Related work:
This specification replaces or supersedes:

This specification is related to:
- Service Component Architecture Assembly Model Specification Version 1.1
- Service Component Architecture Policy Framework Specification Version 1.1
- Service Component Architecture SCA-J Common Annotations and APIs Specification Version 1.1

Declared XML Namespace(s):
http://docs.oasis-open.org/ns/opencsa/sca/200912
Abstract:
This specification extends the SCA Assembly Model by defining how a Java class provides an implementation of an SCA component, including its various attributes such as services, references, and properties and how that class is used in SCA as a component implementation type. It requires all the annotations and APIs as defined by the SCA-J Common Annotations and APIs specification.
This specification also details the use of metadata and the Java API defined in the context of a Java class used as a component implementation type.

Status:
This document was last revised or approved by the OASIS Service Component Architecture / J (SCA-J) TC on the above date. The level of approval is also listed above. Check the “Latest Version” or “Latest Approved Version” location noted above for possible later revisions of this document.
Technical Committee members should send comments on this specification to the Technical Committee’s email list. Others should send comments to the Technical Committee by using the “Send A Comment” button on the Technical Committee’s web page at http://www.oasis-open.org/committees/sca-j/.
For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Technical Committee web page (http://www.oasis-open.org/committees/sca-j/ipr.php).
The non-normative errata page for this specification is located at http://www.oasis-open.org/committees/sca-j/.

1 Introduction

This specification extends the SCA Assembly Model [ASSEMBLY] by defining how a Java class provides
an implementation of an SCA component (including its various attributes such as services, references,
and properties) and how that class is used in SCA as a component implementation type.

This specification requires all the annotations and APIs as defined by the SCA-J Common Annotations
and APIs specification [JAVACAA]. All annotations and APIs referenced in this document are defined in
the former unless otherwise specified. Moreover, the semantics defined in the SCA-J Common
Annotations and APIs specification are normative.

In addition, it details the use of metadata and the Java API defined in the SCA-J Common Annotations
and APIs Specification [JAVACAA] in the context of a Java class used as a component implementation
type.

1.1 Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD
NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described
in [RFC2119].

1.2 Normative References

2 Service

A component implementation based on a Java class can provide one or more services.

The services provided by a Java-based implementation MUST have an interface defined in one of the following ways:

- A Java interface
- A Java class
- A Java interface generated from a Web Services Description Language [WSDL] (WSDL) portType.

Java implementation classes MUST implement all the operations defined by the service interface.

If the service interface is defined by a Java interface, the Java-based component can either implement that Java interface, or implement all the operations of the interface.

Java interfaces generated from WSDL portTypes are remotable, see the WSDL to Java and Java to WSDL section of the SCA-J Common Annotations and APIs Specification [JAVACAA] for details.

A Java implementation type can specify the services it provides explicitly through the use of the @Service annotation. In certain cases as defined below, the use of the @Service annotation is not necessary and the services a Java implementation type offers can be inferred from the implementation class itself.

2.1 Use of @Service

Service interfaces can be specified as a Java interface. A Java class, which is a component implementation, can offer a service by implementing a Java interface specifying the service contract. As a Java class can implement multiple interfaces, some of which might not define SCA services, the @Service annotation can be used to indicate the services provided by the implementation and their corresponding Java interface definitions.

Snippet 2-1 and Error! Reference source not found. are an example of a Java service interface and a Java implementation which provides a service using that interface:

Interface:

```java
package services.hello;

public interface HelloService {
    String hello(String message);
}
```

Snippet 2-1: Example Java Service Interface

Implementation class:

```java
@Service(HelloService.class)
public class HelloServiceImpl implements HelloService {
    public String hello(String message) {
        ...
    }
}
```

Snippet 2-2: Example Java Component Implementation
The XML representation of the component type for this implementation is shown in Snippet 2-3 for illustrative purposes. There is no need to author the component type as it is introspected from the Java class.

```
<?xml version="1.0" encoding="UTF-8" найдено в Snippet 2-3?>
<componentType xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200912">
  <service name="HelloService">
    <interface.java interface="services.hello.HelloService"/ >>
  </service>
</componentType>
```

Snippet 2-3: Effective Component Type for Implementation in Snippet 2-2

Another possibility is to use the Java implementation class itself to define a service offered by a component and the interface of the service. In this case, the @Service annotation can be used to explicitly declare the implementation class defines the service offered by the implementation. In this case, a component will only offer services declared by @Service. Snippet 2-4 illustrates this:

```
package services.hello;

@Service(HelloServiceImpl.class)
public class HelloServiceImpl implements AnotherInterface {
  public String hello(String message) {
    ...
  }
}
```

Snippet 2-4: Example of Java Class Defining a Service

In Snippet 2-4, HelloServiceImpl offers one service as defined by the public methods of the implementation class. The interface AnotherInterface in this case does not specify a service offered by the component. Snippet 2-5 is an XML representation of the introspected component type:

```
<?xml version="1.0" encoding="UTF-8" найдено в Snippet 2-5?>
<componentType xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200912">
  <service name="HelloServiceImpl">
    <interface.java interface="services.hello.HelloServiceImpl"/ >>
  </service>
</componentType>
```

Snippet 2-5: Effective Component Type for Implementation in Snippet 2-4

The @Service annotation can be used to specify multiple services offered by an implementation as in Snippet 2-6:

```
@Service(interfaces={HelloService.class, AnotherInterface.class})
public class HelloServiceImpl implements HelloService, AnotherInterface {
  public String hello(String message) {
    ...
  }
```

### 2.2 Local and Remotal Services

A Java interface or implementation class that defines an SCA service can use the `@Remotable` annotation to declare that the service follows the semantics of remotable services as defined by the SCA Assembly Model Specification [ASSEMBLY]. Snippet 2-8 and Snippet 2-9 demonstrate the use of the `@Remotable` annotation on a Java interface:

#### Interface:

```java
package services.hello;

@Remotable
public interface HelloService {
    String hello(String message);
}
```

#### Implementation class:

```java
package services.hello;

@Service(HelloService.class)
public class HelloServiceImpl implements HelloService {
    ... public String hello(String message) { ... }
}
```

Snippet 2-10 shows the introspected component type for this implementation.

```xml
<componentType xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200912">
    <service name="HelloService">
        <interface.java interface="services.hello.HelloService"/>
    </service>
</componentType>
```
The interface specified in the `@interface` attribute of the `<interface.java/>` element is implicitly remotable because the Java interface contains `@Remotable`. If a service is defined by a Java implementation class instead of a Java interface, the `@Remotable` annotation can be used on the implementation class to indicate that the service is remotable. Snippet 2-11 demonstrates this:

```
package services.hello;

@Remotable
@Service(HelloServiceImpl.class)
public class HelloServiceImpl {

    public String hello(String message) {
        ...
    }
}
```

Snippet 2-11: Remotable Interface Defined by a Class

Snippet 2-12 shows the introspected component type for this implementation.

```
<?xml version="1.0" encoding="UTF-8"?>
<componentType xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200912">
    <service name="HelloServiceImpl">
        <interface.java interface="services.hello.HelloServiceImpl"/>
    </service>
</componentType>
```

Snippet 2-12: Effective Component Type for Implementation in Snippet 2-11

The interface specified in the `@interface` attribute of the `<interface.java/>` element is implicitly remotable because the Java implementation class contains `@Remotable`. It is also possible to use a Java interface with no `@Remotable` annotation to define an SCA service with remotable semantics. In this case, the `@Remotable` annotation is placed on the service implementation class, as shown in Snippet 2-13 and Snippet 2-14:

Interface:

```
package services.hello;

public interface HelloService {
    String hello(String message);
}
```

Snippet 2-13: Interface without @Remotable

Implementation class:

```
package services.hello;

@Remotable
@Service(HelloService.class)
public class HelloServiceImpl implements HelloService {
    public String hello(String message) {
        ...
    }
}
```

Deleted: Snippet 2-9
Deleted: Snippet 2-11
Deleted: Snippet 2-12
Deleted: Snippet 2-13
Deleted: Snippet 2-14
In this case the introspected component type for the implementation uses the @remotable attribute of the `<interface.java/>` element, as shown in Snippet 2-15:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<componentType xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200912">
  <service name="HelloService">
    <interface.java interface="services.hello.HelloService" remotable="true"/>
  </service>
</componentType>
```

An implementation class can provide hints to the SCA runtime about whether it can achieve pass-by-value semantics without making a copy by using the @AllowsPassByReference annotation.

### 2.3 Introspecting Services Offered by a Java Implementation

The services offered by a Java implementation class are determined through introspection, as defined in the section "Component Type of a Java Implementation".

If the interfaces of the SCA services are not specified with the @Service annotation on the implementation class and the implementation class does not contain any @Reference or @Property annotations, it is assumed that all implemented interfaces that have been annotated as @Remotable are the service interfaces provided by the component. If an implementation class has only implemented interfaces that are not annotated with a @Remotable annotation, the class is considered to implement a single local service whose type is defined by the class (note that local services can be typed using either Java interfaces or classes).

### 2.4 Non-Blocking Service Operations

Service operations defined by a Java interface can use the @OneWay annotation to declare that the SCA runtime needs to honor non-blocking semantics as defined by the SCA Assembly Model Specification [ASSEMBLY] when a client invokes the service operation.

### 2.5 Callback Services

A callback interface can be declared by using the @Callback annotation on the service interface or Java implementation class as described in the SCA-J Common Annotations and APIs Specification [JAVACAA]. Alternatively, the @callbackInterface attribute of the `<interface.java/>` element can be used to declare a callback interface.
3 References

A Java implementation class can obtain service references either through injection or through the ComponentContext API as defined in the SCA-J Common Annotations and APIs Specification [JAVACAA]. When possible, the preferred mechanism for accessing references is through injection.

3.1 Reference Injection

A Java implementation type can explicitly specify its references through the use of the @Reference annotation as in Snippet 3-1:

```java
public class ClientComponentImpl implements Client {
    private HelloService service;

    @Reference
    public void setHelloService(HelloService service) {
        this.service = service;
    }
}
```

Snippet 3-1: Specifying a Reference

If @Reference marks a setter method, the SCA runtime provides the appropriate implementation of the service reference contract as specified by the parameter type of the method. This is done by invoking the setter method of an implementation instance of the Java class. When injection occurs is defined by the scope of the implementation. However, injection always occurs before the first service method is called.

If @Reference marks a field, the SCA runtime provides the appropriate implementation of the service reference contract as specified by the field type. This is done by setting the field on an implementation instance of the Java class. When injection occurs is defined by the scope of the implementation. However, injection always occurs before the first service method is called.

If @Reference marks a parameter on a constructor, the SCA runtime provides the appropriate implementation of the service reference contract as specified by the constructor parameter during creation of an implementation instance of the Java class.

Except for constructor parameters, references marked with the @Reference annotation can be declared with required=false, as defined by the SCA-J Common Annotations and APIs Specification [JAVACAA] - i.e., the reference multiplicity is 0..1 or 0..n, where the implementation is designed to cope with the reference not being wired to a target service.

The @Remotable annotation can be used either on the service reference contract or on the reference itself to specify that the service reference contract follows the semantics of remotable services as defined by the SCA Assembly Model Specification [ASSEMBLY]; otherwise, the service reference contract has local semantics.

In the case where a Java class contains no @Reference or @Property annotations, references are determined by introspecting the implementation class as described in the section "ComponentType of an Implementation with no @Reference or @Property annotations ".

3.2 Dynamic Reference Access

As an alternative to reference injection, service references can be accessed dynamically through the API methods ComponentContext.getService() and ComponentContext.getServiceReference() methods as described in the SCA-J Common Annotations and APIs Specification [JAVACAA].
4 Properties

4.1 Property Injection

Properties can be obtained either through injection or through the ComponentContext API as defined in
the SCA-J Common Annotations and APIs Specification [JAVACAA]. When possible, the preferred
mechanism for accessing properties is through injection.

A Java implementation type can explicitly specify its properties through the use of the @Property
annotation as in Snippet 4-1:

```java
public class ClientComponentImpl implements Client {
    private int maxRetries;
    @Property
    public void setMaxRetries(int maxRetries) {
        this.maxRetries = maxRetries;
    }
}
```

Snippet 4-1: Specifying a Property

If the @Property annotation marks a setter method, the SCA runtime provides the appropriate property
value by invoking the setter method of an implementation instance of the Java class. When injection
occurs is defined by the scope of the implementation. However, injection always occurs before the first
service method is called.

If the @Property annotation marks a field, the SCA runtime provides the appropriate property value by
setting the value of the field of an implementation instance of the Java class. When injection occurs is
defined by the scope of the implementation. However, injection always occurs before the first service
method is called.

If the @Property annotation marks a parameter on a constructor, the SCA runtime provides the
appropriate property value during creation of an implementation instance of the Java class.

Except for constructor parameters, properties marked with the @Property annotation can be declared
with required=false as defined by the SCA-J Common Annotations and APIs Specification [JAVACAA],
i.e., the property mustSupply attribute is false and where the implementation is designed to cope with the
component configuration not supplying a value for the property.

In the case where a Java class contains no @Reference or @Property annotations, properties are
determined by introspecting the implementation class as described in the section "ComponentType of an
Implementation with no @Reference or @Property annotations ".

For an unannotated field or setter method that is introspected as a property and where the Java type of
the field or setter method is a JAXB [JAXB] annotated class, the SCA runtime MUST convert a property
value specified by an SCA component definition into an instance of the property's Java type as defined by
the XML to Java mapping in the JAXB specification [JAXB] with XML schema validation enabled.

For an unannotated field or setter method that is introspected as a property and where the Java type of
the field or setter method in not a JAXB [JAXB] annotated class, the SCA runtime can use any XML to
Java mapping when converting property values into instances of the Java type.
4.2 Dynamic Property Access

As an alternative to property injection, properties can also be accessed dynamically through the `ComponentContext.getProperty()` method as described in the SCA-J Common Annotations and APIs Specification [JAVACAA].
5 Implementation Instance Creation

A Java implementation class MUST provide a public or protected constructor that can be used by the SCA runtime to create the implementation instance.[JCI50001] The constructor can contain parameters; in the presence of such parameters, the SCA container passes the applicable property or reference values when invoking the constructor. Any property or reference values not supplied in this manner are set into the field or are passed to the setter method associated with the property or reference before any service method is invoked.

The constructor to use for the creation of an implementation instance MUST be selected by the SCA runtime using the sequence:

1. A declared constructor annotated with a @Constructor annotation.
2. A declared constructor, all of whose parameters are annotated with either @Property or @Reference.
3. A no-argument constructor.

The @Constructor annotation MUST NOT appear on more than one constructor. [JCI50002]

In the absence of an @Constructor annotation, there MUST NOT be more than one constructor that has a non-empty parameter list with all parameters annotated with either @Property or @Reference. [JCI50005]

The property or reference associated with each parameter of a constructor is identified through the presence of a @Property or @Reference annotation on the parameter declaration.

The construction and initialization of component implementation instances is described as part of the SCA component implementation lifecycle in the SCA-J Common Annotations and APIs specification [JAVACAA].

Snippet 5-1 shows examples of legal Java component constructor declarations:

```java
/** Constructor declared using @Constructor annotation */
public class Impl1 {
    private String someProperty;
    @Constructor
    public Impl1( @Property("someProperty") String propval ) {...}
}

/** Declared constructor unambiguously identifying all Property
 * and Reference values */
public class Impl2 {
    private String someProperty;
    private SomeService someReference;
    public Impl2( @Property("someProperty") String a,
        @Reference("someReference") SomeService b ) {
        [...]
    }
}

/** Declared constructor unambiguously identifying all Property
 * and Reference values plus an additional Property injected
 * via a setter method */
public class Impl3 {
    private String someProperty;
    private String anotherProperty;
    private SomeService someReference;
    public Impl3( @Property("someProperty") String a,
        @Reference("someReference") SomeService b ) {
        [...]
    }
    @Property
```
public void setAnotherProperty( String anotherProperty ) {...}

/** No-arg constructor */
public class Impl4 {
    @Property
    public String someProperty;
    @Reference
    public SomeService someReference;
    public Impl4() {...}
}

/** Unannotated implementation with no-arg constructor */
public class Impl5 {
    public String someProperty;
    public SomeService someReference;
    public Impl5() {...}
}
6 Implementation Scopes and Lifecycle Callbacks

The Java implementation type supports all of the scopes defined in the SCA-J Common Annotations and APIs Specification: STATELESS and COMPOSITE. The SCA runtime MUST support the STATELESS and COMPOSITE implementation scopes. [JCl60001]

Implementations specify their scope through the use of the @Scope annotation as shown in Snippet 6-1:

```java
@Scope("COMPOSITE")
public class ClientComponentImpl implements Client {
    // …
}
```

Snippet 6-1: Specifying the Scope of an Implementation

When the @Scope annotation is not specified on an implementation class, its scope is defaulted to STATELESS.

A Java component implementation specifies init and destroy methods by using the @Init and @Destroy annotations respectively, as described in the SCA-J Common Annotations and APIs specification [JAVACAA].

For example:

```java
public class ClientComponentImpl implements Client {

    @Init
    public void init() {
        // …
    }

    @Destroy
    public void destroy() {
        // …
    }
}
```

Snippet 6-2: Example Init and Destroy Methods
7 Accessing a Callback Service

Java implementation classes that implement a service which has an associated callback interface can use the @Callback annotation to have a reference to the callback service associated with the current invocation injected on a field or injected via a setter method.

As an alternative to callback injection, references to the callback service can be accessed dynamically through the API methods RequestContext.getCallback() and RequestContext.getCallbackReference() as described in the SCA-J Common Annotations and APIs Specification [JAVACAA].
8 Component Type of a Java Implementation

An SCA runtime MUST introspect the componentType of a Java implementation class following the rules defined in the section "Component Type of a Java Implementation" [JCI80001].

The component type of a Java Implementation is introspected from the implementation class using the rules:

A <service/> element exists for each interface or implementation class identified by a @Service annotation:

- name attribute is the simple name of the interface or implementation class (i.e., without the package name)
- requires attribute is omitted unless the service implementation class is annotated with general or specific intent annotations - in this case, the requires attribute is present with a value equivalent to the intents declared by the service implementation class.
- policySets attribute is omitted unless the service implementation class is annotated with @PolicySets - in this case, the policySets attribute is present with a value equivalent to the policy sets declared by the @PolicySets annotation.
- <interface.java> child element is present with the interface attribute set to the fully qualified name of the interface or implementation class identified by the @Service annotation. See the SCA-J Common Annotations and APIs specification [JAVACAA] for a definition of how policy annotations on Java interfaces, Java classes, and methods of Java interfaces are handled.
- remotable attribute of <interface.java> child element is omitted unless the service is defined by a Java interface with no @Remotable annotation and the service implementation class is annotated with @Remotable, in which case the <interface.java> element has remotable="true".
- binding child element is omitted
- callback child element is omitted

A <reference/> element exists for each @Reference annotation:

- name attribute has the value of the name parameter of the @Reference annotation, if present, otherwise it is the name of the field or the JavaBeans property name [JAVABEANS] corresponding to the setter method name, depending on what element of the class is annotated by the @Reference (note: for a constructor parameter, the @Reference annotation needs to have a name parameter)
- wiredByImpl attribute is omitted
- wiredByImpl attribute is omitted
- target attribute is omitted
- the multiplicity attribute is set according to the rules in section "@Reference" of the SCA Common Annotations and APIs Specification [JAVACAA]
- requires attribute is omitted unless the field, setter method or parameter is also annotated with general or specific intent annotations - in this case, the requires attribute is present with a value equivalent to the intents declared by the Java reference.
- policySets attribute is omitted unless the field, setter method or parameter is also annotated with @PolicySets - in this case, the policySets attribute is present with a value equivalent to the policy sets declared by the @PolicySets annotation.
- <interface.java> child element with the interface attribute set to the fully qualified name of the interface class which types the field or setter method or constructor parameter. See the SCA-J Common Annotations and APIs specification [JAVACAA] for a definition of how policy annotations on Java interfaces and methods of Java interfaces are handled.
remoteable attribute of <interface.java> child element is omitted unless the interface class has no
@Remotable annotation and there is a @Remotable annotation on the field, setter method or
constructor parameter, in which case the <interface.java> element has remotable="true".

• binding child element is omitted
• callback child element is omitted

A <property/> element exists for each @Property annotation:
• name attribute has the value of the name parameter of the @Property annotation, if present,
otherwise it is the name of the field or the JavaBeans property name [JAVABEANS] corresponding to
the setter method name, depending on what element of the class is annotated by the @Property
(note: for a constructor parameter, the @Property annotation needs to have a name parameter)
• value attribute is omitted
• type attribute which is set to the XML type implied by the JAXB mapping of the Java type of the field
or the Java type defined by the parameter of the setter method. Where the type of the field or of the
setter method is an array, the element type of the array is used. Where the type of the field or of the
setter method is a java.util.Collection, the parameterized type of the Collection or its member type is
used. If the JAXB mapping is to a global element rather than a type (JAXB @XMLRootElement
annotation), the type attribute is omitted. Note that JAXB mapping is the default mapping, but that
other mappings are possible, where supported by the SCA runtime
(for example, SDO). How such alternative mappings are indicated is not described in this
specification.
• element attribute is omitted unless the JAXB mapping of the Java type of the field or the Java type
defined by the parameter of the setter method is to a global element (JAXB @XMLRootElement
annotation). In this case, the element attribute has the value of the name of the XSD global element
implied by the JAXB mapping.
• many attribute is set according to the rules in section "@Property" of the SCA Common Annotations
and APIs Specification [JAVACAA].
• mustSupply attribute is set to "true" unless the @Property annotation has required=false, in which
case it is set to "false"

An <implementation.java/> element exists if the service implementation class is annotated with general or
specific intent annotations or with @PolicySets:
• requires attribute is omitted unless the service implementation class is annotated with general or
specific intent annotations - in this case, the requires attribute is present with a value equivalent to the
intents declared by the service implementation class.
• policySets attribute is omitted unless the service implementation class is annotated with @PolicySets
- in this case, the policySets attribute is present with a value equivalent to the policy sets declared by
the @PolicySets annotation.

8.1 Component Type of an Implementation with no @Service,
@Reference or @Property Annotations

The section defines the rules for determining the services of a Java component implementation that
contains no @Service annotations, no @Reference annotations, and no @Property annotations. If the
implementation class contains any @Service, @Reference or @Property annotations, the rules in this
section do not apply.

The SCA services offered by the implementation class are defined using the rules:
• either: one service for each of the interfaces implemented by the class where the interface is
annotated with @Remotable.
• or: if the class implements zero interfaces where the interface is annotated with @Remotable, then
by default the implementation offers a single local service whose type is the implementation class
itself
A `<service/>` element exists for each service identified in this way:

- name attribute is the simple name of the interface or the simple name of the class
- requires attribute is omitted unless the service implementation class is annotated with general or specific intent annotations - in this case, the requires attribute is present with a value equivalent to the intents declared by the service implementation class.
- policySets attribute is omitted unless the service implementation class is annotated with `@PolicySets` - in this case, the policySets attribute is present with a value equivalent to the policy sets declared by the `@PolicySets` annotation.
- `<interface.java>` child element is present with the interface attribute set to the fully qualified name of the interface class or to the fully qualified name of the class itself. See the SCA-J Common Annotations and APIs specification [JAVACAA] for a definition of how policy annotations on Java interfaces, Java classes, and methods of Java interfaces are handled.
- remotalbe attribute of `<interface.java>` child element is omitted
- binding child element is omitted
- callback child element is omitted

The SCA properties and references of the implementation class are defined using the rules:

The following setter methods and fields are taken into consideration:

1. Public setter methods that are not part of the implementation of an SCA service (either explicitly marked with `@Service` or implicitly defined as described above)
2. Public or protected fields unless there is a public setter method for the same name

An unannotated field or setter method is a reference if:

- its type is an interface annotated with `@Remotable`
- its type is an array where the element type of the array is an interface annotated with `@Remotable`
- its type is a `java.util.Collection` where the parameterized type of the Collection or its member type is an interface annotated with `@Remotable`
- all other attributes and child elements of the reference are omitted

An unannotated field or setter method is a property if it is not a reference using the immediately preceeding rules.

For each property of this type, the component type has a property element with:

- name attribute with the value of the name of the field or the JavaBeans property name [JAVABEANS] corresponding to the setter method name
- multiplicity attribute is (1..1) for the case where the type is an interface
- multiplicity attribute is (1..n) for the cases where the type is an array or is a `java.util.Collection`
- `<interface.java>` child element with the interface attribute set to the fully qualified name of the interface class which types the field or setter method. See the SCA-J Common Annotations and APIs specification [JAVACAA] for a definition of how policy annotations on Java interfaces and methods of Java interfaces are handled.
- remotalbe attribute of `<interface.java>` child element is omitted
- requires attribute is omitted unless the field or setter method is also annotated with general or specific intent annotations - in this case, the requires attribute is present with a value equivalent to the intents declared by the Java reference.
- policySets attribute is omitted unless the field or setter method is also annotated with `@PolicySets` - in this case, the policySets attribute is present with a value equivalent to the policy sets declared by the `@PolicySets` annotation.
- all other attributes and child elements of the reference are omitted

For each property of this type, the component type has a property element with:

- name attribute with the value of the name of the field or the JavaBeans property name [JAVABEANS] corresponding to the setter method name
• type attribute and element attribute are set as described for a property declared via a @Property annotation, following the JAXB mapping of the Java type of the field or setter method by default. Note that other mappings are possible, where supported by the SCA runtime (for example, SDO). How such alternative mappings are indicated is not described in this specification.
• value attribute omitted
• many attribute set to “false” unless the type of the field or of the setter method is an array or a java.util.Collection, in which case it is set to “true”.
• mustSupply attribute set to true

8.2 Impact of JAX-WS Annotations on ComponentType

As described in the Java Common Annotations and APIs specification [JAVACAA], there are a number of JAX-WS [JAX-WS] annotations that can affect the introspection and interpretation of Java classes and Java interfaces. This section describes the effect of the JAX-WS annotations on the introspected componentType of a Java implementation class.

8.2.1 @WebService

An interface or implementation class annotated with @WebService is treated as if it had an @Service annotation:
• The value of the name property of the @WebService annotation is used as the name of the <service/> element
• If the endpointInterface property of the @WebService annotation has a non-default value, then the interface attribute of the <interface.java/> child element of the <service/> element is set to the interface identified by the endpointInterface property.
• The <interface.java/> child element of the <service/> has the remotable attribute set to “true”.
• If the wsdlLocation property of the @WebService annotation has a non-default value, then the <service/> element has an <interface.wsdl/> child element instead of an <interface.java/> child element. The value of the @interface attribute of the <interface.wsdl/> element is constructed by pointing to the portType, in the WSDL definition pointed to by @wsdlLocation, which resulted from the JAX-WS mapping for the annotated class or interface.
• If both the endpointInterface and wsdlLocation properties of the @WebService annotation have default values and there is no @Service annotation, then the interface attribute of the <interface.java/> child element of the <service/> element is set to the fully qualified name of the interface or implementation class.

8.2.2 @WebMethod

• The value of the name property of the @WebMethod annotation is used when testing interface compatibility.
• If the value of the exclude property of the @WebMethod annotation is “true”, then the method is excluded from the SCA interface.

8.2.3 @WebParam

• The value of the mode property of the @WebParam is considered when testing interface compatibility.
• If the value of the header property of the @WebParam is “true”, then the “SOAP” intent is added to the requires annotation of the <service/> element.
8.2.4 @WebResult

- If the value of the header property of the @WebResult is "true", then the "SOAP" intent is added to
the requires annotation of the <service/> element.

8.2.5 @SOAPBinding

- If an interface or class is annotated with @SOAPBinding, then the "SOAP" intent is added to the
requires annotation of the <service/> element. The same is true if any method of the interface or
class is annotated with @SOAPBinding.

8.2.6 @WebFault

- The value of the name property of the @WebFault annotation is used when testing interface
compatibility.

8.2.7 @WebServiceProvider

An implementation class annotated with @WebServiceProvider is treated as if it had an @Service
annotation:

- The <interface.java/> child element of the <service/> has the remotable attribute set to "true".

- If the wsdlLocation property of the @WebServiceProvider annotation has a non-default value, then
the <service/> element has an <interface.wsdl/> child element instead of an <interface.java/> child
element. The value of the @interface attribute of the <interface.wsdl/> element is constructed by
pointing to the portType, in the WSDL definition pointed to by @wsdlLocation, which resulted from the
JAX-WS mapping for the annotated class or interface.

8.2.8 Web Service Binding

By default, the JAX-WS specification requires that JAX-WS service implementation classes have
endpoints that are made available using the SOAP 1.1 HTTP WSDL binding which is denoted by the URL
http://schemas.xmlsoap.org/wsdl/soap/http [JAX-WS]. Therefore, the presence of any JAX-WS annotations in an SCA implementation or in an interface class
requires that any SCA services exposed by an implementation class are made available using the SOAP
1.1 HTTP WSDL binding by default. As a result, the respective <service/> elements in the component
type of the implementation class each have a <binding.ws/> subelement [WSBINDING] with its
wsdIElement attribute set such that the SOAP 1.1 HTTP WSDL binding is used at runtime.

Note that JAX-WS annotations do not cause <reference/> elements in the component type of an
implementation class to have a <binding.ws/> subelement.

8.2.8.1 @BindingType

If the default WSDL binding is not acceptable for a <service/>, the JAX-WS @BindingType annotation
can be used to specify a different WSDL binding URL. If the JAX-WS @BindingType annotation is used,
then the <binding.ws/> subelement has its wsdIElement attribute set such that the WSDL binding used
at runtime matches the value of the @BindingType annotation.

8.3 Component Type Introspection Examples

Snippet 8-1 shows how intent annotations can be applied to service and reference interfaces and
methods as well as to a service implementation class.

```java
// Service interface
cpyackage test;
import org.oasisopen.sca.annotation.Authentication;
import org.oasisopen.sca.annotation.Confidentiality;
```
Snippet 8-1: Intent Annotations on Java Interfaces, Methods, and Implementations.

Snippet 8-2 shows the introspected component type that is produced by applying the component type introspection rules to the interfaces and implementation from Snippet 8-1.

Snippet 8-3 shows examples of illegal Java implementation due to the presence of more than one setter method resulting in either an SCA property or an SCA reference with the same name.
* are annotated with @Property annotation. */

```java
public class IllegalImpl1 {
    // Setter method with upper case initial letter 'S'
    @Property
    public void setSomeProperty(String someProperty) {...}

    // Setter method with lower case initial letter 's'
    @Property
    public void setsomeProperty(String someProperty) {...}
}
```

/** Illegal since setter methods with same JavaBeans property name
* are annotated with @Reference annotation. */

```java
public class IllegalImpl2 {
    // Setter method with upper case initial letter 'S'
    @Reference
    public void setSomeReference(SomeService service) {...}

    // Setter method with lower case initial letter 's'
    @Reference
    public void setsomeReference(SomeService service) {...}
}
```

/** Illegal since two setter methods with same JavaBeans property name
* are resulting in an SCA property. Implementation has no @Property
* or @Reference annotations. */

```java
public class IllegalImpl3 {
    // Setter method with upper case initial letter 'S'
    public void setSomeOtherProperty(String someProperty) {...}

    // Setter method with lower case initial letter 's'
    public void setsomeOtherProperty(String someProperty) {...}
}
```

/** Illegal since two setter methods with same JavaBeans property name
* are resulting in an SCA reference. Implementation has no @Property
* or @Reference annotations. */

```java
public class IllegalImpl4 {
    // Setter method with upper case initial letter 'S'
    public void setSomeOtherReference(SomeService service) {...}

    // Setter method with lower case initial letter 's'
    public void setsomeOtherReference(SomeService service) {...}
}
```

```java
/** Two setter methods with same JavaBeans property name, but one is
* annotated with @Property and the other is annotated with @Reference
*/

```java
```java
public class WeirdButLegalImpl {
    // Setter method with upper case initial letter 'F'
    @Property
    public void setFoo(String foo) {...}

    // Setter method with lower case initial letter 'f'
    @Reference
    public void setfoo(SomeService service) {...}
}
```
Snippet 8-4: Example of Valid Combination of Setter Methods
9 Specifying the Java Implementation Type in an Assembly

Snippet 9-1 shows the pseudo-schema that defines the implementation element schema used for the Java implementation type:

```
<implementation.java class="xs:NCName"
    requires="list of xs:QName"?
    policySets="list of xs:QName"/>
```

Snippet 9-1: Pseudo-Schema for implementation.java

The implementation.java element has the attributes:

- **class**: NCName (1..1) – the fully qualified name of the Java class of the implementation
- **requires**: QName (0..n) – a list of policy intents. See the Policy Framework specification [POLICY] for a description of this attribute.
- **policySets**: QName (0..n) – a list of policy sets. See the Policy Framework specification [POLICY] for a description of this attribute.

The `<implementation.java>` element MUST conform to the schema defined in `sca-implementation-java.xsd`. [JCI90001]

The fully qualified name of the Java class referenced by the `@class` attribute of `<implementation.java/>` MUST resolve to a Java class, using the artifact resolution rules defined in Section 10.2, that can be used as a Java component implementation. [JCI90002]

The Java class referenced by the `@class` attribute of `<implementation.java/>` MUST conform to Java SE version 5.0. [JCI90003]
10 Java Packaging and Deployment Model

The SCA Assembly Model Specification [ASSEMBLY] describes the basic packaging model for SCA contributions in the chapter on Packaging and Deployment. This specification defines extensions to the basic model for SCA contributions that contain Java component implementations.

The model for the import and export of Java classes follows the model for import-package and export-package defined by the OSGi Service Platform Core Specification [OSGi Core]. Similar to an OSGi bundle, an SCA contribution that contains Java classes represents a class loader boundary at runtime. That is, classes are loaded by a contribution specific class loader such that all contributions with visibility to those classes are using the same Class Objects in the JVM.

10.1 Contribution Metadata Extensions

SCA contributions can be self contained such that all the code and metadata needed to execute the components defined by the contribution is contained within the contribution. However, in larger projects, there is often a need to share artifacts across contributions. This is accomplished through the use of the import and export extension points as defined in the sca-contribution.xml document. An SCA contribution that needs to use a Java class from another contribution can declare the dependency via an `<import.java/>` extension element, contained within a `<contribution/>` element, as shown in Snippet 10-1:

```
<import.java package="xs:string" location="xs:anyURI"/>
```

Snippet 10-1: Pseudo-Schema for import.java

The import.java element has the attributes:

- **package : string (1..1)** – The name of one or more Java package(s) to use from another contribution. Where there is more than one package, the package names are separated by a comma ".".
  
  The package can have a version number range appended to it, separated from the package name by a semicolon ";" followed by the text "version=" and the version number range, for example:
  
  ```
  package=com.acme.package1;version=1.4.1
  package=com.acme.package2;version=[1.2,1.3]
  ```

  Version number range follows the format defined in the OSGi Core specification [OSGi Core]:
  
  ```
  [1.2,1.3] - enclosing square brackets - inclusive range meaning any version in the range from the lowest to the highest, including the lowest and the highest
  (1.3.1,2.4.1) - enclosing round brackets - exclusive range meaning any version in the range from the lowest to the highest but not including the lowest or the highest.
  1.4.1 - no enclosing brackets - implies any version at or later than the specified version number is acceptable - equivalent to [1.4.1, infinity)
  ```

  If no version is specified for an imported package, then it is assumed to have a version range of [0.0.0, infinity) - ie any version is acceptable.

- **location : anyURI (0..1)** – The URI of the SCA contribution which is used to resolve the java packages for this import.

Each Java package that is imported into the contribution MUST be included in one and only one import.java element. [JCI100001] Multiple packages can be imported, either through specifying multiple import.java elements in the `@package` attribute or through the presence of multiple import.java elements.
The SCA runtime MUST ensure that the package used to satisfy an import matches the package name, the version number or version number range and (if present) the location specified on the import java element [JC100002].

An SCA contribution that wants to allow a Java package to be used by another contribution can declare the exposure via an &lt;export.java/&gt; extension element as shown in Snippet 10-2:

```
&lt;export.java package="xs:string"/&gt;
```

Snippet 10-2: Pseudo-Schema for export.java

The export.java element has the attributes:

- **package : string (1..1)** – The name of one or more Java package(s) to expose for sharing by another contribution. Where there is more than one package, the package names are separated by a comma ".".

  The package can have a **version number** appended to it, separated from the package name by a semicolon ";" followed by the text "version=" and the version number:

  package="com.acme.package1;version=1.4.1"

  The package can have a **uses directive** appended to it, separated from the package name by a semicolon ";" followed by the text "uses=" which is then followed by a list of package names contained within single quotes "" (needed as the list contains commas).

  The uses directive indicates that the SCA runtime MUST ensure that any SCA contribution that imports this package from this exporting contribution also imports the same version as is used by this exporting contribution of any of the packages contained in the uses directive. [JC100003] Typically, the packages in the uses directive are packages used in the interface to the package being exported (e.g. as parameters or as classes/interfaces that are extended by the exported package). Example:

  package="com.acme.package1;uses=com.acme.package2,com.acme.package3"

If no version information is specified for an exported package, the version defaults to 0.0.0.

If no uses directive is specified for an exported package, there is no requirement placed on a contribution which imports the package to use any particular version of any other packages.

Each Java package that is exported from the contribution MUST be included in one and only one export.java element. [JC100004] Multiple packages can be exported, either through specifying multiple packages in the @package attribute or through the presence of multiple export.java elements.

For example, a contribution that wants to:

- use classes from the **some.package** package from another contribution (any version)
- use classes of the **some.other.package** package from another contribution, at exactly version 2.0.0
- expose the **my.package** package from its own contribution, with version set to 1.0.0

would specify an sca-contribution.xml file shown in Snippet 10-3:

```
<?xml version="1.0" encoding="UTF-8"?>
<contribution xmlns=http://docs.oasis-open.org/ns/opencsa/sca/200912>
  
  &lt;import.java xmlns=http://docs.oasis-open.org/ns/opencsa/sca/200912&gt;
  
  &lt;import.java package="some.package"/&gt;
  &lt;import.java package="some.other.package;version=[2.0.0]"/&gt;
  &lt;import.java package="my.package;version=1.0.0"/&gt;
  
  &lt;/import.java&gt;

  &lt;/contribution&gt;
```

Snippet 10-3: Example Imports and Exports

A Java package that is specified on an export element MUST be contained within the contribution containing the export element. [JC100007]
10.2 Java Artifact Resolution

The SCA runtime MUST ensure that within a contribution, Java classes are resolved according to the following steps in the order specified:

1. If the contribution contains a Java Language specific resolution mechanism such as a classpath declaration in the archive’s manifest, then that mechanism is used first to resolve classes. If the class is not found, then continue searching at step 2.

2. If the package of the Java class is specified in an import declaration then:
   a) if @location is specified, the location searched for the class is the contribution declared by the @location attribute.
   b) if @location is not specified, the locations which are searched for the class are the contribution(s) in the Domain which have export declarations for that package. If there is more than one contribution exporting the package, then the contribution chosen is SCA Runtime dependent, but is always the same contribution for all imports of the package. If the Java package is not found, continue to step 3.

3. The contribution itself is searched using the archive resolution rules defined by the Java Language.

10.3 Class Loader Model

The SCA runtime MUST ensure that the Java classes used by a contribution are all loaded by a class loader that is unique for each contribution in the Domain. The SCA runtime MUST ensure that Java classes that are imported into a contribution are loaded by the exporting contribution’s class loader, as described in the section "Contribution Metadata Extensions".

For example, suppose contribution A using class loader ACL, imports package some.package from contribution B that is using class loader BCL then the expression:

```
ACL.loadClass(importedClassName) == BCL.loadClass(importedClassName)
```

Snippet 10-4: Example Class Loader Use

evaluates to true.

The SCA runtime MUST set the thread context class loader of a component implementation class to the class loader of its containing contribution.
11 Conformance

The XML schema pointed to by the RDDL document at the namespace URI, defined by this specification, are considered to be authoritative and take precedence over the XML schema defined in the appendix of this document.

There are three categories of artifacts that this specification defines conformance for: SCA Java Component Implementation Composite Document, SCA Java Component Implementation Contribution Document and SCA Runtime.

11.1 SCA Java Component Implementation Composite Document

An SCA Java Component Implementation Composite Document is an SCA Composite Document, as defined by the SCA Assembly Model Specification Section 13.1 [ASSEMBLY], that uses the \texttt{<implementation.java>} element. Such an SCA Java Component Implementation Composite Document MUST be a conformant SCA Composite Document, as defined by [ASSEMBLY], and MUST comply with the requirements specified in Section 9 of this specification.

11.2 SCA Java Component Implementation Contribution Document

An SCA Java Component Implementation Contribution Document is an SCA Contribution Document, as defined by the SCA Assembly Model specification Section 13.1 [ASSEMBLY], that uses the contribution metadata extensions defined in Section 10. Such an SCA Java Component Implementation Contribution document MUST be a conformant SCA Contribution Document, as defined by [ASSEMBLY], and MUST comply with the requirements specified in Section 10 of this specification.

11.3 SCA Runtime

An implementation that claims to conform to this specification MUST meet the conditions:

1. The implementation MUST meet all the conformance requirements defined by the SCA Assembly Model Specification [ASSEMBLY].
2. The implementation MUST reject an SCA Java Composite Document that does not conform to the \texttt{sca-implementation-java.xsd} schema.
3. The implementation MUST reject an SCA Java Contribution Document that does not conform to the \texttt{sca-contribution-java.xsd} schema.
4. The implementation MUST meet all the conformance requirements, specified in 'Section 11 Conformance', from the SCA-J Common Annotations and APIs Specification [JAVACAA].
5. This specification permits an implementation class to use any and all the APIs and annotations defined in the SCA-J Common Annotations and APIs Specification [JAVACAA], therefore the implementation MUST comply with all the statements in Appendix B: Conformance Items of [JAVACAA], notably all mandatory statements have to be implemented.
6. The implementation MUST comply with all statements related to an SCA Runtime, specified in 'Appendix B: Conformance Items' of this specification, notably all mandatory statements have to be implemented.
A. XML Schemas

A.1 sca-contribution-java.xsd

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!-- Copyright(C) OASIS(R) 2005,2010. All Rights Reserved.
OASIS trademark, IPR and other policies apply. -->
<schema xmlns="http://www.w3.org/2001/XMLSchema"
xmlns:sca="http://docs.oasis-open.org/ns/opencsa/sca/200912"
targetNamespace="http://docs.oasis-open.org/ns/opencsa/sca/200912"
elementFormDefault="qualified">
  <include schemaLocation="sca-contribution-1.1-cd05.xsd"/>

  <!-- Import.java -->
  <element name="import.java" type="sca:JavaImportType"
    substitutionGroup="sca:importBase" />
  <complexType name="JavaImportType">
    <complexContent>
      <extension base="sca:Import">
        <attribute name="package" type="string" use="required"/>
        <attribute name="location" type="anyURI" use="optional"/>
      </extension>
    </complexContent>
  </complexType>

  <!-- Export.java -->
  <element name="export.java" type="sca:JavaExportType"
    substitutionGroup="sca:exportBase" />
  <complexType name="JavaExportType">
    <complexContent>
      <extension base="sca:Export">
        <attribute name="package" type="string" use="required"/>
      </extension>
    </complexContent>
  </complexType>
</schema>
```

A.2 sca-implementation-java.xsd

```xml

</extension>
</complexContent>
</complexType>
</schema>
## B. Conformance Items

This section contains a list of conformance items for the SCA Java Component Implementation specification.

<table>
<thead>
<tr>
<th>Conformance ID</th>
<th>Description</th>
</tr>
</thead>
</table>
| [JCI20001]     | The services provided by a Java-based implementation MUST have an interface defined in one of the following ways:  
- A Java interface  
- A Java class  
- A Java interface generated from a Web Services Description Language [WSDL] (WSDL) portType. |
| [JCI20002]     | Java implementation classes MUST implement all the operations defined by the service interface. |
| [JCI40001]     | For an unannotated field or setter method that is introspected as a property and where the Java type of the field or setter method is a JAXB [JAXB] annotated class, the SCA runtime MUST convert a property value specified by an SCA component definition into an instance of the property’s Java type as defined by the XML to Java mapping in the JAXB specification [JAXB] with XML schema validation enabled. |
| [JCI50001]     | A Java implementation class MUST provide a public or protected constructor that can be used by the SCA runtime to create the implementation instance. |
| [JCI50002]     | The @Constructor annotation MUST NOT appear on more than one constructor. |
| [JCI50004]     | The constructor to use for the creation of an implementation instance MUST be selected by the SCA runtime using the sequence:  
1. A declared constructor annotated with a @Constructor annotation.  
2. A declared constructor, all of whose parameters are annotated with either @Property or @Reference.  
3. A no-argument constructor.  
4. In the absence of an @Constructor annotation, there MUST NOT be more than one constructor that has a non-empty parameter list with all parameters annotated with either @Property or @Reference. |
| [JCI60001]     | The SCA runtime MUST support the STATELESS and COMPOSITE implementation scopes. |
| [JCI80001]     | An SCA runtime MUST introspect the componentType of a Java implementation class following the rules defined in the section "Component Type of a Java Implementation". |
| [JCI80002]     | If a Java implementation class, with or without @Property and @Reference annotations, has more than one setter method with the same JavaBeans property name [JAVABEANS] corresponding to the setter method name, then if more than one method is inferred to set the same SCA property or to set the same SCA reference, the SCA runtime MUST raise an error and MUST NOT instantiate the implementation class. |
The `<implementation.java>` element MUST conform to the schema defined in `sca-implementation-java.xsd`.

The fully qualified name of the Java class referenced by the `@class` attribute of `<implementation.java>` MUST resolve to a Java class, using the artifact resolution rules defined in Section 10.2, that can be used as a Java component implementation.

The Java class referenced by the `@class` attribute of `<implementation.java>` MUST conform to Java SE version 5.0.

Each Java package that is imported into the contribution MUST be included in one and only one `<import.java>` element.

The SCA runtime MUST ensure that the package used to satisfy an import matches the package name, the version number or version number range and (if present) the location specified on the `<import.java>` element.

The uses directive indicates that the SCA runtime MUST ensure that any SCA contribution that imports this package from this exporting contribution also imports the same version as is used by this exporting contribution of any of the packages contained in the uses directive.

Each Java package that is exported from the contribution MUST be included in one and only one `<export.java>` element.

A Java package that is specified on an export element MUST be contained within the contribution containing the export element.

The SCA runtime MUST ensure that within a contribution, Java classes are resolved according to the following steps in the order specified:

1. If the contribution contains a Java Language specific resolution mechanism such as a classpath declaration in the archive’s manifest, then that mechanism is used first to resolve classes. If the class is not found, then continue searching at step 2.

2. If the package of the Java class is specified in an import declaration then:
   a) if `@location` is specified, the location searched for the class is the contribution declared by the `@location` attribute.
   b) if `@location` is not specified, the locations which are searched for the class are the contribution(s) in the Domain which have export declarations for that package. If there is more than one contribution exporting the package, then the contribution chosen is SCA Runtime dependent, but is always the same contribution for all imports of the package.

   If the Java package is not found, continue to step 3.

3. The contribution itself is searched using the archive resolution rules defined by the Java Language.

The SCA runtime MUST set the thread context class loader of a component implementation class to the class loader of its containing contribution.

The SCA runtime MUST ensure that the Java classes used by a contribution are all loaded by a class loader that is unique for each contribution in the Domain.

The SCA runtime MUST ensure that Java classes that are imported into a contribution are loaded by the exporting contribution’s class loader.
C. Acknowledgements

| wd02     | 2008-12-16 | David Booz     | * Applied resolution for issue 55, 32  
* Editorial cleanup to make a working draft  
  - [1] style changed to [ASSEMBLY]  
  - updated namespace references |
| wd03     | 2009-02-26 | David Booz     | • Accepted all changes from wd02  
• Applied 60, 87, 117, 126, 123 |
| wd04     | 2009-03-20 | Mike Edwards   | Accepted all changes from wd03  
Issue 105 - RFC 2119 Language added - covers most of the specification.  
Accepted all changes after RFC 2119 language added.  
Editorial fix to ensure the term "class loader" is used consistently |
| wd05     | 2009-03-24 | David Booz     | Applied resolution for issues: 119, 137                                                                                                    |
| wd06     | 2009-03-27 | David Booz     | Accepted all previous changes and applied issues 145,146,147,151                                                                            |
| wd07     | 2009-04-06 | David Booz     | Editorial cleanup, namespace changes, changed XML encoding to UTF-8 in examples, applied 144                                                 |
| wd08     | 2009-04-27 | David Booz     | Applied issue 98, 152                                                                                                                        |
| wd09     | 2009-04-29 | David Booz     | Editorial fixes throughout (capitalization, quotes, fonts, spec references, etc.)                                                          |
| wd10     | 2009-04-30 | David Booz     | Editorial fixes, indentation, etc.                                                                                                           |
| cd01     | 2009-05-04 | David Booz     | Final editorial fixes for CD and PRD                                                                                                         |
| cd01-rev1| 2009-08-12 | David Booz     | Editorial fixes, applied issues: 143,153,176                                                                                                 |
| cd01-rev2| 2009-09-14 | David Booz     | Applied issues: 157,162                                                                                                                      |
| cd01-rev3| 2010-01-18 | David Booz     | Upgraded namespace to latest 200912  
Applied issues: 168, 171, 181, 184, 186, 192,193 |
<p>| cd01-rev4| 2010-01-20 | Bryan Aupperle | Editorial updates to match OASIS document standards                                                                                         |</p>
