped with) the key material itself.
- 112 • The Key Value Octet String is the wrapped TTLV-encoded (see Section 9.1) Key Value structure.

| Object | Encoding | REQUIRED |
|--------------|--|---------------------|
| Key Value | Structure | Yes |
| Key Material | Octet String: for Raw, Opaque, PKCS1, PKCS8, ECPrivateKey , or Vendor Extension Key Format types; Structure: for Transparent, or Vendor Extension Key Format Types | Yes |
| Attribute | Attribute Object, see | No. MAY be repeated |

Deleted: Yes

Deleted: Value

Deleted: Value

113

Table 4: Key Value Object Structure

114 **2.1.5 Key Wrapping Data**

115 The Key Block MAY also supply OPTIONAL information about a cryptographic key wrapping mechanism
 116 used to wrap the Key Value. This consists of a *Key Wrapping Data* structure (see [Table 5](#)). The Key Block
 117 is only used inside a Key Block.

Deleted: Table 5

118 This structure contains fields for:

- 119 • A *Wrapping Method*, which indicates the method used to wrap the Key Value.
- 120 • *Encryption Key Information*, which contains the Unique Identifier value of the encryption key and
 121 associated cryptographic parameters.
- 122 • *MAC/Signature Key Information*, which contains the Unique Identifier value of the MAC/signature
 123 key and associated cryptographic parameters.
- 124 • A *MAC/Signature*, which contains the MAC or signature of the Key Value.
- 125 • An *IV/Counter/Nonce*, if REQUIRED by the wrapping method.

Formatted: Outline numbered +
 Level: 1 + Numbering Style: Bullet +
 Aligned at: 0.25" + Tab after: 0.5"
 + Indent at: 0.5", Tabs: 0.5", Left

126 If wrapping is used, then the whole Key Value structure is wrapped unless otherwise specified by the
 127 Wrapping Method. The algorithms are given by the Cryptographic Algorithm attributes of the encryption
 128 key and/or MAC/signature key; the block-cipher mode, padding method, and hashing algorithm used are
 129 given by the Cryptographic Parameters in the Encryption Key Information and/or MAC/Signature Key
 130 Information, or, if not present, from the Cryptographic Parameters attribute of the respective key(s).

131 The following wrapping methods are currently defined:

- 132 • *Encrypt* only (i.e., encryption using a symmetric key or public key, or authenticated encryption
 133 algorithms that use a single key)
- 134 • *MAC/sign* only (i.e., either MACing the Key Value with a symmetric key, or signing the Key Value
 135 with a private key)
- 136 • *Encrypt then MAC/sign*
- 137 • *MAC/sign then encrypt*
- 138 • *TR-31*
- 139 • *Extensions*

| Object | Encoding | REQUIRED |
|-------------------------------|--------------|--|
| Key Wrapping Data | Structure | |
| Wrapping Method | Enumeration | Yes |
| Encryption Key Information | Structure | No. Corresponds to the key that was used to encrypt the Key Value. |
| MAC/Signature Key Information | Structure | No. Corresponds to the symmetric key used to MAC the Key Value or the private key used to sign the Key Value |
| MAC/Signature | Octet String | No |
| IV/Counter/Nonce | Octet String | No |

Deleted: Yes

140

Table 5: Key Wrapping Data Object Structure

141 The structures of the Encryption Key Information (see [Table 6](#)) and the MAC/Signature Key Information
 142 (see [Table 7](#)) are as follows:

Deleted: Table 6

Deleted: Table 7

| Object | Encoding | REQUIRED |
|----------------------------|-------------|----------|
| Encryption Key Information | Structure | |
| Unique Identifier | Text string | Yes |
| Cryptographic Parameters | Structure | No |

Deleted: Yes

143 **Table 6: Encryption Key Information Object Structure**

| Object | Encoding | REQUIRED |
|-------------------------------|-------------|--|
| MAC/Signature Key Information | Structure | |
| Unique Identifier | Text string | Yes. It MAY be the Unique Identifier of the Symmetric Key used to MAC, or of the Private Key (or its corresponding Public Key) used to sign. |
| Cryptographic Parameters | Structure | No |

Deleted: Yes

144 **Table 7: MAC/Signature Key Information Object Structure**

145 2.1.6 Key Wrapping Specification

146 This is a separate structure (see [Table 8](#)) defined for operations that provide the option to return wrapped
 147 keys. The *Key Wrapping Specification* SHALL be specified inside the operation request if clients request
 148 the server to return a wrapped key. If Cryptographic Parameters are specified in the Encryption Key
 149 Information and the MAC/Signature Key Information, then the server SHALL verify that they match one of
 150 the instances of the Cryptographic Parameters attribute of the corresponding key. If Cryptographic
 151 Parameters are omitted, then the server SHALL use the Cryptographic Parameters attribute with the
 152 lowest Attribute Index of the corresponding key. If the corresponding key does not have any
 153 Cryptographic Parameters attribute, or if no match is found, then an error is returned.

Deleted: Table 8

154 This structure contains:

- 155 • A Wrapping Method that indicates the method used to wrap the Key Value.
- 156 • An Encryption Key Information with the Unique Identifier value of the encryption key and
 157 associated cryptographic parameters.
- 158 • A MAC/Signature Key Information with the Unique Identifier value of the MAC/signature key and
 159 associated cryptographic parameters.
- 160 • Zero or more Attribute Names to indicate the attributes to be wrapped with the key material.

Formatted: Outline numbered +
 Level: 1 + Numbering Style: Bullet +
 Aligned at: 0.25" + Tab after: 0.5"
 + Indent at: 0.5", Tabs: 0.5", Left

| Object | Encoding | REQUIRED |
|-------------------------------|-------------|---------------------|
| Key Wrapping Specification | Structure | Deleted: Yes |
| Wrapping Method | Enumeration | Yes |
| Encryption Key Information | Structure | No |
| MAC/Signature Key Information | Structure | No |
| Attribute Name | Text String | No, MAY be repeated |

161 **Table 8: Key Wrapping Specification Object Structure**

162 The structures of the Encryption Key Information and the MAC/Signature Key Information are defined in
 163 Section 2.1.5 .

164 **2.1.7 Transparent Key Structures**

165 *Transparent Key* structures describe key material in a form that is easily interpreted by all participants in
 166 the protocol. They are used in the Key Value structure.

167 **2.1.7.1 Transparent Symmetric Key**

168 If the [Key Format Type](#) in the Key Block is *Transparent Symmetric Key*, then Key Material is a structure
 169 as shown in [Table 9](#).

| Object | Encoding | REQUIRED |
|--------------|--------------|--------------|
| Key Material | Structure | Deleted: Yes |
| Key | Octet String | Yes |

170 **Table 9: Key Material Object Structure for Transparent Symmetric Keys**

171 **2.1.7.2 Transparent DSA Private Key**

172 If the [Key Format Type](#) in the Key Block is *Transparent DSA Private Key*, then Key Material is a structure

2.1.8 Template-Attribute Structures

234
235

These structures are used in various operations to provide the desired attribute values and/or template names in the request and to return the actual attribute values in the response.

236
237

The *Template-Attribute*, *Common Template-Attribute*, *Private Key Template-Attribute*, and *Public Key Template-Attribute* structures are defined identically as follows:

| Object | Encoding | REQUIRED |
|--|-------------------------------------|----------------------|
| Template-Attribute, Common Template-Attribute, Private Key Template-Attribute, Public Key Template-Attribute | Structure | |
| Name | Structure, see Section 3.2 | No, MAY be repeated. |
| Attribute | Attribute Object, see Section 2.1.1 | No, MAY be repeated |

Deleted: Yes

238

Deleted: 20

240

2.2 Managed Objects

241
242
243

Managed Objects are objects that are the subjects of key management operations, which are described in Sections 4 and 1. *Managed Cryptographic Objects* are the subset of Managed Objects that contain cryptographic material (e.g. certificates, keys, and secret data).

Deleted: 5

244

2.2.1 Certificate

245

A Managed Cryptographic Object that is a digital certificate (e.g., an encoded X.509 certificate).

| Object | Encoding | REQUIRED |
|-------------------|--------------|----------|
| Certificate | Structure | |
| Certificate Type | Enumeration | Yes |
| Certificate Value | Octet String | Yes |

Deleted: Yes

| Private Key | Structure | Yes |
| Key Block | Structure | Yes |

Table 26: Private Key Object Structure

Deleted: Yes

Deleted: 26

Inserted: 26

Deleted: 24

2.2.5 Split Key

A Managed Cryptographic Object that is a split key. A split key is a secret, usually a symmetric key or a private key that has been split into a number of parts, each of which MAY then be distributed to several key holders, for additional security. The *Split Key Parts* field contains the total number of parts, and the *Split Key Threshold* field contains the minimum number of parts needed to reconstruct the entire key. The *Key Part Identifier* indicates which key part is contained in the cryptographic object, and SHALL be at least 1 and SHALL be less than or equal to Split Key Parts.

| Object | Encoding | REQUIRED |
|---------------------|-------------|--|
| Split Key | Structure | Yes |
| Split Key Parts | Integer | Yes |
| Key Part Identifier | Integer | Yes |
| Split Key Threshold | Integer | Yes |
| Split Key Method | Enumeration | Yes |
| Prime Field Size | Big Integer | No, REQUIRED only if Split Key Method is Polynomial Sharing Prime Field. |
| Key Block | Structure | Yes |

Table 27: Split Key Object Structure

Deleted: Yes

Deleted: 27

Deleted: 25

Inserted: 27

There are three *Split Key Methods* for secret sharing: the first one is based on XOR and the other two are based on polynomial secret sharing, according to Adi Shamir, "How to share a secret", Communications of the ACM, vol. 22, no. 11, pp. 612-613.

268 Let L be the minimum number of bits needed to represent all values of the secret.

269 | • When the Split Key Method is XOR, then the Key Material in the Key Value of the Key Block is of
270 | length L bits. The number of split keys is Split Key Parts (identical to Split Key Threshold), and
271 | the secret is reconstructed by XORing all of the parts.

272 | • When the Split Key Method is Polynomial Sharing Prime Field, then secret sharing is performed
273 | in the field $GF(\text{Prime Field Size})$, represented as integers, where Prime Field Size is a prime
274 | bigger than 2^L .

275 | • When the Split Key Method is Polynomial Sharing $GF(2^{16})$, then secret sharing is performed in
276 | the field $GF(2^{16})$. The Key Material in the Key Value of the Key Block is a bit string of length L ,
277 | and when L is bigger than 2^{16} , then secret sharing is applied piecewise in pieces of 16 bits each.
278 | The Key Material in the Key Value of the Key Block is the concatenation of the corresponding
279 | shares of all pieces of the secret.

280 Secret sharing is performed in the field $GF(2^{16})$, which is represented as an algebraic extension of
281 $GF(2^8)$:

282 $GF(2^{16}) \approx GF(2^8)[y]/(y^2+y+m)$, where m is defined later.

283 An element of this field then consists of a linear combination $uy + v$, where u and v are elements
284 of the smaller field $GF(2^8)$.

285 The representation of field elements and the notation in this section rely on FIPS PUB 197,
286 Sections 3 and 4. The field $GF(2^8)$ is as described in FIPS PUB 197,

287 $GF(2^8) \approx GF(2)[x]/(x^8+x^4+x^3+x+1)$.

288 An element of $GF(2^8)$ is represented as an octet. Addition and subtraction in $GF(2^8)$ is performed
289 as a bit-wise XOR of the octets. Multiplication and inversion are more complex (see FIPS PUB
290 197 Section 4.1 and 4.2 for details).

291 An element of $GF(2^{16})$ is represented as a pair of octets (u, v) . The element m is given by

292 $m = x^5+x^4+x^3+x$,

293 which is represented by the octet 0x3A (or {3A} in notation according to FIPS PUB 197).

294 Addition and subtraction in $GF(2^{16})$ both correspond to simply XORing the octets. The product of
295 two elements $ry + s$ and $uy + v$ is given by

296 $(ry + s)(uy + v) = ((r + s)(u + v) + sv)y + (ru + svm)$.

297 The inverse of an element $uy + v$ is given by

298 $(uy + v)^{-1} = ud^1y + (u + v)d^1$, where $d = (u + v)v + mu^2$.

299 2.2.6 Template

300 A Template is a named Managed Object containing the client-settable attributes of a Managed
301 Cryptographic Object (i.e., a stored, named list of attributes). A Template is used to specify the attributes
302 of a new Managed Cryptographic Object in various operations. It is intended to be used to specify the
303 cryptographic attributes of new objects in a standardized or convenient way. None of the client-settable
304 attributes specified in a Template except the Name attribute apply to the template object itself, but instead
305 apply to any object created using the Template.

306 The Template MAY be the subject of the Register, Locate, Get, Get Attributes, Get Attribute List, Add
307 Attribute, Modify Attribute, Delete Attribute, and Destroy operations.

308 An attribute specified in a Template is applicable either to the Template itself or to objects created using
309 the Template.

310 Attributes applicable to the Template itself are: Unique Identifier, Object Type, Name, Initial Date, Archive
311 Date, and Last Changed Date.

312 Attributes applicable to objects created using the Template are:

- 313 • Cryptographic Algorithm
- 314 • Cryptographic Length
- 315 • [Cryptographic Domain Parameters](#)
- 316 • Cryptographic Parameters
- 317 • Operation Policy Name
- 318 • Cryptographic Usage Mask
- 319 • Usage Limits
- 320 • Activation Date
- 321 • Process Start Date
- 322 • Protect Stop Date
- 323 • Deactivation Date
- 324 • Object Group
- 325 • Application Specific Information
- 326 • Contact Information
- 327 • Custom Attribute

2.2.7 Secret Data

330 A Managed Cryptographic Object containing a shared secret value that is not a key or certificate (e.g., a
 331 password). The Key Block of the *Secret Data* object contains a Key Value of the Opaque type. The Key
 332 Value MAY be wrapped.

338 3 Attributes

339 The following subsections describe the attributes that are associated with Managed Objects. These
 340 attributes are able to be obtained by a client from the server using the Get Attribute operation. Some
 341 attributes are able to be set by the Add Attribute operation or updated by the Modify Attribute operation,
 342 and some are able to be deleted by the Delete Attribute operation if they no longer apply to the Managed
 343 Object.

344 When attributes are returned by the server (e.g., via a Get Attributes operation), the returned attribute
 345 value MAY differ depending on the client (e.g., the Cryptographic Usage Mask value MAY be different for
 346 different clients, depending on the policy of the server).

347 The attribute name contained in the first row of the Object column of the first table in each subsection is
 348 the canonical name used when managing attributes using the Get Attributes, Get Attribute List, Add
 349 Attribute, Modify Attribute, and Delete Attribute operations.

350 The second table in each subsection lists certain attribute characteristics (e.g., "SHALL always have a
 351 value"). The "When implicitly set" characteristic indicates which operations (other than operations that
 352 manage attributes) are able to implicitly add to or modify the attribute of the object, which MAY be
 353 object(s) on which the operation is performed or object(s) created as a result of the operation. Implicit
 354 attribute changes MAY occur even if the attribute is not specified in the operation request itself.

355 3.1 Unique Identifier

356 The *Unique Identifier* is generated by the key management system to uniquely identify a Managed Object.
 357 It is only REQUIRED to be unique within the identifier space managed by a single key management
 358 system, however it is RECOMMENDED that this identifier be globally unique, to allow for key
 359 management domain export of such objects. This attribute SHALL be assigned by the key management
 360 system at creation or registration time, and then SHALL NOT be changed or deleted by any entity at any
 361 time.

| Object | Encoding |

363 **Table 32: Unique Identifier Attribute Rules**

364 3.2 Name

365 The *Name* attribute is a structure (see [Table 33](#)) used to identify and locate the object, assigned by the
 366 client, and that humans are able to interpret. The key management system MAY specify rules by which
 367 the client creates valid names. Clients are informed of such rules by a mechanism that is not specified by

3.10 Certificate Subject

The Certificate Subject attribute is a structure (see Table 50) used to identify the subject of a certificate, containing the Subject Distinguished Name (i.e., from the Subject field of the certificate). It MAY include one or more alternative names (e.g., email address, IP address, DNS name) for the subject of the certificate (i.e., from the Subject Alternative Name extension within the certificate). These values SHALL be set by the server when the certificate is created or registered and SHALL NOT be changed until the certificate is renewed.

3.11 Certificate Issuer

The Certificate Issuer attribute is a structure (see Table 53) used to identify the issuer of a certificate, containing the Issuer Distinguished Name (i.e., from the Issuer field of the certificate). It MAY include one or more alternative names (e.g., email address, IP address, DNS name) for the issuer of the certificate (i.e., from the Issuer Alternative Name extension within the certificate). The server SHALL set these values based on the information it extracts from a certificate that is created as a result of a Certify or a Re-certify operation or is sent as part of a Register operation. These values SHALL NOT be changed during the lifespan of the certificate.

| Object | Encoding | REQUIRED |

3.12 Digest

The Digest attribute is a structure (see Table 54) that contains the digest value of the key or secret data (i.e., digest of the Key Material), certificate (i.e., digest of the Certificate Value), or opaque object (i.e., digest of the Opaque Data Value). Multiple digests MAY be calculated using different algorithms. The mandatory digest SHALL be computed with the SHA-256 hashing algorithm; the server MAY store additional digests. The digest(s) are static and SHALL be generated by the server when the object is created or registered.

455

3.13 Operation Policy Name

456

An operation policy controls what entities MAY perform which key management operations on the object.

457

The content of the *Operation Policy Name* attribute is the name of a policy object known to the key

458

management system and therefore server dependent. The named policy objects are created and

459

managed using mechanisms outside the scope of the protocol. The policies determine what entities MAY

460

perform specified operations on the object, and which of the object's attributes MAY be modified or

461

deleted. The Operation Policy Name attribute SHOULD be set when operations that result in a new

462

Managed Object on the server are executed. It is set either explicitly or via some default set by the server,

463

which then applies to all subsequent operations on the object.

| Object | Encoding | REQUIRED |

3.14 Cryptographic Usage Mask

The *Cryptographic Usage Mask* defines the cryptographic usage of a key. This is a bit mask that indicates to the client which cryptographic functions MAY be performed using the key.

- Sign
- Verify
- Encrypt
- Decrypt
- Wrap Key
- Unwrap Key
- Export
- MAC Generate
- MAC Verify
- Derive Key
- Content Commitment
- Key Agreement
- Certificate Sign
- CRL Sign

- 519 • Generate Cryptogram
- 520 • Validate Cryptogram
- 521 • Translate Encrypt
- 522 • Translate Decrypt
- 523 • Translate Wrap
- 524 • Translate Unwrap

525 This list takes into consideration values that MAY appear in the Key Usage extension in an X.509
 526 certificate. However, the list does not consider the additional usages that MAY appear in the Extended
 527 Key Usage extension.

528 X.509 Key Usage values SHALL be mapped to Cryptographic Usage Mask values in the following
 529 manner:

| X.509 Key Usage to Cryptographic Usage Mask Mapping | |
|---|---|
| X.509 Key Usage Value | Cryptographic Usage Mask Value |
| digitalSignature | Sign and Verify |
| contentCommitment | Content Commitment (Non Repudiation) |
| keyEncipherment | Wrap Key and Unwrap Key |
| dataEncipherment | Encrypt and Decrypt |
| keyAgreement | Key Agreement |
| keyCertSign | Certificate Sign |
| cRLSign | CRL Sign |
| encipherOnly | Encrypt |
| decipherOnly | Decrypt |

533

534 3.15 Lease Time

535 The *Lease Time* attribute defines a time interval for a Managed Cryptographic Object that indicates how
 536 long a client SHOULD use the object. This attribute always holds the initial value of a lease, and not the
 537 actual remaining time. Once the lease expires, then the client is only able to renew the lease by calling
 538 Obtain Lease. A server SHOULD store in this attribute the maximum Lease Time it is able to serve and a
 539 client obtains lease time (with Obtain Lease) that is less than or equal to the maximum Lease Time. This
 540 attribute is read-only for clients. It SHALL be modified by the server only.

542

543 3.16 Usage Limits

544 This is a mechanism for limiting the usage of a Managed Cryptographic Object. It only applies to
 545 Managed Cryptographic Objects that are able to be used for protection purposes (e.g., symmetric keys,
 546 private keys, public keys, etc.), and it SHALL only reflect their usage for protection (e.g., encryption,
 547 signing, etc.). This attribute does not necessarily exist for all Managed Cryptographic Objects, since some
 548 objects are able to be used without limit, depending on client/server policies. Usage for process purposes
 549 (e.g., decryption, verification, etc.) is not limited. The attribute has four fields for two different types of
 550 limits. Exactly one of these two types (i.e., either bytes or objects) SHALL be present. These limits are:

- 551 • *Usage Limits Total Bytes* – the total number of bytes allowed to be protected. This is the total
552 value for the entire life of the object, and SHALL NOT be changed once the object begins to be
553 used for protection purposes.
- 554 • *Usage Limits Byte Count* – the currently remaining number of bytes allowed to be protected.
- 555 • *Usage Limits Total Objects* – the total number of objects allowed to be protected. This is the total
556 value for the entire life of the object, and SHALL NOT be changed once the object begins to be
557 used for protection purposes.
- 558 • *Usage Limits Object Count* – the currently remaining number of objects allowed to be protected.

559 When the attribute is initially set (usually during object creation or registration), the values set are the
560 Total values allowed for the useful life of the object. The count values SHALL be ignored by the server if
561 the attribute is specified in an operation that creates a new object. Changes made via the Modify Attribute
562 operation reflect corrections to these Total values, but they SHALL NOT be changed once the count
563 values have changed by a Get Usage Allocation operation. The count values SHALL NOT be set or
564 modified by the client via the Add Attribute or Modify Attribute operations.

| Object | Encoding | REQUIRED |
|----------------------------|-------------|--|
| Usage Limits | Structure | |
| Usage Limits Total Bytes | Big Integer | No. SHALL be present if Usage Limits Byte Count is present |
| Usage Limits Byte Count | Big Integer | No. SHALL be present if Usage Limits Object Count is not present |
| Usage Limits Total Objects | Big Integer | No. SHALL be present if Usage Limits Object Count is present |
| Usage Limits Object Count | Big Integer | No. SHALL be present if Usage Limits Byte Count is not present |

3.17 State

Formatted: Bullets and Numbering

This attribute is an indication of the state of an object as known to the key management server. The state SHALL NOT be changed by using the Modify Attribute operation on this attribute. The state SHALL only be changed by the server as a part of other operations or other server processes. An object SHALL be in one of the following states at any given time. (Note: These states correspond to those described in NIST Special Publication 800-57).

- *Pre-Active*: The object exists but is not yet usable for any cryptographic purpose.
- *Active*: The object MAY be used for all cryptographic purposes that are allowed by its Cryptographic Usage Mask attribute.
- *Deactivated*: The object SHALL NOT be used for protection purpose (e.g., encryption or signing), but, if permitted by the Cryptographic Usage Mask attribute, then MAY be used for process purposes (e.g., decryption or verification), but only under extraordinary circumstances and when special permission is granted.
- *Compromised*: It is possible that the object has been compromised, and SHOULD only be used for process purposes in a client that is trusted to handle compromised cryptographic objects.
- *Destroyed*: The object is no longer usable for any purpose.
- *Destroyed Compromised*: The object is no longer usable for any purpose; however its compromised status MAY be retained for audit or security purposes.

Formatted: Outline numbered + Level: 1 + Numbering Style: Bullet + Aligned at: 0.25" + Tab after: 0.5" + Indent at: 0.5", Tabs: 0.5", Left

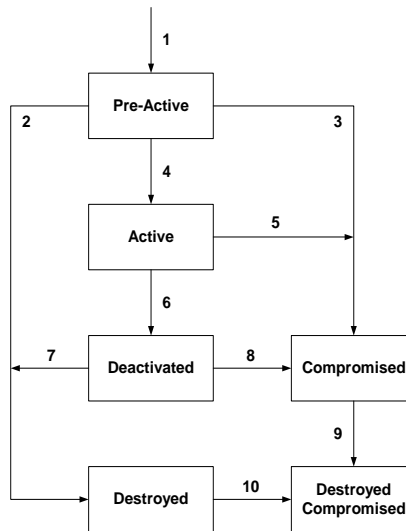

Figure 1: Cryptographic Object States and Transitions

State transitions occur as follows:

1. The transition from a non-existent key to the Pre-Active state is caused by the creation of the object. When an object is created or registered, it automatically goes from non-existent to Pre-Active. If, however, the operation that creates or registers the object contains an Activation Date that has already occurred, then the state immediately transitions to Active. In this case, the server SHALL set the Activation Date attribute to the time when the operation is received, or fail the request attempting to create or register the object, depending on server policy. If the operation contains an Activation Date attribute in the future, or contains no Activation Date, then the Cryptographic Object is initialized in the key management system in the Pre-Active state.
2. The transition from Pre-Active to Destroyed is caused by a client issuing a Destroy operation. The server destroys the object when (and if) server policy dictates.
3. The transition from Pre-Active to Compromised is caused by a client issuing a Revoke operation with a Revocation Reason of Compromised.
4. The transition from Pre-Active to Active SHALL occur in one of three ways:
 - The object has an Activation Date in the future. At the time that the Activation Date is reached, the server changes the state to Active.
 - A client issues a Modify Attribute operation, modifying the Activation Date to a date in the past, or the current date. In this case, the server SHALL either set the Activation Date attribute to the date in the past or fail the operation, depending on server policy.
 - A client issues an Activate operation on the object. The server SHALL set the Activation Date to the time the Activate operation is received.

Formatted: Indent: Left: 0.25", Outline numbered + Level: 1 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: 0" + Tab after: 0.25" + Indent at: 0.25", Tabs: Not at 0.25"

Formatted: Indent: Left: 0.63", Bulleted + Level: 1 + Aligned at: 2" + Tab after: 2.25" + Indent at: 2.25"

- 616 | 5. The transition from Active to Compromised is caused by a client issuing a Revoke operation with
 617 | a Revocation Reason of Compromised.
- 618 | 6. The transition from Active to Deactivated SHALL occur in one of three ways:
- 619 | • The object's Deactivation Date is reached.
- 620 | • A client issues a Revoke operation, with a Revocation Reason other than Compromised.
- 621 | • The client issues a Modify Attribute operation, modifying the Deactivation Date to a date in
 622 | the past, or the current date. In this case, the server SHALL either set the Deactivation
 623 | Date attribute to the date in the past or fail the operation, depending on server policy.
- 624 | 7. The transition from Deactivated to Destroyed is caused by a client issuing a Destroy operation.
 625 | The server destroys the object when (and if) server policy dictates.
- 626 | 8. The transition from Deactivated to Compromised is caused by a client issuing a Revoke operation
 627 | with a Revocation Reason of Compromised.
- 628 | 9. The transition from Compromised to Destroyed Compromised is caused by a client issuing a
 629 | Destroy operation. The server destroys the object when (and if) server policy dictates.
- 630 | 10. The transition from Destroyed to Destroyed Compromised is caused by a client issuing a Revoke
 631 | operation with a Revocation Reason of Compromised.

3.26 Revocation Reason

The Revocation Reason attribute is a structure (see Table 87) used to indicate why the Managed Cryptographic Object was revoked (e.g., "compromised", "expired", "no longer used", etc). This attribute is only changed by the server as a part of the Revoke Operation.

The *Revocation Message* is an OPTIONAL field that is used exclusively for audit trail/logging purposes and MAY contain additional information about why the object was revoked (e.g., "Laptop stolen", or "Machine decommissioned").

3.29 Link

The Link attribute is a structure (see Table 93) used to create a link from one Managed Cryptographic Object to another, closely related target Managed Cryptographic Object. The link has a type, and the allowed types differ, depending on the Object Type of the Managed Cryptographic Object. The *Linked Object Identifier* identifies the target Managed Cryptographic Object by its Unique Identifier. The link contains information associated between the Managed Cryptographic Objects (e.g., the private key corresponding to a public key; the parent certificate for a certificate in a chain; or for a derived symmetric key, the base key from which it was derived).

Possible values of *Link Type* in accordance with the Object Type of the Managed Cryptographic Object are:

- *Private Key Link*. For a Public Key object: the private key corresponding to the public key
- *Public Key Link*. For a Private Key object: the public key corresponding to the private key. For a Certificate object: the public key certified by the certificate
- *Certificate Link*. For Certificate objects: the parent certificate for a certificate in a certificate chain. For Public Key objects: the corresponding certificate(s), containing the same public key
- *Derivation Base Object Link* for a derived Symmetric Key object: the object(s) from which the current symmetric key was derived
- *Derived Key Link*: the symmetric key(s) that were derived from the current object.
- *Replacement Object Link*. For a Symmetric Key, Private Key, or Public Key object: the key that resulted from the re-key of the current key. For a Certificate object: the certificate that resulted from the re-certify. Note that there SHALL be only one such replacement object.
- *Replaced Object Link*. For a Symmetric Key, Private Key, or Public Key object: the key that was re-keyed to obtain the current key. For a Certificate object: the certificate that was re-certified to obtain the current certificate

- Formatted: Outline numbered + Level: 1 + Numbering Style: Bullet + Aligned at: 0.25" + Tab after: 0.5" + Indent at: 0.5", Tabs: 0.5", Left

The Link attribute SHOULD be present for private keys and public keys for which a certificate chain is stored by the server, and for certificates in a certificate chain.

Note that it is possible for a Managed Object to have multiple instances of the Link attribute (e.g., a Private Key has links to the associated certificate as well as the associated public key; a Certificate object has links to both the public key and to the certificate of the certification authority that signed the certificate).

It is also possible that a Managed Object does not have links to associated cryptographic objects. This MAY occur in cases where the associated key material is not available to the server or client (e.g., the

745 registration of a CA Signer certificate with a server, where the corresponding private key is held in a
 746 different manner).

749 3.30 Application Specific Information

750 The Application Specific Information attribute is a structure (see [Table 95](#)) used to store data specific to
 751 the application(s) using the Managed Object. It consists of the following fields: an *Application Namespace*
 752 and *Application Data* specific to that application namespace. A list of standard application namespaces is
 753 provided in [TBD].

Deleted: Table 89

754 Clients MAY request to set (i.e., using any of the operations that results in generating new Managed
 755 Object(s) or adding/modifying the attribute of an existing Managed Object) an instance of this attribute
 756 with a particular Application Namespace while omitting Application Data. In that case, if the server
 757 supports this namespace (as indicated by the Query operation in Section 4.24), then it SHALL return a
 758 suitable Application Data value. If the server does not support this namespace, then an error SHALL be
 759 returned.

760

| Object | Encoding | REQUIRED |

773

774 3.33 Custom Attribute

775 A *Custom Attribute* is a client- or server-defined attribute intended for vendor-specific purposes. It is
 776 created by the client and not interpreted by the server, or is created by the server and MAY be interpreted
 777 by the client. All custom attributes created by the client SHALL adhere to a naming scheme where the
 778 name of the attribute SHALL have a prefix of 'x-', meaning extended. All custom attributes created by the
 779 key management server SHALL adhere to a naming scheme where the name of the attribute SHALL
 780 have a prefix of 'y-'. The tag type Custom Attribute is not able to identify the particular attribute; hence
 781 such an attribute SHALL only appear in an Attribute Structure with its name as defined in Section 2.1.1 .

| Object | Encoding | |
|------------------|----------------------------|--|
| Custom Attribute | Any data type or structure | The name of the attribute SHALL start with 'x-' or 'y-'. |

783

784 4 Client-to-Server Operations

785 The following subsections describe the operations that MAY be requested by a key management client.
786 Not all clients have to be capable of issuing all operation requests; however any client that issues a
787 specific request SHALL be capable of understanding the response to the request. All Object Management
788 operations are sent in requests from clients to servers, and in responses from servers to clients. These
789 operations MAY be combined into a batch, which allows multiple operations to be contained in a single
790 request/response message pair.

791 A number of the operations whose descriptions follow are affected by a mechanism referred to as the *ID*
792 *Placeholder*.

793 The key management server SHALL implement a temporary variable called the ID Placeholder. This
794 value consists of a single Unique Identifier. It is a variable stored inside the server that is only valid and
795 preserved during the execution of a batch of operations. Once the batch of operations has been
796 completed, the ID Placeholder value is discarded and/or invalidated by the server, so that subsequent
797 requests do not find this previous ID Placeholder available.

798 The ID Placeholder is obtained from the Unique Identifier returned by the Create, Create Pair, Register,
799 Derive Key, Re-Key, Certify, Re-Certify, Locate, and Recover operations. If any of these operations
800 successfully completes and returns a Unique Identifier, then the server SHALL copy this Unique Identifier
801 into the ID Placeholder variable, where it is held until the completion of the operations remaining in the
802 batched request. If the Batch Error Continuation Option is set to Stop and the Batch Order Option is set to
803 true, then subsequent operations in the batched request MAY make use of the ID Placeholder by omitting
804 the Unique Identifier field from the request payloads for these operations.

805 Requests MAY contain attribute values to be assigned to the object. This information is specified with a
806 Template-Attribute (see Section 2.1.8) that contains zero or more template names and zero or more
807 individual attributes. If more than one template name is specified, and there is a conflict between the
808 single-instance attributes in the templates, then the value in the subsequent template takes precedence.
809 If there is a conflict between the single-instance attributes in the request and the single-instance attributes
810 in a specified template, then the attribute values in the request take precedence. For multi-value
811 attributes, the union of attribute values is used when the attributes are specified more than once.

812 Responses MAY contain attribute values that were not specified in the request, but have been implicitly
813 set by the server. This information is specified with a Template-Attribute that contains one or more
814 individual attributes.

815 For any operations that operate on Managed Objects already stored on the server, any archived object
816 SHALL first be moved back on-line through a Recover operation (see Section 4.22) before they MAY be
817 specified (i.e., as on-line objects).

818 4.1 Create

819 This operation requests the server to generate a new symmetric key as a Managed Cryptographic Object.
820 This operation is not used to create a Template object (see Register operation, Section 4.3).

821 The request contains information about the type of object being created, and some of the attributes to be
822 assigned to the object (e.g., Cryptographic Algorithm, Cryptographic Length, etc). This information MAY
823 be specified by the names of Template objects that already exist.

824 The response contains the Unique Identifier of the created object. The server SHALL copy the Unique
825 Identifier returned by this operation into the ID Placeholder variable.

| Request Payload | | |
|--------------------|----------|--|
| Object | REQUIRED | Description |
| Object Type | Yes | Determines the type of object to be created. |
| Template-Attribute | Yes | Specifies desired object attributes using templates and/or as individual attributes. |

831 4.2 Create Key Pair

832 This operation requests the server to generate a new public/private key pair and register the two
833 corresponding new Managed Cryptographic Objects.

834 The request contains attributes to be assigned to the objects (e.g., Cryptographic Algorithm,
835 Cryptographic Length, etc). Attributes and Template Names MAY be specified for both keys at the same
836 time by specifying a Common Template-Attribute object in the request. Attributes not common to both
837 keys (e.g., Name, Cryptographic Usage Mask) MAY be specified using the Private Key Template-Attribute
838 and Public Key Template-Attribute objects in the request, which take precedence over the Common
839 Template-Attribute object.

840 A Link Attribute is automatically created by the server for each object, pointing to the corresponding
841 object. The response contains the Unique Identifiers of both created objects. The ID Placeholder value
842 SHALL be set to the Unique Identifier of the Private Key.

| Request Payload | | |
|--------------------------------|----------|--|
| Object | REQUIRED | Description |
| Common Template-Attribute | No | Specifies desired attributes in templates and/or as individual attributes that apply to both the Private and Public Key Objects. |
| Private Key Template-Attribute | No | Specifies templates and/or attributes that apply to the Private Key Object. Order of precedence applies. |
| Public Key Template-Attribute | No | Specifies templates and/or attributes that apply to the Public Key Object. Order of precedence applies. |

Table 106: Create Key Pair Request Payload

843
844 For multi-instance attributes, the union of the values found in the templates and attributes of the
845 Common, Private, and Public Key Template-Attribute is used. For single-instance attributes, the order of
846 precedence is as follows:

- 847 1. attributes specified explicitly in the Private and Public Key Template-Attribute, then
848 2. attributes specified via templates in the Private and Public Key Template-Attribute, then
849 3. attributes specified explicitly in the Common Template-Attribute, then
850 4. attributes specified via templates in the Common Template-Attribute

851 If there are multiple templates in the Common, Private, or Public Key Template-Attribute, then the
852 subsequent value of the single-instance attribute takes precedence.

856

857 4.3 Register

858 This operation requests the server to register a Managed Object that was created by the client or
859 obtained by the client through some other means, allowing the server to manage the object. The
860 arguments in the request are similar to those in the Create operation, but also MAY contain the object
861 itself, for storage by the server. Optionally, objects that are not to be stored by the key management
862 system MAY be omitted from the request (e.g., private keys).

863 The request contains information about the type of object being registered and some of the attributes to
864 be assigned to the object (e.g., Cryptographic Algorithm, Cryptographic Length, etc). This information
865 MAY be specified by the use of a Template-Attribute object.

866 The response contains the Unique Identifier assigned by the server to the registered object. The server
867 SHALL copy the Unique Identifier returned by this operations into the ID Placeholder variable. The Initial
868 Date attribute of the object SHALL be set to the current time.

| Request Payload | | |
|--|----------|--|
| Object | REQUIRED | Description |
| Object Type | Yes | Determines the type of object being registered. |
| Template-Attribute | Yes | Specifies desired object attributes using templates and/or as individual attributes. |
| Certificate, Symmetric Key, Private Key, Public Key, Split Key, Secret Data or Opaque Object | No | The object being registered. The object and attributes MAY be wrapped. Some objects (e.g., Private Keys), MAY be omitted from the request. |

874 4.4 Re-key

875 This request is used to generate a replacement key for an existing symmetric key. It is analogous to the
876 Create operation, except that many of the attributes of the new key are unchanged from the original key.

877 As the replacement key takes over the name attribute of the existing key, Re-key SHOULD only be
878 performed once on a given key.

879 The server SHALL copy the Unique Identifier of the replacement key returned by this operation into the ID
880 Placeholder variable.

881 As a result of Re-key, the Link attribute is set to point to the replacement key.

882 If Offset is set and if such times exist, then the times of the new key SHALL be set based on the times of
883 the existing key as follows:

Deleted: attributes of the existing key are changed similar to performing a Revoke on that key with a Revocation Reason of Superseded, and

| Attribute in Existing Key | Attribute in New Key |
|----------------------------|--|
| Initial Date (IT_1) | Initial Date (IT_2) > IT_1 |
| Activation Date (AT_1) | Activation Date (AT_2) = IT_2 + Offset |

| | |
|-------------------------------|---|
| Process Start Date (CT_1) | Process Start Date = $CT_1 + (AT_2 - AT_1)$ |
| Protect Stop Date (TT_1) | Protect Stop Date = $TT_1 + (AT_2 - AT_1)$ |
| Deactivation Date (DT_1) | Deactivation Date = $DT_1 + (AT_2 - AT_1)$ |

889 4.5 Derive Key

890 This request is used to derive a symmetric key using a key or secret data that is already known to the key
 891 management system. It SHALL only apply to Managed Cryptographic Objects that have the Derive Key
 892 bit set in the Cryptographic Usage Mask attribute of the specified Managed Object (i.e., are able to be
 893 used for key derivation). If the operation is issued for an object that does not have this bit set, then the
 894 server SHALL return a response with a Result Reason of Operation Not Supported. For all derivation
 895 methods, the client SHALL specify the desired length of the derived key or secret using the Cryptographic
 896 Length attribute. If a key is created, then the client SHALL specify both its Cryptographic Length and
 897 Cryptographic Algorithm. If the specified length exceeds the output of the derivation method, then the
 898 server SHALL return an error. Clients have the option to derive multiple keys and IVs by creating a Secret
 899 Data object and specifying a Cryptographic Length that is the total length of the derived object. The length
 900 SHALL NOT exceed the length of the output returned by the chosen derivation method.

901 The fields in the request specify the Unique Identifiers of the keys or secrets to be used for derivation
 902 (e.g., some derivation methods MAY require multiple keys or secrets to derive the result), the method to
 903 be used to perform the derivation, and any parameters needed by the specified method. The method is
 904 specified as an enumerated value. Currently defined derivation methods include:

- 905 • **PBKDF2** – This method is used to derive a symmetric key from a password or pass phrase. The
 906 PBKDF2 method is published in RSA Laboratories' Public-Key Cryptography Standards (PKCS)
 907 series, specifically PKCS #5 v2.0, and also published as Internet Engineering Task Force's RFC
 908 2898.
- 909 • **HASH** – This method derives a key by computing a hash over the derivation key or the derivation
 910 data.
- 911 • **HMAC** – This method derives a key by computing an HMAC over the derivation data.

Formatted: Indent: Left: 0.25", Bulleted + Level: 1 + Aligned at: 0" + Tab after: 0.25" + Indent at: 0.25", Tabs: Not at 0.25"

Formatted: Outline numbered + Level: 1 + Numbering Style: Bullet + Aligned at: 0.25" + Tab after: 0.5" + Indent at: 0.5", Tabs: 0.5", Left

- 912 | • *ENCRYPT* – This method derives a key by encrypting the derivation data.
- 913 | • *NIST800-108-C* – This method derives a key by computing the KDF in Counter Mode as specified
914 | in NIST SP 800-108.
- 915 | • *NIST800-108-F* – This method derives a key by computing the KDF in Feedback Mode as
916 | specified in NIST SP 800-108.
- 917 | • *NIST800-108-DPI* – This method derives a key by computing the KDF in Double-Pipeline Iteration
918 | Mode as specified in NIST SP 800-108.
- 919 | • *Extensions*

920 | The server SHALL perform the derivation function, and then register the derived object as a new
921 | Managed Object, returning the new Unique Identifier for the new object in the response. The server
922 | SHALL copy the Unique Identifier returned by this operation into the ID Placeholder variable.

923 | As a result of Derive Key, the Link attributes (i.e., Derived Key Link in the objects from which the key is
924 | derived, and the Derivation Base Object Link in the derived key) of all objects involved SHALL be set to
925 | point to the corresponding objects.

| Request Payload | | |
|-----------------------|----------------------|---|
| Object | REQUIRED | Description |
| Object Type | Yes | Determines the type of object to be created. |
| Unique Identifier | Yes. MAY be repeated | Determines the object or objects to be used to derive a new key. At most, two MAY be specified: one for the derivation key and another for the secret data. Note that the ID Placeholder is not able to be used here. |
| Derivation Method | Yes | An Enumeration object specifying the method to be used to derive the new key. |
| Derivation Parameters | Yes | A Structure object containing the parameters needed by the specified derivation method. |
| Template-Attribute | Yes | Specifies desired object attributes using templates and/or as individual attributes; length SHALL always be specified and algorithm is REQUIRED for the creation of symmetric keys. |

926 | **Table 116: Derive Key Request Payload**

Deleted: 116

| Response Payload | | |
|--------------------|----------|--|
| Object | REQUIRED | Description |
| Unique Identifier | Yes | The Unique Identifier of the newly derived key. |
| Template-Attribute | No | An OPTIONAL list of object attributes with values that were not specified in the request, but have been implicitly set by the key management server. |

Table 117: Derive Key Response Payload

927
928
929

The *Derivation Parameters* for all derivation methods consist of the following parameters, except PBKDF2, which requires two additional parameters.

Deleted: 117
Inserted: 117
Deleted: 111

| Object | Encoding | REQUIRED |
|--------------------------|--------------|--|
| Derivation Parameters | Structure | Yes |
| Cryptographic Parameters | Structure | Yes, except for HMAC derivation keys. |
| Initialization Vector | Octet String | No, depends on PRF and mode of operation: empty IV is assumed if not provided. |
| Derivation Data | Octet String | Yes, unless the Unique Identifier of a Secret Data object is provided. |

Table 118: Derivation Parameters Structure (Except PBKDF2)

930
931
932
933
934
935
936
937

939
940
941
942
943
944
945
946
947
948

Cryptographic Parameters identify the Pseudorandom Function (PRF) or the mode of operation of the PRF (e.g., if a key is to be derived using the HASH derivation method, then clients are REQUIRED to indicate the hash algorithm inside Cryptographic Parameters; similarly, if a key is to be derived using AES in CBC mode, then clients are REQUIRED to indicate the Block Cipher Mode). The server SHALL verify that the specified mode matches one of the instances of Cryptographic Parameters set for the corresponding key. If Cryptographic Parameters are omitted, then the server SHALL select the Cryptographic Parameters with the lowest Attribute Index for the specified key. If the corresponding key does not have any Cryptographic Parameters attribute, or if no match is found, then an error is returned.

If a key is derived using HMAC, then the attributes of the derivation key provide enough information about the PRF and Cryptographic Parameters are ignored.

Derivation Data is either the data to be encrypted, hashed, or HMACed. For NIST SP 800-108 methods, Derivation Data is Label||{0x00}||Context, where the all-zero octet is OPTIONAL.

Most derivation methods (e.g., ENCRYPT) require a derivation key and the derivation data to be encrypted. The HASH derivation method requires either a derivation key or derivation data. Derivation data MAY either be explicitly provided by the client with the Derivation Data field or implicitly provided by providing the Unique Identifier of a Secret Data object. If both are provided, then an error SHALL be returned.

The PBKDF2 derivation method requires two additional parameters:

| Object | Encoding | REQUIRED |
|--------------------------|-----------|-------------------------|
| Derivation Parameters | Structure | Yes |
| Cryptographic Parameters | Structure | No, depends on the PRF. |

Deleted: 118
Inserted: 118
Deleted: 112

| | | |
|-----------------------|--------------|--|
| Initialization Vector | Octet String | No, depends on PRF and mode of operation: empty IV is assumed if not provided. |
| Derivation Data | Octet String | Yes, unless the Unique Identifier of a Secret Data object is provided. |
| Salt | Octet String | Yes |
| Iteration Count | Integer | Yes |

949

950 4.6 Certify

951 This request is used to obtain a new certificate for a public key. Only a single certificate SHALL be
 952 requested at a time. Server support for this operation is OPTIONAL, as it requires that the key
 953 management system have access to a certification authority.

954 Requests are passed as Octet Strings, which allow multiple certificate request types for X.509 certificates
 955 (e.g., PKCS#10, PEM, etc) or PGP certificates to be submitted to the server.

956 The new Certificate object whose Unique Identifier is returned MAY be obtained by the client via a Get
 957 operation in the same batch, using the ID Placeholder mechanism.

958 As a result of Certify, the Link attribute of the Public Key and of the new Certificate SHALL be set to point
 959 at each other.

960 The server SHALL copy the Unique Identifier of the new certificate returned by this operation into the ID
 961 Placeholder variable.

962 If the information in the Certificate Request conflicts with the attributes specified in the Template-Attribute,
 963 then the information in the Certificate Request takes precedence.

| Object | Request Payload | |
|--------------------------|-----------------|--|
| | REQUIRED | Description |
| Unique Identifier | No | The Unique Identifier of the Public Key being certified. If omitted, then the ID Placeholder is substituted by the server. |
| Certificate Request Type | Yes | An Enumeration object specifying the type of certificate request. |
| Certificate Request | Yes | An Octet String object with the certificate request. |
| Template-Attribute | No | Specifies desired object attributes using templates and/or as individual attributes. |

964

| Response Payload | | |
|--------------------|----------|--|
| Object | REQUIRED | Description |
| Unique Identifier | Yes | The Unique Identifier of the new certificate. |
| Template-Attribute | No | An OPTIONAL list of object attributes with values that were not specified in the request, but have been implicitly set by the key management server. |

Table 121: Certify Response Payload

Deleted: 121

Inserted: 121

Deleted: 115

965

966 4.7 Re-certify

967 This request is used to renew an existing certificate with the same key pair. Only a single certificate
 968 SHALL be renewed at a time. Server support for this operation is OPTIONAL, as it requires that the key
 969 management system have access to a certification authority.

970 Requests are passed as Octet Strings, which allow multiple certificate request types for X.509 certificates
 971 (e.g., PKCS#10, PEM, etc) or PGP certificates to be submitted to the server.

972 The server SHALL copy the Unique Identifier of the certificate returned by this operation into the ID
 973 Placeholder variable.

974 If the information in the Certificate Request conflicts with the attributes specified in the Template-Attribute,
 975 then the information in the Certificate Request takes precedence.

976 Since the new certificate assumes the name attribute of the existing certificate, Re-certify SHOULD only
 977 be performed once on a given certificate.

978 In addition, the Link attribute of the existing certificate and of the new certificate are set to point at each
 979 other. In addition, the Link attribute of the Public Key is changed to point to the new certificate. If *Offset* is
 980 set, then the times of the new certificate SHALL be set based on the times of the existing certificate (if
 981 such times exist) as follows:

Deleted: As a result of Re-certify, attributes of the existing certificate are changed similar to the result of performing a Revoke on that certificate with a Revocation Reason of Superseded.¶

| Attribute in Existing Certificate | Attribute in New Certificate |
|-----------------------------------|--|
| Initial Date (IT_1) | Initial Date (IT_2) > IT_1 |
| Activation Date (AT_1) | Activation Date (AT_2) = $IT_2 + Offset$ |
| Deactivation Date (DT_1) | Deactivation Date = $DT_1 + (AT_2 - AT_1)$ |

986

987 4.8 Locate

988 This operation requests that the server searches for one or more Managed Objects, specified by one or
 989 more attributes. All attributes are allowed to be used. However, no attributes specified in the request
 990 SHOULD contain Attribute Index values. Attribute Index values SHALL be ignored by the *Locate*
 991 operation. The request MAY also contain a *Maximum Items* field, which specifies the maximum number of
 992 objects to be returned. If the Maximum Items field is omitted, then the server MAY return all objects
 993 matched, or MAY impose an internal maximum limit due to resource limitations.

994 If more than one object satisfies the identification criteria specified in the request, then the response MAY
 995 contain Unique Identifiers for multiple Managed Objects. Returned objects SHALL match all of the
 996 attributes in the request. If no objects match, then an empty response payload is returned.

997 The server returns a list of Unique Identifiers of the found objects, which then MAY be retrieved using the
 998 Get operation. If the objects are archived, then the Recover and Get operations are REQUIRED to be
 999 used. If a single Unique Identifier is returned to the client, then the server SHALL copy the Unique
 1000 Identifier returned by this operation into the ID Placeholder variable. If the Locate operation matches
 1001 more than one object, and the Maximum Items value is omitted in the request, or is set to a value larger
 1002 than one, then the server SHALL NOT set the ID Placeholder value, causing any subsequent operations
 1003 that are batched with the Locate, and which do not specify a Unique Identifier explicitly, to fail. This
 1004 ensures that these batched operations SHALL proceed only if a single object is returned by Locate.

1005 When using the Name or Object Group attributes for identification, wild-cards or regular expressions MAY
 1006 be supported by specific key management system implementations.

1007 The Date attributes (e.g., Initial Date, Activation Date, etc) are used to specify a time or a time range. If a
 1008 single instance of a given Date attribute is used (e.g., the Activation Date), then objects with the same
 1009 Date attribute are matching candidate objects. If two instances of the same Date attribute are used (i.e.,
 1010 with two different values specifying a range), then objects for which the Date attribute is inside or at a limit
 1011 of the range are matching candidate objects. If a Date attribute is set to its largest possible value, then it
 1012 is equivalent to an undefined attribute.

1013 When the Cryptographic Usage Mask attribute is specified in the request, candidate objects are
 1014 compared against this field via an operation that consists of a logical AND of the requested mask with the
 1015 mask in the candidate object, and then a comparison of the resulting value with the requested mask. For
 1016 example, if the request contains a mask value of 10001100010000, and a candidate object mask contains
 1017 10000100010000, then the logical AND of the two masks is 10000100010000, which is compared against
 1018 10001100010000 and fails the match. This means that a matching candidate object at least has all of the
 1019 bits set in its mask that are set in the requested mask, but MAY have additional bits set.

1020 When the Usage Allocation attribute is specified in the request, matching candidate objects SHALL have
 1021 an Object or Byte Count and Total Objects or Bytes equal to or larger than the values specified in the
 1022 request.

1023 When an attribute defined as a structure is specified, all of the structure fields are not REQUIRED to be
 1024 specified. For instance, for the Link attribute, if the Linked Object Identifier value is specified without the
 1025 Link Type value, then matching candidate objects have the Linked Object Identifier as specified,
 1026 irrespective of their Link Type.

1027 The Storage Status Mask field (see Section 9.1.3.3.2) is used to indicate whether only on-line objects,
 1028 only archived objects, or both on-line and archived objects are to be searched. Note that the server MAY
 1029 store attributes of archived objects in order to expedite Locate operations that search through archived
 1030 objects.

| Request Payload | | |
|---------------------|----------------------|---|
| Object | REQUIRED | Description |
| Maximum Items | No | An Integer object that indicates the maximum number of object identifiers the server SHALL return. |
| Storage Status Mask | No | An Integer object (used as a bit mask) that indicates whether only on-line objects, only archived objects, or both on-line and archived objects are to be searched. If omitted, then on-line only is assumed. |
| Attribute | Yes, MAY be repeated | Specifies an attribute and its value that are REQUIRED to match the desired object. |

1031 **Table 126: Locate Request Payload**

| Response Payload | | |
|-------------------|---------------------|---|
| Object | REQUIRED | Description |
| Unique Identifier | No, MAY be repeated | The Unique Identifier of the located objects. |

Deleted: 120

Deleted: 127

Inserted: 127

Deleted: 121

1033 **4.9 Check**

1034 This operation requests that the server checks for the use of a Managed Object according to values
 1035 specified in the request. This operation SHOULD only be used when placed in a batched set of
 1036 operations, usually following a Locate, Create, Create Pair, Derive Key, Certify, Re-Certify or Re-Key
 1037 operation, and followed by a Get operation. The Unique Identifier field in the request MAY be omitted if
 1038 the operation is in a batched set of operations and follows an operation that sets the ID Placeholder
 1039 variable.

1040 If the server determines that the client is allowed to use the object according to the specified attributes,
 1041 then the server returns the Unique Identifier of the object. If the server determines that the client is not
 1042 allowed to use the object according to the specified attributes, then the server invalidates the ID
 1043 Placeholder value and does not return the Unique Identifier, and the operation returns the set of attributes
 1044 specified in the request that caused the server policy denial. The only attributes returned are those
 1045 according to which the server determined that the client is not allowed to use the object, allowing the
 1046 client to determine how to proceed. The operation also returns a failure, and the server SHALL ignore any
 1047 subsequent operations in the batch.

1048 The additional objects that MAY be specified in the request are limited to:

- 1049 • Usage Limits Byte Count or Usage Limits Object Count (see Section 3.16.)– The request MAY
 1050 contain the usage amount that the client deems necessary to complete its needed function. This
 1051 does not require that any subsequent Get Usage Allocation operations request this amount. It
 1052 only means that the client is ensuring that the amount specified is available.
- 1053 • Cryptographic Usage Mask – This is used to specify the cryptographic operations for which the
 1054 client intends to use the object (see Section 3.14.). This allows the server to determine if the
 1055 policy allows this client to perform these operations with the object. Note that this MAY be a

1056 different value from the one specified in a *Locate* operation that precedes this operation. *Locate*,
 1057 for example, MAY specify a Cryptographic Usage Mask requesting a key that MAY be used for
 1058 both Encryption and Decryption, but the value in the Check operation MAY specify that the client
 1059 is only using the key for Encryption at this time.

- 1060 • Lease Time – This specifies a desired lease time (see Section 3.15). The client MAY use this to
 1061 determine if the server allows the client to use the object with the specified lease or longer.
 1062 Including this attribute in the Check operation does not actually cause the server to grant a lease,
 1063 but only indicates that the requested lease time value MAY be granted if requested by a
 1064 subsequent, batched, Obtain Lease operation.

Deleted: 3.13

1065 Note that these objects are not encoded in an Attribute structure as shown in Section 2.1.1

| Request Payload | | |
|---------------------------|----------|---|
| Object | REQUIRED | Description |
| Unique Identifier | No | Determines the object being checked. If omitted, then the ID Placeholder is substituted by the server. |
| Usage Limits Byte Count | No | Specifies the number of bytes to be protected to be checked against server policy. SHALL only be present if Usage Limits Object Count is not present. |
| Usage Limits Object Count | No | Specifies the number of objects to be protected to be checked against server policy. SHALL only be present if Usage Limits Byte Count is not present. |
| Cryptographic Usage Mask | No | Specifies the Cryptographic Usage for which the client uses the object. |
| Lease Time | No | Specifies a Lease Time value that the Client is asking the server to validate against server policy. |

1066 Table 128: Check Request Payload

| Response Payload | | |
|---------------------------|----------|--|
| Object | REQUIRED | Description |
| Unique Identifier | Yes | The Unique Identifier of the object. |
| Usage Limits Byte Count | No | Returned by the Server if the Usage Limits value specified in the Request Payload is larger than the value that the server policy allows. SHALL only be present if Usage Limits Object Count is not present. |
| Usage Limits Object Count | No | Returned by the Server if the Usage Limits value specified in the Request Payload is larger than the value that the server policy allows. SHALL only be present if Usage Limits Byte Count is not present. |
| Cryptographic Usage Mask | No | Returned by the Server if the Cryptographic Usage Mask specified in the Request Payload is rejected by the server for policy violation. |

Table 129: Check Response Payload

The encodings of the Usage limits Byte and Object Counts is as shown in Section 3.16.

4.10 Get

This operation requests that the server returns the Managed Object specified in the request by its Unique Identifier. The Unique Identifier field in the request MAY be omitted if the *Get* operation is in a batched set of operations and follows an operation that sets the ID Placeholder variable.

Only a single object is returned. The response contains the Unique Identifier of the object, along with the object itself, which MAY be wrapped using a wrapping key specified in the request.

The following key format restrictions apply when requesting the server to return an object in a particular format:

- If a client registers a key in a given format, the server SHALL be able to return the key during the Get operation in at least that same format as it was registered.
- Any other format conversion MAY optionally be supported by the server.

1083 **4.11 Get Attributes**

1084 This operation returns one or more attributes of a Managed Object. The object is specified by its Unique
 1085 Identifier and the attributes are specified by name in the request. If a specified attribute has multiple
 1086 instances, then all instances are returned. If a specified attribute does not exist (i.e., has no value), then it
 1087 SHALL NOT be present in the returned response. If no requested attributes exist, then the response
 1088 SHALL consist only of the Unique Identifier.

| Request Payload | | |
|-------------------|----------------------|---|
| Object | REQUIRED | Description |
| Unique Identifier | No | Determines the object whose attributes are being requested. If omitted, then the ID Placeholder is substituted by the server. |
| Attribute Name | Yes, MAY be repeated | Specifies a desired attribute of the object |

1096 **4.13 Add Attribute**

1097 This request adds a new attribute instance to a Managed Object and sets its value. The request contains
 1098 the Unique Identifier of the Managed Object to which the attribute pertains, and the attribute name and

1099 value. For non multi-instance attributes, this is how they are created. For multi-instance attributes, this is
 1100 how the first and subsequent values are created. Existing attribute values are only able to be changed by
 1101 the Modify Attribute operation. Read-Only attributes are not able to be added using the Add Attribute
 1102 operation. No Attribute Index SHALL be specified in the request. The response returns a new Attribute
 1103 Index if the attribute being added is allowed to have multiple instances. Multiple Add Attribute requests
 1104 MAY be included in a single batched request to add multiple attributes.

| Request Payload | | |
|-------------------|----------|--|
| Object | REQUIRED | Description |
| Unique Identifier | No | The Unique Identifier of the object. If omitted, then the ID Placeholder is substituted by the server. |
| Attribute | Yes | Specifies the attribute of the object to be added. |

1107 **4.14 Modify Attribute**

1108 This request modifies the value of an existing attribute instance associated with a Managed Object. The
 1109 request contains the Unique Identifier of the Managed Object whose attribute is to be modified, and the
 1110 attribute name, OPTIONAL Attribute Index, and new value. Only existing attributes MAY be changed via
 1111 this operation. New attributes are only able to be added by the Add Attribute operation. Read-Only
 1112 attributes are not able to be changed using this operation. If an Attribute Index is specified, then only the
 1113 specified instance is modified. If the attribute has multiple instances, and no Attribute Index is specified in
 1114 the request, then the Attribute Index is assumed to be 0. If the attribute does not support multiple
 1115 instances, then the Attribute Index SHALL NOT be specified. Using a non-existent Attribute Index in a
 1116 Modify Attribute operation SHALL result in an error.

| Request Payload | | |
|-------------------|----------|--|
| Object | REQUIRED | Description |
| Unique Identifier | No | The Unique Identifier of the object. If omitted, then the ID Placeholder is substituted by the server. |
| Attribute | Yes | Specifies the attribute of the object to be modified. |

1119 **4.15 Delete Attribute**

1120 This request deletes an attribute associated with a Managed Object. The request contains the Unique
 1121 Identifier of the Managed Object whose attribute is to be deleted, the attribute name, and optionally the
 1122 Attribute Index of the attribute. REQUIRED attributes and Read-Only attributes are not able to be deleted
 1123 by this operation. If no Attribute Index is specified, and the Attribute whose name is specified has multiple
 1124 instances, then the operation is rejected. Note that only a single attribute SHALL be deleted at a time.
 1125 Multiple delete operations (e.g., possibly batched) are necessary to delete several attributes. Attempting
 1126 to delete a non-existent attribute or using a non-existent Attribute Index in a delete operation SHALL
 1127 result in an error.

| Request Payload | | |
|-------------------|----------|---|
| Object | REQUIRED | Description |
| Unique Identifier | No | Determines the object whose attributes are being deleted. If omitted, then the ID Placeholder is substituted by the server. |
| Attribute Name | Yes | Specifies the name of the attribute to be deleted. |
| Attribute Index | No | Specifies the Index of the Attribute. |

1128 **Table 140: Delete Attribute Request Payload**

1130 **4.16 Obtain Lease**

1131 This request is used to obtain a new *Lease Time* for a specified Managed Object. The Lease Time is an
 1132 interval value that determines when the client's internal cache of information about the object expires and
 1133 needs to be renewed. If the returned value of the lease time is zero, then the server is indicating that no
 1134 lease interval is effective, and the client MAY use the object without any lease time limit. If a client's lease
 1135 expires, then the client SHALL NOT use the associated cryptographic object until a new lease is
 1136 obtained. If the server determines that a new lease SHALL NOT be issued for the specified cryptographic
 1137 object, then the server SHALL respond to the Obtain Lease request with a failure.

1138 The response payload for the operation also contains the current value of the Last Changed Date
 1139 attribute for the object. This MAY be used by the client to determine if any of the attributes cached by the
 1140 client need to be refreshed, by comparing this time to the time when the attributes were previously
 1141 obtained.

| Request Payload | | |
|-------------------|----------|---|
| Object | REQUIRED | Description |
| Unique Identifier | No | Determines the object for which the lease is being obtained. If omitted, then the <i>ID Placeholder</i> is substituted by the server. |

1143

4.17 Get Usage Allocation

1145 This request is used to obtain an allocation from the current Usage Limits values to allow the client to use
 1146 the Managed Cryptographic Object for protection purposes. It only applies to Managed Cryptographic
 1147 Objects that are able to be used for protection purposes (i.e., symmetric keys, private keys and public
 1148 keys) and is only valid if the Managed Cryptographic Object has a Usage Limits attribute. Usage for
 1149 process purposes (e.g., decryption, verification, etc.) is not limited and is not able to be allocated. A
 1150 Managed Cryptographic Object that has a Usage Limits attribute SHALL NOT be used by a client for
 1151 protection purposes unless an allocation has been obtained using this operation. The operation SHALL
 1152 only be requested during the time that protection is enabled for these objects (i.e., after the Activation
 1153 Date and before the Protect Stop Date). If the operation is requested for an object that has no Usage
 1154 Limits attribute, or is not an object that MAY be used for protection purposes, then the server SHALL
 1155 return a response with a Result Reason of Operation Not Supported.

1156 The fields in the request specify the number of bytes or number of objects that the client needs to protect.
 1157 Exactly one of the two count fields SHALL be specified in the request. If the requested amount is not
 1158 available or if the Managed Object is not able to be used for protection purposes at this time, then the
 1159 server SHALL return an error. The server SHALL assume that the entire allocated amount has been
 1160 consumed. Once the entire allocated amount has been consumed, the client SHALL NOT continue to use
 1161 the Managed Cryptographic Object for protection purposes until a new allocation is obtained.

| Request Payload | | |
|---------------------------|----------|--|
| Object | REQUIRED | Description |
| Unique Identifier | No | Determines the object whose usage allocation is being requested. If omitted, then the ID Placeholder is substituted by the server. |
| Usage Limits Byte Count | No | The number of bytes to be protected. SHALL only be present if Usage Limits Object Count is not present. |
| Usage Limits Object Count | No | The number of objects to be protected. SHALL only be present if Usage Limits Byte Count is not present. |

4.18 Activate

This request is used to activate a Managed Cryptographic Object. The request SHALL NOT specify a Template object. The request contains the Unique Identifier of the Managed Cryptographic Object. The operation is only able to be performed on an object in the Pre-Active state and has the effect of changing its state to Active, and setting its Activation Date to the current date and time.

| Request Payload | | |
|-------------------|----------|--|
| Object | REQUIRED | Description |
| Unique Identifier | No | Determines the object being activated. If omitted, then the ID Placeholder is substituted by the server. |

1173
1174
1175
1176
1177
1178
1179
1180
1181

This request is used to revoke a Managed Cryptographic Object or an Opaque Object. The request SHALL NOT specify a Template object. The request contains the unique identifier of the Managed Cryptographic Object and a reason for the revocation (e.g., "compromised", "no longer used", etc). Special authentication and authorization SHOULD be enforced to perform this request (see Usage Guide). Only the object creator or an authorized security officer SHOULD be allowed to issue this request. The operation has one of two effects. If the revocation reason is "compromised", then the object is placed into the "compromised" state, and the Compromise Date attribute is set to the current date and time. Otherwise, the object is placed into the "deactivated" state, and the Deactivation Date attribute is set to the current date and time.

| Request Payload | | |
|----------------------------|----------|--|
| Object | REQUIRED | Description |
| Unique Identifier | No | Determines the object being revoked. If omitted, then the ID Placeholder is substituted by the server. |
| Revocation Reason | Yes | Specifies the reason for revocation. |
| Compromise Occurrence Date | No | SHALL be specified if the Revocation Reason is 'compromised'. |

1184 **4.20 Destroy**

1185 This request is used to indicate to the server that the key material for the specified Managed Object
1186 SHALL be destroyed. The meta-data for the key material MAY be retained by the server (e.g., used to
1187 ensure that an expired or revoked private signing key is no longer available). Special authentication and
1188 authorization SHOULD be enforced to perform this request (see Usage Guide). Only the object creator or
1189 an authorized security officer SHOULD be allowed to issue this request. If the Unique Identifier specifies
1190 a Template object, then the object itself, including all meta-data, SHALL be destroyed.

| Request Payload | | |
|-------------------|----------|--|
| Object | REQUIRED | Description |
| Unique Identifier | No | Determines the object being destroyed. If omitted, then the ID Placeholder is substituted by the server. |

1193 **4.21 Archive**

1194 This request is used to specify that a Managed Object MAY be archived. The actual time when the object
1195 is archived, the location of the archive, or level of archive hierarchy is determined by the policies within
1196 the key management system and is not specified by the client. The request contains the unique identifier
1197 of the Managed Object. Special authentication and authorization SHOULD be enforced to perform this
1198 request (see Usage Guide). Only the object creator or an authorized security officer SHOULD be allowed
1199 to issue this request. This request is only a "hint" to the key management system to possibly archive the
1200 object.

| Request Payload | | |
|-------------------|----------|---|
| Object | REQUIRED | Description |
| Unique Identifier | No | Determines the object being archived. If omitted, then the ID Placeholder is substituted by the server. |

1203 **4.22 Recover**

1204 This request is used to obtain access to a Managed Object that has been archived. This request MAY
1205 require asynchronous polling to obtain the response due to delays caused by retrieving the object from
1206 the archive. Once the response is received, the object is now on-line, and MAY be obtained (e.g., via a
1207 Get operation). Special authentication and authorization SHOULD be enforced to perform this request
1208 (see Usage Guide).

| Request Payload | | |

1211 4.23 Validate

1212 This requests that the server validate a certificate chain and return information on its validity. Only a
 1213 single certificate chain SHALL be included in each request. Support for this operation at the server is
 1214 OPTIONAL.

1215 The request may contain a list of certificate objects, and/or a list of Unique Identifiers that identify
 1216 Managed Certificate objects. Together, the two lists compose a certificate chain to be validated. The
 1217 request MAY also contain a date for which the certificate chain is REQUIRED to be valid.

1218 The method or policy by which validation is conducted is a decision of the server and is outside of the
 1219 scope of this protocol. Likewise, the order in which the supplied certificate chain is validated and the
 1220 specification of trust anchors used to terminate validation are also controlled by the server.

| Request Payload | | |
|-------------------|---------------------|--|
| Object | REQUIRED | Description |
| Certificate | No, MAY be repeated | One or more Certificates. |
| Unique Identifier | No, MAY be repeated | One or more Unique Identifiers of Certificate Objects. |
| Validity Date | No | A Date-Time object indicating when the certificate chain is valid. |

1221

1223 4.24 Query

1224 This request is used by the client to interrogate the server to determine its capabilities and/or protocol
 1225 mechanisms. The *Query* operation SHOULD be invocable by unauthenticated clients to interrogate server
 1226 features and functions. The *Query Function* field in the request SHALL contain one or more of the
 1227 following items:

- 1228 • Query Operations
- 1229 • Query Objects
- 1230 • Query Server Information
- 1231 • Query Application Namespaces

Formatted: Outline numbered + Level: 1 + Numbering Style: Bullet + Aligned at: 0.25" + Tab after: 0.5" + Indent at: 0.5", Tabs: 0.5", Left

1232 The *Operation* fields in the response contain Operation enumerated values, which SHALL list the
 1233 OPTIONAL operations that the server supports. If the request contains a Query Operations value in the
 1234 Query Function field, then these fields SHALL be returned in the response. The OPTIONAL operations
 1235 are:

- 1236 • Validate
- 1237 • Certify
- 1238 • Re-Certify
- 1239 • Notify
- 1240 • Put

Formatted: Outline numbered + Level: 1 + Numbering Style: Bullet + Aligned at: 0.25" + Tab after: 0.5" + Indent at: 0.5", Tabs: 0.5", Left

1241 The *Object Type* fields in the response contain Object Type enumerated values, which SHALL list the
 1242 object types that the server supports. If the request contains a *Query Objects* value in the Query Function
 1243 field, then these fields SHALL be returned in the response. The object types (any of which are
 1244 OPTIONAL) are:

- 1245 • Certificate
- 1246 • Symmetric Key
- 1247 • Public Key
- 1248 • Private Key
- 1249 • Split Key
- 1250 • Template
- 1251 • Secret Data
- 1252 • Opaque Object

Formatted: Outline numbered + Level: 1 + Numbering Style: Bullet + Aligned at: 0.25" + Tab after: 0.5" + Indent at: 0.5", Tabs: 0.5", Left

1253 The *Server Information* field in the response is a structure containing vendor-specific fields and/or
 1254 substructures. If the request contains a *Query Server Information* value in the Query Function field, then
 1255 this field SHALL be returned in the response.

1256 The Application Namespace fields in the response contain the namespaces that the server SHALL
 1257 generate values for if requested by the client (see Section 3.30). These fields SHALL only be returned in
 1258 the response if the request contains a Query Application Namespaces value in the Query Function field.

Deleted: 3.28

1259 Note that the response payload is empty if there are no values to return.

4.25 Cancel

This request is used to cancel an outstanding asynchronous operation. The correlation value (see Section 6.8) of the original operation SHALL be specified in the request. The server SHALL respond with a *Cancellation Result* that contains one of the following values:

- *Canceled* – The cancel operation succeeded in canceling the pending operation.
- *Unable To Cancel* – The cancel operation is unable to cancel the pending operation.
- *Completed* – The pending operation completed successfully before the cancellation operation was able to cancel it.
- *Failed* – The pending operation completed with a failure before the cancellation operation was able to cancel it.
- *Unavailable* – The specified correlation value did not match any recently pending or completed asynchronous operations.

Formatted: Outline numbered + Level: 1 + Numbering Style: Bullet + Aligned at: 0.25" + Tab after: 0.5" + Indent at: 0.5", Tabs: 0.5", Left

The response to this operation is not able to be asynchronous.

| Request Payload | | |
|--------------------------------|----------|--------------------------------------|
| Object | REQUIRED | Description |
| Asynchronous Correlation Value | Yes | Specifies the request being canceled |

 Inserted: 161
 Deleted: 155

1276

1277 **4.26 Poll**

1278 This request is used to poll the server in order to obtain the status of an outstanding asynchronous
1279 operation. The correlation value (see Section 6.8) of the original operation SHALL be specified in the
1280 request. The response to this operation is not able to be asynchronous.

| Request Payload | | |
|---------------------------------|----------|------------------------------------|
| Object | REQUIRED | Description |
| Asynchronous Correlation Value. | Yes | Specifies the request being polled |

1281 **Table 162: Poll Request Payload**

1282 The server SHALL reply with one of two responses:

1283 If the operation has not completed, the response SHALL contain no payload and a Result Status of
1284 Pending.

1285 If the operation has completed, the response SHALL contain the appropriate payload for the operation.
1286 This response SHALL be identical to the response that would have been sent if the operation had
1287 completed synchronously.

Deleted: 162

Inserted: 162

Deleted: 156

1288 5 Server-to-Client Operations

1289 Server-to-client operations are used by servers to send information or Managed Cryptographic Objects to
1290 clients via means outside of the normal client-server request-response mechanism. These operations are
1291 used to send Managed Cryptographic Objects directly to clients without a specific request from the client.

1292 5.1 Notify

1293 This operation is used to notify a client of events that resulted in changes to attributes of an object. This
1294 operation is only ever sent by a server to a client via means outside of the normal client request/response
1295 protocol, using information known to the server via unspecified configuration or administrative
1296 mechanisms. It contains the Unique Identifier of the object to which the notification applies, and a list of
1297 the attributes whose changed values have triggered the notification. The message is sent as a normal
1298 Request message, except that the Maximum Response Size, Asynchronous Indicator, Batch Error
1299 Continuation Option, and Batch Order Option fields are not allowed. The client SHALL send a response in
1300 the form of a Response Message containing no payload, unless both the client and server have prior
1301 knowledge (obtained via out-of-band mechanisms) that the client is not able to respond. Server and Client
1302 support for this message is OPTIONAL.

| Message Payload | | |
|-------------------|----------------------|---|
| Object | REQUIRED | Description |
| Unique Identifier | Yes | The Unique Identifier of the object. |
| Attribute | Yes, MAY be repeated | The attributes that have changed. This includes at least the Last Changed Date attribute. |

1303 Table 163: Notify Message Payload

Deleted: 163

Inserted: 163

Deleted: 157

1304 5.2 Put

1305 This operation is used to “push” Managed Cryptographic Objects to clients. This operation is only ever
1306 sent by a server to a client via means outside of the normal client request/response protocol, using
1307 information known to the server via unspecified configuration or administrative mechanisms. It contains
1308 the Unique Identifier of the object that is being sent, and the object itself. The message is sent as a
1309 normal Request message, except that the Maximum Response Size, Asynchronous Indicator, Batch Error
1310 Continuation Option, and Batch Order Option fields are not allowed. The client SHALL send a response in
1311 the form of a Response Message containing no payload, unless both the client and server have prior
1312 knowledge (obtained via out-of-band mechanisms) that the client is not able to respond. Server and client
1313 support for this message is OPTIONAL.

1314 The *Put Function* field indicates whether the object being “pushed” is a new object, or is a replacement for
1315 an object already known to the client (e.g., when pushing a certificate to replace one that is about to
1316 expire, the Put Function field would be set to indicate replacement, and the Unique Identifier of the
1317 expiring certificate would be placed in the *Replaced Unique Identifier* field). The Put Function SHALL
1318 contain one of the following values:

- 1319 • *New* – which indicates that the object is not a replacement for another object.
- 1320 • *Replace* – which indicates that the object is a replacement for another object, and that the
1321 Replaced Unique Identifier field is present and contains the identification of the replaced object.

1322 The Attribute field contains one or more attributes that the server is sending along with the object. The
1323 server MAY include attributes with the object to specify how the object is to be used by the client. The
1324 server MAY include a Lease Time attribute that grants a lease to the client.

1325 If the Managed Object is a wrapped key, then the key wrapping specification SHALL be exchanged prior
1326 to the transfer via out-of-band mechanisms.

| Message Payload | | |
|---|---------------------|---|
| Object | REQUIRED | Description |
| Unique Identifier | Yes | The Unique Identifier of the object. |
| Put Function | Yes | Indicates function for Put message. |
| Replaced Unique Identifier | No | Unique Identifier of the replaced object. SHALL be present if the <i>Put Function</i> is <i>Replace</i> . |
| Certificate, Symmetric Key, Private Key, Public Key, Split Key, Template, Secret Data, or Opaque Object | Yes | The object being sent to the client. |
| Attribute | No, MAY be repeated | The additional attributes that the server wishes to send with the object. |

1327

1328 **6 Message Contents**

1329 The messages in the protocol consist of a message header, one or more batch items (which contain
 1330 OPTIONAL message payloads), and OPTIONAL message extensions. The message headers contain
 1331 fields whose presence is determined by the protocol features used (e.g., asynchronous responses). The
 1332 field contents are also determined by whether the message is a request or a response. The message
 1333 payload is determined by the specific operation being requested or to which is being replied.

1334 The message headers are structures that contain some of the following objects.

1335 **6.1 Protocol Version**

1336 This field contains the version number of the protocol, ensuring that the protocol is fully understood by
 1337 both communicating parties. The version number is specified in two parts, major and minor. Servers and
 1338 clients SHALL support backward compatibility with versions of the protocol with the same major version.
 1339 Support for backward compatibility with different major versions is OPTIONAL.

| Object | Encoding | REQUIRED |
|------------------------|-----------|----------|
| Protocol Version | Structure | |
| Protocol Version Major | Integer | Yes |
| Protocol Version Minor | Integer | Yes |

1340 **Table 165: Protocol Version Structure in Message Header**

1341 **6.2 Operation**

1342 This field indicates the operation being requested or the operation for which the response is being
 1343 returned. The operations are defined in Sections 4 and 5.

| Object | Encoding | REQUIRED |
|-----------|-------------|----------|
| Operation | Enumeration | |

1344 **Table 166: Operation in Batch Item**

1345 **6.3 Maximum Response Size**

1346 This field is optionally contained in a request message, and is used to indicate the maximum size of a
 1347 response that the requester SHALL handle. It SHOULD only be sent in requests that possibly return large
 1348 replies.

| Object | Encoding | REQUIRED |
|-----------------------|----------|----------|
| Maximum Response Size | Integer | |

1349 **Table 167: Maximum Response Size in Message Request Header**

1350 **6.4 Unique Batch Item ID**

1351 This field is optionally contained in a request, and is used for correlation between requests and
 1352 responses. If a request has a *Unique Batch Item ID*, then responses to that request SHALL have the
 1353 same Unique Batch Item ID.

| Object | Encoding | REQUIRED |
|----------------------|--------------|----------|
| Unique Batch Item ID | Octet String | |

1355 **6.5 Time Stamp**

1356 This field is optionally contained in a request, is REQUIRED in a response, is used for time stamping, and
 1357 MAY be used to enforce reasonable time usage at a client (e.g., a server MAY choose to reject a request
 1358 if a client's time stamp contains a value that is too far off the known correct time). Note: the time stamp
 1359 MAY be used by a client that has no real-time clock but has a countdown timer, to obtain useful "seconds
 1360 from now" values from all of the Date attributes by performing a subtraction.

1362 **6.6 Authentication**

1363 This is used to authenticate the requester. It is an OPTIONAL information item, depending on the type of
 1364 request being issued and on server policies. Servers MAY require authentication on no requests, a
 1365 subset of the requests, or all requests, depending on policy. Query operations used to interrogate server
 1366 features and functions SHOULD NOT require authentication.

1367 The authentication mechanisms are described and discussed in Section 8 .

1370 **6.7 Asynchronous Indicator**

1371 This Boolean flag indicates whether the client is able to accept an asynchronous response. It SHALL
 1372 have the Boolean value True if the client is able to handle asynchronous responses, and the value False
 1373 otherwise. If not present in a request, then False is assumed. If a client indicates that it is not able to
 1374 handle asynchronous responses (i.e., flag is set to False), and the server is not able to process the
 1375 request synchronously, then the server SHALL respond to the request with a failure.

1377 **6.8 Asynchronous Correlation Value**

1378 This is returned in the immediate response to an operation that requires asynchronous polling. Note: the
 1379 server decides which operations are performed synchronously or asynchronously. A server-generated
 1380 correlation value SHALL be specified in any subsequent Poll or Cancel operations that pertain to the
 1381 original operation.

Deleted: 166

1383 **6.9 Result Status**

1384 This is sent in a response message and indicates the success or failure of a request. The following values
 1385 MAY be set in this field:

- 1386 • *Success* – The requested operation completed successfully.
- 1387 • *Pending* – The requested operation is in progress, and it is necessary to obtain the actual result
 1388 via asynchronous polling. The asynchronous correlation value SHALL be used for the subsequent
 1389 polling of the result status.
- 1390 • *Undone* – The requested operation was performed, but had to be undone (i.e., due to a failure in
 1391 a batch for which the Error Continuation Option was set to Undo).
- 1392 • *Failure* – The requested operation failed.

| Object | Encoding |
|---------------|-------------|
| Result Status | Enumeration |

1393 **Table 173: Result Status in Response Batch Item**

1394 **6.10 Result Reason**

1395 This field indicates a reason for failure or a modifier for a partially successful operation and SHALL be
 1396 present in responses that return a Result Status of Failure. It is OPTIONAL in any response that returns a
 1397 Result Status of Success. The following defined values MAY be set in this field:

- 1398 • *Item not found* – A requested object was not found or did not exist.
- 1399 • *Response too large* – The response to a request would exceed the *Maximum Response Size* in
 1400 the request.
- 1401 • *Authentication not successful* – The authentication information in the request was not able to be
 1402 validated, or there was no authentication information in the request when there SHOULD have
 1403 been.
- 1404 • *Invalid message* – The request message was not understood by the server.
- 1405 • *Operation not supported* – The operation requested by the request message is not supported by
 1406 the server.
- 1407 • *Missing data* – The operation requires additional OPTIONAL information in the request, which
 1408 was not present.
- 1409 • *Invalid field* – Some data item in the request has an invalid value.
- 1410 • *Feature not supported* – An OPTIONAL feature specified in the request is not supported.
- 1411 • *Operation canceled by requester* – The operation was asynchronous, and the operation was
 1412 canceled by the Cancel operation before it completed successfully.
- 1413 • *Cryptographic failure* – The operation failed due to a cryptographic error.
- 1414 • *Illegal operation* – The client requested an operation that was not able to be performed with the
 1415 specified parameters.
- 1416 • *Permission denied* – The client does not have permission to perform the requested operation.
- 1417 • *Object archived* – The object SHALL be recovered from the archive before performing the
 1418 operation.
- 1419 • *General failure* – The request failed for a reason other than the defined reasons above.

Table 174: Result Reason in Response Batch Item

6.11 Result Message

This field MAY be returned in a response. It contains a more descriptive error message, which MAY be used by the client to display to an end user or for logging/auditing purposes.

| Object | Encoding | |
|----------------|-------------|--|
| Result Message | Text String | |

Table 175: Result Message in Response Batch Item

6.12 Batch Order Option

A Boolean value used in requests where the Batch Count is greater than 1. If True, then batched operations SHALL be executed in the order in which they appear within the request. If False, then the server MAY choose to execute the batched operations in any order. If not specified, then False is assumed (i.e., no implied ordering). Server support for this feature is OPTIONAL, but if the server does not support the feature, and a request is received with the batch order option set to True, then the entire request SHALL be rejected.

| Object | Encoding | |
|--------------------|----------|--|
| Batch Order Option | Boolean | |

Table 176: Batch Order Option in Message Request Header

6.13 Batch Error Continuation Option

This option SHALL only be present if the Batch Count is greater than 1. This option SHALL have one of three values:

- *Undo* – If any operation in the request fails, then the server SHALL undo all the previous operations.
- *Stop* – If an operation fails, then the server SHALL NOT continue processing subsequent operations in the request. Completed operations SHALL NOT be undone.
- *Continue* – Return an error for the failed operation, and continue processing subsequent operations in the request.

If not specified, then Stop is assumed.

Server support for this feature is OPTIONAL, but if the server does not support the feature, and a request is received containing the *Batch Error Continuation* option with a value other than the default Stop, then the entire request SHALL be rejected.

| Object | Encoding | |
|---------------------------------|-------------|--|
| Batch Error Continuation Option | Enumeration | |

Table 177: Batch Error Continuation Option in Message Request Header

6.14 Batch Count

This field contains the number of Batch Items in a message and is REQUIRED. If only a single operation is being requested, then the batch count SHALL be set to 1. The Message Payload, which follows the Message Header, contains one or more batch items.

1455

6.16 Message Extension

The *Message Extension* is an OPTIONAL structure that MAY be appended to any Batch Item. It is used to extend protocol messages for the purpose of adding vendor specified extensions. The Message Extension is a structure containing a Vendor Identification, a Criticality Indicator, and vendor-specific extensions. The *Vendor Identification* SHALL be a text string that uniquely identifies the vendor, allowing a client to determine if it is able to parse and understand the extension. If a client or server receives a protocol message containing a message extension that it does not understand, then its actions depend on the *Criticality Indicator*. If the indicator is True (i.e., Critical), and the receiver does not understand the extension, then the receiver SHALL reject the entire message. If the indicator is False (i.e., Non-Critical), and the receiver does not understand the extension, then the receiver MAY process the rest of the message as if the extension were not present.

 Deleted: 180

7.3 Asynchronous Operations

1479 If the client is capable of accepting asynchronous responses, then it MAY set the *Asynchronous Indicator*
 1480 in the header of a batched request. The batched responses MAY contain a mixture of synchronous and
 1481 asynchronous responses.

1485

1486 **8 Authentication**

1487 The mechanisms used to authenticate the client to the server and the server to the client are not part of
1488 the message definitions, and are external to the protocol. The *Authentication* field contained in Request
1489 Headers is used to identify the client and to provide linkage between this identification and the external
1490 authentication mechanism.

1491 The Usage Guide describes authentication profiles appropriate to this protocol, as well as the relationship
1492 of those mechanisms to the credentials that are optionally included in the Authentication field. The
1493 authentication profiles described are:

1494 | • SSL/TLS authentication. If the transport protocol uses a normal TCP stream, then that stream
1495 | SHOULD use an SSL/TLS encryption layer, and the client and server authentication features
1496 | SHALL be enabled unless otherwise specified in the operation. The Credential object contained
1497 | in the Authentication field in all request messages SHALL contain the client's certificate. The
1498 | server SHOULD use this certificate to identify the client for policy enforcement purposes, and
1499 | SHOULD verify that this certificate matches the one used for SSL/TLS authentication.

Formatted: Outline numbered +
Level: 1 + Numbering Style: Bullet +
Aligned at: 0.25" + Tab after: 0.5"
+ Indent at: 0.5", Tabs: 0.5", Left

1500 | • HTTPS authentication. If the transport protocol is HTTP over TCP, then the HTTPS protocol
1501 | SHOULD be used, and the client and server authentication features enabled unless otherwise
1502 | specified in the operation. The contents and use of the *Credential* object are the same as in the
1503 | case of SSL/TLS above.

Formatted: Outline numbered +
Level: 1 + Numbering Style: Bullet +
Aligned at: 0.25" + Tab after: 0.5"
+ Indent at: 0.5", Tabs: 0.5", Left

1504 All server implementations SHOULD, at a minimum, support the SSL/TLS and HTTPS profiles described
1505 in [Section 10](#).

Deleted: the Usage Guide

1506 Other mechanisms (e.g., Kerberos) are potentially usable, with the identity established in the mechanism
1507 (e.g., the Kerberos token), expressed as the Credential object. Profiles for these mechanisms are not
1508 currently described in the Usage Guide.

1509 9 Message Encoding

1510 To support different transport protocols and different client capabilities, a number of message-encoding
1511 mechanisms are supported.

1512 9.1 TTLV Encoding

1513 In order to minimize the resource impact on potentially low-function clients, one encoding mechanism to
1514 be used for protocol messages is a simplified TTLV (Tag, Type, Length, Value) scheme.

1515 The scheme is designed to minimize the CPU cycle and memory requirements of clients that need to
1516 encode or decode protocol messages, and to provide optimal alignment for both 32-bit and 64-bit
1517 processors. Minimizing bandwidth over the transport mechanism is considered to be of lesser importance.

1518 9.1.1 TTLV Encoding Fields

1519 Every Data object encoded by the TTLV scheme consists of 4 items, in order:

1520 9.1.1.1 Item Tag

1521 An Item Tag is a 3-byte binary unsigned integer, transmitted big endian, which contains a number that
1522 designates the specific Protocol Field or Object that the TTLV object represents. To ease debugging, and
1523 to ensure that malformed messages are detected more easily, all tags SHALL contain either the value 42
1524 in hex or the value 54 in hex as the high order (first) byte. Tags defined by this specification contain hex
1525 42 in the first byte. Extensions, which are permitted, but are not defined in this specification, contain the
1526 value 54 hex in the first byte. A list of defined Item Tags is in Section [9.1.3.1](#).

1527 9.1.1.2 Item Type

1528 An Item Type is a byte containing a coded value that indicates the data type of the data object. The
1529 allowed values are:

| Data Type | Coded Value in Hex |
|--------------|--------------------|
| Structure | 01 |
| Integer | 02 |
| Long Integer | 03 |
| Big Integer | 04 |
| Enumeration | 05 |
| Boolean | 06 |
| Text String | 07 |
| Octet String | 08 |
| Date-Time | 09 |
| Interval | 0A |

1530 **Table 191:** Allowed Item Type Values

1531 **9.1.1.3 Item Length**

1532 An Item Length is a 32-bit binary integer, transmitted big-endian, containing the number of bytes in the
1533 Item Value. The allowed values are:

1534

| Data Type | Length |
|--------------|-----------------------|
| Structure | Varies, multiple of 8 |
| Integer | 4 |
| Long Integer | 8 |
| Big Integer | Varies, multiple of 8 |
| Enumeration | 4 |
| Boolean | 8 |
| Text String | Varies |
| Octet String | Varies |
| Date-Time | 8 |
| Interval | 4 |

Table 192: Allowed Item Length Values

Deleted: 192

Inserted: 192

Deleted: 186

1535

1536 If the Item Type is Structure, then the Item Length is the total length of all of the sub-items contained in
1537 the structure, including any padding. If the Item Type is Integer, Enumeration, Text String, Octet String, or
1538 Interval, then the Item Length is the number of bytes excluding the padding bytes. Text Strings and Octet
1539 Strings SHALL be padded with the minimal number of bytes following the Item Value to obtain a multiple
1540 of 8 bytes. Integers, Enumerations, and Intervals SHALL be padded with 4 bytes following the Item Value.

1541 **9.1.1.4 Item Value**

1542 The item value is a sequence of bytes containing the value of the data item, depending on the type:

- 1543 | • Integers are encoded as 4-byte long (32 bit) binary signed numbers in 2's complement notation,
1544 | transmitted big-endian.
- 1545 | • Long Integers are encoded as 8-byte long (64 bit) binary signed numbers in 2's complement
1546 | notation, transmitted big-endian.
- 1547 | • Big Integers are encoded as a sequence of 8-bit bytes, in 2's complement notation, transmitted
1548 | big-endian. If the length of the sequence is not a multiple of 8 bytes, then Big Integers SHALL be
1549 | padded with the minimal number of leading sign-extended bytes to make the length a multiple of
1550 | 8 bytes. These padding bytes are part of the Item Value and SHALL be counted in the Item
1551 | Length.
- 1552 | • Enumerations are encoded as 4-byte long (32 bit) binary unsigned numbers transmitted big-
1553 | endian. Extensions, which are permitted, but are not defined in this specification, contain the
1554 | value 8 hex in the first nibble of the first byte.
- 1555 | • Booleans are encoded as an 8-byte value that SHALL either contain the hex value
1556 | 0000000000000000, indicating the Boolean value *False*, or the hex value 0000000000000001,
1557 | transmitted big-endian, indicating the Boolean value *True*.

Formatted: Outline numbered +
Level: 1 + Numbering Style: Bullet +
Aligned at: 0.25" + Tab after: 0.5"
+ Indent at: 0.5", Tabs: 0.5", Left

- 1558 | • Text Strings are sequences of bytes encoding character values according to the UTF-8 encoding
1559 | standard. There SHALL be no null-termination at the end of such strings.
- 1560 | • Octet Strings are sequences of bytes containing individual unspecified 8 bit binary values.
- 1561 | • Date-Time values are encoded as 8-byte long (64 bit) binary signed numbers, transmitted big-
1562 | endian. They are POSIX Time values (described in IEEE Standard 1003.1) extended to a 64 bit
1563 | value to eliminate the "Year 2038 problem" (i.e., problem that affects Unix systems that store time
1564 | as a signed 32-bit integer). The value is expressed as the number of seconds from a time epoch,
1565 | which is 00:00:00 GMT January 1st, 1970. This value has a resolution of 1 second. All Date-Time
1566 | values are expressed as UTC values.
- 1567 | • Intervals are encoded as 4-byte long (32 bit) binary unsigned numbers, transmitted big-endian.
1568 | They have a resolution of 1 second.
- 1569 | • Structure Values are encoded as the concatenated encodings of the elements of the structure. All
1570 | structures defined in this specification SHALL have all of their fields encoded in the order in which
1571 | they appear in their respective structure descriptions.

1572 | **9.1.2 Examples**

1573 | These examples are assumed to be encoding a Protocol Object whose tag is 420020. The examples are
1574 | shown as a sequence of bytes in hexadecimal notation:

- 1575 | • An Integer containing the decimal value 8:
1576 | 42 00 20 | 02 | 00 00 00 04 | 00 00 00 08 00 00 00 00
- 1577 | • A Long Integer containing the decimal value 123456789000000000:
1578 | 42 00 20 | 03 | 00 00 00 08 | 01 B6 9B 4B A5 74 92 00
- 1579 | • A Big Integer containing the decimal value 12345678900000000000000000000000:
1580 | 42 00 20 | 04 | 00 00 00 10 | 00 00 00 00 03 FD 35 EB 6B C2 DF 46 18 08
1581 | 00 00
- 1582 | • An Enumeration with value 255:
1583 | 42 00 20 | 05 | 00 00 00 04 | 00 00 00 FF 00 00 00 00
- 1584 | • A Boolean with the value *True*:
1585 | 42 00 20 | 06 | 00 00 00 08 | 00 00 00 00 00 00 00 01
- 1586 | • A Text String:
1587 | 42 00 20 | 07 | 00 00 00 0B | 48 65 6C 6C 6F 20 57 6F 72 6C 64 00 00 00
1588 | 00 00
- 1589 | • An Octet String:
1590 | 42 00 20 | 08 | 00 00 00 03 | 01 02 03 00 00 00 00 00
- 1591 | • A Date-Time, containing the value for Friday, March 14, 2008, 11:56:40 GMT:
1592 | 42 00 20 | 09 | 00 00 00 08 | 00 00 00 00 47 DA 67 F8
- 1593 | • An Interval, containing the value for 10 days:
1594 | 42 00 20 | 0A | 00 00 00 04 | 00 0D 2F 00 00 00 00 00
- 1595 | • A Structure containing an Enumeration, value 254, followed by an Integer, value 255, having tags
1596 | 420004 and 420005 respectively:
1597 | 42 00 20 | 01 | 00 00 00 20 | 42 00 04 | 05 | 00 00 00 04 | 00 00 00 FE
1598 | 00 00 00 00 | 42 00 05 | 02 | 00 00 00 04 | 00 00 00 FF 00 00 00 00

1599 **9.1.3 Defined Values**

1600 This section specifies the values that are defined by this specification. In all cases where an extension
 1601 mechanism is allowed, this extension mechanism is only able to be used for communication between
 1602 parties that have pre-agreed understanding of the specific extensions.

1680 10 Transport

1681 This section describes two KMIP transport profiles. These profiles describe mechanisms by which
1682 authentication and communications privacy are established outside KMIP.

1683 10.1 SSL/TLS Profile

1684 Transport Layer Security (TLS) and its predecessor, Secure Sockets Layer (SSL), are cryptographic
1685 protocols that provide secure communications for data transfers, using cryptographic mechanisms to
1686 provide both the authentication of participants and privacy of the communication. SSL 2.0 has known
1687 security issues, and all current implementations of HTTP/S support more recent protocols. Therefore, this
1688 profile prohibits the use of SSL 2.0 and requires SSL 3.1 or TLS 1.0 or later.

1689 In this profile, a KMIP client and server SHALL use SSL/TLS to negotiate a mutually-authenticated
1690 connection. This is REQUIRED for all KMIP communication except for the Query operation.

1691 In SSL and TLS, choices of algorithms are expressed as cipher suites. The following subsections specify
1692 cipher suites that are either REQUIRED or discouraged. The use of any other cipher suite not discussed
1693 below is OPTIONAL.

1694 10.1.1 Mandatory cipher suites

1695 The mandatory cipher suites for the SSL/TLS profile are:

- 1696 • A TLS-capable instance SHALL support TLS_RSA_WITH_AES_128_CBC_SHA
- 1697 • An SSL-capable instance SHALL support SSL_RSA_WITH_AES_128_CBC_SHA

1698 10.1.2 Discouraged cipher suites

1699 As discussed in “WS-I Basic Security Profile”, the cipher suites defined in the SSL and TLS specifications
1700 that use anonymous Diffie-Hellman (i. e. those that have *DH_anon* in their symbolic name) are vulnerable
1701 to man-in-the-middle attacks. Such cipher suites SHALL be avoided. This profile disallows the use of the
1702 following cipher suites due to their lack of confidentiality services:

- 1703 • SSL_RSA_WITH_NULL_SHA
- 1704 • TLS_RSA_WITH_NULL_SHA
- 1705 • SSL_RSA_WITH_NULL_MD5
- 1706 • TLS_RSA_WITH_NULL_MD5

1707 Also, cipher suites that use 40 or 56 bit keys SHALL be avoided, due to their relative ease of compromise
1708 through brute-force attack.

1709 10.2 HTTPS Profile

1710 Hypertext Transfer Protocol over Secure Socket Layer or https is a URI (Universal Resource Indicator)
1711 scheme that is used to indicate a secure HTTP connection, requiring an additional encryption and
1712 authentication layer, implemented by SSL/TLS, between HTTP and TCP. The establishment of the trust
1713 relationship between the client and server is the same as in the SSL/TLS profile described above.

1714 As in the SSL/TLS profile, mutual authentication SHALL be performed for all KMIP communication unless
1715 otherwise specified in the operation.

1716 10.2.1 HTTP Encoding

1717 A client using the HTTPS profile SHALL:

- 1718 • Use the POST request method

- 1719 | • Specify Content-Type: application/octet-stream
- 1720 | • Send one TTLV KMIP message in binary form in the body of each HTTP request
- 1721 | • Comply with the HTTP version claimed in the request line
- 1722 | A client using the HTTPS profile SHALL NOT:
 - 1723 | • Use the HTTP Authorization header to transmit any authentication data
- 1724 | A server using the HTTPS profile SHALL:
 - 1725 | • Return HTTP response code 200 Success if a KMIP response was returned, including KMIP error responses
 - 1726 |
 - 1727 | • Specify Content-Type: application/octet-stream
 - 1728 | • Send one TTLV KMIP message in binary form in the body of each HTTP response with response code 200
 - 1729 |
 - 1730 | • Comply with the HTTP version claimed in the status line
 - 1731 | • Send the Cache-Control: no-cache directive to prevent clients from caching KMIP responses (HTTP/1.1 only)
 - 1732 |
- 1733 | Servers supporting the OPTIONAL server-to-client Put and Notify messages SHALL behave as an HTTP client. Clients responding to these messages SHALL behave as an HTTP server.
- 1734 |
- 1735 | A client MAY use the Accept-Encoding header to indicate it accepts compressed or otherwise transformed responses.
- 1736 |
- 1737 | A clients MAY use HTTP/1.0 Keep Alive or HTTP/1.1 Connection headers to control persistent connection behavior.
- 1738 |
- 1739 | The Content-Length header MAY be used by clients and servers to support persistent connections where allowed by HTTP. This header is not REQUIRED.
- 1740 |
- 1741 | The Request-URI is not specified and MAY be used by clients and servers in an implementation specific fashion. The value / is RECOMMENDED.
- 1742 |
- 1743 | KMIP servers supporting the HTTPS profile SHOULD listen on port TBD1. KMIP clients responding to OPTIONAL server-to-client Put and Notify messages should listen on port TBD2.
- 1744 |

1745 **11 Error Handling**

1746 This section details the specific Result Reasons that SHOULD be returned for errors detected. Note that
 1747 this is not an exhaustive list of possible errors for each operation (allowing other Result Reasons to be
 1748 returned if an implementation needs to do so).

1749 **11.1 General**

1750 These errors MAY occur when any protocol message is received by the server.

Formatted: Indent: Left: 0",
 Outline numbered + Level: 2 +
 Numbering Style: 1, 2, 3, ... + Start

 0.5" + Tab after: 0" + Indent at:
 0.5"

| Error Definition | Action | Result Reason |
|--|---|-------------------------|
| Protocol major version mismatch | Response message containing a header and a Batch Item without Operation, but with the Result Status field set to Operation Failed | Invalid Message |
| Error parsing batch item or payload within batch item (e.g., REQUIRED fields missing, etc.) | Batch item fails; Result Status is Operation Failed | Invalid Message |
| The same field is contained in a header/batch item/payload more than once | Result Status is Operation Failed | Invalid Message |
| Same major version, different minor versions (e.g., client is newer); unknown fields/fields the server does not understand | Ignore unknown fields, process rest normally | N/A |
| Same major & minor version, unknown field | Result Status is Operation Failed | Invalid Field |
| Client is not allowed to perform the specified operation | Result Status is Operation Failed | Permission Denied |
| Operation is not able to be completed synchronously and client does not support asynchronous requests | Result Status is Operation Failed | Operation Not Supported |
| Maximum Response Size has been exceeded | Result Status is Operation Failed | Response Too Large |

1803

1804 **11.28 Batch Items**

1805 These errors MAY occur when a protocol message with one or more batch items is processed by the
 1806 server. If a message with one or more batch items was parsed correctly, then the response message
 1807 SHOULD include response(s) to the batch item(s) in the request according to the table below.

1808

| Error Definition | Result Status | Result Reason |
|---|--|--|
| Processing of batch item fails with Batch Error Continuation Option set to Stop | Batch item fails. Responses to batch items that have already been processed are returned normally. Responses to batch items that have not been processed are not returned. | See tables above, referring to the operation being performed in the batch item that failed |
| Processing of batch item fails with Batch Error Continuation Option set to Continue | Batch item fails. Responses to other batch items are returned normally. | See tables above, referring to the operation being performed in the batch item that failed |
| Processing of batch item fails with Batch Error Continuation Option set to Undo | Batch item fails. Batch items that had been processed have been undone and their responses are returned with Undone result status. | See tables above, referring to the operation being performed in the batch item that failed |

13 Implementation Conformance

An implementation is a conforming KMIP Server if the implementation meets the conditions in [Section 13.1](#).

An implementation SHALL be a conforming KMIP Server.

If an implementation claims support for a particular clause, then the implementation SHALL conform to all normative statements within that clause and any subclauses to that clause.

13.1 Conformance clauses for a KMIP Server

An implementation conforms to this specification as a KMIP Server if it meets the following conditions:

1. Supports the following objects:
 - a. Attribute (see [Section 2.1.1](#))
 - b. Credential (see [Section 2.1.2](#))
 - c. Key Block (see [Section 2.1.3](#))
 - d. Key Value (see [Section 2.1.4](#))
 - e. Transparent Key Structure (see [Section 2.1.7](#))
 - f. Template-Attribute Structure (see [Section 2.1.8](#))
2. Supports the following attributes:
 - a. Unique Identifier (see [Section 3.1](#))
 - b. Name (see [Section 3.2](#))
 - c. Object Type (see [Section 3.3](#))
 - d. Cryptographic Algorithm (see [Section 3.4](#))
 - e. Cryptographic Length (see [Section 3.5](#))
 - f. Cryptographic Parameters (see [Section 3.6](#))
 - g. Digest (see [Section 3.12 3.10](#))
 - h. Default Operation Policy (see [Section 3.13.2](#))
 - i. Cryptographic Usage Mask (see [Section 3.14](#))
 - j. State (see [Section 3.17](#))
 - k. Initial Date (see [Section 3.18](#))
 - l. Activation Date (see [Section 3.19](#))
 - m. Deactivation Date (see [Section 3.22](#))
 - n. Destroy Date (see [Section 3.23](#))
 - o. Compromise Occurrence Date (see [Section 3.24](#))
 - p. Compromise Date (see [Section 3.25](#))
 - q. Revocation Reason (see [Section 3.26](#))
 - r. Archive Date (see [Section 3.27](#))
3. Supports the following client-to-server operations:
 - a. Locate (see [Section 4.8](#))
 - b. Check (see [Section 4.9](#))
 - c. Get (see [Section 4.10](#))
 - d. Get Attribute (see [Section 4.11](#))
 - e. Get Attribute List (see [Section 4.12](#))
 - f. Add Attribute (see [Section 4.13](#))

C. Operation and Object Cross-reference

The following table indicates the types of Managed Object(s) that each Operation accepts as input or provide as output. This table is not normative.

| Operation | Managed Objects | | | | | | | |
|----------------------|-----------------|---------------|------------|-------------|-----------|----------|-------------|---------------|
| | Certificate | Symmetric Key | Public Key | Private Key | Split Key | Template | Secret Data | Opaque Object |
| Create | N/A | Y | N/A | N/A | N/A | Y | N/A | N/A |
| Create Key Pair | N/A | N/A | Y | Y | N/A | N/A | N/A | N/A |
| Register | Y | Y | Y | Y | Y | Y | Y | Y |
| Re-Key | N/A | Y | N/A | N/A | N/A | Y | N/A | N/A |
| Derive Key | N/A | Y | N/A | N/A | N/A | Y | Y | N/A |
| Certify | Y | N/A | Y | N/A | N/A | Y | N/A | N/A |
| Re-certify | Y | N/A | N/A | N/A | N/A | Y | N/A | N/A |
| Locate | Y | Y | Y | Y | Y | Y | Y | Y |
| Check | Y | Y | Y | Y | Y | N/A | Y | Y |
| Get | Y | Y | Y | Y | Y | Y | Y | Y |
| Get Attributes | Y | Y | Y | Y | Y | Y | Y | Y |
| Get Attribute List | Y | Y | Y | Y | Y | Y | Y | Y |
| Add Attribute | Y | Y | Y | Y | Y | Y | Y | Y |
| Modify Attribute | Y | Y | Y | Y | Y | Y | Y | Y |
| Delete Attribute | Y | Y | Y | Y | Y | Y | Y | Y |
| Obtain Lease | Y | Y | Y | Y | Y | N/A | Y | N/A |
| Get Usage Allocation | N/A | Y | Y | Y | N/A | N/A | N/A | N/A |
| Activate | Y | Y | Y | Y | Y | N/A | Y | N/A |
| Revoke | Y | Y | N/A | Y | Y | N/A | Y | Y |
| Destroy | Y | Y | Y | Y | Y | Y | Y | Y |
| Archive | Y | Y | Y | Y | Y | Y | Y | Y |
| Recover | Y | Y | Y | Y | Y | Y | Y | Y |
| Validate | Y | N/A | N/A | N/A | N/A | N/A | N/A | N/A |
| Query | N/A | N/A | N/A | N/A | N/A | N/A | N/A | N/A |
| Cancel | N/A | N/A | N/A | N/A | N/A | N/A | N/A | N/A |
| Poll | N/A | N/A | N/A | N/A | N/A | N/A | N/A | N/A |
| Notify | N/A | N/A | N/A | N/A | N/A | N/A | N/A | N/A |
| Put | Y | Y | Y | Y | Y | Y | Y | Y |

1891

1892 **D. Acronyms**

1893 The following abbreviations and acronyms are used in this document:

- 1894 3DES - Three key Data Encryption Standard
- 1895 AES - Advanced Encryption Standard specified in FIPS 197
- 1896 ASN.1 - Abstract Syntax Notation One
- 1897 CA - Certification Authority
- 1898 CBC - Cipher Block Chaining
- 1899 CPU - Central Processing Unit
- 1900 CRL - Certificate Revocation List
- 1901 CRT - Chinese Remainder Theorem
- 1902 DER - Distinguished Encoding Rules
- 1903 DES - Data Encryption Standard
- 1904 DH - Diffie-Hellman
- 1905 DSA - Digital Signature Algorithm specified in FIPS 186-3
- 1906 DSKPP - Dynamic Symmetric Key Provisioning Protocol
- 1907 ECB - Electronic Code Book
- 1908 ECDH - Elliptic Curve Diffie-Hellman
- 1909 ECDSA - Elliptic Curve Digital Signature Algorithm specified in ANSX9.62
- 1910 [ECMQV - Elliptic Curve Menezes Qu Vanstone](#)
- 1911 HMAC - Keyed-Hash Message Authentication Code specified in FIPS 198
- 1912 HTTP - Hyper Text Transfer Protocol
- 1913 HTTP(S) - Hyper Text Transfer Protocol (Secure socket)
- 1914 IEEE - Institute of Electrical and Electronics Engineers
- 1915 IETF - Internet Engineering Task Force
- 1916 IPsec - Internet Protocol Security
- 1917 IV - Initialization Vector
- 1918 KMIP - Key Management Interoperability Protocol
- 1919 MAC - Message Authentication Code
- 1920 MD5 - Message Digest 5 Algorithm
- 1921 PBKDF2 - Password-Based Key Derivation Function 2
- 1922 PGP - Pretty Good Privacy
- 1923 PKCS - Public Key Cryptography Standards
- 1924 POSIX - Portable Operating System Interface
- 1925 RFC - Request for Comments documents of IETF
- 1926 RSA - Rivest, Shamir, Adelman (an algorithm)
- 1927 SHA-1 - Secure Hash Algorithm Revision One
- 1928 SSL/TLS - Secure Sockets Layer/Transport Layer Security

- 1929 S/MIME - Secure/Multipurpose Internet Mail Extensions
- 1930 TCP - Transport Control Protocol
- 1931 TTLV - Tag, Type, Length, Value
- 1932 URI - Unique Resource Identifier
- 1933 UTF - Universal Transformation Format
- 1934 XML - Extensible Markup Language

F. Acknowledgements

2195 The following individuals have participated in the creation of this specification and are gratefully
2196 acknowledged:

2197 **Original Authors of the initial contribution:**

2198 David Babcock, HP
2199 Steven Bade, IBM
2200 Paolo Bezoari, NetApp
2201 Mathias Björkqvist, IBM
2202 Bruce Brinson, EMC
2203 Christian Cachin, IBM
2204 Tony Crossman, Thales/nCipher
2205 Stan Feather, HP
2206 Indra Fitzgerald, HP
2207 Judy Furlong, EMC
2208 Jon Geater, Thales/nCipher
2209 Bob Griffin, EMC
2210 Robert Haas, IBM (editor)
2211 Timothy Hahn, IBM
2212 Jack Harwood, EMC
2213 Walt Hubis, LSI
2214 Glen Jaquette, IBM
2215 Jeff Kravitz, IBM (editor emeritus)
2216 Michael McIntosh, IBM
2217 Brian Metzger, HP
2218 Anthony Nadalin, IBM
2219 Elaine Palmer, IBM
2220 Joe Pato, HP
2221 René Pawlitzek, IBM
2222 Subhash Sankuratripati, NetApp
2223 Mark Schiller, HP
2224 Martin Skagen, Brocade
2225 Marcus Streets, Thales/nCipher
2226 John Tattan, EMC
2227 Karla Thomas, Brocade
2228 Marko Vukolić, IBM
2229 Steve Wierenga, HP

2230 **Participants:**

2231 TBD

G. Revision History

| Revision | Date | Editor | Changes Made |
|-------------------------|----------------------------|---|--|
| ed-0.98 | 2009-04-24 | Robert Haas | Initial conversion of input document to OASIS format together with clarifications. |
| ed-0.98 | 2009-05-21 | Robert Haas | Changes to TTLV format for 64-bit alignment. Appendices indicated as non normative. |
| ed-0.98 | 2009-06-25 | Robert Haas, Indra Fitzgerald | Multiple editorial and technical changes, including merge of Template and Policy Template. |
| ed-0.98 | 2009-07-23 | Robert Haas, Indra Fitzgerald | Multiple editorial and technical changes, mainly based on comments from Elaine Barker and Judy Furlong. Fix of Template Name. |
| ed-0.98 | 2009-07-27 | Indra Fitzgerald | Added captions to tables and figures. |
| ed-0.98 | 2009-08-27 | Robert Haas | Wording compliance changes according to RFC2119 from Rod Wideman. Removal of attribute mutation in server responses. |
| ed-0.98 | 2009-09-03 | Robert Haas | Incorporated the RFC2119 language conformance statement from Matt Ball; the changes to the Application-Specific Information attribute from René Pawlitzek; the extensions to the Query operation for namespaces from Mathias Björkqvist; the key roles proposal from Jon Geater, Todd Arnold, & Chris Dunn. Capitalized all RFC2119 keywords (required by OASIS) together with editorial changes. |
| ed-0.98 | 2009-09-17 | Robert Haas | Replaced Section 10 on HTTPS and SSL with the content from the User Guide. Additional RFC2119 language conformance changes. Corrections in the enumerations in Section 9. |
| ed-0.98 | 2009-09-25 | Indra Fitzgerald, Robert Haas | New Cryptographic Domain Parameters attribute and change to the Create Key Pair operation (from Indra Fitzgerald). Changes to Key Block object and Get operation to request desired Key Format and Compression Types (from Indra Fitzgerald). Changes in Revocation Reason code and new Certificate Issuer attribute (from Judy Furlong). No implicit object state change after Re-key or Re-certify. New Section 13 on Implementation Conformance from Matt Ball. Multiple editorial changes and new enumerations. |
