
Privacy Management Reference Model and Methodology (PMRM) Version 1.0

Working Draft 04

18 Mar 2012

Technical Committee:

OASIS Privacy Management Reference Model (PMRM) TC

Chairs:

John Sabo (john.t.sabo@ca.com), CA Technologies
Michael Willett (mwillett@nc.rr.com), Individual

Editors:

John Sabo (john.t.sabo@ca.com), CA Technologies
Michael Willett (mwillett@nc.rr.com), Individual
Peter F Brown (peter@peterfbrown.com), Individual
Dawn N Jutla (dawn.jutla@smu.ca), Saint Mary's University

Abstract:

The Privacy Management Reference Model and Methodology (PMRM, pronounced "pim-rim") provides a model and a methodology for:

- understanding and analyzing privacy policies and their privacy management requirements in defined use cases; and
- selecting the technical services which must be implemented to support privacy controls.

It is particularly relevant for use cases in which personal information (PI) flows across regulatory, policy, jurisdictional, and system boundaries.

Status:

This Working Draft (WD) has been produced by one or more TC Members; it has not yet been voted on by the TC or approved as a Committee Draft (Committee Specification Draft or a Committee Note Draft). The OASIS document Approval Process begins officially with a TC vote to approve a WD as a Committee Draft. A TC may approve a Working Draft, revise it, and re-approve it any number of times as a Committee Draft.

1 Introduction

The Privacy Management Reference Model and Methodology (PMRM) addresses the reality of today's networked, interoperable capabilities, applications and devices and the complexity of managing personal information (PI)¹ across legal, regulatory and policy environments in interconnected domains. It is a valuable tool that helps improve privacy management and compliance in cloud computing, health IT, smart grid, social networking, federated identity and similarly complex environments where the use of personal information is governed by laws, regulations, business contracts and other policies, but where traditional enterprise-focused models are inadequate. It can be of value to business and program managers who need to understand the implications of privacy policies for specific business systems and to help assess privacy management risks.

The PMRM is neither a static model nor a purely prescriptive set of rules (although it includes characteristics of both), and implementers have flexibility in determining the level and granularity of analysis required by a particular use case. The PMRM can be used by systems architects to inform the development of a privacy management architecture. The PMRM may also be useful in fostering interoperable policies and policy management standards and solutions. In many ways, the PMRM enables "privacy by design" because of its analytic structure and primarily operational focus.

1.1 Context

Predictable and trusted privacy management must function within a complex, inter-connected set of networks, systems, applications, devices, data, and associated governing policies. Such a privacy management capability is needed both in traditional computing and in cloud computing capability delivery environments. A useful privacy management capability must be able to establish the relationship between personal information ("PI") and associated privacy policies in sufficient granularity to enable the assignment of privacy management functionality and compliance controls throughout the lifecycle of the PI. It must also accommodate a changing mix of PI and policies, whether inherited or communicated to and from external domains or imposed internally. It must also include a methodology to carry out a detailed, structured analysis of the application environment and create a custom privacy management analysis (PMA) for the particular use case.

1.2 Objectives

The PMRM is used to analyze complex use cases, to understand and implement appropriate operational privacy management functionality and supporting mechanisms, and to achieve compliance across policy, system, and ownership boundaries.

In addition to serving as an analytic tool, the PMRM can aid the design of a privacy management architecture in response to use cases and as appropriate for a particular operational environment. It can also be used to help in the selection of integrated mechanisms capable of executing privacy controls in line with privacy policies, with predictability and assurance. Such an architectural view is important, because business and policy drivers are now both more global and more complex and must thus interact with many loosely-coupled systems.

In addition, multiple jurisdictions, inconsistent and often-conflicting laws, regulations, business practices, and consumer preferences, together create huge barriers to online privacy management and compliance. It is unlikely that these barriers will diminish in any significant way, especially in the face of rapid technological change and innovation and differing social and national values, norms and policy interests.

The Privacy Management Reference Model and Methodology therefore provides policymakers, program and business managers, system architects and developers with a tool to improve privacy management

¹ There is a distinction between 'personal information' (PI) and 'personally identifiable information' (PII) – see Glossary. However, for clarity, the term 'PI' is generally used in this document and is assumed to cover both. Specific contexts do, however, require that the distinction is made explicit.

44 and compliance in multiple jurisdictional contexts while also supporting capability delivery and business
45 objectives. In this Model, the controls associated with privacy (including security) will be flexible,
46 configurable and scalable and make use of technical mechanisms, business process and policy
47 components. These characteristics require a specification that is policy-configurable, since there is no
48 uniform, internationally-adopted privacy terminology and taxonomy.

49 Analysis and documentation produced using the PMRM will result in a Privacy Management Analysis
50 (PMA) that serves multiple stakeholders, including privacy officers and managers, general compliance
51 managers, and system developers. While other privacy instruments, such as privacy impact assessments
52 (“PIAs”), also serve multiple stakeholders, the PMRM does so in a way that is somewhat different from
53 these others. Such instruments, while nominally of interest to multiple stakeholders, tend to serve
54 particular groups. For example, PIAs are often of most direct concern to privacy officers and managers,
55 even though developers are often tasked with contributing to them. Such privacy instruments also tend to
56 change hands on a regular basis. As an example, a PIA may start out in the hands of the development or
57 project team, move to the privacy or general compliance function for review and comment, go back to the
58 project for revision, move back to the privacy function for review, and so on. This iterative process of
59 successive handoffs is valuable, but can easily devolve into a challenge and response dynamic that can
60 itself lead to miscommunication and misunderstandings.

61 The PMRM process output, in contrast, should have direct and ongoing relevance for all stakeholders and
62 is less likely to suffer the above dynamic. This is because it should be considered as a “boundary object,”
63 a construct that supports productive interaction and collaboration among multiple communities. Although
64 a boundary object is fully and continuously a part of each relevant community, each community draws
65 from it meanings that are grounded in the group’s own needs and perspectives. As long as these
66 meanings are not inconsistent across communities, a boundary object acts as a shared yet
67 heterogeneous understanding. The PMRM process output, if properly generated, constitutes just such a
68 boundary object. It is accessible and relevant to all stakeholders, but each group takes from it and
69 attributes to it what they specifically need. As such, the PMRM can facilitate collaboration across relevant
70 communities in a way that other privacy instruments often cannot.

71 1.3 Target Audience

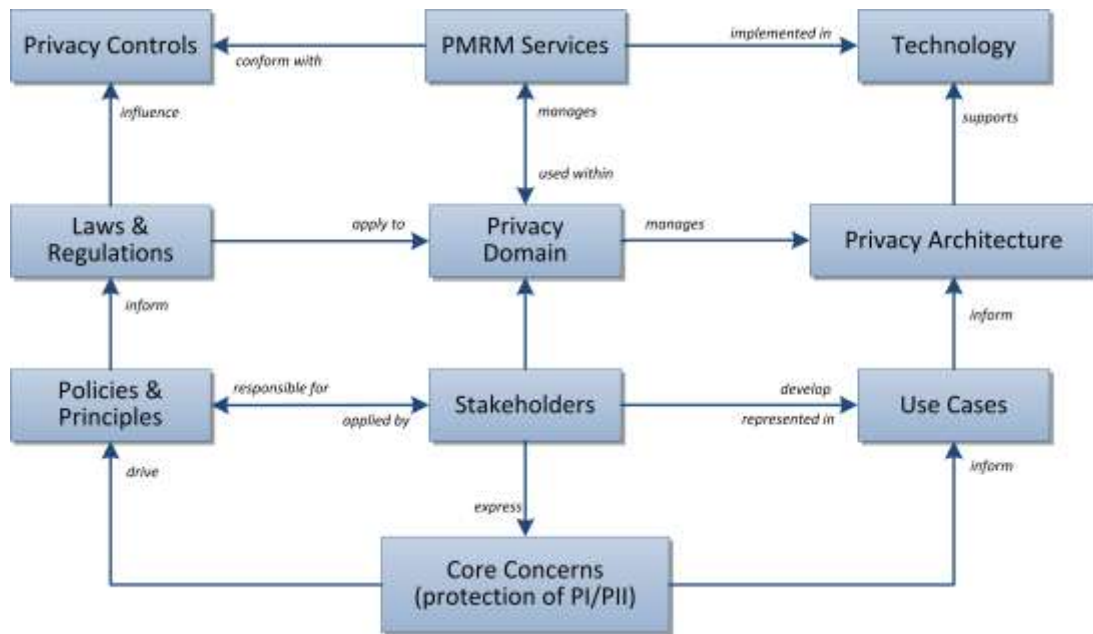

72 The intended audiences of this document and expected benefits to be realized include:

- 73 • **Privacy and Risk Officers** will gain a better understanding of the specific privacy management
74 environment for which they have compliance responsibilities as well as detailed policy and
75 operational processes and technical systems that are needed to achieve their organization’s privacy
76 compliance;
- 77 • **Systems/Business Architects** will have a series of templates for the rapid development of core
78 systems functionality, developed using the PMRM as a tool.
- 79 • **Software and Service Developers** will be able to identify what processes and methods are required
80 to ensure that personal data is created and managed in accordance with requisite privacy provisions.
- 81 • **Public policy makers** will be able to identify any weaknesses or shortcomings of current policies and
82 use the PMRM to establish best practice guidelines where needed.

83 1.4 Specification Summary

84 The PMRM consists of:

- 85 • A conceptual model of privacy management, including definitions of terms;
- 86 • A methodology; and
- 87 • A set of operational services,
- 88 together with the inter-relationships among these three elements.

89
90 *Figure 1 – The PMRM Conceptual Model*

91 In Figure 1, we see that the core concern of privacy protection (by users, policy makers, solution
92 providers, etc.) helps, on the one hand, drive policy and principles (which in turn influence actual
93 regulation and lawmaking); and on the other hand, informs the use cases that are developed to address
94 the specific architecture and solutions required by the stakeholders in a particular domain.

95 Legislation in its turn is a major influence on privacy controls – indeed, privacy controls are often
96 expressed as policy objectives rather than as specific technology solutions – and these form the basis of
97 the PMRM Services that are created to conform to those controls when implemented.

98 The PMRM conceptual model is anchored in the principles of Service-Oriented Architecture (and
99 particularly the principle of services operating across ownership boundaries). Given the general reliance
100 by the privacy policy community on non-uniform definitions of so-called “Fair Information
101 Practices/Principles” (FIP/Ps), a non-normative, working set of *operational* privacy definitions (see section
102 5.1) is used to provide a foundation for the Model. With their operational focus, these working definitions
103 are not intended to supplant or to in any way suggest a bias for or against any specific policy or policy set.
104 However, they may prove valuable as a tool to help deal with the inherent biases built into current
105 terminology associated with privacy and to abstract their operational features.

106 The PMRM methodology covers a series of tasks, outlined in the following sections of the document,
107 concerned with:

- 108 • defining and describing use-cases;
- 109 • identifying particular business domains and understanding the roles played by all actors and systems
110 within that domain in relation to privacy issues;
- 111 • identifying the data flows and touch-points for all personal information within a privacy domain;
- 112 • specifying various privacy controls;
- 113 • mapping technical and process mechanisms to operational services;
- 114 • performing risk and compliance assessments.

115 The specification also defines a set of Services deemed necessary to implement the management and
116 compliance of detailed privacy requirements within a particular use case. The Services are sets of
117 functions which form an organizing foundation to facilitate the application of the model and to support the
118 identification of the specific mechanisms which will be incorporated in the privacy management
119 architecture appropriate for that use case. The set of operational services (Agreement, Usage, Validation
120 Certification, Enforcement, Security, Interaction, and Access) is described in Section 4 below.

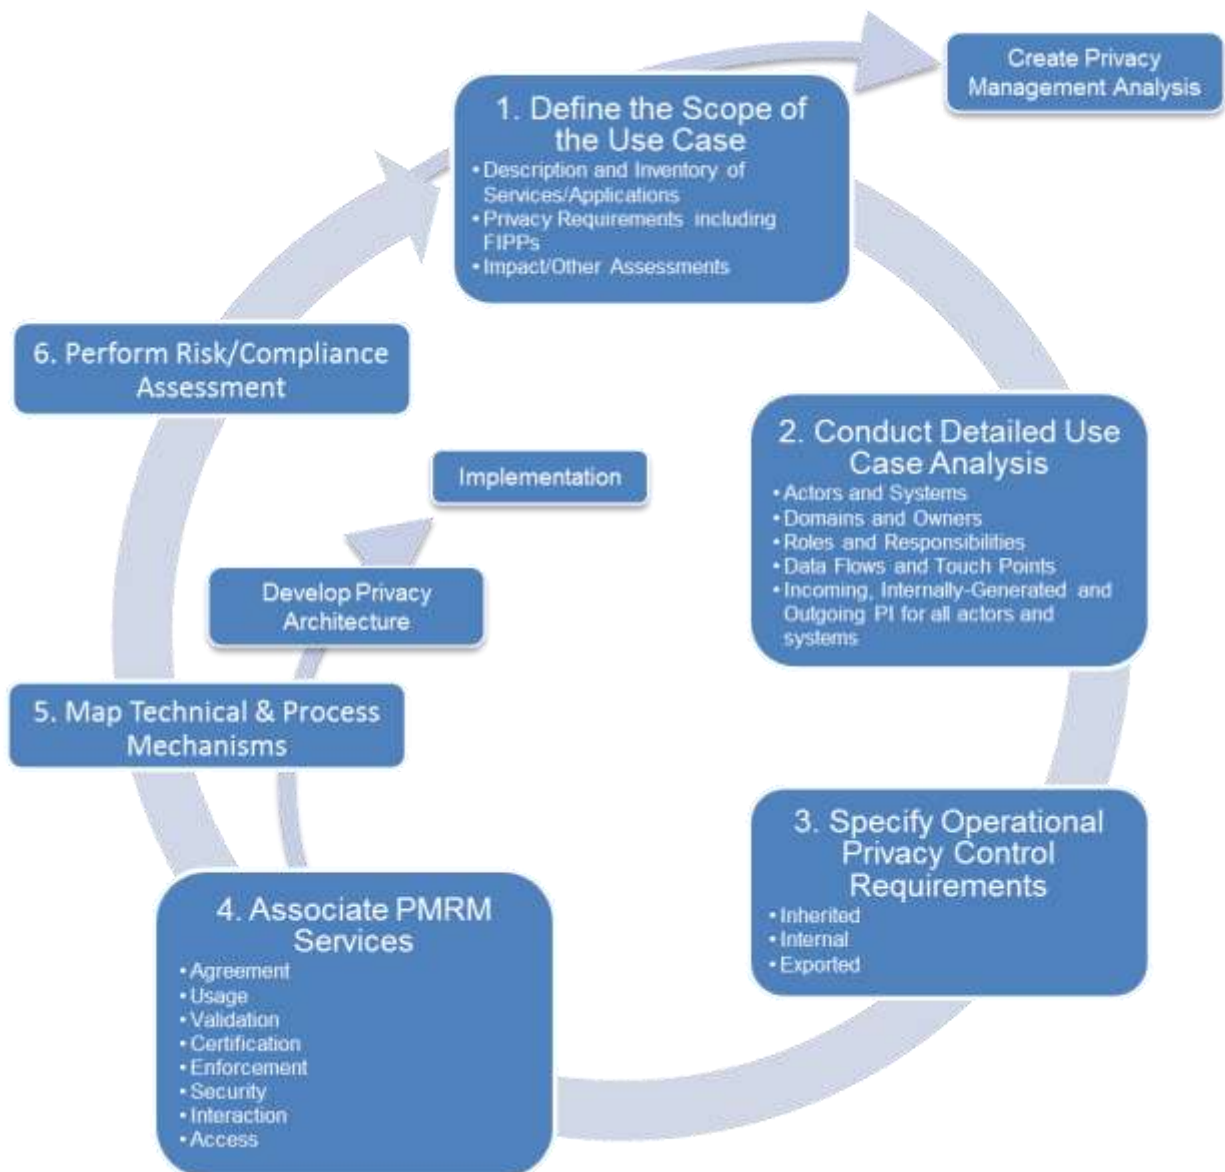

121 The core of the specification is expressed in two normative sections: the High Level Privacy Analysis and
122 the Detailed Privacy Management Reference Model Description. The Detailed PMRM Description section

123 is informed by the general findings associated with the High Level Analysis. However, it is much more
124 detail-focused and requires development of a use case which clearly expresses the complete application
125 and/or business environment within which personal information is collected, communicated, processed,
126 stored, and disposed.

127 It is also important to point out that the model is not generally prescriptive and that users of the model
128 may choose to adopt some parts of the model and not others. However, a complete use of the model will
129 contribute to a more comprehensive privacy management architecture for a given capability or
130 application. As such, the PMRM may serve as the basis for the development of privacy-focused
131 capability maturity models and improved compliance frameworks. The PMRM provides a model
132 foundation on which to build privacy architectures.

133 Use of the PMRM by and within a particular business domain and context (with a suitable Use Case), will
134 lead to the production of a Privacy Management Analysis (PMA). An organization may have one or more
135 PMAs, particularly across different business units, or it may have a unified PMA. Theoretically, a PMA
136 may apply across organizations, states, and even countries or other geo-political regions.

137 Figure 2 below shows the high-level view of the PMRM methodology that is used to create a PMA.
138 Although the stages are numbered for clarity, no step is an absolute pre-requisite for starting work on
139 another step and the overall process will usually be iterative. Equally, the process of establishing an
140 appropriate privacy architecture, and determining when and how technology implementation will be
141 carried out, can both be started at any stage during the overall process.

142

143 *Figure 2 - The PMRM Methodology*

144 **1.5 Terminology**

145 References are surrounded with [square brackets] and are in **bold** text.

146 The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD
 147 NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described
 148 in **[RFC2119]**.

149 A glossary of key terms used in this specification as well as operational definitions for sample Fair
 150 Information Practices/Principles (“FIP/Ps”) are included in Section 5 of the document. We note that words
 151 and terms used in the discipline of data privacy in many cases have meanings and inferences associated
 152 with specific laws, regulatory language, and common usage within privacy communities. The use of such
 153 well-established terms in this specification is unavoidable. However we urge readers to consult the
 154 definitions in the glossary and clarifications in the text to reduce confusion about the use of such terms
 155 within this specification.

156 **1.6 Normative References**

157 **[RFC2119]** S. Bradner, *Key words for use in RFCs to Indicate Requirement Levels*,
158 <http://www.ietf.org/rfc/rfc2119.txt>, IETF RFC 2119, March 1997.

159 **1.7 Non-Normative References**

160 **[SOA-RM]** OASIS Standard, "Reference Model for Service Oriented Architecture 1.0", 12
161 October 2006. <http://docs.oasis-open.org/soa-rm/v1.0/soa-rm.pdf>

163 Organizations – Appendix J: Privacy Controls Catalog", NIST Special Publication
164 800-53 Draft Appendix J, July 2011.

2 High-Level Privacy Analysis and Use Case Description

165
166

167 The first phase in applying the PMRM methodology requires the scoping of the application or business
168 service in which personal information (PI) is associated - in effect, identifying the complete environment in
169 which the application or capabilities where privacy and data protection requirements are applicable. The
170 extent of the scoping analysis and the definitions of “application” or “business capability” are set by the
171 entity utilizing the PMRM. These may be defined broadly or narrowly, and may include lifecycle (time)
172 elements.

173 The high level analysis may also make use of privacy impact assessments, previous risk assessments,
174 privacy maturity assessments, compliance reviews, and accountability model assessments as determined
175 by the user of the PMRM. However, the scope of the high level privacy analysis (including all aspects of
176 the capability or application under review and all relevant privacy policies) must correspond with the
177 scope of the second phase, covered in Section 3, “Detailed Privacy Use Case Analysis”, below.

2.1 Application and Business Process Descriptions

178

Task #1: Use Case Description

179

180 **Objective** Provide a general description of the Use Case.

180

Example

181

182 A California utility, with a residential customer base with smart meters installed, wants to promote the
183 increased use of electric vehicles in its service area by offering significantly reduced electricity rates for
184 nighttime recharging of vehicle battery. The system also permits the customer to use the charging
185 station at another customer’s site [such as at a friend’s house] and have the system bill the vehicle
186 owner instead of the customer whose charging station is used.

187 The customer plugs in the car and requests “charge at cheapest rates”. The utility is notified of the car’s
188 presence, its ID number and the approximate charge required (provided by the car’s on board
189 computer). The utility schedules the recharge to take place during the evening hours and at different
190 times than other EV charging (thus putting diversity into the load).

191 The billing department now calculates the amount of money to charge the EV customer based on EV
192 rates and for the measured time period.

193 The same EV customer drives to a friend’s home (who also has an EV) and requests a quick charge to
194 make sure that he can get back home. When he plugs his EV into his friend’s EV charger, the utility
195 identifies the fact that the EV belongs to a different customer and places the charging bill on the correct
196 person’s invoice.

197 The billing department now calculates the amount of money to invoice the customer who owns the EV,
198 based on EV rates and for the measured time period.

Task #2: Use Case Inventory

199

200 **Objective** Provide an inventory of the capabilities, applications and policy environment under review
201 at the level of granularity appropriate for the analysis covered by the PMRM and define a
202 High Level Use Case which will guide subsequent analysis. In order to facilitate the
203 analysis described in the Detailed Privacy Use Case Analysis in Section 4, the
204 components of the Use Case Inventory should align as closely as possible with the
205 components that will be analyzed in the corresponding detailed use case analysis.

206 **Context** The inventory can include applications and business processes; products; policy
207 environment; legal and regulatory jurisdictions; systems supporting the capabilities and
208 applications; data; time; and other factors impacting the collection, communication,

209 processing, storage and disposition of PI. The inventory should also include the types of
210 data subjects covered by the use case together with individual user privacy options (such
211 as policy preferences, privacy settings, etc. if these are formally expressed).

212 **Example**

213 Systems: Utility Communications Network, Customer Billing System, EV On Board System...

214 Legal and Regulatory Jurisdictions:

215 California Constitution, Article 1, section 1 gives each citizen an "inalienable right" to
216 pursue and obtain "privacy."

217 Office of Privacy Protection - California Government Code section 11549.5.

218 Automobile "Black Boxes" - Vehicle Code section 9951.

219 ...

220 Personal Information Collected on Internet:

221 Government Code section 11015.5. This law applies to state government agencies...

222 The California Public Utilities Commission, which "serves the public interest by protecting
223 consumers and ensuring the provision of safe, reliable utility service and infrastructure at
224 reasonable rates, with a commitment to environmental enhancement and a healthy
225 California economy"...

226 Policy: The Utility has a published Privacy Policy covering the EV recharging/billing application

227
228 Customer: The Data Subject can accept default settings for all customer-facing interfaces or
229 customize the settings.

230 **2.2 Applicable Privacy Policies**

231 **Task #3: Privacy Policy Conformance Criteria**

232 **Objective** Define and describe the criteria for conformance of a system or business process
233 (identified in the use case and inventory) with an applicable privacy policy. As with the
234 Use Case Inventory described in Task # 2 above, the conformance criteria should align
235 with the equivalent elements in the Detailed Privacy Use Case Analysis described in
236 Section 3. Wherever possible, they should be grouped by the relevant FIP/Ps and
237 expressed as privacy constraints.

238 Note that whereas Task #2 itemizes the environmental elements relevant to the Use Case, Task #3
239 focuses on the privacy requirements specifically.

240 **Example**

241 Privacy Policy Conformance Criteria:

242 (1) Ensure that the utility does not share data with third parties without the consumer's consent...etc.

243 (2) Ensure that the utility supports strong levels of:

244 (a) Identity authentication

245 (b) Security of transmission between the charging stations and the utility information systems...etc.

246 (3) Ensure that personal data is deleted on expiration of retention periods...

247 ...

248 **2.3 Initial Privacy Impact (or other) Assessment(s) [optional]**

249 **Task #4: Assessment Preparation**

250 **Objective** Prepare an initial privacy impact assessment, or as appropriate, a risk assessment,
251 privacy maturity assessment, compliance review, or accountability model assessment
252 applicable within the scope of analysis carried out in steps 2.1 and 0. Such an
253 assessment can be deferred until a later iteration step (see Section 4.3) or inherited from
254 a previous exercise.

255 **Example**

256 Since the Electric Vehicle (EV) has a unique ID, it can be linked to an individual. Individuals'
257 whereabouts may be tracked through utility transaction visibility...

258 The EV charging and vehicle management system may retain data which can be used to identify
259 patterns of charging and location information that can constitute PI.

260 Unless safeguards are in place and (where appropriate) under the user's control, there is a danger that
261 intentionally anonymized PI nonetheless become PII...

262 The utility wishes to capture behavioral and movement patterns and sell this information to potential
263 advertisers or other information brokers to generate additional revenue. This information constitutes PII.
264 The collection and use of this information should only be done with the explicit, informed consent of the
265 user.

266 3 Detailed Privacy Use Case Analysis

267 3.1 Use Case Development

268 **Goal** Prepare and document a detailed Privacy Management Analysis of the Use Case which
269 corresponds with the High Level Privacy Analysis and the High Level Use Case
270 Description.

271 **Constraint** The Detailed Use Case must be clearly bounded and must include the following
272 components.

273 **Task #5: Identify Actors**

274 **Objective** Identify actors having operational privacy responsibilities.

275 **Definition** An actor is a data subject or a human or a non-human agent interacting with PI managed
276 by a System within a Privacy Domain.

277 A “domain” covers both physical areas (such as a customer site or home) and logical
278 areas (such as a wide-area network or cloud computing environment) that are subject to
279 the control of a particular domain owner.

280 **Example**

281 *Actors Located at the Customer Site:*

282 Customer, Guest

283 *Actors Located at the EV's Location:*

284 Non-Customer Host (Temporary host for EV charging)

285 *Actors Located within the Utility's domain:*

286 Service Provider (Utility)

287 Contractors and Suppliers to the Utility

288 **Task #6: Identify Systems**

289 **Objective** Identify the Systems where PI is collected, communicated, processed, stored or disposed
290 within a Privacy Domain.

291 **Definition** For purposes of this specification, a System is a collection of components organized to
292 accomplish a specific function or set of functions having a relationship to operational
293 privacy management.

307
308
309

Example

Located at the Customer Site:

- Customer Communication Portal
- EV Physical Re-Charging and Metering System

Located in the EV:

- EV: Device
- EV On-Board System: System

Located within the EV manufacturer's domain:

- EV Charging Data Storage and Analysis System

Located within the Utility's domain:

- EV Program Information System (includes Rates, Customer Charge Orders, Customers enrolled in the program, Usage Info etc.)
- EV Load Scheduler System
- Utility Billing System
- Remote Charge Monitoring System
- Partner marketing system for transferring usage pattern and location information

310 **Task #7: Identify Privacy Domains and Owners**

- 311 **Objective** Identify the Privacy Domains included in the use case together with the respective
312 Domain Owners.
- 313 **Definition** Privacy Domains are the physical or logical areas within the use case subject to control
314 by Domain Owners.
- 315 Domain Owners are entities responsible for ensuring that privacy controls and PMRM
316 services are managed in business processes and technical systems within a given
317 Domain.
- 318 **Context** Privacy Domains may be under the control of individuals or data subjects; data
319 controllers; capability providers; data processors; and other distinct entities having
320 defined operational privacy management responsibilities.
- 321 **Rationale** Domain Owner identification is important for purposes of establishing accountability.

334
335
336
337

Example

Utility Domain:

The physical premises located at... which includes the Utility's program information system, load scheduling system, billing system, and remote monitoring system

This physical location is part of a larger logical privacy domain, owned by the Utility and extends to the Customer Portal Communication system at the Customer's site, and the EV On-Board software application System installed in the EV by the Utility, together with cloud-based services hosted by.....

Customer Domain:

The physical extent of the customer's home and adjacent land as well as the EV, wherever located, together with the logical area covered by devices under the ownership and control of the customer (such as mobile devices).

Example

The EV On-Board System belongs to the utility Privacy Domain Owner.

The EV (with its ID Number) belongs to the Customer Domain Owner and the Vehicle Manufacturer Domain Owners, but the EV ID may be accessed by the Utility.

338 **Task #8: Identify roles and responsibilities within a domain**

339 **Objective** For any given use case, identify the roles and responsibilities assigned to specific actors
340 within a specific privacy domain

341 **Rationale** Any individual or position may carry multiple roles and responsibilities and these need to
342 be distinguishable, particularly as many functions involved in processing of PI are
343 assigned to a person or other actor, according to explicit roles and authority to act, rather
344 to a person or actor as such.

Example

345 **Role:** EV Manufacturer Privacy Officer

346 **Responsibilities:** Ensure that all PI data flows from EV On-Board System conform both with
347 contractual obligations towards the Utility as well as the Collection Limitation and
348 Information Minimization FIP/P.
349

350 **Task #9: Identify Touch Points**

351 **Objective** Identify the touch points at which the data flows intersect with Privacy Domains or
352 Systems within Privacy Domains.

353 **Definition** Touch Points are the intersections of data flows with Privacy Domains or Systems within
354 Privacy Domains.

355 **Rationale** The main purpose for identifying touch points in the use case is to clarify the data flows
356 and ensure a complete picture of all Privacy Domains and Systems in which PI is used.

357
358
359
360
361
362
363

Example

The Communication Interfaces whereby actors send and receive data are touch points. For instance the Customer Communication Portal provides an interface via which the Customer communicates a charge order to the Utility.

When the customer plugs into the charging station, the EV On-Board System also embeds communication functionality that acts as its touch point to send EV ID and EV Charge Requirements to the Customer Communication Portal

364 **Task #10: Identify Data Flows**

365 **Objective** Identify the data flows carrying PI and privacy constraints among Domains in the Use
366 Case.

367 **Constraint** Data flows may be multidirectional or unidirectional.

368
369
370
371
372
373
374

Example

When a charging request event occurs, the Customer Communication Portal sends Customer information, EV identification, and Customer Communication Portal location information to the EV Program Information System managed by the Utility.

This application uses metadata tags to indicate whether or not customer' identification and location data may be shared (and then, only with authorized third parties), and prohibits the sharing of data that provides customers' movement history, if derived from an aggregation of transactions.

375 **3.2 Identify PI in Use Case Privacy Domains and Systems**

376 **Objective** Specify the PI collected, created, communicated, processed or stored within Privacy
377 Domains or Systems in three categories.

378 **Incoming PI**

379 **Definition** Incoming PI is PI flowing into a Privacy Domain, or a system within a Privacy Domain.

380 **Constraint** Incoming PI may be defined at whatever level of granularity appropriate for the scope of
381 analysis of the Use Case and the Privacy Policies established in Section 2.

382 **Internally Generated PI**

383 **Definition** Internally Generated PI is PI created within the Privacy Domain or System itself.

384 **Constraint** Internally Generated PI may be defined at whatever level of granularity appropriate for
385 the scope of analysis of the Use Case and the Privacy Policies established in Section 2.

386 **Example** Examples include device information, time-stamps, location information, and other
387 system-generated data that may be linked to an identity.

388 **Outgoing PI**

389 **Definition** Outgoing PI is PI flowing out of one system to another system within a Privacy Doman or
390 to another Privacy Domain.

391 **Constraint** Outgoing PI may be defined at whatever level of granularity appropriate for the scope of
392 analysis of the Use Case and the Privacy Policies established in Section 2.

393 **Task #11: Identify Incoming/Internally Generated/Outgoing PI**

394 **Example**

395 *Incoming PI:*

396 Customer ID received by Customer Communications Portal

397 *Internally Generated PI:*

398 Current EV location logged by EV On-Board system

399 *Outgoing PI:*

400 Current EV location transmitted to Utility Load Scheduler System

401 **3.3 Specify Required Privacy Controls**

402 **Goal** For Incoming, Internally Generated and Outgoing PI, specify the privacy controls required
403 to enforce the privacy policy associated with the PI. Privacy controls may be pre-defined
404 or may be derived. In either case, privacy controls are typically associated with specific
405 Fair Information Practices Principles (FIP/PIs) that apply to the PI.

406 **Definition** Control is a process designed to provide reasonable assurance regarding the
407 achievement of stated objectives.

408 **Definition** Privacy Controls are administrative, technical and physical safeguards employed within
409 an organization in order to protect PI. They are the means by which privacy policies are
410 satisfied in an operational setting.

411 **Task #12: Specify Inherited Privacy Controls**

412 **Objective** Specify the required Privacy Controls which are inherited from Privacy Domains or
413 Systems within Privacy Domains.

414 **Example:**

415 The utility inherits a Privacy Control associated with the Electric Vehicle's ID (EVID) from the vehicle
416 manufacturer's privacy policies.

417 The utility inherits the consumer's Operational Privacy Control Requirements, expressed as privacy
418 preferences, via a link with the customer communications portal when she plugs her EV into friend
419 Rick's charging station. The utility must apply Jane's privacy preferences to the current transaction.

420 The Utility accesses Jane's privacy preferences and learns that Jane does not want her association
421 with Rick exported to the Utility's third party partners. Even though Rick's privacy settings differ around
422 his PI, Jane's non-consent to the association being transmitted out of the Utility's privacy domain is
423 sufficient to prevent commutative association. Thus if Rick were to charge his car's batteries at Jane's,
424 the association between them would also not be shared with third parties.

425

426 **Task #13: Specify Internal Privacy Controls**

427 **Objective** Specify the Privacy Controls which are mandated by internal Privacy Domain policies.

428 **Example**

429 **Use Limitation Internal Privacy Controls**

430 The Utility complies with California Code SB 1476 of 2010 (Public Utilities Code §§ 8380-8381 Use
431 Limitation).

432 It implements the 2011 California Public Utility Commission (CPUC) privacy rules, recognizing the
433 CPUC's regulatory privacy jurisdiction over it and third parties with which it shares customer data.

434 Further, it adopts NIST 800-53 Appendix J's "Control Family" on Use Limitation – e.g. it evaluates any
435 proposed new instances of sharing PII with third parties to assess whether they are authorized and
436 whether additional or new public notice is required.

437 **Task #14: Specify Exported Privacy Controls**

438 **Objective** Specify the Privacy Controls which must be exported to other Privacy Domains or to
439 Systems within Privacy Domains.

440 **Example**

441 The Utility exports Jane's privacy preferences associated with her PI to its third party partner. One of
442 her privacy control requirements is to not share her EVID with marketing aggregators or advertisers.

4 Services Supporting Privacy Controls

Privacy controls are usually stated in the form of a policy declaration or requirement and not in a way that is immediately actionable or implementable. “Services” provide the bridge between those requirements and a privacy management implementation by providing privacy constraints on system-level actions governing the flow of PI between touch points.

4.1 Services Needed to Implement the Controls

A set of operational Services is the organizing structure which will be used to link the required Privacy Controls specified in Section 4.3 to operational mechanisms necessary to implement those requirements.

Eight Privacy Services have been identified, based on the mandate to support an arbitrary set of privacy policies, but at a *functional level*. The eight Services can be logically grouped into three categories:

- **Core Policy:** Agreement, Usage
- **Privacy Assurance:** Security, Validation, Certification, Enforcement
- **Presentation and Lifecycle:** Interaction, Access

These groupings, illustrated below, are meant to clarify the “architectural” relationship of the Services in an operational design. However, the functions provided by all Services are available for mutual interaction without restriction.

| Core Policy Services | Privacy Assurance Services | | Presentation & Lifecycle Services |
|-----------------------------|-----------------------------------|---------------|--|
| Agreement | Validation | Certification | Interaction |
| Usage | Security | Enforcement | Access |

A system architect or technical manager should be able to integrate these privacy Services into a functional architecture, with specific mechanisms selected to implement these functions. In fact, a key purpose of the PMRM is to stimulate design and analysis of the specific functions - both manual and automated - that are needed to implement any set of privacy policies. In that sense, the PMRM is an analytic tool.

The PMRM identifies various system capabilities that are not typically described in privacy practices and principles. For example, a policy management (or “usage and control”) function is essential to manage the PI usage constraints established by the individual, information collector or regulation, but such a function is not explicitly named in privacy principles/practices. Likewise, interfaces (and agents) are not explicit in the privacy principles/practices, but are necessary to represent other essential operational capabilities.

Such inferred capabilities are necessary if information systems are to be made “privacy configurable and compliant.” Without them, enforcing privacy policies in a distributed, fully automated environment will not be possible, and businesses, individuals, and regulators will be burdened with inefficient and error-prone manual processing, inadequate privacy governance and compliance controls, and inadequate compliance reporting.

A “Service”, as used here, is defined as a collection of related functions and mechanisms that operate for a specified purpose. The eight privacy Services defined are **Agreement, Usage, Security, Validation,**

480 **Certification, Enforcement, Interaction, and Access.** Specific operational behavior of these Services is
 481 governed by the privacy policy and constraints that are configured in a particular implementation and
 482 jurisdictional context. These will be identified as part of the Use Case analysis. Practice with use cases
 483 has shown that the Services listed above can, together, operationally encompass any arbitrary set of
 484 privacy requirements.

485 The functions of one Service may invoke another Service. In other words, functions under one Service
 486 may “call” those under another Service (for example, pass information to a new function for subsequent
 487 action). In line with principles of Service-Oriented Architecture (SOA)², the Services can thus interact in
 488 an arbitrary interconnected sequence to accomplish a privacy management task or set of privacy lifecycle
 489 requirements. Use cases will illustrate such interactions and their sequencing as the PMRM is used to
 490 solve a particular privacy problem. By examining and by solving multiple use cases, the PMRM can be
 491 tested for applicability and robustness.

492 The table below provides a description of each Service’s functionality and an informal definition of each
 493 Service:

| SERVICE | FUNCTIONALITY | PURPOSE |
|----------------------|---|---|
| AGREEMENT | Define and document permissions and rules for the handling of PI based on applicable policies, individual preferences, and other relevant factors; provide relevant Actors with a mechanism to negotiate or establish new permissions and rules; express the agreements for use by other Services | Manage and negotiate permissions and rules |
| USAGE | Ensure that the use of PI complies with the terms of any applicable permission, policy, law or regulation, including PI subjected to information minimization, linking, integration, inference, transfer, derivation, aggregation, and anonymization over the lifecycle of the use case | Control PI use |
| VALIDATION | Evaluate and ensure the information quality of PI in terms of Accuracy, Completeness, Relevance, Timeliness and other relevant qualitative factors | Check PI |
| CERTIFICATION | Ensure that the credentials of any Actor, Domain, System , or system component are compatible with their assigned roles in processing PI; verify compliance and trustworthiness of that Actor, Domain, System or system component against defined policies and assigned roles. | Check credentials |
| ENFORCEMENT | Initiate response actions, policy execution, and recourse when audit controls and monitoring indicate that an Actor or System does not conform to defined policies or the terms of a permission (agreement) | Monitor and respond to audited exception conditions |
| SECURITY | Provide the procedural and technical mechanisms necessary to ensure the confidentiality, integrity, and availability of personal information; make possible the trustworthy processing, communication, storage and disposition of privacy operations | Safeguard privacy information and operations |
| INTERACTION | Provide generalized interfaces necessary for presentation, communication, and interaction of PI and relevant information associated with PI; encompasses functionality such as user interfaces, system-to-system information exchanges, and agents | Information presentation and communication |
| ACCESS | Enable data-subject Actors, as required and/or allowed by permission, policy, or regulation, to review their PI that is held within a Domain and propose changes and/or corrections to their PI | View and propose changes to stored PI |

494

² See for example the [SOA-RM]

495 4.2 Service Details and Function Descriptions

496 4.2.1 Core Policy Services

497 1. Agreement Service

- 498 • Define and document permissions and rules for the handling of PI based on applicable policies,
499 individual preferences, and other relevant factors.
- 500 • Provide relevant Actors with a mechanism to negotiate or establish new permissions and rules.
- 501 • Express the agreements for use by other Services.

502 Example

503 As part of its standard customer service agreement, a bank requests selected customer PI, with
504 associated permissions for use. Customer negotiates with the bank to modify the permissions.
505 Customer provides the PI to the bank, with the modified and agreed to permissions. This agreement is
506 signed by both parties, stored in an appropriate representation and the customer is provided a copy.

507 2. Usage Service

- 508 • Ensure that the use of PI complies with the terms of any applicable permission, policy, law or
509 regulation,
- 510 • Including PI subjected to information minimization, linking, integration, inference, transfer,
511 derivation, aggregation, and anonymization,
- 512 • Over the lifecycle of the use case.

513 Example

514 A third party has acquired individual PI, consistent with agreed permissions for use. Before using the PI,
515 the third party has implemented functionality ensuring that the usage of the PI is consistent with the
516 permissions.

517 4.2.2 Privacy Assurance Services

518 3. Validation Service

- 519 • Evaluate and ensure the information quality of PI in terms of Accuracy, Completeness,
520 Relevance, Timeliness and other relevant qualitative factors.

521 Example

522 PI is received from an authorized third party for a particular purpose. The PI is checked to ensure it is
523 sufficiently current for use.

524 4. Certification Service

- 525 • Ensure that the credentials of any Actor, Domain, System, or system component are compatible
526 with their assigned roles in processing PI;
- 527 • Verify that an Actor, Domain, System, or system component supports defined policies and
528 conforms with assigned roles.

529
530
531
532

Example

A patient enters an emergency room, presenting identifying credentials. Functionality has been implemented which enables hospital personnel to check those credentials against their prior-patient database. Hospital personnel invoke the certification service's authentication processes.

533

5. Enforcement Service

534
535
536

- Initiate response actions, policy execution, and recourse when audit controls and monitoring indicate that an Actor or System does not conform to defined laws, regulations, policies or the terms of a permission (agreement).

537

Example

A magazine's subscription service provider forwards customer PI to a third party not authorized to receive the information. A routine audit of the service provider's system reveals this unauthorized disclosure practice, alerting the appropriate responsible official person (the organization's privacy officer) who takes appropriate action.

542

6. Security Service

543
544
545
546

- Make possible the trustworthy processing, communication, storage and disposition of privacy operations;
- Provide the procedural and technical mechanisms necessary to ensure the confidentiality, integrity, and availability of personal information.

547

Example

PI is transferred between authorized recipients, using transmission encryption, to ensure confidentiality. Strong identity and authorization management systems are implemented to conform to data confidentiality policies.

551

4.2.3 Presentation and Lifecycle Services

552

7. Interaction Service

553
554
555
556

- Provide generalized interfaces necessary for presentation, communication, and interaction of PI and relevant information associated with PI;
- Encompasses functionality such as user interfaces, system-to-system information exchanges, and agents.

557

Example:

Your home banking application uses a graphical user interface (GUI) to communicate with you, including presenting any relevant privacy Notices.

560

8. Access Service

561
562

- Enable data-subjects, as required and/or allowed by permission, policy, or regulation, to review their PI held within a Domain and propose changes and/or corrections to it.

563

Example:

A national credit bureau has implemented an online service enabling individuals to request their credit score details and to report discrepancies in their credit histories.

566

567 **4.3 Services satisfying the privacy controls**

568 The Services defined in Section 4.1 encompass detailed Functions and Mechanisms needed to transform
569 the privacy controls of section 3.3 into an operational system design for the use case. Since the detailed
570 use case analysis focused on the data flows – incoming, internally generated, outgoing – between
571 Systems (and Actors), the Service selections should be on the same granular basis.

572 **Task #15: Identify the Services that conform to the identified privacy controls.**

573 Perform this task for each data flow exchange of PI between systems.

574 This detailed conversion into Service operations can then be synthesized into consolidated sets of
575 Service actions per System involved in the Use Case.

576 On further iteration and refinement, the engaged Services can be further delineated by the appropriate
577 Functions and Mechanisms for the relevant privacy controls.

578 **Examples:**

579 Based upon

580 **a) Internally Generated PI** (Current EV location logged by EV On-Board system), and

581 **b) Outgoing PI** (Current EV location transmitted to Utility Load Scheduler System),

582 convert to operational Services as follows:

583 **“Log EV location”:**

584 **Validation** EV On-Board System checks that location is not previously rejected by EV owner

585 **Enforcement** If location is previously rejected, then notify the Owner and/or the Utility

586 **Interaction** Communicate EV Location to EV On-Board System

587 **Usage** EV On-Board System records EV Location in secure storage, together with agreements

588 **“Transmit EV Location to Utility Load Scheduler System (ULSS)”:**

589 **Interaction** Communication established between EV Location and ULSS

590 **Security** Authenticate the ULSS site; secure the transmission

591 **Certification** ULSS checks the credentials of the EV On-Board System

592 **Validation** Validate the EV Location against accepted locations

593 **Usage** ULSS records the EV Location, together with agreements

594 **4.4 Define the Technical Functionality and Business Processes**
595 **Supporting the Selected Services**

596 Each Service is composed of a set of operational Functions, reflected in defined business processes and
597 technical solutions.

598 The **Functions** step is critical because it necessitates either designating the particular business process
599 or technical mechanism being implemented to support the Services required in the use case or the
600 absence of such a business process or technical mechanism.

601 **4.4.1 Functions Satisfying the Selected Services**

602 Up to this point in the PMRM methodology, the primary focus of the use case analysis has been on the
603 “what” - PI, policies, control requirements, the Services needed to manage privacy. Here the PMRM
604 requires a statement of the “how” – what business processes and technical mechanisms are identified as
605 providing expected functionality.

606 **Task #16: Identify the Functions that satisfy the selected Services**

607 **Examples**

608 “Log EV Location” (uses services **Validation, Enforcement, Interaction, and Usage Services**):

609 **Function:** Encrypt the EV Location and Agreements and store in on-board solid-state drive

610 “Transmit EV Location to Utility Load Scheduler System (ULSS)” (uses **Interaction, Security,**
611 **Certification, Validation, and Usage Services**):

612 **Function:** Establish a TLS/SSL communication between EV Location and ULSS, which includes
613 mechanisms for authentication of the source/destination

614 **4.5 Risk Assessment**

615 **Task #17: Conduct Risk Assessment**

616 **Objective** Once the requirements in the Use Case have been converted into operational Services,
617 an overall risk assessment should be performed from that operational perspective

618 **Constraint** Additional controls may be necessary to mitigate risks within Services. The level of
619 granularity is determined by the Use Case scope. Provide operational risk assessments
620 for the selected Services within the use case.

621 **Examples**

622 “Log EV location”:

623 **Validation** EV On-Board System checks that location is not previously rejected by EV owner
624 **Risk:** On-board System has been corrupted

625 **Enforcement** If location is previously rejected, then notify the Owner and/or the Utility
626 **Risk:** On-board System not current

627 **Interaction** Communicate EV Location to EV On-Board System
628 **Risk:** Communication link not available

629 **Usage** EV On-Board System records EV Location in secure storage, together with agreements
630 **Risk:** Security controls for On-Board System are compromised

631 “Transmit EV Location to Utility Load Scheduler System (ULSS)”:

632 **Interaction** Communication established between EV Location and ULSS
633 **Risk:** Communication link down

634 **Security** Authenticate the ULSS site; secure the transmission
635 **Risk:** ULSS site credentials are not current

636 **Certification** ULSS checks the credentials of the EV On-Board System
637 **Risk:** EV On-Board System credentials do not check

638 **Validation** Validate the EV Location against accepted locations
639 **Risk:** Accepted locations are back-level

640 **Usage** ULSS records the EV Location, together with agreements
641 **Risk:** Security controls for the ULSS are compromised

642

643 **4.6 Iterative Process**

644 **Goal** A 'first pass' through the Tasks above could be used to identify the scope of the Use
645 Case and the underlying privacy policies and constraints. Additional iterative passes
646 would serve to refine the Use Case and to add detail. Later passes could serve to resolve
647 "TBD" sections that were not previously well-understood.

648 **Task #18: Iterate the analysis and refine.**

649 Iterate the analysis in the previous sections, seeking further refinement and detail.

650 5 PMRM Glossary, plus Operational Definitions for 651 Fair Information Practices/Principles (“FIPPs”)

652 As explained in the introduction, every specialized domain is likely to create and use a domain-specific
653 vocabulary of concepts and terms that should be used and understood in the specific context of that
654 domain. PMRM is no different and this section contains such terms.

655 In addition, a number of “operational definitions” are intended to be used in the PMRM to support
656 development of the “Detailed Privacy Use Case Analysis” described in Section 4. Their use is completely
657 optional, but may be helpful in organizing privacy policies and controls where there are inconsistencies in
658 definitions across policy boundaries or where existing definitions do not adequately express the
659 operational characteristics associated with Fair Information Practices/Principles.

660 5.1 Operational FIPPs

661 The following 14 Fair Information Practices/Principles are composite definitions derived from a
662 comprehensive list of international legislative instruments. These operational FIPPs can serve as a
663 sample set, as needed.

664 **Accountability**

665 Functionality enabling reporting by the business process and technical systems which implement
666 privacy policies, to the individual or entity accountable for ensuring compliance with those policies,
667 with optional linkages to redress and sanctions.

668 **Notice**

669 Functionality providing Information, in the context of a specified use, regarding an entity’s privacy
670 policies and practices including: definition of the Personal Information collected; its use (purpose
671 specification); its disclosure to parties within or external to the entity; practices associated with the
672 maintenance and protection of the information; options available to the individual regarding the
673 collector’s privacy practices; retention and deletion; changes made to policies or practices; and other
674 information provided to the individual at designated times and under designated circumstances.

675 **Consent**

676 Functionality, including support for Sensitive Information, Informed Consent, Change of Use Consent,
677 and Consequences of Consent Denial, enabling individuals to agree to allow the collection and/or
678 specific uses of some or all of their Personal Information either through an affirmative process (opt-in)
679 or implied (not choosing to opt-out when this option is provided).

680 **Collection Limitation and Information Minimization**

681 Functionality exercised by the information collector or information user to limit the information
682 collected, processed, communicated and stored to the minimum necessary to achieve a stated
683 purpose and, when required, demonstrably collected by fair and lawful means.

684 **Use Limitation**

685 Functionality exercised by the information collector or information user to ensure that Personal
686 Information will not be used for purposes other than those specified and accepted by the individual or
687 provided by law, and not maintained longer than necessary for the stated purposes.

688 **Disclosure**

689 Functionality enabling the release, transfer, provision of access to, use for new purposes, or divulging
690 in any other manner, Personal Information held by an entity in accordance with notice and consent
691 permissions and/or applicable laws and functionality making known the information collectors policies
692 to external parties receiving the information.

- 693 **Access and Correction**
- 694 Functionality allowing individuals having adequate proof of identity to discover from an entity, or
695 discover and/or correct or delete, their Personal Information, at specified costs and within specified
696 time constraints; and functionality providing notice of denial of access and options for challenging
697 denial when specified.
- 698 **Security/Safeguards**
- 699 Functionality that ensures the confidentiality, availability and integrity of Personal Information
700 collected, used, communicated, maintained, and stored; and that ensures specified Personal
701 Information will be de-identified and/or destroyed as required.
- 702 **Information Quality**
- 703 Functionality that ensures that information collected and used is adequate for purpose, relevant for
704 purpose, accurate at time of use, and, where specified, kept up to date, corrected or destroyed.
- 705 **Enforcement**
- 706 Functionality ensuring compliance with privacy policies, agreements and legal requirements and to
707 give individuals a means of filing complaints of compliance violations and having them addressed,
708 including recourse for violations of law, agreements and policies.
- 709 **Openness**
- 710 Functionality making availability to individuals the information collector's or information user's policies
711 and practices relating to their management of Personal Information and for establishing the existence
712 of, nature and purpose of use of Personal Information held about the individuals.
- 713 **Anonymity**
- 714 Functionality which renders personal information anonymous so that an individual is no longer
715 identifiable.
- 716 **Information Flow**
- 717 Functionality enabling the communication of personal information across geo-political jurisdictions by
718 private or public entities involved in governmental, economic, social or other activities.
- 719 **Sensitivity**
- 720 Functionality that provides special handling, processing, security treatment or other treatment of
721 specified information, as defined by law, regulation or policy.
- 722 **5.2 Glossary**
- 723 **Actor**
- 724 A data subject or a human or a non-human agent or (sub)system interacting with PI within Privacy
725 Domain or System.
- 726 **Boundary Object**
- 727 A sociological construct that supports productive interaction and collaboration among multiple
728 communities
- 729 **Control**
- 730 A process designed to provide reasonable assurance regarding the achievement of stated objectives.
- 731 **Domain Owner**
- 732 An entity having responsibility for ensuring that privacy controls and privacy constraints are
733 implemented and managed in business processes and technical systems in accordance with policy
734 and requirements.
- 735 **Incoming PI**
- 736 PI flowing into a Privacy Domain, or a system within a Privacy Domain.

- 737 **Internally Generated PI**
- 738 PI created within the Privacy Domain or System itself.
- 739 **Outgoing PI**
- 740 PI flowing out of one system to another system within a Privacy Domain or to another Privacy Domain.
- 741 **PI**
- 742 Personal Information – any data which describes some attribute of, or that is uniquely associated
- 743 with, an individual.
- 744 **PII**
- 745 Personally identifiable information – any (set of) data that can be used to distinguish or trace an
- 746 individual's identity.
- 747 **Privacy Constraint**
- 748 An operational mechanism that controls the extent to which PII may flow between touch points.
- 749 **Privacy Control**
- 750 An administrative, technical or physical safeguard employed within an organization in order to protect
- 751 PII.
- 752 **Privacy Domain**
- 753 A physical or logical area within the use case subject to control by Domain Owner(s)
- 754 **Privacy Management**
- 755 The collection of policies, processes and methods used to protect and manage PI.
- 756 **Privacy Management Reference Model and Methodology (PMRM)**
- 757 A model and methodology for understanding and analyzing privacy policies and their management
- 758 requirements in defined use cases; and for selecting the technical services which must be
- 759 implemented to support privacy controls.
- 760 **(PMRM) Service**
- 761 A collection of related functions and mechanisms that operate for a specified purpose.
- 762 **System**
- 763 A collection of components organized to accomplish a specific function or set of functions having a
- 764 relationship to operational privacy management.
- 765 **Touch Point**
- 766 The intersection of data flows with Privacy Domains or Systems within Privacy Domains.

767 **Appendix A. Acknowledgments**

768 The following individuals have participated in the creation of this specification and are gratefully
769 acknowledged:

770 **Participants:**

771 Peter F Brown, Individual Member
