19 Abstract:

20 This document lists approved errata to the SAML V2.0 OASIS Standard.

21 Status:

22 This document is a Working Draft and as such has no official standing with regard to the OASIS
23 Technical Committee Process.

24 Copyright © OASIS® 2012. All Rights Reserved.

25 All capitalized terms in the following text have the meanings assigned to them in the OASIS Intellectual
26 Property Rights Policy (the "OASIS IPR Policy"). The full Policy may be found at the OASIS website.

27 This document and translations of it may be copied and furnished to others, and derivative works that
28 comment on or otherwise explain it or assist in its implementation may be prepared, copied, published,
29 and distributed, in whole or in part, without restriction of any kind, provided that the above copyright notice
30 and this section are included on all such copies and derivative works. However, this document itself may
31 not be modified in any way, including by removing the copyright notice or references to OASIS, except as
32 needed for the purpose of developing any document or deliverable produced by an OASIS Technical
33 Committee (in which case the rules applicable to copyrights, as set forth in the OASIS IPR Policy, must
34 be followed) or as required to translate it into languages other than English.

35 The limited permissions granted above are perpetual and will not be revoked by OASIS or its successors
36 or assigns.

1 Introduction

128

129 This document lists the approved errata to the SAML V2.0 OASIS Standard. Each one has been given an
130 *Err* designation. Numbers in the sequence are missing wherever a reported problem (a “proposed
131 erratum”, or PE) resulted in a TC decision not to issue an erratum to any V2.0 specification text, or where
132 an issue has not yet been disposed.

133 As required by the OASIS Technical Committee Process, the approved errata represent changes that are
134 not “substantive”. The changes focus on clarifications to ambiguous or conflicting specification text, where
135 different compliant implementations might have reasonably chosen different interpretations. The intent of
136 the Security Services TC has been to resolve such issues in service of improved interoperability based on
137 implementation and deployment experience.

138 In this document, errata change instructions are presented with surrounding context as necessary to
139 make the intent clear. Original specification text is often presented as follows, with problem text
140 highlighted in bold:

141 This is an original specification sentence. **The second sentence needs to be changed, removed, or**
142 **replaced.**

143 New specification text is typically presented as follows, with new or changed text highlighted in bold:

144 This is a **highly** original specification sentence. **This is the wholly new content to replace the old second**
145 **sentence. It runs on and on and on.**

146 In a few cases, text needs only to be struck, in which case the change is shown as follows, with text to be
147 removed both highlighted in bold and struck through:

148 This is yet another original specification sentence which contains ~~**an inappropriately**~~ long description.

149 In addition to this normative document, non-normative “errata composite” documents may be provided
150 that combine the prescribed corrections with the original specification text, illustrating the changes with
151 margin change bars, struck-through original text, and highlighted new text. These documents, if available,
152 will be found at the same location as this approved form.

153 All cited line numbers refer to the PDF forms of the original OASIS Standard specifications in question,
154 not to line numbers in this document or in the errata composite documents.

2 Approved Errata

Following are the approved errata to the SAML V2.0 OASIS Standard.

E0: Incorrect Section Reference

Change [SAMLCore] at line 2660 to refer to section 3.7.3 rather than 3.6.3 for Reason codes. This was a typographical error.

E1: Relay State for HTTP Redirect

Change [SAMLBind] Section 3.4.3 at lines 551-553 to reflect the fact that, indeed, the RelayState parameter is covered by the query string signature described in Section 3.4.4.1 (DEFLATE encoding). Note that Section 3.5.3, which has similar original wording, remains correct for its case.

Original:

RelayState data MAY be included with a SAML protocol message transmitted with this binding. The value MUST NOT exceed 80 bytes in length and SHOULD be integrity protected by the entity creating the message. **Signing is not realistic given the space limitation, but because the value is exposed to third-party tampering, the entity SHOULD insure that the value has not been tampered with by using a checksum, a pseudo-random value, or similar means.**

New:

RelayState data MAY be included with a SAML protocol message transmitted with this binding. The value MUST NOT exceed 80 bytes in length and SHOULD be integrity protected by the entity creating the message, **either via a digital signature (see Section 3.4.4.1) or by some independent means.**

E2: Metadata Clarifications for HTTP Artifact Binding

Change [SAMLBind] Section 3.6.7 at lines 1188-1191 to clarify metadata requirements on profiles using the HTTP Artifact binding.

Original:

Support for the HTTP Artifact binding SHOULD be reflected by indicating URL endpoints at which requests and responses for a particular protocol or profile should be sent. Either a single endpoint or distinct request and response endpoints MAY be supplied. **One or more indexed endpoints for processing <samlp:ArtifactResolve> messages SHOULD also be described.**

New:

Support for **receiving messages using** the HTTP Artifact binding SHOULD be reflected by indicating URL endpoints at which requests and responses for a particular protocol or profile should be sent. **Support for sending messages using this binding SHOULD be accompanied by one or more indexed <md:ArtifactResolutionService> endpoints for processing <samlp:ArtifactResolve> messages.**

E4: No Role for SAML V1.1 Artifacts in SAML V2.0

Change [SAMLBind] Section 3.6.4 at line 1067 to clarify that SAML V1.1 artifacts have no role in SAML V2.0.

New:

The following describes the single artifact type defined by SAML V2.0. **Although the general artifact structure resembles that used in prior versions of SAML and the type code of the single format described below does not conflict with previously defined formats, there is explicitly no correspondence between SAML V2.0 artifacts and those found in any previous specifications, and**

230
231

artifact formats not defined specifically for use with SAML V2.0 MUST NOT be used with this binding.

232

E6: Clarify Constraints on Encrypted NameID

233 Change [SAMLCore] Section 3.4.1.1 at line 2139 to clarify that, if encrypted name identifiers are chosen,
234 no further description of the type of name identifier will be available in SAML messages..

235 New:

236 The special Format value `urn:oasis:names:tc:SAML:2.0:nameid-format:encrypted` indicates
237 that the resulting assertion(s) MUST contain `<EncryptedID>` elements instead of plaintext. The underlying
238 name identifier's unencrypted form can be of any type supported by the identity provider for the requested
239 subject. **It is not possible for the service provider to specifically request that a particular kind of
240 identifier be returned if it asks for encryption. The `<md:NameIDFormat>` metadata element (see
241 [SAMLMeta]) or other out-of-band means MAY be used to determine what kind of identifier to
242 encrypt and return.**

243

E7: Metadata for Agreeing to Sign Authentication Requests

244 Change [SAMLMeta] Section 2.4.3 at line 710, 741-742, and 744-747 to remove ambiguity about how to
245 accomplish signing when the IdP SSO descriptor includes the setting `WantAuthnRequestsSigned` and the
246 SP SSO descriptor includes the setting `AuthnRequestsSigned` .

247 New at line 710:

248 **The `WantAuthnRequestsSigned` attribute is intended to indicate to service providers whether or not
249 they can expect an unsigned `<AuthnRequest>` message to be accepted by the identity provider. The
250 identity provider is not obligated to reject unsigned requests nor is a service provider obligated to
251 sign its requests, although it might reasonably expect an unsigned request will be rejected. In some
252 cases, a service provider may not even know which identity provider will ultimately receive and
253 respond to its requests, so the use of this attribute in such a case cannot be strictly defined.**

254 **Furthermore, note that the specific method of signing that would be expected is binding dependent.
255 The HTTP Redirect binding (see [SAMLBind]) requires that the signature be applied to the URL-
256 encoded value rather than placed within the XML message, while other bindings generally permit the
257 signature to be within the message in the usual fashion.**

258
259
260 The following schema fragment defines the `<IDPSSODescriptor>` element and its
261 `IDPSSODescriptorType` complex type:

262 New at lines 741-742:

263 Optional attribute that indicates whether the `<samlp:AuthnRequest>` messages sent by this service
264 provider will be signed. If omitted, the value is assumed to be false. **A value of false (or omission of this
265 attribute) does not imply that the service provider will never sign its requests or that a signed
266 request should be considered an error. However, an identity provider that receives an unsigned
267 `<samlp:AuthnRequest>` message from a service provider whose metadata contains this attribute
268 with a value of true MUST return a SAML error response and MUST NOT fulfill the request.**

269 New at lines 744-747:

270 Optional attribute that indicates a requirement for the `<saml:Assertion>` elements received by this
271 service provider to be signed. If omitted, the value is assumed to be false. This requirement is in addition to
272 any requirement for signing derived from the use of a particular profile/binding combination. **Note that an
273 enclosing signature at the SAML binding or protocol layer does not suffice to meet this requirement,
274 for example signing a `<samlp:Response>` containing the assertion(s) or a TLS connection.**

275 E8: SLO and NameID Termination

276 Change [SAMLCore] Section 3.6.3 at lines 2479-2480 to clarify the rules around SP single logout
277 behavior when a name identifier has been terminated.

278 Original:

279 The receiving provider can perform any maintenance with the knowledge that the relationship represented
280 by the name identifier has been terminated. **It can choose to invalidate the active session(s) of a**
281 **principal for whom a relationship has been terminated.**

282 New:

283 The receiving provider can perform any maintenance with the knowledge that the relationship represented
284 by the name identifier has been terminated. **In general it SHOULD NOT invalidate any active session(s)**
285 **of the principal for whom the relationship has been terminated. If the receiving provider is an identity**
286 **provider, it SHOULD NOT invalidate any active session(s) of the principal established with other**
287 **service providers. A requesting provider MAY send a <LogoutRequest> message prior to initiating**
288 **a name identifier termination by sending a <ManageNameIDRequest> message if that is the**
289 **requesting provider's intent (e.g., the name identifier termination is initiated via an administrator**
290 **who wished to terminate all user activity). The requesting provider MUST NOT send a**
291 **<LogoutRequest> message after the <ManageNameIDRequest> message is sent.**

292 E10: Logout Request Reason Mismatch with Schema

293 Change [SAMLCore] Section 3.7.1 at line 2540 to resolve an apparent conflict between the specification
294 text and the schema. (Note that although in this case the schema could have been more specific, text in
295 SAML specifications is allowed to impose further restrictions on syntactic constraints imposed by a
296 schema, and this technique has been used here to resolve the issue without a substantive change.)

297 New:

298 An indication of the reason for the logout, in the form of a URI reference. **The Reason attribute is specified**
299 **as a string in the schema. This specification further restricts the schema by requiring that the**
300 **Reason attribute MUST be in the form of a URI reference.**

301 E11: Improperly Labeled Feature

302 Change [SAMLConf] in Section 3.2 (Table 2) to make the labels in feature rows 6 through 9 consistent.

303 Original labels:

304 Name Identifier Management, HTTP Redirect (IdP-initiated)
305 Name Identifier Management, SOAP (IdP-initiated)
306 Name Identifier Management, HTTP Redirect
307 Name Identifier Management, SOAP

308 New labels:

309 **Name Identifier Management (IdP-Initiated), HTTP Redirect**
310 **Name Identifier Management (IdP-Initiated), SOAP**
311 **Name Identifier Management (SP-Initiated), HTTP Redirect**
312 **Name Identifier Management (SP-Initiated), SOAP**

313 E12: Clarification on ManageNameIDRequest

314 Change [SAMLCore] Section 3.6 at lines 2412-2413 and 2438, and change [SAMLProf] Section 4.5 at
315 lines 1320-1321, to remove incorrect implications that the name identifier format can be changed in the
316 course of the protocol.

317 New [SAMLCore] at lines 2412-2413:

318 After establishing a name identifier for a principal, an identity provider wishing to change the value **and/or-**
319 **format** of the identifier that it will use when referring to the principal, or to indicate that a name identifier will
320 no longer be used to refer to the principal, informs service providers of the change by sending them a
321 <ManageNameIDRequest> message.

322 New [SAMLCore] at line 2438:

323 If the requester is the identity provider, the new value will appear in subsequent <NameID> elements as the
324 element's content. **In either case, if the <NewEncryptedID> is used, its encrypted content is just a**
325 **<NewID> element containing only the new value for the identifier (format and qualifiers cannot be**
326 **changed once established).**

327 New [SAMLProf] at lines 1320-23121:

328 Subsequently, the identity provider may wish to notify the service provider of a change in the **format and/or-**
329 **value** that it will use to identify the same principal in the future.

330 **E13: Inaccurate Description of Authorization Decision**

331 Change [SAMLCore] Section 2 at lines 357-358 to complete the list of potential results from an
332 authorization decision.

333 New:

334 Authorization Decision: A request to allow the assertion subject to access the specified resource has been
335 granted or denied **or is indeterminate.**

336 **E14: AllowCreate**

337 Change [SAMLCore] at lines 2123-2129, 2130, 2143-2147, 2419-2420, and 2480, and change
338 [SAMLProf] at lines 521-524, to clarify the semantics of AllowCreate.

339 Original at [SAMLCore] Section 3.4.1.1, lines 2123-2129:

340 A Boolean value used to indicate whether the identity provider **is allowed**, in the course of fulfilling the
341 request, to create a new identifier **to represent the principal**. Defaults to "false". **When "false", the**
342 **requester constrains the identity provider to only issue an assertion to it if an acceptable identifier**
343 **for the principal has already been established. Note that this does not prevent the identity provider**
344 **from creating such identifiers outside the context of this specific request (for example, in advance**
345 **for a large number of principals).**

346 New at [SAMLCore] Section 3.4.1.1, lines 2123-2129:

347 A Boolean value used to indicate whether the **requester grants to** the identity provider, in the course of
348 fulfilling the request, **permission to create a new identifier or to associate an existing identifier**
349 **representing the principal with the relying party**. Defaults to "false" **if not present or the entire element**
350 **is omitted.**

351 New at [SAMLCore] Section 3.4.1.1, line 2130 (just after the above changes):

352 **The AllowCreate attribute may be used by some deployments to influence the creation of state**
353 **maintained by the identity provider pertaining to the use of a name identifier (or any other persistent,**
354 **uniquely identifying attributes) by a particular relying party, for purposes such as dynamic identifier**
355 **or attribute creation, tracking of consent, subsequent use of the Name Identifier Management**
356 **protocol (see Section 3.6), or other related purposes.**

357
358 **When "false", the requester tries to constrain the identity provider to issue an assertion only if such**
359 **state has already been established or is not deemed applicable by the identity provider to the use of**
360 **an identifier. Thus, this does not prevent the identity provider from assuming such information**
361 **exists outside the context of this specific request (for example, establishing it in advance for a large**
362 **number of principals).**

363
364 **A value of "true" permits the identity provider to take any related actions it wishes to fulfill the**

365 request, subject to any other constraints imposed by the request and policy (the `IsPassive`
366 attribute, for example).
367
368 Generally, requesters cannot assume specific behavior from identity providers regarding the initial
369 creation or association of identifiers on their behalf, as these are details left to implementations or
370 deployments. Absent specific profiles governing the use of this attribute, it might be used as a hint
371 to identity providers about the requester's intention to store the identifier or link it to a local value.
372
373 A value of "false" might be used to indicate that the requester is not prepared or able to do so and
374 save the identity provider wasted effort.
375
376 Requesters that do not make specific use of this attribute SHOULD generally set it to "true" to
377 maximize interoperability.
378
379 The use of the `AllowCreate` attribute MUST NOT be used and SHOULD be ignored in conjunction
380 with requests for or assertions issued with name identifiers with a `Format` of
381 `urn:oasis:names:tc:SAML:2.0:nameid-format:transient` (they preclude any such state in
382 and of themselves).

383 Original at [SAMLCore] Section 3.6, lines 2419-2420:

384 A service provider also uses this message to register or change the `SPProvidedID` value to be included
385 when the underlying name identifier is used to communicate with it, or to terminate the use of a name
386 identifier between itself and the identity provider.

387
388 **Note that this protocol is typically not used with "transient" name identifiers, since their value is not**
389 **intended to be managed on a long-term basis.**

390 New at [SAMLCore] Section 3.6, lines 2419-2420:

391 A service provider also uses this message to register or change the `SPProvidedID` value to be included
392 when the underlying name identifier is used to communicate with it, or to terminate the use of a name
393 identifier between itself and the identity provider.

394
395 **This protocol MUST NOT be used in conjunction with the**
396 **`urn:oasis:names:tc:SAML:2.0:nameidformat:transient` <NameID> Format.**

397 New at [SAMLCore] Section 3.6.3, line 2480 (note that E8 and E55 specify additional changes to the
398 original text shown here):

399 If the `<Terminate>` element is included in the request, the requesting provider is indicating that (in the case
400 of a service provider) it will no longer accept assertions from the identity provider or (in the case of an
401 identity provider) it will no longer issue assertions to the service provider about the principal. The receiving
402 provider can perform any maintenance with the knowledge that the relationship represented by the name
403 identifier has been terminated. It can choose to invalidate the active session(s) of a principal for whom a
404 relationship has been terminated.

405
406 **If the receiving provider is maintaining state associated with the name identifier, such as the value of**
407 **the identifier itself (in the case of a pair-wise identifier), an `SPProvidedID` value, the sender's**
408 **consent to the identifier's creation/use, etc., then the receiver can perform any maintenance with the**
409 **knowledge that the relationship represented by the name identifier has been terminated.**

410
411 **Any subsequent operations performed by the receiver on behalf of the sender regarding the**
412 **principal (for example, a subsequent `<AuthnRequest>`) SHOULD be carried out in a manner**
413 **consistent with the absence of any previous state.**

414
415 **Termination is potentially the cleanup step for any state management behavior triggered by the use**
416 **of the `AllowCreate` attribute in the Authentication Request protocol (see Section 3.4). Deployments**
417 **that do not make use of that attribute are likely to avoid the use of the `<Terminate>` element or**
418 **would treat it as a purely advisory matter.**

419
420 **Note that in most cases (a notable exception being the rules surrounding the `SPProvidedID`**

421 attribute), there are no requirements on either identity providers or service providers regarding the
422 creation or use of persistent state. Therefore, no explicit behavior is mandated when the
423 <Terminate> element is received. However, if persistent state is present pertaining to the use of an
424 identifier (such as if an SPProvidedID attribute was attached), the <Terminate> element provides a
425 clear indication that this state SHOULD be deleted (or marked as obsolete in some fashion).

426 Original at [SAMLProf] Section 4.1.4.1, lines 521-524:

427 If the identity provider cannot or will not satisfy the request, it MUST respond with a <Response> message
428 containing an appropriate error status code or codes.

429
430 If the service provider wishes to permit the identity provider to establish a new identifier for the
431 principal if none exists, it MUST include a <NameIDPolicy> element with the AllowCreate attribute
432 set to "true". Otherwise, only a principal for whom the identity provider has previously established
433 an identifier usable by the service provider can be authenticated successfully.

434 New at [SAMLProf] Section 4.1.4.1, lines 521-524:

435 If the identity provider cannot or will not satisfy the request, it MUST respond with a <Response> message
436 containing an appropriate error status code or codes.

437
438 This profile does not provide any guidelines for the use of AllowCreate; see [SAMLCore] for
439 normative rules on using AllowCreate.

440 E15: NameID Policy Adherence

441 Change [SAMLCore] Section 3.4.1.1 at line 2139 to clarify that the expressed name identifier policy must
442 be adhered to.

443 New (note that E6 specifies additional changes to the original text shown here):

444 The special Format value urn:oasis:names:tc:SAML:2.0:nameid-format:encrypted indicates
445 that the resulting assertion(s) MUST contain <EncryptedID> elements instead of plaintext. The underlying
446 name identifier's unencrypted form can be of any type supported by the identity provider for the requested
447 subject.

448
449 When a Format defined in Section Error: Reference source not found 8.3 other than
450 urn:oasis:names:tc:SAML:1.1:nameid-format:unspecified or
451 urn:oasis:names:tc:SAML:2.0:nameid-format:encrypted is used, then if the identity provider
452 returns any assertions:

453
454 ● the Format value of the <NameID> within the <Subject> of any <Assertion> MUST be identical
455 to the Format value supplied in the <NameIDPolicy>, and

456
457 ● if SPNameQualifier is not omitted in <NameIDPolicy>, the SPNameQualifier value of the
458 <NameID> within the <Subject> of any <Assertion> MUST be identical to the SPNameQualifier
459 value supplied in the <NameIDPolicy>.

460 E17: Authentication Response IssuerName vs. Assertion 461 IssuerName

462 Change [SAMLProf] Section 4.1.4.2 at lines 541-543 to accurately reflect the conditions under which
463 issuer information is required and how issuer information at the different levels must correlate.

464 Original:

465 The <Issuer> element MAY be omitted, but if present it MUST contain the unique identifier of the
466 issuing identity provider; the Format attribute MUST be omitted or have a value of
467 urn:oasis:names:tc:SAML:2.0:nameid-format:entity.

468 New:

469 **If the <Response> message is signed or if an enclosed assertion is encrypted, then the <Issuer>**
470 **element MUST be present. Otherwise it MAY be omitted. If present it MUST** contain the unique identifier
471 of the issuing identity provider; the `Format` attribute **MUST** be omitted or have a value of
472 `urn:oasis:names:tc:SAML:2.0:nameid-format:entity`.

473 **E18: Reference to Identity Provider Discovery Service in ECP** 474 **Profile**

475 Change [SAMLProf] Section 4.2.2 at lines 725-726 to remove the incorrect implication that an ECP is a
476 direct participant in the identity provider discovery profile.

477 New:

478 In step 3, the ECP obtains the location of an endpoint at an identity provider for the authentication request
479 protocol that supports its preferred binding. The means by which this is accomplished is implementation-
480 dependent. ~~The ECP MAY use the SAML identity provider discovery profile described in Section 4.3.~~

481 **E19: Clarification on Error Processing**

482 Change [SAMLBind] Section 3.2.2.1 at lines 310-317 and Section 3.2.3.3 at line 378 to clarify SAML error
483 processing and its relationship to SOAP error processing.

484 Original at Section 3.2.2.1, lines 310-317:

485 The SAML responder **MUST** return **either a SAML response element within the body of another SOAP**
486 **message or generate a SOAP fault**. The SAML responder **MUST NOT** include more than one SAML
487 response per SOAP message or include any additional XML elements in the SOAP body. **If a SAML**
488 **responder cannot, for some reason, process a SAML request, it MUST generate a SOAP fault**. SOAP
489 fault codes **MUST NOT** be sent for errors within the SAML problem domain, for example, inability to find an
490 extension schema or as a signal that the subject is not authorized to access a resource in an authorization
491 query. (SOAP 1.1 faults and fault codes are discussed in [SOAP11] Section 4.1.)

492 New at Section 3.2.2.1, lines 310-317:

493 The SAML responder **SHOULD** return a **SOAP message containing either a SAML response element in**
494 **the body or a SOAP fault**. The SAML responder **MUST NOT** include more than one SAML response per
495 SOAP message or include any additional XML elements in the SOAP body. SOAP fault codes **SHOULD**
496 **NOT** be sent for errors within the SAML problem domain, for example, inability to find an extension schema
497 or as a signal that the subject is not authorized to access a resource in an authorization query. **See Section**
498 **3.2.3.3 for more information about error handling**. (SOAP 1.1 faults and fault codes are discussed in
499 [SOAP11] Section 4.1.)

500 Original at Section 3.2.3.3, line 378:

501 In the case of a SAML processing error, the SOAP HTTP server **MUST** respond with "200 OK" and
502 include a SAML-specified `<samlp:Status>` element in the SAML response within the SOAP body.

503 New at Section 3.2.3.3, line 378:

504 In the case of a SAML processing error, the SOAP HTTP server **SHOULD** respond with "200 OK" and
505 include a SAML-specified `<samlp:Status>` element in the SAML response within the SOAP body.

506 **E20: ECP SSO Profile and Metadata**

507 Change [SAMLProf] at line 1081 to add a new subsection, Section 4.2.6, in order to add metadata
508 considerations to the ECP profile.

509 New (small portion of previous subsection shown):

510 The ECP **SHOULD** be authenticated to the identity provider, such as by maintaining an authenticated
511 session. Any HTTP exchanges subsequent to the delivery of the `<AuthnRequest>` message and before
512 the identity provider returns a `<Response>` **MUST** be securely associated with the original request.

513
514
515
516
517
518
519
520
521
522
523

4.2.6 Use of Metadata

The rules specified in the browser SSO profile in Section 4.1.6 apply here as well. Specifically, the indexed endpoint element `<md:AssertionConsumerService>` with a binding of `urn:oasis:names:tc:SAML:2.0:bindings:PAOS` MAY be used to describe the supported binding and location(s) to which an identity provider may send responses to a service provider using this profile. IN addition, the endpoint `<md:SingleSignOnService>` with a binding of `urn:oasis:names:tc:SAML:2.0:bindings:SOAP` MAY be used to describe the supported binding and location(s) to which an service provider may send requests to an identity provider using this profile.

524

E21: PAOS Version

525 Change [SAMLBind] Section 3.3.3 at line 474 to clarify the PAOS version required. New:

526
527

• The HTTP PAOS Header field MUST be present and specify the PAOS version with `"urn:liberty:paos:2003-08"` **at a minimum**.

528

E22: Error in Profile/ECP

529 Change [SAMLProf] Section 4.2.4.1 at line 907 to refer to the **AssertionConsumerServiceURL** attribute rather than the **AssertionServiceConsumerURL** attribute. This was a typographical error.

531

E24: HTTPS in URI Binding

532 Change [SAMLBind] Section 3.7 at lines 1349-1351 to make the HTTP support requirements more appropriate in the context of the URI binding.

534 Original:

535
536
537

Like SOAP, URI resolution can occur over multiple underlying transports. This binding has **transport-independent** aspects, but also calls out the **use of HTTP with SSL 3.0 [SSL3] or TLS 1.0 [RFC2246] as REQUIRED (mandatory to implement)**.

538 New:

539
540

Like SOAP, URI resolution can occur over multiple underlying transports. This binding has **protocol-independent** aspects, but also calls out **as mandatory the implementation of HTTP URIs**.

541

E25: Metadata Feature in Conformance

542 Change [SAMLConf] in Section 3.2 (Tables 2 and 4) to add feature rows, and at line 231 to add two subsections, Sections 3.6 and 3.7, in order to reflect conformance aspects of the SAML metadata feature.

544 New in Table 2:

545
546
547

Feature	IdP	IdP Lite	SP	SP Lite	ECP
Metadata Structures	OPT	OPT	OPT	OPT	N/A
Metadata Interoperation	OPT	OPT	OPT	OPT	N/A

548 New in Table 4:

549
550
551

Feature	Authn	Attrib	Authz	Requester
Metadata Structures	OPT	OPT	OPT	OPT
Metadata Interoperation	OPT	OPT	OPT	OPT

552 New at line 231 (small portion of previous subsection shown):

553
554

If a SAML authority uses SSL 3.0 or TLS 1.0, it MUST use a server-side certificate.

3.6 Metadata Structures

Implementations claiming conformance to SAML V2.0 may declare each operational mode's conformance to SAML V2.0 Metadata [SAMLMeta] through election of the Metadata Structures option.

With respect to each operational mode, such conformance entails the following:

- Implementing SAML metadata according to the extensible SAML V2.0 Metadata format in all cases where an interoperating peer has the option, as stated in SAML V2.0 specifications, of depending on the existence of SAML V2.0 Metadata. Electing the Metadata Structures option has the effect of requiring that such metadata be available to the interoperating peer. The Metadata Interoperation feature, described below, provides a means of satisfying this requirement.
- Referencing, consuming, and adhering to the SAML metadata, according to [SAMLMeta], of an interoperating peer when the known metadata relevant to that peer and the particular operation, and the current exchange, has expired or is no longer valid in cache, provided the metadata is available and is not prohibited by policy or the particular operation and that specific exchange.

3.7 Metadata Interoperation

Election of the Metadata Interoperation option requires the implementation to offer, in addition to any other mechanism, the well-known location publication and resolution mechanism described in the SAML metadata specification [SAMLMeta].

E26: Ambiguities Around Multiple Assertions and Statements in the SSO Profile

Change [SAMLProf] Section 4.1.4.2 at lines 541-572, Section 4.1.4.3 at lines 576-591, and Section 4.1.4.5 at lines 600-601 to resolve ambiguities around the usage of multiple assertions and multiple statements within an assertion in the SSO profile.

Original at Section 4.1.4.2, lines 541-572:

- The <Issuer> element MAY be omitted, but if present it MUST contain the unique identifier of the issuing identity provider; the Format attribute MUST be omitted or have a value of urn:oasis:names:tc:SAML:2.0:nameid-format:entity.
- It MUST contain at least one <Assertion>. Each assertion's <Issuer> element MUST contain the unique identifier of the **issuing** identity provider; the Format attribute MUST be omitted or have a value of urn:oasis:names:tc:SAML:2.0:nameid-format:entity.
- **The set of one or more assertions MUST contain at least one <AuthnStatement> that reflects the authentication of the principal to the identity provider.**
- **At least one assertion containing an <AuthnStatement> MUST contain a <Subject> element with at least one <SubjectConfirmation> element containing a Method of urn:oasis:names:tc:SAML:2.0:cm:bearer. If the identity provider supports the Single Logout profile, defined in Section 4.4, any such authentication statements MUST include a SessionIndex attribute to enable per-session logout requests by the service provider.**
- **The bearer <SubjectConfirmation> element described above MUST contain a <SubjectConfirmationData> element that contains a Recipient attribute containing the service provider's assertion consumer service URL and a NotOnOrAfter attribute that limits the window during which the assertion can be delivered. It MAY contain an Address attribute limiting the client address from which the assertion can be delivered. It MUST NOT contain a NotBefore attribute. If the containing message is in response to an <AuthnRequest>, then the InResponseTo attribute MUST match the request's ID.**
- Other statements and confirmation methods MAY be included in the assertion(s) at the discretion of the identity provider. In particular, <AttributeStatement> elements MAY be included. The

607 <AuthnRequest> MAY contain an AttributeConsumingServiceIndex XML attribute referencing
608 information about desired or required attributes in [SAMLMeta]. The identity provider MAY ignore this, or
609 send other attributes at its discretion.

- 610 • **The assertion(s) containing a bearer subject confirmation** MUST contain an
611 <AudienceRestriction> including the service provider's unique identifier as an <Audience>.
- 612 • Other conditions (and other <Audience> elements) MAY be included as requested by the service
613 provider or at the discretion of the identity provider. (Of course, all such conditions MUST be understood
614 by and accepted by the service provider in order for the assertion to be considered valid.) The identity
615 provider is NOT obligated to honor the requested set of <Conditions> in the <AuthnRequest>, if
616 any.
- 617 • The identity provider is NOT obligated to honor the requested set of <Conditions> in the
618 <AuthnRequest>, if any.

619 New at Section 4.1.4.2, lines 541-572 (note that E17 specifies additional changes to the first bullet item
620 shown here):

- 621 • The <Issuer> element MAY be omitted, but if present it MUST contain the unique identifier of the
622 issuing identity provider; the Format attribute MUST be omitted or have a value of
623 urn:oasis:names:tc:SAML:2.0:nameid-format:entity.
- 624 • It MUST contain at least one <Assertion>. Each assertion's <Issuer> element MUST contain the
625 unique identifier of the **responding** identity provider; the Format attribute MUST be omitted or have a
626 value of urn:oasis:names:tc:SAML:2.0:nameid-format:entity. **Note that this profile**
627 **assumes a single responding identity provider, and all assertions in a response MUST be issued**
628 **by the same entity.**
- 629 • **If multiple assertions are included, then each assertion's <Subject> element MUST refer to the**
630 **same principal. It is allowable for the content of the <Subject> elements to differ (e.g. using**
631 **different <NameID> or alternative <SubjectConfirmation> elements).**
- 632 • **Any assertion issued for consumption using this profile MUST contain a <Subject> element**
633 **with at least one <SubjectConfirmation> element containing a Method of**
634 **urn:oasis:names:tc:SAML:2.0:cm:bearer. Such an assertion is termed a bearer**
635 **assertion. Bearer assertions MAY contain additional <SubjectConfirmation> elements.**
- 636 • **Assertions without a bearer <SubjectConfirmation> MAY also be included; processing of**
637 **additional assertions or <SubjectConfirmation> elements is outside the scope of this**
638 **profile.**
- 639 • **At least one bearer <SubjectConfirmation> element MUST contain a**
640 **<SubjectConfirmationData> element that itself MUST contain a Recipient attribute**
641 **containing the service provider's assertion consumer service URL and a NotOnOrAfter**
642 **attribute that limits the window during which the assertion can be [PE52]confirmed by the relying**
643 **party. It MAY also contain an Address attribute limiting the client address from which the**
644 **assertion can be delivered. It MUST NOT contain a NotBefore attribute. If the containing**
645 **message is in response to an <AuthnRequest>, then the InResponseTo attribute MUST**
646 **match the request's ID.**
- 647 • **The set of one or more bearer assertions MUST contain at least one <AuthnStatement> that**
648 **reflects the authentication of the principal to the identity provider. Multiple <AuthnStatement>**
649 **elements MAY be included, but the semantics of multiple statements is not defined by this**
650 **profile.**
- 651 • **If the identity provider supports the Single Logout profile, defined in Section Error: Reference**
652 **source not found, any authentication statements MUST include a SessionIndex attribute to**
653 **enable per-session logout requests by the service provider.**
- 654 • Other statements MAY be included in the **bearer** assertion(s) at the discretion of the identity provider. In
655 particular, <AttributeStatement> elements MAY be included. The <AuthnRequest> MAY contain
656 an AttributeConsumingServiceIndex XML attribute referencing information about desired or

657 required attributes in [SAMLMeta]. The identity provider MAY ignore this, or send other attributes at its
658 discretion.

- 659 • **Each bearer** assertion MUST contain an <AudienceRestriction> including the service provider's
660 unique identifier as an <Audience>.
- 661 • Other conditions (and other <Audience> elements) MAY be included as requested by the service
662 provider or at the discretion of the identity provider. (Of course, all such conditions MUST be understood
663 by and accepted by the service provider in order for the assertion to be considered valid.) The identity
664 provider is NOT obligated to honor the requested set of <Conditions> in the <AuthnRequest>, if
665 any.
- 666 • The identity provider is NOT obligated to honor the requested set of <Conditions> in the
667 <AuthnRequest>, if any.

668 Original at Section 4.1.4.3, lines 576-591:

- 669 • Verify that the Recipient attribute in any bearer <SubjectConfirmationData> matches the assertion
670 consumer service URL to which the <Response> or artifact was delivered
- 671
- 672 • Verify that the NotOnOrAfter attribute in any bearer <SubjectConfirmationData> has not passed,
673 subject to allowable clock skew between the providers
- 674
- 675 • Verify that the InResponseTo attribute in the bearer <SubjectConfirmationData> equals the ID of
676 its original <AuthnRequest> message, unless the response is unsolicited (see Section 4.1.5), in which
677 case the attribute MUST NOT be present
- 678
- 679 • Verify that any assertions relied upon are valid in other respects.
- 680
- 681 • If any bearer <SubjectConfirmationData> includes an Address attribute, the service provider MAY
682 check the user agent's client address against it.
- 683
- 684 • Any assertion which is not valid, or whose subject confirmation requirements cannot be met SHOULD be
685 discarded and SHOULD NOT be used to establish a security context for the principal.
- 686
- 687 • If an <AuthnStatement> used to establish a security context for the principal contains a
688 SessionNotOnOrAfter attribute, the security context SHOULD be discarded once this time is reached,
689 unless the service provider reestablishes the principal's identity by repeating the use of this profile.

686 New at Section 4.1.4.3, lines 576-591:

- 687 • Verify that the Recipient attribute in **the** bearer <SubjectConfirmationData> matches the assertion
688 consumer service URL to which the <Response> or artifact was delivered
- 689
- 690 • Verify that the NotOnOrAfter attribute in **the** bearer <SubjectConfirmationData> has not passed,
691 subject to allowable clock skew between the providers
- 692
- 693 • Verify that the InResponseTo attribute in the bearer <SubjectConfirmationData> equals the ID of
694 its original <AuthnRequest> message, unless the response is unsolicited (see Section 4.1.5), in which
695 case the attribute MUST NOT be present
- 696
- 697 • Verify that any assertions relied upon are valid in other respects. **Note that while multiple bearer**
698 **<SubjectConfirmation> elements may be present, the successful evaluation of a single such**
699 **element in accordance with this profile is sufficient to confirm an assertion. However, each**
700 **assertion, if more than one is present, MUST be evaluated independently.**
- 701
- 702 • If **any the** bearer <SubjectConfirmationData> includes an Address attribute, the service provider
703 MAY check the user agent's client address against it.
- 704
- 705 • Any assertion which is not valid, or whose subject confirmation requirements cannot be met SHOULD be
706 discarded and SHOULD NOT be used to establish a security context for the principal.
- 707
- 708 • If an <AuthnStatement> used to establish a security context for the principal contains a
709 SessionNotOnOrAfter attribute, the security context SHOULD be discarded once this time is reached,
710 unless the service provider reestablishes the principal's identity by repeating the use of this profile. **Note**

707 that if multiple <AuthnStatement> elements are present, the SessionNotOnOrAfter value closest
708 to the present time SHOULD be honored.

709 Original at Section 4.1.4.5, lines 600-601:

710 If the HTTP POST binding is used to deliver the <Response>, the enclosed assertion(s) MUST be signed.

711 New at Section 4.1.4.5, lines 600-601:

712 If the HTTP POST binding is used to deliver the <Response>, each assertion MUST be protected by a
713 digital signature. This can be accomplished by signing each individual <Assertion> element or by
714 signing the <Response> element.

715 E27: Incorrect Step Number in ECP Profile

716 Change [SAMLProf] Section 4.2.4.3 at line 947 to change the reference to the step number from 5 to 7.
717 This was a typographical error.

718 E28: Profile Labeling in Conformance

719 Change [SAMLConf] Section 2 at Table 1 to make its labeling and categorization of profiles more
720 consistent.

721 Combine the profile rows labeled **Artifact Resolution**, **Authentication Query**, **Attribute Query**, and
722 **Authorization Decision Query** into a single profile row labeled **Assertion Query/Request** in column 1,
723 with the breakdown of these four protocol types moved to column 2 (message flows) for that row.

724 Remove the profile rows labeled **SAML URI binding** and **Metadata**.

725 E29: Incomplete Listing of Features in Conformance

726 Change [SAMLConf] Section 3.2 at Table 2 to include missing feature rows. New:

727 Feature	IdP	IdP Lite	SP	SP Lite	ECP
728 Request for Assertion by Identifier	OPT	N/A	N/A	N/A	N/A
729 SAML URI Binding	OPT	N/A	N/A	N/A	N/A

730 E30: Key Replacement

731 Change [SAMLCore] Section 6.1 at line 3110 to improve wording around key replacement. Original:

732 Encrypted data and **optionally one** or more encrypted keys MUST replace the plaintext information in the
733 same location within the XML instance.

734 New:

735 Encrypted data and **zero** or more encrypted keys MUST replace the plaintext information in the same
736 location within the XML instance.

737 E31: Various Minor Errors in Binding

738 Change [SAMLBind] Section 3.3.5 at line 511, Section 3.5.3 at line 785, and Section 3.6.5 at lines 1136
739 and 1397 to clean up various minor wording errors.

740 At Section 3.3.5, line 511, capitalize the word **RECOMMENDED**.

741 Original at Section 3.5.3, line 785:

742 If no such **value** is included with a SAML request message, or if the SAML response message is being
743 generated without a corresponding request ...

744 New at Section 3.5.3, line 785:

745 If no such **RelayState data** is included with a SAML request message, or if the SAML response message is
746 being generated without a corresponding request ...

747 Original at Section 3.6.5, line 1136:

748 The SAML requester determines the SAML responder by examining the artifact, and issues a
749 <samlp:ArtifactResolve> request containing the artifact to the SAML responder using a **direct** SAML
750 binding, as in step 3.

751 New at Section 3.6.5, line 1136:

752 The SAML requester determines the SAML responder by examining the artifact, and issues a
753 <samlp:ArtifactResolve> request containing the artifact to the SAML responder using a **synchronous**
754 SAML binding, as in step 3.

755 Original at Section 3.6.5, line 1397:

756 Note that the use of wildcards **is not allowed for on** such queries.

757 New at Section 3.6.5, line 1397:

758 Note that **the URI syntax does not support** the use of wildcards **in** such ID queries.

759 **E32: Missing Required Information in Profiles**

760 Change [SAMLProf] at line 1092. New subsection added at line 1092 as Section 4.3.1, incrementing the
761 subsection numbers of the existing Sections 4.3.1 through 4.3.3:

762 **4.3.1 Required Information**

763 **Identification:** urn:oasis:names:tc:SAML:2.0:profiles:SSO:idp-discovery

764 **Contact information:** security-services-comment@lists.oasis-open.org

765 **Description:** Given below.

766 **Updates:** None.

767 **E33: References to Assertion Request Protocol**

768 Change [SAMLMeta] Section 2.4.3 at line 700, Section 2.4.5 at line 838, Section 2.4.6 at line 871, and
769 Section 2.4.7 at line 904 to change references to the **Assertion Request** protocol to **Assertion**
770 **Query/Request**. This is just a typographical error.

771 **E34: RequestedAttribute Section Heading**

772 Change [SAMLMeta] at line 809 to make the Section **2.4.4.2** heading be a level below, at **2.4.4.1.1**, for
773 consistency in reflecting element nesting in the document outline.

774 **E35: Response Consumer URL Rules and Example**

775 Change [SAMLProf] Section 4.2.4.1 at lines 906-908, and Section 4.2.4.3 at line 964, to make the
776 example conform to the rules for a response consumer URL and explain these rules more clearly.

777 Original at Section 4.2.4.1, lines 906-908:

778 Specifies where the ECP is to send an error response. Also used to verify the correctness of the identity
779 provider's response, by cross checking this location against the **AssertionServiceConsumerURL** in the
780 ECP response header block. This value **MUST** be the same as the AssertionServiceConsumerURL (or the
781 URL referenced in metadata) conveyed in the <AuthnRequest>.

782 New at lines Section 4.2.4.1, 906-908:

783 Specifies where the ECP is to send an error response. Also used to verify the correctness of the identity
784 provider's response, by cross checking this location against the **AssertionConsumerServiceURL** in the
785 ECP response header block. This value **MUST** be the same as the AssertionServiceConsumerURL (or the
786 URL referenced in metadata) conveyed in the <AuthnRequest> **and SHOULD NOT be a relative URL.**

787 Original at Section 4.2.4.3, line 964:

```
788 <paos:Request xmlns:paos="urn:liberty:paos:2003-08"  
789   responseConsumerURL="http://identity-service.example.com/abc"
```

790 New at Section 4.2.4.3, line 964:

```
791 <paos:Request xmlns:paos="urn:liberty:paos:2003-08"  
792   responseConsumerURL="  
793   https://ServiceProvider.example.com/ecp_assertion_consumer"
```

794 **E36: Clarification on Action Element**

795 Change [SAMLCore] Section 2.7.4.2 at lines 1359-1363 to remove the incorrect specification text that
796 says the action namespace is optional (the schema mandates it, and in cases of disagreement, the
797 schema takes precedence).

798 Original:

```
799 Namespace [Optional]  
800 A URI reference representing the namespace in which the name of the specified action is to be interpreted.  
801 If this element is absent, the namespace urn:oasis:names:tc:SAML:1.0:action:rwdc-negation  
802 specified in Section 8.1.2 is in effect.
```

803 New:

```
804 Namespace [Required]  
805 A URI reference representing the namespace in which the name of the specified action is to be interpreted.
```

806 **E37: Clarification in Metadata on Indexed Endpoints**

807 Change [SAMLMeta] Section 2.2.3 at line 272 to clarify what it means for two endpoints to be "like".

808 Original:

```
809 In any such sequence of like endpoints based on this type, the default endpoint is the first such endpoint  
810 with the isDefault attribute set to true.
```

811 New:

```
812 In any such sequence of indexed endpoints that share a common element name and namespace (i.e. all  
813 instances of <md:AssertionConsumerService> within a role), the default endpoint is the first such  
814 endpoint with the isDefault attribute set to true.
```

815 **E38: Clarification Regarding Index on <LogoutRequest>**

816 Change [SAMLCore] Section 3.7.1 at line 2546 and [SAMLProf] Section 4.4.4.1 at lines 1302-1304 to
817 clarify requirements around session indexes in logout requests.

818 Original at [SAMLCore] Section 3.7.1, line 2546:

```
819 <SessionIndex> [Optional]
```

820 **The identifier that indexes this session at the message recipient.**

821 New at [SAMLCore] Section 3.7.1, line 2546:

```
822 <SessionIndex> [Optional]
```

823 **The index of the session between the principal identified by the <saml:BaseID>, <saml:NameID>, 824 or <saml:EncryptedID> element, and the session authority. This must correlate to the 825 SessionIndex attribute, if any, in the <saml:AuthnStatement> of the assertion used to establish 826 the session that is being terminated.**

827 New at [SAMLProf] Section 4.4.4.1, lines 1302-1304:

828 If the requester is a session participant, it MUST include at least one <SessionIndex> element in the 829 request. (Note that the session participant always receives a SessionIndex attribute in the 830 <saml:AuthnStatement> elements that it receives to initiate the session, per Section 4.1.4.2 of 831 the Web Browser SSO Profile.) If the requester is a session authority (or acting on its behalf), then it MAY 832 omit any such elements to indicate the termination of all of the principal's applicable sessions.

833 **E39: Error in SAML Profile Example**

834 **Note:** E39 corrects text in a section that is affected by E53, which deprecates the entire 835 section. Please see E53 for details.

836 Change [SAMLProf] Section 8.5.6 at lines 2095-2098 to move the ldaprof:Encoding attribute to the 837 correct location.

838 Original:

```
839 <saml:Attribute
840   xmlns:xacmlprof="urn:oasis:names:tc:SAML:2.0:profiles:attribute:XACML"
841   xmlns:ldaprof="urn:oasis:names:tc:SAML:2.0:profiles:attribute:LDAP"
842  xacmlprof:DataType="http://www.w3.org/2001/XMLSchema#string"
843   ldaprof:Encoding="LDAP"
844   NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:uri"
845   Name="urn:oid:2.5.4.42" FriendlyName="givenName">
846   <saml:AttributeValue xsi:type="xs:string">By-Tor</saml:AttributeValue>
847 </saml:Attribute>
```

848 New:

```
849 <saml:Attribute
850   xmlns:xacmlprof="urn:oasis:names:tc:SAML:2.0:profiles:attribute:XACML"
851   xmlns:ldaprof="urn:oasis:names:tc:SAML:2.0:profiles:attribute:LDAP"
852  xacmlprof:DataType="http://www.w3.org/2001/XMLSchema#string"
853   NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:uri"
854   Name="urn:oid:2.5.4.42" FriendlyName="givenName">
855   <saml:AttributeValue xsi:type="xs:string"
856   ldaprof:Encoding="LDAP">By-Tor</saml:AttributeValue>
857 </saml:Attribute>
```

858 **E40: Holder of Key**

859 Change [SAMLProf] Section 3.1 at lines 335-337 to align the description of Holder of Key in the profiles 860 specification with the language in the core specification.

861 Original:

862 As described in [XMLSig], each <ds:KeyInfo> element holds a key or information that enables an 863 application to obtain a key. The holder of a specified key is considered to be **the subject of** the assertion by 864 the asserting party.

865 New (note that E47 specifies additional changes to the original text shown here):

866 As described in [XMLSig], each <ds:KeyInfo> element holds a key or information that enables an 867 application to obtain a key. The holder of a specified key is considered to be **an acceptable attesting entity 868 for** the assertion by the asserting party.

E41: EndpointType ResponseLocation Clarification in Metadata

869

870 Change [SAMLMeta] Section 2.2.2 at line 242 to clarify correct behavior when the response location is
871 omitted from the metadata.

872 New:

873 The `ResponseLocation` attribute is used to enable different endpoints to be specified for receiving request
874 and response messages associated with a protocol or profile, not as a means of load-balancing or
875 redundancy (multiple elements of this type can be included for this purpose). When a role contains an
876 element of this type pertaining to a protocol or profile for which only a single type of message (request or
877 response) is applicable, then the `ResponseLocation` attribute is unused. **If the `ResponseLocation`
878 attribute is omitted, any response messages associated with a protocol or profile may be assumed
879 to be handled at the URI indicated by the `Location` attribute.**

E42: Match Authorities to Queries in Conformance

880

881 Change [SAMLConf] Section 3.2 at Table 4 to indicate more precisely the relationship between SAML
882 authorities and queries for types of assertion statements that those authorities do not specialize in
883 producing.

884 Original:

Feature	Authn	Attrib	Authz	Requester
Authentication Query, SOAP	MUST	OPT	OPT	OPT
Attribute Query, SOAP	OPT	MUST	OPT	OPT
Authorization Decision Query, SOAP	OPT	OPT	MUST	OPT

889 New:

Feature	Authn	Attrib	Authz	Requester
Authentication Query, SOAP	MUST	N/A	N/A	OPT
Attribute Query, SOAP	N/A	MUST	N/A	OPT
Authorization Decision Query, SOAP	N/A	N/A	MUST	OPT

E43: Key Location in saml:EncryptedData

894

895 Change [SAMLCore] at line 3116 by replacing the existing Section 6.2 with new Sections 6.2 and 6.3 to
896 reflect correct application and usage of the XML Encryption standard and to add several examples to fully
897 demonstrate this.

898 Original:

899 **6.2 Combining Signatures and Encryption**

900 **Use of XML Encryption and XML Signature MAY be combined. When an assertion is to be signed**
901 **and encrypted, the following rules apply. A relying party MUST perform signature validation and**
902 **decryption in the reverse order that signing and encryption were performed.**

903 • **When a signed <Assertion> element is encrypted, the signature MUST first be calculated and**
904 **placed within the <Assertion> element before the element is encrypted.**

905 • **When a <BaseID>, <NameID>, or <Attribute> element is encrypted, the encryption MUST be**
906 **performed first and then the signature calculated over the assertion or message containing the**
907 **encrypted element.**

908 New:

909 **6.2 Key and Data Referencing Guidelines**

910 **If an encrypted key is NOT included in the XML instance, then the relying party must be able to**
911 **locally determine the decryption key, per [XMLEnc].**

912 **Implementations of SAML MAY implicitly associate keys with the corresponding data they are used**
913 **to encrypt, through the positioning of <xenc:EncryptedKey> elements next to the associated**

914 <xenc:EncryptedData> element, within the enclosing SAML parent element. However, the
 915 following set of explicit referencing guidelines are suggested to facilitate interoperability.

916 If the encrypted key is included in the XML instance, then it SHOULD be referenced within the
 917 associated <xenc:EncryptedData> element, or alternatively embedded within the
 918 <xenc:EncryptedData> element. When an <xenc:EncryptedKey> element is used, the
 919 <ds:KeyInfo> element within <xenc:EncryptedData> SHOULD reference the
 920 <xenc:EncryptedKey> element using a <ds:RetrievalMethod> element of Type
 921 http://www.w3.org/2001/04/xmlenc#EncryptedKey.

922 In addition, an <xenc:EncryptedKey> element SHOULD contain an <xenc:ReferenceList>
 923 element containing a <xenc:DataReference> that references the corresponding
 924 <xenc:EncryptedData> element(s) that the key was used to encrypt.

925 In scenarios where the encrypted element is being “multicast” to multiple recipients, and the key
 926 used to encrypt the message must be in turn encrypted individually and independently for each of
 927 the multiple recipients, the <xenc:CarriedKeyName> element SHOULD be used to assign a
 928 common name to each of the <xenc:EncryptedKey> elements so that a <ds:KeyName> can be
 929 used from within the <xenc:EncryptedData> element’s <ds:KeyInfo> element.

930 Within the <xenc:EncryptedData> element, the <ds:KeyName> can be thought of as an “alias” that
 931 is used for backwards referencing from the <xenc:CarriedKeyName> element in each individual
 932 <xenc:EncryptedKey> element. While this accommodates a “multicast” approach, each recipient
 933 must be able to understand (at least one) <ds:KeyName>. The Recipient attribute is used to
 934 provide a hint as to which key is meant for which recipient.

935 The SAML implementation has the discretion to accept or reject a message where multiple
 936 Recipient attributes or <ds:KeyName> elements are understood. It is RECOMMENDED that
 937 implementations simply use the first key they understand and ignore any additional keys.

938 6.3 Examples

939 In the following example, the parent element (<EncryptedID>) contains <xenc:EncryptedData>
 940 and (referenced) <xenc:EncryptedKey> elements as siblings (note that the key can in fact be
 941 anywhere in the same instance, and the key references the <xenc:EncryptedData> element):

```

942 <saml:EncryptedID xmlns:saml="urn:oasis:names:tc:SAML:2.0:assertion">
943   <xenc:EncryptedData xmlns:xenc="http://www.w3.org/2001/04/xmlenc#"
944     Id="Encrypted_DATA_ID"
945     Type="http://www.w3.org/2001/04/xmlenc#Element">
946     <xenc:EncryptionMethod
947       Algorithm="http://www.w3.org/2001/04/xmlenc#aes128-cbc"/>
948     <ds:KeyInfo xmlns:ds="http://www.w3.org/2000/09/xmldsig#"
949       <ds:RetrievalMethod URI="#Encrypted_KEY_ID"
950         Type="http://www.w3.org/2001/04/xmlenc#EncryptedKey"/>
951     </ds:KeyInfo>
952     <xenc:CipherData>
953       <xenc:CipherValue>Nk4W4mx...</xenc:CipherValue>
954     </xenc:CipherData>
955   </xenc:EncryptedData>
956
957   <xenc:EncryptedKey xmlns:xenc="http://www.w3.org/2001/04/xmlenc#"
958     Id="Encrypted_KEY_ID">
959     <xenc:EncryptionMethod
960       Algorithm="http://www.w3.org/2001/04/xmlenc#rsa-1_5"/>
961     <xenc:CipherData>
962       <xenc:CipherValue>PzA5X...</xenc:CipherValue>
963     </xenc:CipherData>
964     <xenc:ReferenceList>
965       <xenc:DataReference URI="#Encrypted_DATA_ID"/>
966     </xenc:ReferenceList>
967   </xenc:EncryptedKey>
  
```

968 In the following <EncryptedAttribute> example, the <xenc:EncryptedKey> element is contained
969 within the <xenc:EncryptedData> element, so there is no explicit referencing:

```
970 <saml:EncryptedAttribute
971   xmlns:saml="urn:oasis:names:tc:SAML:2.0:assertion">
972   <xenc:EncryptedData xmlns:xenc="http://www.w3.org/2001/04/xmlenc#"
973     Id="Encrypted_DATA_ID"
974     Type="http://www.w3.org/2001/04/xmlenc#Element">
975     <xenc:EncryptionMethod
976       Algorithm="http://www.w3.org/2001/04/xmlenc#aes128-cbc"/>
977     <ds:KeyInfo xmlns:ds="http://www.w3.org/2000/09/xmldsig#">
978       <xenc:EncryptedKey Id="Encrypted_KEY_ID">
979         <xenc:EncryptionMethod
980           Algorithm="http://www.w3.org/2001/04/xmlenc#rsa-1_5"/>
981         <xenc:CipherData>
982           <xenc:CipherValue>SDFSDF... </xenc:CipherValue>
983         </xenc:CipherData>
984       </xenc:EncryptedKey>
985     </ds:KeyInfo>
986     <xenc:CipherData>
987       <xenc:CipherValue>Nk4W4mx...</xenc:CipherValue>
988     </xenc:CipherData>
989   </xenc:EncryptedData>
990 </saml:EncryptedAttribute>
```

991 The final example shows an assertion encrypted for multiple recipients, using the
992 <xenc:CarriedKeyName> approach:

```
993 <saml:EncryptedAssertion
994   xmlns:saml="urn:oasis:names:tc:SAML:2.0:assertion">
995   <xenc:EncryptedData xmlns:xenc="http://www.w3.org/2001/04/xmlenc#"
996     Id="Encrypted_DATA_ID"
997     Type="http://www.w3.org/2001/04/xmlenc#Element">
998     <xenc:EncryptionMethod
999       Algorithm="http://www.w3.org/2001/04/xmlenc#aes128-cbc"/>
1000   <ds:KeyInfo xmlns:ds="http://www.w3.org/2000/09/xmldsig#">
1001     <ds:KeyName>MULTICAST_KEY_NAME</ds:KeyName>
1002   </ds:KeyInfo>
1003   <xenc:CipherData>
1004     <xenc:CipherValue>Nk4W4mx...</xenc:CipherValue>
1005   </xenc:CipherData>
1006 </xenc:EncryptedData>
1007
1008   <xenc:EncryptedKey xmlns:xenc="http://www.w3.org/2001/04/xmlenc#"
1009     Id="Encrypted_KEY_ID_1" Recipient="https://sp1.org">
1010     <xenc:EncryptionMethod
1011       Algorithm="http://www.w3.org/2001/04/xmlenc#rsa-1_5"/>
1012     <ds:KeyInfo xmlns:ds="http://www.w3.org/2000/09/xmldsig#">
1013       <ds:KeyName>KEY_NAME_1</ds:KeyName>
1014     </ds:KeyInfo>
1015     <xenc:CipherData>
1016       <xenc:CipherValue>xyzABC...</xenc:CipherValue>
1017     </xenc:CipherData>
1018     <xenc:ReferenceList>
1019       <xenc:DataReference URI="#Encrypted_DATA_ID"/>
1020     </xenc:ReferenceList>
1021
1022     <xenc:CarriedKeyName>MULTICAST_KEY_NAME</xenc:CarriedKeyName>
1023   </xenc:EncryptedKey>
1024
1025   <xenc:EncryptedKey xmlns:xenc="http://www.w3.org/2001/04/xmlenc#"
1026     Id="Encrypted_KEY_ID_2" Recipient="https://sp2.org">
1027     <xenc:EncryptionMethod
1028       Algorithm="http://www.w3.org/2001/04/xmlenc#rsa-1_5"/>
```

```

1029 <ds:KeyInfo xmlns:ds="http://www.w3.org/2000/09/xmldsig#">
1030   <ds:KeyName>KEY_NAME_2</ds:KeyName>
1031 </ds:KeyInfo>
1032 <xenc:CipherData>
1033   <xenc:CipherValue>abcXYZ...</xenc:CipherValue>
1034 </xenc:CipherData>
1035 <xenc:ReferenceList>
1036   <xenc:DataReference URI="#Encrypted_DATA_ID"/>
1037 </xenc:ReferenceList>
1038
1039   <xenc:CarriedKeyName>MULTICAST_KEY_NAME</xenc:CarriedKeyName>
1040 </xenc:EncryptedKey>
1041 </saml:EncryptedAssertion>

```

E45: AuthnContext Comparison Order

1042
1043 Change [SAMLCore] Section 3.3.2.2.1 at lines 1815-1819 and 1826 to clarify the lack of orderedness in
1044 the comparison of a set of authentication contexts.

1045 Original at Section 3.3.2.2.1, lines 1815-1819:

1046 Either a set of class references or a set of declaration references can be used. The set of supplied
1047 references MUST be evaluated as an ordered set, where the first element is the most preferred
1048 authentication context class or declaration. If none of the specified classes or declarations can be satisfied in
1049 accordance with the rules below, then the responder MUST return a <Response> message with a second-
1050 level <StatusCode> of urn:oasis:names:tc:SAML:2.0:status:NoAuthnContext.

1051 New at Section 3.3.2.2.1, lines 1815-1819:

1052 Either a set of class references or a set of declaration references can be used. **If ordering is relevant to**
1053 **the evaluation of the request, then** the set of supplied references MUST be evaluated as an ordered set,
1054 where the first element is the most preferred authentication context class or declaration. If none of the
1055 specified classes or declarations can be satisfied in accordance with the rules below, then the responder
1056 MUST return a <Response> message with a second-level <StatusCode> of
1057 urn:oasis:names:tc:SAML:2.0:status:NoAuthnContext. **For example, ordering is significant**
1058 **when using this element in an <AuthnRequest> message but not in an <AuthnQuery> message.**

1059 Original at Section 3.3.2.2.1, line 1826:

1060 If Comparison is set to "better", then the resulting authentication context in the authentication statement
1061 MUST be stronger (as deemed by the responder) than **any** of the authentication contexts specified.

1062 New at Section 3.3.2.2.1, line 1826:

1063 If Comparison is set to "better", then the resulting authentication context in the authentication statement
1064 MUST be stronger (as deemed by the responder) than **one** of the authentication contexts specified.

E46: AudienceRestriction Clarifications

1065
1066 Change [SAMLCore] Section 2.5.1.4 at lines 924-925 to clarify the logical sense with respect to individual
1067 audience elements within an audience-restriction condition grouping.

1068 Original:

1069 Note that multiple <AudienceRestriction> elements MAY be included in a single assertion, and each
1070 MUST be evaluated independently. The effect of this requirement and the preceding definition is that within
1071 a given **condition**, the **audiences** form a disjunction (an "OR") while multiple **conditions** form a conjunction
1072 (an "AND").

1073 New:

1074 Note that multiple <AudienceRestriction> elements MAY be included in a single assertion, and each
1075 MUST be evaluated independently. The effect of this requirement and the preceding definition is that within

1076 a given <AudienceRestrictions>, the <Audience> elements form a disjunction (an "OR") while
1077 multiple <AudienceRestrictions> elements form a conjunction (an "AND").

1078 **E47: Clarification on SubjectConfirmation**

1079 Change [SAMLCore] Section 2.4.1.1 at line 698, and change [SAMLProf] Section 3.1 at lines 336 and 341
1080 and Section 3.3 at lines 361-363, in order to clarify behavior around the subject confirmation element and
1081 the intent of the embedded secondary identifier.

1082 New at [SAMLCore] Section 2.4.1.1, line 698 (add text just before the schema listing introduction):

1083 **If the <SubjectConfirmation> element in an assertion subject contains an identifier the issuer**
1084 **authorizes the attesting entity to wield the assertion on behalf of that subject. A relying party MAY**
1085 **apply additional constraints on the use of such an assertion at its discretion, based upon the**
1086 **identities of both the subject and the attesting entity.**

1087 **If an assertion is issued for use by an entity other than the subject, then that entity SHOULD be**
1088 **identified in the <SubjectConfirmation> element.**

1089 The following schema fragment defines the <SubjectConfirmation> element and its
1090 SubjectConfirmationType complex type:

1091 Original at [SAMLProf] Section 3.1, line 336:

1092 As described in [XMLSig], each <ds:KeyInfo> element holds a key or information that enables an
1093 application to obtain a key. The holder of a **specified key** is considered to be the subject of the assertion by
1094 the asserting party.

1095 New at [SAMLProf] Section 3.1, line 336 (note that E40 specified additional changes to the original text
1096 shown here):

1097 As described in [XMLSig], each <ds:KeyInfo> element holds a key or information that enables an
1098 application to obtain a key. The holder of **one or more of the specified keys** is considered to be the subject
1099 of the assertion by the asserting party.

1100 New at [SAMLProf] Section 3.1, line 341 (add text just before the example):

1101 **If the <SubjectConfirmation> element in an assertion subject contains an identifier the issuer**
1102 **authorizes the attesting entity to wield the assertion on behalf of that subject. A relying party MAY**
1103 **apply additional constraints on the use of such an assertion at its discretion, based upon the**
1104 **identities of both the subject and the attesting entity.**

1105 **If an assertion is issued for use by an entity other than the subject, then that entity SHOULD be**
1106 **identified in the <SubjectConfirmation> element.**

1107 Example: The holder of the key named "By-Tor" or the holder of the key named "Snow Dog" can confirm
1108 itself as the subject.

1109 Original at [SAMLProf] Section 3.3, lines 361-363:

1110 The subject of the assertion is **the bearer of the assertion**, subject to optional constraints on confirmation
1111 using the attributes that MAY be present in the <SubjectConfirmationData> element, as defined by
1112 [SAMLCore].

1113 New at [SAMLProf] Section 3.3, lines 361-363:

1114 The subject of the assertion is **considered to be an acceptable attesting entity for the assertion by the**
1115 **asserting party**, subject to optional constraints on confirmation using the attributes that MAY be present in
1116 the <SubjectConfirmationData> element, as defined by [SAMLCore].

1117 **If the intended bearer is known by the asserting party to be an entity other than the subject, then the**
1118 **asserting party SHOULD identify that entity to the relying party by including a SAML identifier**
1119 **representing it in the enclosing <SubjectConfirmation> element.**

1120 **If multiple attesting entities are to be permitted to use the assertion based on bearer semantics, then**
1121 **multiple <SubjectConfirmation> elements SHOULD be included.**

1122

E48: Clarification on Encoding for Binary Values in LDAP Profile

1123

Note: E48 corrects text in a section that is affected by E53, which deprecates the entire section. Please see E53 for details.

1124

1125 Change [SAMLProf] at line 1762. Original:

1126

For all other LDAP syntaxes, the attribute value is encoded, as the content of the `<AttributeValue>` element, by base64-encoding [RFC2045] the **encompassing** ASN.1 OCTET STRING-encoded LDAP attribute value. The `xsi:type` XML attribute **MUST** be set to `xs:base64Binary`. The profile-specific `Encoding` XML attribute is provided, with a value of "LDAP".

1127

1128

1129

1130 New:

1131

For all other LDAP syntaxes, the attribute value is encoded, as the content of the `<AttributeValue>` element, by base64-encoding [RFC2045] the **contents of the** ASN.1 OCTET STRING-encoded LDAP attribute value (**not including the ASN.1 OCTET STRING wrapper**). The `xsi:type` XML attribute **MUST** be set to `xs:base64Binary`. The profile-specific `Encoding` XML attribute is provided, with a value of "LDAP".

1132

1133

1134

1135

1136

E49: Clarification on Attribute Name Format

1137

Change [SAMLCore] Section 2.7.3.1 at line 1217 to clarify the relationship between an attribute's `NameFormat` setting and its syntax.

1138

1139 New (add text to the end of the definition of `<AttributeValue>`):

1140

`<AttributeValue>` [Any Number]

1141

Contains a value of the attribute. If an attribute contains more than one discrete value, it is RECOMMENDED that each value appear in its own `<AttributeValue>` element. If more than one `<AttributeValue>` element is supplied for an attribute, and any of the elements have a datatype assigned through `xsi:type`, then all of the `<AttributeValue>` elements must have the identical datatype assigned.

1142

1143

1144

1145

1146

Attributes are identified/named by the combination of the `NameFormat` and `Name` XML attributes described above. Neither one in isolation can be assumed to be unique, but taken together, they ought to be unambiguous within a given deployment.

1147

1148

1149

The SAML profiles specification [SAMLProf] includes a number of attribute profiles designed to improve the interoperability of attribute usage in some identified scenarios. Such profiles typically include constraints on attribute naming and value syntax. There is no explicit indicator when an attribute profile is in use, and it is assumed that deployments can establish this out of band, based on the combination of `NameFormat` and `Name`.

1150

1151

1152

1153

1154

E50: Clarification on SSL Ciphersuites

1155

Change [SAMLConf] Section 4 at line 235 and Section 5 at line 257 to clarify that the named ciphersuites are not the only ones that can be supported.

1156

1157 New at Section 4, line 235:

1158

SAML V2.0 uses XML Signature [XMLSig] to implement XML signing and encryption functionality for integrity, and source authentication. SAML V2.0 uses XML Encryption [XMLEnc] to implement confidentiality, including encrypted identifiers, encrypted assertions, and encrypted attributes. **The algorithms listed below as being required for SAML V2.0 conformance are based on the mandated algorithms in the W3C recommendations for XML Signature and for XML Encryption, but modified by the SSTC to ensure interoperability of conformant SAML implementations. While the SAML-defined set of algorithms is a minimal set for conformance, additional algorithms supported by XML Signature and XML Encryption MAY be used. Note, however, that the use of non-mandated algorithms may introduce interoperability issues if those algorithms are not widely implemented. As additional algorithms become mandated for use in XML Signature and XML Encryption, the set required for SAML conformance may be extended.**

1159

1160

1161

1162

1163

1164

1165

1166

1167

1168

1169 New at Section 5, line 257:

1170 In any SAML V2.0 use of SSL 3.0 [SSL3] or TLS 1.0 [RFC 2246], servers MUST authenticate to clients
1171 using a X.509 v3 certificate. The client MUST establish server identity based on contents of the certificate
1172 (typically through examination of the certificate's subject DN field). **The set of algorithms required for**
1173 **SAML V2.0 conformance is equivalent to that defined in SAML V1.0 and SAML V1.1. These mandated**
1174 **algorithms were chosen by the SSTC because of their wide implementation support in the industry.**
1175 **While the algorithms defined below are the minimal set for SAML conformance, additional**
1176 **algorithms supported by SSL 3.0 and TLS 1.0 MAY be used.**

1177 **E51: Schema Type of Contents of <AttributeValue>**

1178 Change [SAMLProf] Section 8.1.4 at line 1670 to change the reference from **Section 3.3** to **Section 3**, in
1179 order to fix a typographical error that would have improperly restricted the valid types for attribute values
1180 to derived types, rather than the larger category of built-in types.

1181 **E52: Clarification on NotOnOrAfter Attribute for Subject** 1182 **Confirmation**

1183 Change [SAMLProf] Section 4.1.4.2 at line 557 to correctly reflect the type of validity period that applies to
1184 subject confirmation.

1185 Original:

1186 The bearer <SubjectConfirmation> element described above MUST contain a
1187 <SubjectConfirmationData> element that contains a Recipient attribute containing the service
1188 provider's assertion consumer service URL and a NotOnOrAfter attribute that limits the window during
1189 which the assertion can be **delivered**. It MAY contain an Address attribute limiting the client address from
1190 which the assertion can be delivered.

1191 New (note that E26 specifies additional changes to the original text shown here):

1192 The bearer <SubjectConfirmation> element described above MUST contain a
1193 <SubjectConfirmationData> element that contains a Recipient attribute containing the service
1194 provider's assertion consumer service URL and a NotOnOrAfter attribute that limits the window during
1195 which the assertion can be **confirmed by the relying party**. It MAY contain an Address attribute limiting
1196 the client address from which the assertion can be delivered.

1197 **E53: Correction to LDAP/X.500 Profile Attribute**

1198 Deprecate [SAMLProf] Section 8.2 at lines 1677-1799 by adding a notice after line 1677.

1199 New:

1200 **8.2 X.500/LDAP Attribute Profile – Deprecated**
1201 **NOTE: This attribute profile is deprecated because of a flaw that makes it schema-invalid. The SSTC**
1202 **has replaced it with a separately published SAML V2.0 X.500/LDAP Attribute Profile specification**
1203 **that removes this flaw.**
1204 Directories based on the ITU-T X.500 specifications [X.500] and the related IETF Lightweight Directory
1205 Access Protocol specifications [LDAP] are widely deployed....

1206 **E54: Corrections to ECP URN**

1207 Change [SAMLProf] Section 4.2.3.1 at lines 757 and 763-764 to correct the usage of quotation marks in
1208 HTTP headers.

1209 New at line 757 (add double quotation marks around the URN):

1210 Furthermore, support for this profile **MUST** be specified in the HTTP PAOS Header field as a service value,
1211 with the value "urn:oasis:names:tc:SAML:2.0:profiles:SSO:ecp".

1212 Original at lines 763-764 (single quotation marks are problematic):

```
1213 GET /index HTTP/1.1  
1214 Host: identity-service.example.com  
1215 Accept: text/html; application/vnd.paos+xml  
1216 PAOS: ver='urn:liberty:paos:2003-08' ;  
1217 'urn:oasis:names:tc:SAML:2.0:profiles:SSO:ecp'
```

1218 New at lines 763-764 (double quotation marks used instead):

```
1219 GET /index HTTP/1.1  
1220 Host: identity-service.example.com  
1221 Accept: text/html; application/vnd.paos+xml  
1222 PAOS: ver="urn:liberty:paos:2003-08" ;  
1223 "urn:oasis:names:tc:SAML:2.0:profiles:SSO:ecp"
```

1224 **E55: Language Cleanup Around Name Identifier Management**

1225 Change [SAMLCore] Section 3.6.3 at lines 2477, 2483, and 2486-2487, and Section 8.3.7 at lines 3337-
1226 3339, and change [SAMLProf] Section 4.5 at lines 1319 and 1323 to clear up ambiguities around name
1227 identifier management and its application to various name identifier formats and differing identities for a
1228 principal.

1229 Original at [SAMLCore] Section 3.6.3, lines 2477, 2483, and 2486-2487:

1230 If the <Terminate> element is included in the request, the requesting provider is indicating that (in the case
1231 of a service provider) it will no longer accept assertions from the identity provider or (in the case of an
1232 identity provider) it will no longer issue assertions to the service provider **about the principal**. The receiving
1233 provider can perform any maintenance with the knowledge that the relationship represented by the name
1234 identifier has been terminated.

1235 If the service provider requests that its identifier for the principal be changed by including a <NewID> (or
1236 <NewEncryptedID>) element, the identity provider **MUST** include the element's content as the
1237 SPProvidedID when subsequently communicating to the service provider **regarding this principal**.

1238 If the identity provider requests that its identifier for the principal be changed by including a <NewID> (or
1239 <NewEncryptedID>) element, the service provider **MUST** use the element's content as the
1240 <saml:NameID> element content when subsequently communicating with the identity provider **regarding
1241 this principal**.

1242 New at [SAMLCore] Section 3.6.3, lines 2477, 2483, and 2486-2487 (note that E8 specifies additional
1243 changes to the original text shown here):

1244 If the <Terminate> element is included in the request, the requesting provider is indicating that (in the case
1245 of a service provider) it will no longer accept assertions from the identity provider or (in the case of an
1246 identity provider) it will no longer issue assertions to the service provider **using that identifier**. The receiving
1247 provider can perform any maintenance with the knowledge that the relationship represented by the name
1248 identifier has been terminated.

1249 If the service provider requests that its identifier for the principal be changed by including a <NewID> (or
1250 <NewEncryptedID>) element, the identity provider **MUST** include the element's content as the
1251 SPProvidedID when subsequently communicating to the service provider **using the primary identifier**.

1252 If the identity provider requests that its identifier for the principal be changed by including a <NewID> (or
1253 <NewEncryptedID>) element, the service provider **MUST** use the element's content as the
1254 <saml:NameID> element content when subsequently communicating with the identity provider **in any case
1255 where the identifier being changed would have been used**.

1256 New at [SAMLCore] Section 8.4.7, lines 3337-3339:

1257 The element's `SPNameQualifier` attribute, if present, MUST contain the unique identifier of the service
1258 provider or affiliation of providers for whom the identifier was generated (see Section 8.3.6). It MAY be
1259 omitted if the element is contained in a message intended only for consumption directly by the service
1260 provider, and the value would be the unique identifier of that service provider.

1261 ~~The element's `sPProvidedID` attribute MUST contain the alternative identifier of the principal most~~
1262 ~~recently set by the service provider or affiliation, if any (see Section 3.6). If no such identifier has~~
1263 ~~been established, then the attribute MUST be omitted.~~

1264 Original at [SAMLProf] Section 4.5, lines 1319 and 1323:

1265 In the scenario supported by the Name Identifier Management profile, an identity provider has exchanged
1266 some form of **persistent** identifier for a principal with a service provider, allowing them to share a common
1267 identifier for some length of time. Subsequently, the identity provider may wish to notify the service provider
1268 of a change in the format and/or value that it will use to identify the same principal in the future. Alternatively
1269 the service provider may wish to attach its own "alias" for the principal in order to ensure that the identity
1270 provider will include it when communicating with it in the future **about the principal**. Finally, one of the
1271 providers may wish to inform the other that it will no longer issue or accept messages using a particular
1272 identifier. To implement these scenarios, a profile of the SAML Name Identifier Management protocol is
1273 used.

1274 New at [SAMLProf] Section 4.5, lines 1319 and 1323 (note that E12 specifies additional changes to the
1275 original text shown here):

1276 In the scenario supported by the Name Identifier Management profile, an identity provider has exchanged
1277 some form of **long-term** identifier (**including but not limited to identifiers with a Format of**
1278 **`urn:oasis:names:tc:SAML:2.0:nameid-format:persistent`**) for a principal with a service
1279 provider, allowing them to share a common identifier for some length of time. Subsequently, the identity
1280 provider may wish to notify the service provider of a change in the format and/or value that it will use to
1281 identify the same principal in the future. Alternatively the service provider may wish to attach its own "alias"
1282 for the principal in order to ensure that the identity provider will include it when communicating with it in the
1283 future **using that identifier**. Finally, one of the providers may wish to inform the other that it will no longer
1284 issue or accept messages using a particular identifier. To implement these scenarios, a profile of the SAML
1285 Name Identifier Management protocol is used.

1286 **E56: Confirmation Method Typo**

1287 Change [SAMLProf] Section 3 at line 326 to change the reference from **<ConfirmationMethod>** (an
1288 element that no longer exists) to **Method** (an attribute, used instead of the element beginning in V2.0 of
1289 SAML).

1290 **E57: SAMLmime Reference**

1291 Change [SAMLBind] Section 4 at lines 1468-1469 to replace a reference to an expired IETF I-D for the
1292 SAMLmime definition to a persistent reference for the same definition.

1293 Original:

1294 [SAMLmime] **application/saml+xml Media Type Registration, IETF Internet-Draft,**
1295 **<http://www.ietf.org/internet-drafts/draft-hodges-saml-mediatype-01.txt>.**

1296 New:

1297 [SAMLmime] **OASIS Security Services Technical Committee (SSTC),**
1298 **"application/samlassertion+xml MIME Media Type Registration", IANA**
1299 **MIME Media Types Registry application/samlassertion+xml, December**
1300 **2004. See [http://www.iana.org/assignments/media-](http://www.iana.org/assignments/media-types/application/samlassertion+xml)**
1301 **types/application/samlassertion+xml.**

1302 **E58: KeyDescriptor Typos in Profiles**

1303 Change [SAMLProf] Section 4.1.6 at lines 626 and 627 to expand the keyword **sign** to **signing** and to
1304 expand the keyword **encrypt** to **encryption**. These were typographical errors.

1305 Original:

1306 The providers MAY document the key(s) used to sign requests, responses, and assertions with
1307 `<md:KeyDescriptor>` elements with a `use` attribute of **sign**. When encrypting SAML elements,
1308 `<md:KeyDescriptor>` elements with a `use` attribute of **encrypt** MAY be used to document supported
1309 encryption algorithms and settings, and public keys used to receive bulk encryption keys.

1310 New:

1311 The providers MAY document the key(s) used to sign requests, responses, and assertions with
1312 `<md:KeyDescriptor>` elements with a `use` attribute of **signing**. When encrypting SAML elements,
1313 `<md:KeyDescriptor>` elements with a `use` attribute of **encryption** MAY be used to document
1314 supported encryption algorithms and settings, and public keys used to receive bulk encryption keys.

1315 **E59: SSO Response When Using HTTP-Artifact**

1316 Change [SAMLBind] Section 3.6.5.2 at line 1173 to observe for clarity's sake that particular message
1317 delivery mechanisms are not mandated for the "nested" message exchange that takes place as part of
1318 the HTTP-Artifact binding.

1319 New:

1320 Note also that there is no mechanism defined to protect the integrity of the relationship between the artifact
1321 and the "RelayState" value, if any. That is, an attacker can potentially recombine a pair of valid HTTP
1322 responses by switching the "RelayState" values associated with each artifact. As a result, the
1323 producer/consumer of "RelayState" information MUST take care not to associate sensitive state information
1324 with the "RelayState" value without taking additional precautions (such as based on the information in the
1325 SAML protocol message retrieved via artifact).

1326 **Finally, note that the use of the `Destination` attribute in the root SAML element of the protocol
1327 message is unspecified by this binding, because of the message indirection involved.**

1328 **E60: Incorrect URI for Unspecified NameID Format**

1329 Change [SAMLCore] Section 2.2.2 at line 460 to change the name identifier format from
1330 `urn:oasis:names:tc:SAML:1.0:nameid-format:unspecified` to
1331 `urn:oasis:names:tc:SAML:1.1:nameid-format:unspecified`. This was a typographical error.

1332 **E61: Reference to Non-Existent Element**

1333 Change [SAMLCore] Section 7.1.2 at lines 3160.

1334 Original:

1335 The following SAML protocol **elements** are intended specifically for use as extension points in an extension
1336 schema; **their types** are set to abstract, and are thus usable only as the base of a derived type:

- 1337 • **<Request>** and RequestAbstractType
- 1338 • **<SubjectQuery>** and SubjectQueryAbstractType

1339 New:

1340 The following SAML protocol **constructs** are intended specifically for use as extension points in an
1341 extension schema; **the types listed** are set to abstract, and are thus usable only as the base of a derived
1342 type:

- 1343 • RequestAbstractType

1344 • <SubjectQuery> and SubjectQueryAbstractType

1345 **E62: TLS Keys in KeyDescriptor**

1346 Change [SAMLMeta] Section 2.4.1.1 at line 624 to specify more clearly how to interpret the
1347 KeyDescriptor element's use attribute.

1348 New (just after the conclusion of the definition list for KeyDescriptorType):

1349 **A use value of "signing" means that the contained key information is applicable to both signing
1350 and TLS/SSL operations performed by the entity when acting in the enclosing role.**

1351 **A use value of "encryption" means that the contained key information is suitable for use in
1352 wrapping encryption keys for use by the entity when acting in the enclosing role.**

1353 **If the use attribute is omitted, then the contained key information is applicable to both of the above
1354 uses.**

1355 The following schema fragment defines the <KeyDescriptor> element and its KeyDescriptorType
1356 complex type:

1357 **E63: IdP Discovery Cookie Interpretation**

1358 Change [SAMLProf] Section 4.3.1 at line 1105 to clear up confusion over interpretation of the contents of
1359 an IdP Discovery cookie. (Note that E32 specifies changes to Section 4 that result in a new Section 4.3.1
1360 being inserted before the original one; E63 applies to the original Section 4.3.1.)

1361 New:

1362 **Cookie syntax should be in accordance with IETF RFC 2965 [RFC2965] or [NSCookie]. The cookie MAY be
1363 either session-only or persistent. This choice may be made within a deployment, but should apply uniformly
1364 to all identity providers in the deployment. Note that while a session-only cookie can be used, the intent
1365 of this profile is not to provide a means of determining whether a user actually has an active session
1366 with one or more of the identity providers stored in the cookie. The cookie merely identifies identity
1367 providers known to have been used in the past. Service providers MAY instead rely on the
1368 IsPassive attribute in their <samlp:AuthnRequest> message to probe for active sessions.**

1369 **E64: Liberty Moniker Used Inappropriately**

1370 Change [SAMLSec] Section 7.1.1.9, Impersonation without Reauthentication to replace an accidental use
1371 of the moniker "Liberty" in place of "SAML V2.0".

1372 New:

1373 **Cookies posted by identity providers MAY be used to support this validation process, though LibertySAML
1374 V2.0 does not mandate a cookie-based approach.**

1375 **E65: Second-level StatusCode**

1376 Change various sections as follows in [SAMLCore] to constrain the optional second-level <StatusCode>
1377 element used, and clarify that use of second-level codes is optional.

1378 Change section 3.3.2.2.1, lines 1817-1819.

1379 New:

1380 **If none of the specified classes or declarations can be satisfied in accordance with the rules below, then the
1381 responder MUST return a <Response> message with a top-level <StatusCode> value of
1382 urn:oasis:names:tc:SAML:2.0:status:Responder and MAY return a second-level
1383 <StatusCode> of urn:oasis:names:tc:SAML:2.0:status:NoAuthnContext.**

1384 Change section 3.4.1.2, lines 2172-2173.

1385 New:

1386 In profiles specifying an active intermediary, the intermediary MAY examine the list and return a
1387 <Response> message with an error <Status> and **optionally** a second-level <StatusCode> of

1388 Change section 3.4.1.5.1, lines 2282-2285.

1389 Original:

1390 An identity provider MUST NOT proxy a request where <ProxyCount> is set to zero. The identity
1391 provider MUST return an error <Status> containing a second-level <StatusCode> value of
1392 urn:oasis:names:tc:SAML:2.0:status:ProxyCountExceeded, unless it can directly
1393 authenticate the presenter.

1394 New:

1395 **Unless the identity provider can directly authenticate the presenter, it MUST return a <Response>**
1396 **message with a top-level <StatusCode> value of**
1397 **urn:oasis:names:tc:SAML:2.0:status:Responder and MAY return a second-level**
1398 **<StatusCode> value of urn:oasis:names:tc:SAML:2.0:status:ProxyCountExceeded.**

1399 Change section 3.8.3, lines 2729-2731.

1400 New:

1401 If the responder does not recognize the principal identified in the request, it MAY respond with an error
1402 <Status>, **optionally** containing a second-level <StatusCode> of
1403 urn:oasis:names:tc:SAML:2.0:status:UnknownPrincipal.

1404 **E66: Metadata and DNSSEC**

1405 Change [SAMLMeta] to update the DNSSEC reference from RFC 2535 to RFC 4035.

1406 Updated line 1253:

1407 It is RECOMMENDED that entities publish their resource records in signed zone files using ~~[RFC2535]~~
1408 **[RFC4035]**

1409 Original at lines 1447-1448:

1410 [RFC2535] D. Eastlake. *Domain Name System Security Extensions*. IETF RFC 2535, March 1999. See
1411 <http://www.ietf.org/rfc/rfc2535.txt>.

1412 New at lines 1447-1448:

1413 **[RFC4035] R. Arends et al. *Protocol Modifications for the DNS Security Extensions*. IETF RFC 4035,**
1414 **March 2005. See <http://www.ietf.org/rfc/rfc4035.txt>.**

1415 **E68: Use of Multiple <KeyDescriptor> Elements**

1416 Add text to section 2.4.1.1 of [SAMLMeta] to clarify the meaning of identically-purposed
1417 <KeyDescriptor> elements within a role.

1418 New at line 625:

1419 **The inclusion of multiple <KeyDescriptor> elements with the same use attribute (or no such**
1420 **attribute) indicates that any of the included keys may be used by the containing role or affiliation. A**
1421 **relying party SHOULD allow for the use of any of the included keys. When possible the signing or**
1422 **encrypting party SHOULD indicate as specifically as possible which key it used to enable more**
1423 **efficient processing.**

1424 The following schema fragment defines the <KeyDescriptor> element and its KeyDescriptorType
1425 complex type:

1426 **E69: Semantics of <ds:KeyInfo> in <KeyDescriptor>**

1427 Add text to section 2.4.1.1 of [SAMLMeta] to clarify the limitations of the specification regarding the
1428 semantics of various kinds of common key representations.

1429 New at line 625 (this change should appear after E68 above):

1430 **The <ds:KeyInfo> element is a highly generic and extensible means of communicating key**
1431 **material. This specification takes no position on the allowable or suggested content of this element,**
1432 **nor on its meaning to a relying party. As a concrete example, no implications of including an X.509**
1433 **certificate by value or reference are to be assumed. Its validity period, extensions, revocation status,**
1434 **and other relevant content may or may not be enforced, at the discretion of the relying party. The**
1435 **details of such processing, and their security implications, are out of scope; they may, however, be**
1436 **addressed by other SAML profiles.**

1437 The following schema fragment defines the <KeyDescriptor> element and its KeyDescriptorType
1438 complex type:

1439 **E70: Obsolete reference to UUID URN namespace**

1440 Change [SAMLProf] to update the Internet Draft reference for the UUID URN namespace to RFC 4122.

1441 Updated Section 8.3.3.1, line 1836:

1442 values are equal in the sense of [<http://www.ietf.org/internet-drafts/draft-mealling-uuid-urn-05.txt>][RFC4122].
1443 The

1444 Updated Section 8.4.3.1, line 1885:

1445 values are equal in the sense of [<http://www.ietf.org/internet-drafts/draft-mealling-uuid-urn-05.txt>][RFC4122].
1446 The

1447 Original at lines 2111-2112:

1448 [Mealling] P Leach et al. *A UUID URN Namespace*. IETF Internet-Draft, December 2004. See
1449 <http://www.ietf.org/internet-drafts/draft-mealling-uuid-urn-05.txt>.

1450 New at lines 2111-2112:

1451 [RFC4122] P. Leach et al. *A Universally Unique Identifier (UUID) URN Namespace*. IETF RFC 4122,
1452 July 2005. See <http://www.ietf.org/rfc/rfc4122.txt>.

1453 **E71: Missing namespace definition in Profiles**

1454 Change [SAMLProf] to add the "xs" namespace prefix to the table in Section 1.

1455 New row of table in Section 1, between lines 267-268:

1456 **xs :**

1457 **<http://www.w3.org/2001/XMLSchema>**

1458 **This namespace is defined in the W3C XML Schema specification [Schema1]. In schema listings, this**
1459 **is the default namespace and no prefix is shown. For clarity, the prefix is generally shown in**
1460 **specification text when XML Schema-related constructs are mentioned.**

1461 **E74: Update XML Signature Reference**

1462 Update the XML Signature specification reference in [SAMLCore], [SAMLBind], [SAMLProf], [SAMLMeta],
1463 [SAMLAuthCtx], [SAMLConf], [SAMLSec] to the "Second Edition". Also remove a stale non-normative
1464 reference in [SAMLCore].

1465 Strike [SAMLCore], lines 3439-3440:

1466 [RFC 3075] D. Eastlake, J. Reagle, D. Solo. *XML Signature Syntax and Processing*. IETF RFC 3075,
1467 March 2001. See <http://www.ietf.org/rfc/rfc3075.txt>.

1468 Original at [SAMLCore] lines 3415-3416, [SAMLBind] lines 1489-1491, [SAMLProf] lines 2205-2206,
1469 [SAMLMeta] lines 1490-1491, [SAMLAuthCtx] lines 3926-3928, [SAMLConf] lines 410-412, [SAMLSec] lines
1470 1078-1079:

1471 If the `Format` value is omitted or set to
1472 `urn:oasis:names:tc:SAML:2.0:nameidformat:unspecified`[XMLSig] D. Eastlake et al. XML-
1473 Signature Syntax and Processing. World Wide Web Consortium, February 2002. See
1474 <http://www.w3.org/TR/xmlsig-core/>. Note that this specification normatively references [XMLSig-XSD],
1475 listed below.

1476 New at [SAMLCore] lines 3415-3416, [SAMLBind] lines 1489-1491, [SAMLProf] lines 2205-2206,
1477 [SAMLMeta] lines 1490-1491, [SAMLAuthCtx] lines 3926-3928, [SAMLConf] lines 410-412, [SAMLSec]
1478 lines 1078-1079:

1479 [XMLSig] D. Eastlake et al. *XML Signature Syntax and Processing, Second Edition*. World
1480 Wide Web Consortium, June 2008. See <http://www.w3.org/TR/xmlsig-core/>.

1481 **E75: Clarify Handling of SubjectConfirmation in AuthnRequest**

1482 Change [SAMLCore] Section 3.4.1.4 to clarify an identity provider's obligation to return an error if it can't
1483 honor the requirements of a `<SubjectConfirmation>` element in an `<AuthnRequest>` message.

1484 New at line 2247:

1485 In such a case, the identifier's physical content MAY be different, but it MUST refer to the same principal. **If**
1486 **the identity provider cannot or will not produce assertions with a strongly matching subject, then it**
1487 **MUST return a `<Response>` with an error `<Status>`, and MAY return a second-level `<StatusCode>`**
1488 **that reflects the reason for the failure.**

1489 **E76: Clarify nested validUntil/cacheDuration**

1490 Add text to [SAMLMeta] to clarify the processing of nested `validUntil` or `cacheDuration` attributes.

1491 New in Sections 2.3.1 and 2.3.2, before lines 336 and 409:

1492 When not used as the root element of a metadata instance, a `validUntil` or `cacheDuration` attribute
1493 MAY be used to impose a shorter expiration or cache duration than that of the parent or root element, but
1494 never a longer one; the smaller value takes precedence.

1495 New in Sections 2.4.1 and 2.5, before lines 589 and 972:

1496 A `validUntil` or `cacheDuration` attribute MAY be used to impose a shorter expiration or cache duration
1497 than that of the parent or root element, but never a longer one; the smaller value takes precedence.

1498 **E77: Generalize scope of Metadata specification**

1499 Change [SAMLMeta] to address inadvertent language appearing to restrict use of SAML metadata to only
1500 SAML profiles.

1501 New in Section 1, before line 137:

1502 A variety of extension points are also included to allow for the use of SAML metadata in non-SAML
1503 specifications, profiles, and deployments, and such use is encouraged.

1504 Updated Section 2, lines 153-154:

1505 SAML metadata is organized around an extensible collection of roles representing common combinations of
1506 SAML **(and potentially non-SAML)** protocols and profiles supported by system entities.

1507 Remove the word "SAML" from lines 226, 230, 311, 323, 332, 360, 372, 397, 403, 444, 478, 531, and
1508 940.

1509 **E78: Reassignment of persistent identifiers**

1510 Add text to [SAMLCore] Section 8.3.7, at line 3325, to clarify that non-reassignment to different principals
1511 is a required property of "persistent" name identifiers.

1512 New:

1513 **Persistent name identifier values MUST NOT exceed a length of 256 characters. A given value, once**
1514 **associated with a principal, MUST NOT be assigned to a different principal at any time in the future.**

1515 **E79: Clarification of SessionNotOnOrAfter**

1516 Change [SAMLCore] Section 2.7.2, lines 1062-1065 to loosen wording around the
1517 `SessionNotOnOrAfter` attribute and defer more explicitly to profiles.

1518 Original:

1519 Specifies a time instant at which the session between the principal identified by the subject and the SAML
1520 authority issuing this statement MUST be considered ended. The time value is encoded in UTC, as
1521 described in Section 1.3.3. There is no required relationship between this attribute and a `NotOnOrAfter`
1522 condition attribute that may be present in the assertion.

1523 New:

1524 **Indicates an upper bound on sessions with the subject derived from the enclosing assertion. The**
1525 **time value is encoded in UTC, as described in Section 1.3.3. There is no required relationship between this**
1526 **attribute and a `NotOnOrAfter` condition attribute that may be present in the assertion. It's left to profiles**
1527 **to provide specific processing rules for relying parties based on this attribute.**

1528 **E81: Algorithm statement in XML Signature profile**

1529 Change [SAMLCore] Section 5.4.1, lines 2926-2927, and [SAMLMeta] Section 3.1.1, lines 1182-1183, to
1530 relax the implication that RSA with SHA1 is the only supported algorithm.

1531 Original:

1532 SAML processors SHOULD support the use of RSA signing and verification for public key operations in
1533 accordance with the algorithm identified by <http://www.w3.org/2000/09/xmldsig#rsa-sha1>.

1534 New:

1535 **Any algorithm defined for use with the XML Signature specification MAY be used.**

1536 **E82: Empty <ContactPerson> element**

1537 Add text to [SAMLMeta] Section 2.3.2.2, before line 500, to clarify that child elements should be included.

1538 New:

1539 **At least one child element SHOULD be present in a <ContactPerson> element.**

1540 **E83: Weaken claim made about Exclusive C14N**

1541 Change [SAMLCore] Section 5.4.3, lines 2939-2940, and [SAMLMeta] Section 3.1.3, lines 1196-1197, to
1542 better explain the purpose of using exclusive canonicalization.

1543 Original:

1544 Use of Exclusive Canonicalization ensures that signatures created over SAML messages embedded in an
1545 XML context can be verified independent of that context.

1546 New:

1547 Use of Exclusive Canonicalization facilitates the verification of signatures created over SAML messages
1548 when placed into a different XML context than present during signing.

1549 Note that use of this algorithm alone does not guarantee that a particular signed object can be moved from
1550 one context to another safely, nor is that a requirement of signed SAML objects in general, though it MAY be
1551 required by particular profiles

1552 **E84: Incorrect NameID Format constant**

1553 Change [SAMLCore] Section 3.4.1.1., lines 2133-2134 to fix reference to incorrect constant.

1554 Original:

1555 If the `Format` value is omitted or set to
1556 `urn:oasis:names:tc:SAML:2.0:nameidformat:unspecified`

1557 New:

1558 If the `Format` value is omitted or set to
1559 `urn:oasis:names:tc:SAML:1.1:nameidformat:unspecified`

1560 **E85: Conflicting language on profile error responses**

1561 Add text to [SAMLProf] Section 4.1.3.5., before line 487, to more strongly encourage support for returning
1562 error responses to Service Providers with appropriate security considerations.

1563 New:

1564 Identity provider implementations SHOULD support the issuance of `<saml2p:Response>` messages (with
1565 appropriate status codes) in the event of an error condition, provided that the user agent remains available
1566 and an acceptable location to which to deliver the response is available. The criteria for "acceptability" of a
1567 response location are not formally specified, but are subject to identity provider policy and reflect its
1568 responsibility to protect users from being sent to untrusted or possibly malicious parties.

1569 **E86: Pseudorandom requirement for persistent NameID format**

1570 Change [SAMLCore] Section 8.3.7., lines 3321-3323 to relax requirement for cryptographic pseudo-
1571 randomness in the generation of persistent name identifier values.

1572 Original:

1573 Persistent name identifiers generated by identity providers MUST be constructed using pseudo-random
1574 values that have no discernible correspondence with the subject's actual identifier (for example, username).

1575 New:

1576 Persistent name identifiers generated by identity providers MUST be constructed using values that have no
1577 discernible correspondence with the subject's actual identity (for example, username). They MAY be
1578 pseudo-random values, or generated in any other manner, provided there is no guessable relationship
1579 between the value and the subject's underlying identity, and that they are unique within the range of values
1580 generated by a given identity provider for a given service provider or affiliation of providers.

1581 **E87: Clarify default rules for `<md:AttributeConsumingService>`**

1582 Change [SAMLMeta] Section 2.4.4., lines 755-756 to align defaulting rules to similar elements.

1583 Original:

1584 At most one `<AttributeConsumingService>` element can have the attribute `isDefault` set to true. It
1585 is permissible for none of the included elements to contain an `isDefault` attribute set to true.

1586 New:

1587 At most one `<AttributeConsumingService>` element can have the attribute `isDefault` set to true.
1588 The default element is the first element with the `isDefault` attribute set to true. If no such elements exist,
1589 the default element is the first element without the `isDefault` attribute set to false. If no such elements
1590 exist, the default element is the first element in the sequence.

1591 **E88: Human readability of `<md:ServiceName>`**

1592 Change [SAMLMeta] Section 2.4.4.1., line 788 to clarify requirement for human readability.

1593 Original:

1594 One or more language-qualified names for the service.

1595 New:

1596 One or more language-qualified names for the service that are suitable for human consumption.

1597 **E89: NameFormat defaulting for `<md:RequestedAttribute>`**

1598 Add text to [SAMLMeta] Section 2.4.4.2., before line 816, to clarify default value of `NameFormat` attribute.

1599 New:

1600 If no `NameFormat` value is provided, the identifier `urn:oasis:names:tc:SAML:2.0:attrname-`
1601 `format:unspecified` (see Section 8.2.1 of [SAMLCore]) is in effect.

1602 **E90: RelayState sanitization**

1603 Security analysis of SAML implementations in [Sec2011] suggests that guidance is needed to advise
1604 implementers how to avoid enabling a class of attacks involving misuse of the `RelayState` feature
1605 supported by SAML bindings. The TC thanks the following for their identification of the problem, and their
1606 assistance in drafting this material:

- 1607 • Alessandro Armando, University of Genova and Fondazione Bruno Kessler
- 1608 • Roberto Carbone, Fondazione Bruno Kessler
- 1609 • Luca Compagna, SAP
- 1610 • Jorge Cuellar, Siemens
- 1611 • Giancarlo Pellegrino, SAP
- 1612 • Alessandro Sorniotti, IBM
- 1613 • The EU Projects AVANTSSAR, SPaCloS, and SIAM

1614 Add text to [SAMLBind] Section 3.1.1., before line 233:

1615 New:

1616 Some bindings that define a "RelayState" mechanism do not provide for end to end origin authentication or
1617 integrity protection of the `RelayState` value. Most such bindings are defined in conjunction with HTTP, and
1618 `RelayState` is often involved in the preservation of HTTP resource state that may involve the use of HTTP
1619 redirects, or embedding of `RelayState` information in HTTP responses, HTML content, etc. In such cases,
1620 implementations need to beware of Cross-Site Scripting (XSS) and other attack vectors (e.g., Cross-Site
1621 Request Forgery, CSRF) that are common to such scenarios.

1622
1623 Implementations MUST carefully sanitize the URL schemes they permit (for example, disallowing anything
1624 but "http" or "https"), and should disallow unencoded characters that may be used in mounting such attacks.
1625 This caution applies to both identity and service provider implementations.

1626 Add text to [SAMLBind] Section 3.4.5.2. before line 678, Section 3.5.5.2. before line 861, and Section
1627 3.6.5.2. before line 1174:

1628 New:

1629 When using RelayState in conjunction with HTTP redirects or response information, implementations MUST
1630 carefully sanitize the URL schemes they permit (for example, disallowing anything but "http" or "https"), and
1631 should disallow unencoded characters that may be used in mounting such attacks.

1632 Add text to [SAMLProf] Section 4.1.5., before line 617:

1633 New:

1634 Note that the use of unsolicited responses can lead to Cross-Site Request Forgery (CSRF) vulnerabilities
1635 due to the inability to ensure that a request from the client originated the SAML profile transaction. Service
1636 providers SHOULD have a means of disabling the acceptance of unsolicited responses if circumstances
1637 warrant. The use of solicited responses may also be vulnerable to such attacks, the use of cookies to
1638 correlate the issuance of SAML requests and responses with the same client being one possible solution.
1639 However, if unsolicited responses cannot be prevented, no improvement to the solicited case will be of use.

1640 Add text to [SAMLProf] before line 617, after previous addition:

1641 New:

1642 4.1.6 Use of Relay State

1643 The RelayState feature of the various HTTP-based bindings defined for use with this profile MAY be used to
1644 preserve information about resources requested by the user agent prior to the use of the profile. As
1645 discussed in [SAMLBind], the lack of integrity protection in many scenarios, including the case of unsolicited
1646 responses, makes it essential for identity and service providers to perform appropriate sanitization of the
1647 RelayState value and any URLs derived from it. The URL scheme eventually derived SHOULD be limited to
1648 "https" or "http", and protection against unencoded executable content must be applied.

1649 Add text to [SAMLProf] Section 4.2.5., before line 1082:

1650 New:

1651 The RelayState header block defined for use with this profile MAY be used to preserve information about
1652 resources requested by the client prior to the use of the profile. As discussed in [SAMLBind], the lack of
1653 integrity protection in many scenarios, including the case of unsolicited responses, makes it essential for
1654 identity and service providers to perform appropriate sanitization of the RelayState value and any URLs
1655 derived from it. The URL scheme eventually derived SHOULD be limited to "https" or "http", and protection
1656 against unencoded executable content must be applied.

1657 **E91: Disallow <ds:Object> element in signatures**

1658 Add text to [SAMLCore] before line 2951:

1659 New:

1660 5.4.5 Object

1661 The <ds:Object> element is not defined for use with SAML signatures, and SHOULD NOT be present.
1662 Since it can be used in service of an attacker by carrying unsigned data, verifiers SHOULD reject signatures
1663 that contain a <ds:Object> element.

1664 **E92: Add guidance for implementers on clock skew**

1665 Add text to [SAMLCore] after line 314:

1666 New:

1667 SAML system entities SHOULD allow for reasonable clock skew between systems when interpreting time
1668 instants and enforcing security policies based on them. Tolerances of 3-5 minutes are reasonable defaults,
1669 but allowing for configurability is a suggested practice in implementations.

1670 Add text to [SAMLCore] after line 759:

1671 New:

1672 As noted in section 1.3.3, relying parties SHOULD allow for reasonable clock skew in the interpretation of
1673 both values.

1674 Add text to [SAMLCore] after line 887:

1675 New:

1676 As noted in section 1.3.3, relying parties SHOULD allow for reasonable clock skew in the interpretation of
1677 both values.

1678 Add text to [SAMLCore] after line 2538:

1679 New:

1680 As noted in that same section, relying parties SHOULD allow for reasonable clock skew in the interpretation
1681 of this value.

1682 **E93: Mitigation for XML Encryption CBC deficiencies**

1683 A published paper [Enc2011] has described vulnerabilities in the use of CBC algorithms for data
1684 encryption when the ciphertext is not integrity-protected. The algorithms that provide built-in protection are
1685 not widely implemented yet, and the most effective mitigation for SAML implementations is to encourage
1686 the use of XML Signature or transport authentication at a layer above the use of XML Encryption. In
1687 particular, the ability to sign Responses (and require their use) is an effective strategy in many SAML
1688 profiles. This is to some extent a reversal of conventional wisdom that it's more efficient and just as secure
1689 to limit signing to the Assertion layer (and then encrypt the result).

1690 Replace Section 6.2 in [SAMLCore] with the following:

1691 6.2 Encryption and Integrity Protection

1692 SAML allows for assertions containing encrypted elements to be integrity protected, and allows for
1693 encrypted assertions to be included inside protocol response elements that are themselves integrity
1694 protected (typically via XML Signature, or in some cases through binding-specific mechanisms such as
1695 TLS).

1696 Recent practical attacks against the most common algorithms (at the time of this writing) used for bulk data
1697 encryption in [XMLEnc], which operate in CBC-mode, necessitate the enforcement of integrity protection by
1698 a relying party prior to processing encrypted data. As a result, when CBC-mode algorithms are used for data
1699 encryption, relying parties SHOULD require the presence of integrity protection before processing encrypted
1700 SAML assertions or assertions containing encrypted data. The most appropriate means of achieving this will
1701 vary by profile, but may involve the use of authenticated TLS requests, or a requirement for an authenticated
1702 digital signature at a layer above that of the encrypted elements.

1703 The ability to protect the encryption layer via a signature or TLS is limited by the fact that one typically does
1704 not have the ability to relate the asserting party's key to the cipher key. Thus, while one can limit exposure to
1705 only trusted asserting parties (via their key), it will often be the case that any trusted party's key will be
1706 accepted for the purposes of exploiting this issue.

1707 Other countermeasures, such as attempting to mitigate timing attacks, or limiting reuse of encryption keys,
1708 tend to be impractical for most implementations and the use of integrity protection, when properly
1709 implemented, is the suggested solution if authenticated encryption modes are unavailable.

1710 Change paragraph in Section 4.1.3.5 of [SAMLProf], lines 497-500 to clarify position of signature and add
1711 guidance when CBC-mode encryption is used.

1712 Original:

1713 It is RECOMMENDED that the HTTP requests in this step be made over either SSL 3.0 [SSL3] or TLS 1.0
1714 [RFC2246] to maintain confidentiality and message integrity. The <Assertion> element(s) in the
1715 <Response> MUST be signed, if the HTTP POST binding is used, and MAY be signed if the HTTP-Artifact
1716 binding is used.

1717 New:

1718 It is RECOMMENDED that the HTTP requests in this step be made over either SSL 3.0 [SSL3] or TLS 1.0
1719 [RFC2246] to maintain confidentiality and message integrity. For the purposes of the profile, either the
1720 <Response> or the <Assertion> element(s) in the <Response> MUST be signed, if the HTTP POST
1721 binding is used, and MAY be signed if the HTTP-Artifact binding is used. If an <EncryptedAssertion>
1722 element is present and a CBC-mode algorithm is used, then the <Response> SHOULD be signed to ensure
1723 the ciphertext is integrity protected (see section 6.2 of [SAMLCore]).

1724 Add text to Section 4.1.4.3 of [SAMLProf], after line 591:

1725 Note that if <EncryptedAssertion> elements are present and a CBC-mode algorithm is used, then the
1726 <Response> SHOULD be signed to ensure the ciphertext is integrity protected (see section 6.2 of
1727 [SAMLCore]). Some deployments may require both the <Response> and any <Assertion> elements be
1728 signed to address both the encryption issue and non-repudiation of the assertion (the latter being outside the
1729 scope of SAML).

1730 Change paragraph in Section 4.2.5 of [SAMLProf], lines 1071-1074 to clarify position of signature and add
1731 guidance when CBC-mode encryption is used.

1732 Original:

1733 The <AuthnRequest> message SHOULD be signed. Per the rules specified by the browser SSO profile,
1734 the assertions enclosed in the <Response> MUST be signed. The delivery of the response in the SOAP
1735 envelope via PAOS is essentially analogous to the use of the HTTP POST binding and security
1736 countermeasures appropriate to that binding are used.

1737 New:

1738 The <AuthnRequest> message SHOULD be signed. Per the rules specified by the browser SSO profile,
1739 the assertions enclosed in the <Response>, or the <Response> itself, MUST be signed. The delivery of
1740 the response in the SOAP envelope via PAOS is essentially analogous to the use of the HTTP POST
1741 binding and security countermeasures appropriate to that binding are used.

1742 Note that if <EncryptedAssertion> elements are present and a CBC-mode algorithm is used, then the
1743 <Response> SHOULD be signed to ensure the ciphertext is integrity protected (see section 6.2 of
1744 [SAMLCore]). Some deployments may require both the <Response> and any <Assertion> elements be
1745 signed to address both the encryption issue and non-repudiation of the assertion (the latter being outside the
1746 scope of SAML).

1747 Add text to Section 6.4.2 of [SAMLProf], after line 1562:

1748 Note that if <EncryptedAssertion> elements are present and a CBC-mode algorithm is used, then the
1749 <Response> SHOULD be signed to ensure the ciphertext is integrity protected (see section 6.2 of
1750 [SAMLCore]). Some deployments may require both the <Response> and any <Assertion> elements be
1751 signed to address both the encryption issue and non-repudiation of the assertion (the latter being outside the
1752 scope of SAML).

1753 Add text to Section 4.2.2 of [SAMLSec], at line 371:

1754 See section 4.6 for additional considerations related to the use of XML Encryption.

1755 Add new Section 4.6 to [SAMLSec], after line 492:

1756 4.6 XML Encryption Considerations

1757 The XML Encryption specification [XMLEnc] includes important information for implementers and deployers
1758 that should be reviewed in conjunction with the use of the specification. In addition, take note that
1759 subsequent to the publication of the original 1.0 specification, vulnerabilities have been found with some of
1760 the algorithms defined as mandatory to implement and that are in common usage [Enc2011], [RFC3218].

1761 For example, the use of PKCS 1.5 as a Key Transport algorithm is subject to attacks that require mitigation
1762 by implementations The use of RSA-OAEP as an alternative algorithm is recommended as a replacement,
1763 regardless of the type or size of symmetric key.

1764 In addition, the use of CBC mode algorithms for data encryption have been found vulnerable to attacks
1765 when used without a surrounding layer of integrity protection. Mitigating these attacks is difficult and in some
1766 cases impractical, and it is strongly advised that data encrypted with these algorithms only be processed

1767 with integrity protection in place. The use of TLS or XML Signature is often used for this purpose.
1768 Alternatively, implementations may be able to migrate to newer algorithms that include integrity protection as
1769 a feature, such as Galois/Counter Mode [800-38D].
1770 Implementers are encouraged to review all of the available literature to fully understand these issues.

1771

3 Acknowledgments

1772 The editor would like to acknowledge the contributions of the OASIS Security Services Technical
1773 Committee, whose voting members at the time of publication were:

- 1774 • Scott Cantor, Internet2
- 1775 • Nate Klingenstein, Internet2
- 1776 • Chad LaJoie, Internet2
- 1777 • Thomas Hardjono, M.I.T.
- 1778 • John Bradley, Open Identity Exchange
- 1779 • Hal Lockhart, Oracle
- 1780 • Anil Saldhana, Red Hat

1781 The editors also would like to gratefully acknowledge **Jahan Moreh** of Sigaba and **Eve Maler** (then at
1782 Sun Microsystems), who during their tenures on the TC were editors of the errata working document and
1783 made major substantive contributions to all of the errata materials.
