Why isn’t HTTP enough?

- The HTTP standard revolutionized how people consume data
  - A single simple model: Send a request, read the response
  - Available via any tablet, laptop, phone, PC etc.
- The Internet of Things has fundamentally different challenges
  - HTTP remains ideal for requesting data from a known source
  - We also need an event-oriented paradigm:
    - Emitting information *one to many*
    - Listening for events *whenever they happen*
    - Distributing minimal packets of data in *huge volumes*
    - *Pushing* information over *unreliable networks*
Additional comms challenges for Mobile and M2M apps

- Volume (cost) of data being transmitted (especially in M2M with limited data plans)
- Power consumption (battery powered devices)
- Responsiveness (near-real time delivery of information)
- Reliable delivery over fragile connections
- Security and privacy
- Scalability
MQTT in a Nutshell

- MQTT == MQ Telemetry Transport
- In a nutshell

“A light weight event and message oriented protocol allowing devices to asynchronously communicate efficiently across constrained networks to remote systems”
The Realm of MQTT

- Intelligence and Analytics
- Traditional Backend Systems
- Big Data
- Interconnect
- Visualise and Respond
- Sense and Control
- Mobile
- Embedded Controllers
- Sensors
- Actuators
- Edge Gateways
- Web
- M2M
Background to MQTT / Original Design Goals

- To make it simple to connect the M2M (physical) world to the traditional IT world
- Expect and cater for frequent network disruption – built for *low bandwidth, high latency, unreliable, high cost* networks (cost per byte)
- Expect that client applications may have very limited resources available (8 bit controller, 256kb ram)
- Provide loose coupling to support dynamic system environments where high volumes of physical world messages and events need to be made available to enterprise servers and other consumers in ways that may not have been originally anticipated.
- Provide multiple deterministic message delivery qualities of service to reflect tradeoffs between bandwidth, availability, and delivery guarantees
- Capable of supporting large numbers of devices (10k MQTT clients)
- Simple for application developers and implementers of the protocol
- Publish the protocol for ease of adoption by device vendors and third-party client software enabling support for a proliferation of platforms, technologies and networks that are driven by very diverse equations of cost, technology and physical constraints.
- To be industry agnostic
A Publish Subscribe messaging protocol allowing a message to be published once and multiple consumers (applications / devices) to receive the message providing decoupling between the producer and consumer(s)

A producer sends (publishes) a message (publication) on a topic (subject)
A consumer subscribes (makes a subscription) for messages on a topic (subject)

A message server / broker matches publications to subscriptions
• If no matches the message is discarded
• If one or more matches the message is delivered to each matching subscriber/consumer
MQTT - Publish Subscribe Messaging aka One to Many

- A topic forms the namespace
  - Is hierarchical with each “sub topic” separated by a /
  - An example topic space
    - A house publishes information about itself on:
      - <country>/<region>/<town>/<postcode>/<house>/energyConsumption
      - <country>/<region>/<town>/<postcode>/<house>/solarEnergy
      - <country>/<region>/<town>/<postcode>/<house>/alarmState
    - And subscribes for control commands:
      - <country>/<region>/<town>/<postcode>/<house>/thermostat/setTemp

- A subscriber can subscribe to an absolute topic or can use wildcards:
  - Single-level wildcards “+” can appear anywhere in the topic string
  - Multi-level wildcards “#” must appear at the end of the string
  - Wildcards must be next to a separator
  - Cannot use wildcards when publishing

- For example
  - UK/Hants/Hursley/SO212JN/1/energyConsumption
    - Energy consumption for 1 house in Hursley
  - UK/Hants/Hursley/+/+/energyConsumption
    - Energy consumption for all houses in Hursley
  - UK/Hants/Hursley/SO212JN/#
    - Details of energy consumption, solar and alarm for all houses in SO212JN
A subscription can be durable or non-durable
- Durable:
  - Once a subscription is in place, a broker will forward matching messages to the subscriber:
    - Immediately if the subscriber is connected
    - If the subscriber is not connected, messages are stored on the server/broker until the next time the subscriber connects
- Non-durable: The subscription lifetime is the same as the time the subscriber is connected to the server/broker

A publication may be retained
- A publisher can mark a publication as retained
- The broker/server remembers the last known good message of a retained topic
- The broker/server gives the last known good message to new subscribers
  - i.e. the new subscriber does not have to wait for a publisher to publish a message in order to receive its first message
Use on Constrained Networks

- Designed for constrained networks:
  - Protocol compressed into bit-wise headers and variable length fields.
  - Smallest possible packet size is 2 bytes
  - Asynchronous bidirectional "push" delivery of messages to applications (no polling)
    - Client to server and server to client
  - Supports always-connected and sometimes-connected models
  - Provides Session awareness
    - Configurable keep alive providing granular session awareness
    - "Last will and testament" enable applications to know when a client goes offline abnormally
  - Typically utilises TCP based networks e.g. Webscokets
  - Tested on many networks – vsat, gprs, 2G....

- Provides multiple deterministic message delivery qualities of service
  - 0 – message delivered at most once.
  - 1 – message will be delivered but may be duplicated
  - 2 – once and once only delivery
  - QOS maintained over fragile network even if connection breaks
Constrained Device

• Designed for constrained devices:
  – Suited to applications / devices that may have limited resources available
    • 8 Bit controllers upwards
    • Battery
  – Multiple MQTT client implementations available in many form factors / languages
    • Tiny footprint MQTT client (and server) libraries e.g. a c client lib in 30Kb and a Java lib in 64Kb
Open and Easy to use

- The MQTT specification is open and royalty free for ease of adoption

- Is industry agnostic
  - Move a payload / data / event for any form of data

- Many implementations from enterprise scale fully supported through open source and hobbyist
  - See http://mqtt.org for full details

- API is simple to use via small set of well defined verbs
Open and Easy to use

• Open royalty free specification

• Open Source
  • Eclipse.org Paho project
  • IBM Contributed MQTT clients

• MQTT Implementations
  • Hobbyist to Enterprise
  • Open Source to Commercial
  • 16+ MQTT severs
  • 40+ MQTT clients
  • See http://mqtt.org

• Standard
  • MQTT is being standardised at OASIS
Benefits of MQTT verses HTTP

- Push delivery of messages / data / events
  - MQTT – low latency push delivery of messages from client to server and **server to client**
    - Helps bring an event oriented architecture to the web
  - HTTP – push from client to server but poll from server to client
- Efficient use of network
  - For an M2M project the number of bytes with MQTT was **137130 bytes per device per month** with HTTP the number of bytes was **801000 bytes per device per month**
- Reliable delivery over fragile network
  - MQTT will deliver message to QOS even **across connection breaks**
- Decoupling and publish subscribe – **one to many delivery**

Programming with Paho Java API

- MqttClient object is the starting point
- Messages and notifications received via callbacks
- Publishes made asynchronously
- Local persistence store used to achieve high QoS levels
Connect

First step is to create an MqttClient object
- Specify optional persistence store, URI and ClientID
- ClientID must be unique for the broker it is connecting to

```java
MQTTClientPersistence persistence = new MQTTDefaultFilePersistence("/tmp");
MQTTClient client = new MQTTClient("tcp://localhost:1883", "MQTTSub", persistence);
```

Then specify connection options, and connect!
- Keep alive of 480 seconds
- A retained publication Will message with QoS of 1

```java
MQTTConnectOptions opts = new MQTTConnectOptions();
opts.setKeepAliveInterval(480);
opts.setWill(client.getTopic("WillTopic"), "Something bad happened".getBytes(), 1, true);
client.connect(opts);
```
Create a message and Publish

Create a message
- Message properties allow it to be set as a retained publication and what the QoS needs to be
- Message payload is always a byte array

```java
MqttMessage msg = new MqttMessage("My Message".getBytes());
msg.setRetained(true);
msg.setQos(2);
```

To send a message
- Get a topic object and publish
- The returned DeliveryToken is used to determine when delivery is complete

```java
MqttTopic topic = client.getTopic("Fruit/Grape/Red");
MqttDeliveryToken token = topic.publish(msg);
```
Setup callback

Messages are delivered via a callback mechanism

- This is also used to indicate when the connection is broken and a publish has completed

```java
client.setCallback(new MqttCallback() {

    public void messageArrived(MqttTopic topic, MqttMessage message) throws Exception {
    }

    public void deliveryComplete(MqttDeliveryToken token) {
    }

    public void connectionLost(Throwable cause) {
    }

});
```
Subscribe for messages

After connecting, subscribe by providing the topic string:
- Messages will then be delivered to the callback

```java
client.subscribe("Fruit/#");
```

Can subscribe to multiple topics at the same time, and provide QoS levels:

```java
client.subscribe(new String[]{"MyTopic","Fruit/#"},new int[]{2,1});
```

To stop receiving messages, unsubscribe.

```java
client.unsubscribe(new String[]{"MyTopic","Fruit/#"});
```
Java API : Further notes

To resume a previous session, set the clean session option to false

- Requires the application to use the same client identifier
- When false subscriptions are durable
- When true previous state and subscriptions are cleaned up at start and / or end of session and subscriptions are non-durable

```java
opts.setCleanSession(false);
```

To cleanly disconnect

```java
client.disconnect();
```
MQTT technology

- In Paho
  - Java, JavaScript C and Lua client libraries
  - Utilities
- Others client libraries outside Eclipse
  - Python, Perl, Ruby...
  - See http://mqtt.org/software for a list
- Server implementations
  - Also http://mqtt.org/software
Lucy Zhang, a software engineer at Facebook, has written about their new Facebook Messenger app:

“One of the problems we experienced was long latency when sending a message. The method we were using to send was reliable but slow, and there were limitations on how much we could improve it. With just a few weeks until launch, we ended up building a new mechanism that maintains a persistent connection to our servers. To do this without killing battery life, we used a protocol called MQTT that we had experimented with in Beluga. MQTT is specifically designed for applications like sending telemetry data to and from space probes, so it is designed to use bandwidth and batteries sparingly. By maintaining an MQTT connection and routing messages through our chat pipeline, we were able to often achieve phone-to-phone delivery in the hundreds of milliseconds, rather than multiple seconds.”
A Virtual Power Plant with MQ Telemetry

An Intelligent Utility Network
Smart homes enabled with smart devices (HVAC, appliances...)
Devices connect to a home gateway box via Zigbee or Homeplug
Home gateway monitors devices collecting data that impacts energy usage
Home gateway publishes energy data to Virtual Power Plant (VPP) every 5 mins over a mobile network
VPP analyses real time data from all homes and other sources. When required it sheds load:
  Publishing control commands to the home gateway of multiple homes
Home gateway controls smart device(s) when instructed by VPP
Monitor large numbers of patient’s with pace makers in their home

- An MQTT client is embedded in the home monitoring appliance
- Collects diagnostics when patient is in close proximity and periodically dials health care provider
- Immediately dials if abnormality detected
- Runs over dial up and mobile networks which may be “old”, very slow and fragile
- MQ/MB receives diagnostics and hands off to analytics application
- Analytics applications look for abnormalities and notifies clinician

Benefits

- Saves time, effort & money for the patient: there is no longer a need to visit the clinic on a fixed interval
- Peace of mind, problems are detected early preventing potentially life threatening incidents
- Clinicians time is better utilized: only patients with potential problems are seen
Enterprise to physical world solution with MQTT

Scalability for whole pipeline!
Network traffic much lower - events pushed to/from devices and report by exception
Network cost reduced
Lower CPU utilization
Broken out of the SCADA prison – data accessible to other applications

Central Systems
Billing
Maintenance
SCADA

Message Broker
20 Field Devices to 1 Concentrator
transformation
pub sub
low-bandwidth, expensive comms

MQTT
Enterprise Messaging
Some areas where MQTT has been used:

- Environment & Traffic Monitoring
- SCADA
- Chemical Detection
- Field Force Automation
- Kiosks
- POS
- Fire & Gas Testing
- Asset tracking / management
- Slot Machines
- Home Automation
- Automotive/Telematics
- Medical
- Railway
- Slot Machines
