## Stage 3 proposal: Feature 13023, <div> element

---

New generic division element, <div>. Content is intersection of <bodydiv> and <sectiondiv>. To be allowed wherever <p> or other block-level elements are allowed.

### Champion

Eliot Kimber is the champion.

### Approved technical requirements

Allow <div> wherever <p> is allowed or any block context where <p> is not allowed for some reason (including within <p>, <fig>, etc.). The design intent is to allow <div> in all block-containing contexts.

Define a new element type, <div>, that allows all body content except <section> and also allows <div>.

## Dependencies or interrelated proposals

There are no related proposals.

## Modified DTDs

For DTDs, the specific changes are:

- Declare the parameter entity %div in the commonElements.div module:

```
<!ENTITY % div          "div"          >
```

- Declare the <div> element type in the commonElements.mod module:

```
<!--          LONG NAME: Div element          -->
<!ENTITY % div.content
          "(#PCDATA |
           %basic.block; |
           %basic.ph; |
           %data.elements.incl; |
           %foreign.unknown.incl; |
           %txt.incl;)*"
">
<!ENTITY % div.attributes
          "%data-element-atts;"
>
<!ELEMENT div      %div.content;>
<!ATTLIST div      %div.attributes;>
```

- Add %div; to the following parameter entities:

- %basic.block
- %basic.block.notbl
- %basic.block.nonote
- %basic.block.nopara
- %basic.block.nolq
- %basic.block.notbnofg
- %basic.block.notbfgobj

- Declare the @class attribute:

```
<!ATTLIST div          %global-atts;  class CDATA "- topic/div "          >
```

## Modified specification documentation

Provide a listing of new or modified topics. For existing topics, provide the location of the DITA 1.2 topic; for new topics, suggest where you think the topic should be located in the TOC.

List the exact language suggested for the topics. For existing topics, you can use a table to compare the DITA 1.2 text and the proposed text for DITA 1.3. For new topics, use the templates nested within this topic.

**Table 1: Modified Topics**

Topic Name	DITA 1.2 Text	DITA 1.3 Text
topiccontent.dita		<p>Add new definition list entry for "div" as follows:</p> <p><b>Div</b>            Div allows for the arbitrary grouping of content within</p>

Topic Name	DITA 1.2 Text	DITA 1.3 Text
constraint-module-examples.dita	<pre data-bbox="647 491 1040 636">%foreign.unknown.incl;   %sectiondiv;)*)</pre>	<p data-bbox="1268 203 1446 453">a topic. The div does not include a title. Content that requires a title should use section or example or, possibly, fig.</p> <p data-bbox="1060 485 1425 543">Reflect %div; in content model of section.</p> <pre data-bbox="1060 564 1461 735">%foreign.unknown.incl;   %div;   %sectiondiv;)*)</pre>
dita_concept_topic.dita	<p data-bbox="647 768 1040 1241">The &lt;conbody&gt; element holds the main body-level elements of the concept topic. Like the body element of a base topic, the &lt;conbody&gt; allows paragraphs, lists, tables, figures and other general elements. It also provides two key elements that allow authors to subdivide the topic into parts, with or without titles. These subdivisions are called sections and examples. The &lt;conbody&gt; also allows &lt;bodydiv&gt; and &lt;sectiondiv&gt; to facilitate grouping elements in the &lt;conbody&gt; for reuse.</p>	<p data-bbox="1060 768 1463 890">Add "&lt;div&gt;," before &lt;bodydiv&gt; and ", " after &lt;bodydiv&gt;. Remove " for reuse" since there are other reasons to use divisions.</p> <p data-bbox="1060 911 1463 1383">The &lt;conbody&gt; element holds the main body-level elements of the concept topic. Like the body element of a base topic, the &lt;conbody&gt; allows paragraphs, lists, tables, figures and other general elements. It also provides two key elements that allow authors to subdivide the topic into parts, with or without titles. These subdivisions are called sections and examples. The &lt;conbody&gt; also allows &lt;div&gt;, &lt;bodydiv&gt;, and &lt;sectiondiv&gt; to facilitate grouping elements in the &lt;conbody&gt;.</p>
bodydiv.dita		<p data-bbox="1060 1415 1438 1474">Insert new paragraph at end of first section within &lt;refbody&gt;:</p> <p data-bbox="1060 1495 1455 1680">Because the &lt;bodydiv&gt; element allows &lt;section&gt;, it may not be used within &lt;section&gt; elements. Use the &lt;div&gt; element for containers that may occur (or be used by reference from) both topic bodies and sections.</p>
sectiondiv.dita		<p data-bbox="1060 1709 1438 1768">Insert new paragraph at end of first section within &lt;refbody&gt;:</p> <p data-bbox="1060 1789 1455 1904">Because the &lt;sectiondiv&gt; element allows &lt;section&gt;, it may not be used within &lt;section&gt; elements. Use the &lt;div&gt; element for containers that</p>

Topic Name	DITA 1.2 Text	DITA 1.3 Text		
speclimits.dita		<p>may occur (or be used by reference from) both topic bodies and sections.</p> <p>Under section "", add new dl entry after the entry for &lt;sectiondiv&gt;:</p> <table> <tr> <td><b>div</b></td> <td>generic, untitled, nestable container for content within topic bodies or sections</td> </tr> </table>	<b>div</b>	generic, untitled, nestable container for content within topic bodies or sections
<b>div</b>	generic, untitled, nestable container for content within topic bodies or sections			

## div

The <div> element is used to contain informal blocks of information within a topic. The div element is specifically designed to be a grouping element, without any explicit semantics other than to organize subsets of content into logical groups that are not intended or should not be contained as a topic. As such, it does not contain an explicit title to avoid enabling the creation of deeply nested content that would otherwise be written as separate topics. Content that requires a title should use a section element or a nested topic, or possibly a figure.

### Inheritance

- topic/div

### Example

A division used to organize several elements together that could not be used as a unit using content reference range (because the last element in the sequence is not the same type as the first element in the sequence):

```
...
<div id="div-01">
  <p>The first paragraph</p>
  <p>The second paragraph</p>
  <note>This is a note</note>
</div>
...
```

An element, <pullquote>, specialized from <div>:

```
<!ENTITY % pullquote.content
  "(%div.cnt;)*"
>
<!ENTITY % pullquote.attributes
  "%id-atts;
  %localization-atts;
  base
          CDATA
          #IMPLIED
  %base-attribute-extensions;
  outputclass
          CDATA
          #IMPLIED"
>
<!ELEMENT pullquote    %pullquote.content;>
<!ATTLIST pullquote    %pullquote.attributes;>
```

```
<!ATTLIST pullquote %global-atts; class CDATA "+ topic/div d4p-
pubcontent-d/pullquote ">
```

Instances of <pullquote> could then be used in both <body> and <section> contexts:

```
<article id="article-01">
  <title>My Article</title>
  <body>
    <p>Something pithy someone said</p>
    <pullquote><p>Something Pithy</p></pullquote>
    ...
    <section spectitle="Deep Dive">
      <p>This is really really pithy</p>
      <pullquote><p>Really Pithy</p></pullquote>
      ...
    </section>
  </body>
</article>
```
