Abstract:

This document describes how to use Security Assertion Markup Language (SAML) V1.1 assertions with the Web Services Security (WSS): SOAP Message Security specification.

Status:

This is an interim draft. Please send comments to the editors.

Committee members should send comments on this specification to wss@lists.oasis-open.org list. Others should subscribe to and send comments to the wss-comment@lists.oasis-open.org list. To subscribe, visit http://lists.oasis-open.org/ob/adm.pl.

For information on the disclosure of Intellectual Property Rights or licensing terms related to the work of the Web Services Security TC please refer to the Intellectual Property Rights section of the TC web page at http://www.oasis-open.org/committees/wss/. The OASIS policy on Intellectual Property Rights is described at http://www.oasis-open.org/who/intellectualproperty.shtml.

Table of Contents

1 Introduction

The WSS: SOAP Message Security specification defines a standard set of SOAP extensions that implement message level integrity and confidentiality. This specification defines the use of Security Assertion Markup Language (SAML) assertions as security tokens from the `<wsse:Security>` header block defined by the WSS: SOAP Message Security specification.

1.1 Goals

The goal of this specification is to define the use of SAML V1.1 assertions in the context of WSS: SOAP Message Security including for the purpose of securing SOAP messages and SOAP message exchanges. To achieve this goal, this profile describes how

1. SAML assertions are carried in and referenced from `<wsse:security>` Headers.
2. SAML assertions are used with XML signature to bind the statements of the assertions (i.e. the claims) to a SOAP message.

1.1.1 Non-Goals

The following topics are outside the scope of this document:

3. Defining SAML statement syntax or semantics.
4. Describing the use of SAML assertions other than for SOAP Message Security.

2 Notations and Terminology

This section specifies the notations, namespaces, and terminology used in this specification.

2.1 Notational Conventions

The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC2119.

This document uses the notational conventions defined in the WS-Security SOAP Message Security document.

Namespace URIs (of the general form "some-URI") represent some application-dependent or context-dependent URI as defined in RFC2396.

This specification is designed to work with the general SOAP message structure and message processing model, and should be applicable to any version of SOAP. The current SOAP 1.2 namespace URI is used herein to provide detailed examples, but there is no intention to limit the applicability of this specification to a single version of SOAP.

Readers are presumed to be familiar with the terms in the Internet Security Glossary.

2.2 Namespaces

The XML namespace [XML-ns] URIs that MUST be used by implementations of this specification are as follows:

Prefix	Namespace
S11	http://schemas.xmlsoap.org/soap/envelope/
S12	http://www.w3.org/2003/05/soap-envelope
ds	http://www.w3.org/2000/09/xmldsig#
xenc	http://www.w3.org/2001/04/xmlenc
wsse	http://www.docs.oasis-open.org/wss/2004/01/oasis-200401-wss-wssecurity-secext-01.xsd
wsu	http://www.docs.oasis-open.org/wss/2004/01/oasis-200401-wss-wssecurity-utility-1.0.xsd
saml	Urn: oasis:names:tc:SAML:1.0:assertion
samlp	Urn: oasis:names:tc:SAML:1.0:protocol

Table-1 Namespace Prefixes

2.3 Terminology

This specification employs the terminology defined in the WSS: SOAP Message Security specification. Defined below are the definitions for additional terminology used in this specification.

Attesting Entity – the entity that provides the confirmation evidence that will be used to establish the correspondence between the subject of SAML subject statements (in SAML assertions) and SOAP message content.

Confirmation Method Identifier – the value within the `<saml:SubjectConfirmation>` element of a SAML subject statement that identifies the confirmation method to be used with the statement.

Subject Confirmation – the method used to establish the correspondence between the subject of SAML subject statements (in SAML assertions) and SOAP message content by verifying the confirmation evidence provided by an attesting entity.

SAML Assertion Authority - An abstract *system entity* that issues *assertions*.

Subject – A representation of the entity to which the claims in a SAML subject statement apply.

3 Usage

This section defines the specific mechanisms and procedures for using SAML assertions as security tokens.

3.1 Processing Model

This specification extends the token-independent processing model defined by the WSS: SOAP Message Security specification.

When a receiver processes a `<wsse:Security>` header containing or referencing SAML assertions, it selects, based on its policy, the signatures and assertions that it will process. It is assumed that a receiver's signature selection policy MAY rely on semantic labeling[1] of `<wsse:SecurityTokenReference>` elements occurring in the `<ds:KeyInfo>` elements within the signatures. It is also assumed that the assertions selected for validation and processing will include those referenced from the `<ds:KeyInfo>` and `<ds:SignedInfo>` elements of the selected signatures.

As part of its validation and processing of the selected assertions, the receiver MUST establish the relationship between the subject of each SAML subject statement (of the referenced SAML assertions) and the entity providing the evidence to satisfy the confirmation method defined for the statements (i.e. the attesting entity). Two methods for establishing this correspondence, `holder-of-key` and `sender-vouches` are described below. Systems implementing this specification MUST implement the processing necessary to support both of these subject confirmation methods.

3.2 Attaching Security Tokens

SAML assertions are attached to SOAP messages using WSS: SOAP Message Security by placing assertion elements or references to assertions inside a `<wsse:Security>` header. The following example illustrates a SOAP message containing a SAML assertion in a `<wsse:Security>` header.

```
<S12:Envelope xmlns:S="...">
<S12:Header>
<wsse:Security xmlns:wsse="...">
<saml:Assertion
  AssertionID="_a75adf55-01d7-40cc-929f-dbd8372ebdfc"
  IssueInstant="2003-04-17T00:46:02Z"
  Issuer="www.opensaml.org"
  MajorVersion="1"
```

[1] The optional `<wsse:Usage>` attribute of the `<wsse:SecurityTokenReference>` element MAY be used to associate one of more semantic usage labels (as QNAMES) with a reference and thus use of a Security Token. Please refer to WSS: SOAP Message Security for the details of this attribute.

```
  MinorVersion="1"
  xmlns="urn:oasis:names:tc:SAML:1.0:assertion">
        . . .
</saml:Assertion>
        . . .
</wsse:Security>
</S12:Header>
<S12:Body>
        . . .
</S12:Body>
</S12:Envelope>
```

3.3 Identifying and Referencing Security Tokens

The WSS: SOAP Message Security specification defines the <wsse:SecurityTokenReference> element for referencing security tokens. Three forms of token references are defined by this element and the element schema includes provision for defining additional reference forms should they be necessary. The three forms of token references defined by the <wsse:SecurityTokenReference> element are defined as follows:

- A key identifier reference – a generic element (i.e. <wsse:KeyIdentifier>) that conveys a security token identifier as an <wsse:EncodedString> and indicates in its attributes (as necessary) the key identifier type (i.e. the <wsse:ValueType>), the identifier encoding type (i.e. the <wsse:EncodingType>), and perhaps other parameters used to reference the security token.

  When a key identifier is used to reference a SAML assertion, the key identifier MUST contain as its element value the corresponding <saml:AssertionID>. The key identifier MUST also contain a <wsse:ValueType> attribute and the value of this attribute MUST be the wsse:KeyIdentifier/@ValueType from Table 2. When the <wsse:EncodingType> attribute is not specified, the element value of the key identifier MUST be encoded as xsi:string.

  When a key identifier is used to reference a SAML Assertion, a <saml:AuthorityBinding> element MUST be contained in the <wsse:SecurityTokenReference> element containing the key identifier. The contents of the <saml:AuthorityBinding> element MUST be as defined in [SAMLCore] and contain values sufficient for the intended recipients of the <wsse:SecurityTokenReference> to acquire the identified assertion from the intended Authority. To this end, the value of the <saml:AuthortyKind> attribute of the <saml:AuthorityBinding> element MUST be "samlp:AssertionIdReference".

- A Direct or URI reference – a generic element (i.e. <wsse:Reference>) that identifies a security token by URI. If only a fragment identifier is specified, then the reference is to the security token within the document whose local identifier (e.g. <wsu:id> attribute) matches the fragment identifier. Otherwise, the reference is to the (potentially external) security token identified by the URI.

  When a Direct or URI reference is used to reference a SAML assertion within the document, the value of the <wsse:URI> attribute of the reference MAY be a

fragment identifier containing the <saml:AssertionID> of the referenced assertion. Independent of whether a fragment identifier or full URI is specified, The reference MUST contain a <wsse:ValueType> attribute and the value of this attribute MUST be the wsse:Reference/@ValueType from Table 2 that corresponds to the version of the SAML Assertion being referenced.

- An Embedded reference – a reference that encapsulates a security token.

  When an Embedded reference is used to encapsulate a SAML assertion the SAML assertion MUST be included as a contained element within a <wsse:Embedded> element within a <wsse:SecurityTokenReference>.

This specification describes how SAML assertions may be referenced in five contexts:

- A SAML assertion may be referenced directly from a <wsse:Security> header element. In this case, the assertion is being conveyed by reference in the message.
- A SAML assertion may be referenced from a <ds:KeyInfo> element of a <ds:Signature> element in a <wsse:Security> header. In this case, the assertion contains a subject statement with a <saml:SubjectConfirmation> element that identifies the key used in the signature calculation.
- A SAML assertion reference may be referenced from a <ds:Reference> element within the <ds:SignedInfo> element of a <ds:Signature> element in a <wsse:Security> header. In this case, the doubly referenced assertion is signed by the containing signature.
- A SAML assertion may be referenced from a <ds:KeyInfo> element of a <saml:SubjectConfirmation> element of a subject statement in a SAML assertion. In this case, the referenced assertion contains one or more subject statements each of which identifies a key that MAY be used to confirm the subject and any other claims of the referencing statement.
- A SAML assertion may be referenced from a <xenc:DataReference> element within an <xenc:ReferenceList> element. In this case, the referenced assertion is encrypted.

In each of these contexts, the referenced assertion may be:

- local – in which case, it is included in the <wsse:Security> header containing the reference.
- remote – in which case it is not included in the <wsse:Security> header containing the reference, but may occur in another part of the SOAP message or may be available at the location identified by the reference which may be an assertion authority.

SAML key identifier references, with a supporting <saml:AuthorityBinding> element are currently the best suited, of the <wsse:SecurityTokenReference> forms, for expressing remote references to SAML assertions. A future version of [SAMLCore] is expected to facilitate remote references by URI.

309

Attribute	Value
wsse:Reference/@ValueType	http://www.docs.oasis-open.org/wss/2004/XX/oasis-2004XX-wss-saml-token-profile-1.0#SAMLAssertion-1.0

310 *Table-2 ValueType Attribute Values*

311 3.3.1 SAML Assertion Referenced from Header or Element

312 All conformant implementations MUST be able to process SAML assertion references
313 occurring in a `<wsse:Security>` header or in a header element other than a
314 signature to acquire the corresponding assertion.

315 A SAML assertion may be referenced from a `<wsse:Security>` header or from an
316 element (other than a signature) in the header. The following example demonstrates
317 the use of a direct reference in a `<wsse:Security>` header to reference a local SAML
318 assertion.

```
319 <S12:Envelope xmlns:S="...">
320 <S12:Header>
321 <wsse:Security xmlns:wsse="...">
322 <saml:Assertion
323   AssertionID="_a75adf55-01d7-40cc-929f-dbd8372ebdfc"
324   IssueInstant="2003-04-17T00:46:02Z"
325   Issuer="www.opensaml.org"
326   MajorVersion="1"
327   MinorVersion="1"
328   xmlns="urn:oasis:names:tc:SAML:1.0:assertion">
329         . . .
330 </saml:Assertion>
331 <wsse:SecurityTokenReference wsu:id="STR1">
332 <wsse:Reference wsu:id="…"
333   wsse:ValueType="http://www.docs.oasis-
334 open.org/wss/2004/XX/oasis-2004XX-wss-saml-token-profile-
335 1.0#SAMLAssertion-1.1"
336    wsse:URI="#_a75adf55-01d7-40cc-929f-dbd8372ebdfc"/>
337 </wsse:SecurityTokenReference>
338 </wsse:Security>
339 </S12:Header>
340 <S12:Body>
341         . . .
342 </S12:Body>
343 </S12:Envelope>
```

344 A SAML assertion that exists outside of a `<wsse:Security>` header may be
345 referenced from the `<wsse:Security>` header element by including (in the
346 `<wsse:SecurityTokenReference>`) a `<saml:AuthorityBinding>` element that

defines the location, binding, and query that may be used to acquire the identified assertion at a SAML assertion authority or responder.

```
<wsse:SecurityTokenReference wsu:id=”STR1”>
<saml:AuthorityBinding>
   saml:Binding=”urn:oasis:names:tc:SAML:1.0:bindings:SOAP-
binding”
  saml:Location=”http://www.opensaml.org/SAML-Authority”
  saml:AuthortyKind= “samlp:AssertionIdReference”
</saml:AuthorityBinding>
<wsse:keyIdentifier
   wsu:id=”…”
   wsse:ValueType=”http://www.docs.oasis-
open.org/wss/2004/XX/oasis-2004XX-wss-saml-token-profile-
1.0#SAMLAssertionID”>
   _a75adf55-01d7-40cc-929f-dbd8372ebdfc
</wsse:KeyIdentifier>
</wsse:SecurityTokenReference>
```

3.3.2 SAML assertion referenced from KeyInfo

All conformant implementations MUST be able to process SAML assertion references occurring in the `<ds:KeyInfo>` element of a `<ds:Signature>` element in a `<wsse:Security>` header as defined by the Holder-of-Key and Sender Vouches confirmations methods.

The following example depicts the use of a direct reference a local assertion from <ds:KeyInfo>.

```
<ds:KeyInfo>
<wsse:SecurityTokenReference wsu:id=”STR1”>>
<wsse:Reference wsu:id=”…”
  wsse:ValueType=”http://www.docs.oasis-
open.org/wss/2004/XX/oasis-2004XX-wss-saml-token-profile-
1.0#SAMLAssertion-1.0”
   wsse:URI=”#_a75adf55-01d7-40cc-929f-dbd8372ebdfc”/>
</wsse:SecurityTokenReference>
</ds:KeyInfo>
```

The following example demonstrates the use of a `<wsse:SecurityTokenReference>` containing a key identifier and a `<saml:AuthorityBinding>` to communicate information (location, binding, and query) sufficient to acquire the identified assertion at an identified SAML assertion authority or responder.

```
<ds:KeyInfo>
<wsse:SecurityTokenReference wsu:id=”STR1”>
<saml:AuthorityBinding>
   saml:Binding=”urn:oasis:names:tc:SAML:1.0:bindings:SOAP-
binding”
  saml:Location=”http://www.opensaml.org/SAML-Authority”
  saml:AuthortyKind= “samlp:AssertionIdReference”
</saml:AuthorityBinding>
<wsse:keyIdentifier wsu:id=”…”
  wsse:ValueType=”http://www.docs.oasis-
open.org/wss/2004/XX/oasis-2004XX-wss-saml-token-profile-
1.0#SAMLAssertionID”>
```

```
    a75adf55-01d7-40cc-929f-dbd8372ebdfc
</wsse:KeyIdentifier>
</wsse:SecurityTokenReference>
</ds:KeyInfo>
```

<ds:KeyInfo> elements may also occur in <xenc:EncryptedData> and <xenc:EncryptedKey> elements where they serve to identify the encryption key. Conformant implementations of this profile are not required to process SAML assertion references occurring within the <ds:keyInfo> element of <xenc:EncryptedData> or <xenc:EncryptedKey> elements.

3.3.3 SAML assertion referenced from SignedInfo

All conformant implementations MUST be able to process SAML assertions referenced by <Wsse:SecurityTokenReference> from <ds:Reference> elements within the <ds:SignedInfo> element of a <ds:Signature> element in a <wsse:Security> header. Embedded references may be digested directly, thus affectively digesting the encapsulated assertion. Other <Wsse:SecurityTokenReference> forms must be dereferenced for the referenced assertion to be digested.

The core specification, WSS: SOAP Message Security, defines the STR Dereference transform to cause the replacement (in the digest stream) of a <Wsse:SecurityTokenReference> with the contents of the referenced token. The STR Dereference transform MUST be specified and applied to digest any SAML assertion that is referenced by a <Wsse:SecurityTokenReference> that is not an embedded reference. The transform MAY also be specified and applied to an embedded reference.

The following example demonstrates the use of a the STR Dereference transform to dereference a reference to a SAML Assertion (i.e. Security Token) such that the digest operation is performed on the security token not its reference.

```
<wsse:SecurityTokenReference wsu:id=”STR1”>
<saml:AuthorityBinding>
   saml:Binding=”urn:oasis:names:tc:SAML:1.0:bindings:SOAP-
binding”
  saml:Location=”http://www.opensaml.org/SAML-Authority”
  saml:AuthortyKind= “samlp:AssertionIdReference”
</saml:AuthorityBinding>
<wsse:keyIdentifier wsu:id=”…”
  wsse:ValueType=”http://www.docs.oasis-
open.org/wss/2004/XX/oasis-2004XX-wss-saml-token-profile-
1.0#SAMLAssertionID”>
   _a75adf55-01d7-40cc-929f-dbd8372ebdfc
</wsse:KeyIdentifier>
</wsse:SecurityTokenReference>
         . . .
<ds:SignedInfo>
<ds:CanonicalizationMethod
  Algorithm="http://www.w3.org/2001/10/xml-exc-c14n#"/>
<ds:SignatureMethod Algorithm=
       "http://www.w3.org/2000/09/xmldsig#hmac-sha1"/>
<ds:Reference URI="#STR1">
```

```
<Transforms>
<ds:Transform
  Algorithm="http://schemas.xmlsoap.org/ws/2003/06/STR-
Transform"/>
<wsse:TransformationParameters>
<ds:CanonicalizationMethod
  Algorithm="http://www.w3.org/2001/10/xml-exc-c14n#"/>
</wsse:TransformationParameters>
</Transforms>
<ds:DigestMethod
  Algorithm= "http://www.w3.org/2000/09/xmldsig#sha1"/>
<ds:DigestValue>...</ds:DigestValue>
</ds:Reference>
</ds:SignedInfo>
```

Note that the URI appearing in the `<ds:Reference>` element identifies the `<Wsse:SecurityTokenReference>` element by its `wsu:id` value. Also note that the STR Dereference transform MUST contain (in `<wsse:TransformationParameters>`) a `<ds:CanonicalizationMethod>` that defines the algorithm to be used to serialize the input node set (of the referenced assertion).

3.3.4 SAML assertion referenced from SubjectConfirmation

All conformant implementations MUST be able to process SAML assertion references occurring in the `<ds:KeyInfo>` element of a `<saml:SubjectConfirmation>` element of a subject statement in a SAML assertion according to the processing defined by the holder-of-Key confirmation mechanism.

The assertions referenced by this mechanism MUST contain one or more holder-of-key confirmed subject statements each of which identifies a key that MAY be used to confirm the subject and any other claims of the referencing statement.

Such references are identical in format to the references that MAY appear in the `<ds:KeyInfo>` element within signatures.

```
<saml:Assertion
  AssertionID="_a75adf55-01d7-40cc-929f-dbd8372ebdfc"
  IssueInstant="2003-04-17T00:46:02Z"
  Issuer=”www.opensaml.org”
  MajorVersion="1"
  MinorVersion="1"
   xmlns="urn:oasis:names:tc:SAML:1.0:assertion">
<saml:Conditions>
  NotBefore="2002-06-19T16:53:33.173Z"
  NotOnOrAfter="2002-06-19T17:08:33.173Z"/>
<saml:AttributeStatement>
<saml:Subject>
<saml:NameIdentifier
  NameQualifier="www.example.com"
  Format="">
   uid=joe,ou=people,ou=saml-demo,o=baltimore.com
</saml:NameIdentifier>
<saml:SubjectConfirmation>
<saml:ConfirmationMethod>
```

```
  urn:oasis:names:tc:SAML:1.0:cm:holder-of-key
</saml:ConfirmationMethod>
<ds:KeyInfo>
<wsse:SecurityTokenReference wsu:id="STR1">
<wsse:Reference wsu:id="…"
  wsse:ValueType="http://www.docs.oasis-
open.org/wss/2004/XX/oasis-2004XX-wss-saml-token-profile-
1.0#SAMLAssertion-1.0"
  wsse:URI="#_a75adf55-01d7-40cc-929f-dbd8372ebdfc"/>
</wsse:SecurityTokenReference>
</ds:KeyInfo>
</saml:SubjectConfirmation>
</saml:Subject>
        . . .
</saml:Assertion>
```

3.3.5 SAML assertion referenced from Encrypted Data Reference

All conformant implementations MUST be able to process SAML assertion references occurring in the `<xenc:DataReference>` element of a `<xenc:ReferenceList>` element. An `<xenc:ReferenceList>` element may occur either as a top level element in a Security header, or embedded within an `<xenc:EncryptedKey>` element. In either case, the `<xenc:ReferenceList>` identifies the encrypted content.

Such references are similar in format to the references that MAY appear in the `<ds:Reference>` element within `<ds:SignedInfo>`, except the STR Dereference transform does not apply. As shown in the following example, an encrypted assertion or an encrypted `<wsse:SecurityTokenReference>` is referenced from an `<xenc:DataReference>` by a direct (i.e. URI) reference, where the URI appearing in the `<xenc:DataReference>` element identifies the encrypted (within the message) `<Wsse:SecurityTokenReference>` element by its `wsu:id` value.

```
<xenc:EncryptedData Id="STR1">
<ds:KeyInfo>
        . . .
</ds:KeyInfo>
<xenc:CipherData>
<xenc:CipherValue>...</xenc:CipherValue>
</xenc:CipherData>
/xenc:EncryptedData>
<xenc:ReferenceList>
<xenc:DataReference URI="#STR1"/>
</xenc:ReferenceList>
```

3.4 Subject Confirmation of SAML Assertions

The SAML profile of WSS: SOAP Message Security requires that systems support the holder-of-key and sender-vouches methods of subject confirmation. It is strongly RECOMMENDED that an XML signature be used to establish the relationship between the message and the subject statements of the attached assertions. This is

especially RECOMMENDED whenever the SOAP message exchange is conducted over an unprotected transport.

Any processor of SAML assertions MUST conform to the required validation and processing rules defined in the SAML specification.

The following table enumerates the mandatory subject confirmation methods and summarizes their associated processing models:

Mechanism	RECOMMENDED Processing Rules
`urn:oasis:names:tc:SAML:1.0:cm:holder-of-key`	The attesting entity includes an XML Signature that can be verified with the key information in the `<saml:ConfimationMethod>` of the subject statements of the SAML assertion referenced for keyInfo by the Signature.
`urn:oasis:names:tc:SAML:1.0:cm:sender-vouches`	The attesting entity, different from the subject, vouches for the verification of the subject. The receiver MUST have an existing trust relationship with the attesting entity. In the typical case (that is, where the assertion authority has not bound a confirmation key to the subject statements) the attesting entity MUST protect the Assertion (containing the subject statements) in combination with the message content against modification by another party. See also section 4.

Note that the high level processing model described in the following sections does not differentiate between the attesting entity and the message sender as would be necessary to guard against replay attacks. The high-level processing model also does not take into account requirements for authentication of receiver by sender, or for message or assertion confidentiality. These concerns must be addressed by means other than those described in the high-level processing model (i.e. section 3.1).

3.4.1 Holder-of-key Subject Confirmation Method

The following sections describe the holder-of-key method of establishing the correspondence between a SOAP message and the subject of SAML assertions added to the SOAP message according to this specification.

3.4.1.1 Attesting entity

An attesting entity uses the holder-of-key confirmation method to demonstrate that it is authorized to act as the subject of the SAML subject statements containing the holder-of-key <saml:SubjectConfirmation> element. The subject statements that will be confirmed by the holder-of-key method MUST include the following <saml:SubjectConfirmation> element:

```
<saml:SubjectConfirmation>
<saml:ConfirmationMethod>
  urn:oasis:names:tc:SAML:1.0:cm:holder-of-key
</saml:ConfirmationMethod>
<ds:KeyInfo>…</ds:KeyInfo>
</saml:SubjectConfirmation>
```

The <saml:SubjectConfirmation> element MUST include a <ds:KeyInfo> element that identifies the public or secret key to be used to confirm the identity of the subject.

To satisfy the associated confirmation method processing to be performed by the message receiver, the attesting entity MUST demonstrate knowledge of the confirmation key. The attesting entity MAY accomplish this by using the confirmation key to sign content within the message and by including the resulting <ds:Signature> element in the <wsse:Security> header. <ds:Signature> elements produced for this purpose MUST conform to the canonicalization and token pre-pending rules defined in the WSS: SOAP Message Security specification.

SAML assertions that contain a holder-of-key <saml:SubjectConfirmation> element SHOULD contain a <ds:Signature> element that protects the integrity of the confirmation <ds:KeyInfo> established by the assertion authority.

The canonicalization method used to produce the <ds:Signature> elements used to protect the integrity of SAML assertions MUST support the validation of these <ds:Signature> elements in contexts (such as <wsse:Security> header elements) other than those in which the signatures were calculated.

3.4.1.2 Receiver

Of the SAML assertions it selects for processing, a message receiver MUST NOT accept assertions containing a holder-of-key <saml:ConfirmationMethod>, unless the receiver has validated the integrity of the assertions and the attesting entity has demonstrated knowledge of the key identified by the <ds:keyInfo> element of the <saml:SubjectConfirmation> element.
If the receiver determines that the attesting entity has demonstrated knowledge of a subject confirmation key, then the SAML assertions containing the confirmation key MAY be attributed to the attesting entity and any elements of the message whose integrity is protected by the subject confirmation key MAY be considered to have been provided by the subject.

3.4.1.3 Example

The following example illustrates the use of the holder-of-key subject confirmation method to establish the correspondence between the SOAP message and the subject of the SAML assertions in the `<wsse:Security>` header:

```
<?xml:version="1.0" encoding="UTF-8"?>

3.4.2 Sender-vouches Subject Confirmation Method

The following sections describe the sender-vouches method of establishing the correspondence between a SOAP message and the SAML assertions added to the SOAP message according to the SAML profile of WSS: SOAP Message Security.

3.4.2.1 Attesting entity

An attesting entity uses the sender-vouches confirmation method to assert that it is acting on behalf of the subject of SAML subject statements containing a sender-vouches `<saml:SubjectConfirmation>` element. The subject statements that the attesting entity will confirm by the sender-vouches method MUST include the following `<saml:SubjectConfirmation>` element:

```
<saml:SubjectConfirmation>
  <saml:ConfirmationMethod>
        urn:oasis:names:tc:SAML:1.0:cm:sender-vouches
  </saml:ConfirmationMethod>
</saml:SubjectConfirmation>
```

To satisfy the associated confirmation method processing of the receiver, the attesting entity MUST protect the vouched for SOAP message content such that the

receiver can determine when it has been altered by another party. In the typical case, where the assertion authority has NOT securely bound a confirmation key in the sender-vouches `<saml:SubjectConfirmation>` element, the attesting entity MUST also protect the vouched for subject statements against unauthorized modification. The attesting entity MAY satisfy these requirements by including in the corresponding `<wsse:Security>` header a `<ds:Signature>` element that it prepares by using its key to sign the relevant message content and assertions (if the assertion authority did NOT securely establish a confirmation key). As defined by the XML Signature specification, the attesting entity MAY identify its key by including a `<ds:KeyInfo>` element within the `<ds:Signature>` element.

A `<ds:Signature>` element produced for this purpose MUST conform to the `canonicalization` and token prepending rules defined in the WSS: SOAP Message Security specification.

3.4.2.2 Receiver

Of the SAML assertions it selects for processing, a message receiver MUST NOT accept assertions containing a sender-vouches `<saml:ConfirmationMethod>` unless the assertions and SOAP message content being vouched for are protected (as described above) by an attesting entity who is trusted by the receiver to act on behalf of the subject of the assertions.

3.4.2.3 Example

The following example illustrates an attesting entity's use of the sender-vouches subject confirmation method with an associated `<ds:Signature>` element to establish its identity and to assert that it has sent message elements on behalf of the subjects of the contained assertion (i.e., the assertion referenced by "STR1"):

```
<?xml:version="1.0" encoding="UTF-8"?>
<S12:Envelope xmlns:S="...">
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns:xsd="http://www.w3.org/2001/XMLSchema">

3.5 Error Codes

When a system that implements the SAML token profile of WSS: SOAP Message Security does not perform its normal processing because of an error detected during the processing of a security header, it MAY choose to report the cause of the error using the SOAP fault mechanism. The SAML token profile of WSS: SOAP Message Security does not require that SOAP faults be generated for such errors, and systems that choose to return faults SHOULD take care not to introduce any security vulnerabilities as a result of the information returned in error responses.

Systems that choose to return faults SHOULD respond with the error codes defined in the WSS: SOAP Message Security specification. The RECOMMENDED correspondence between the common assertion processing failures and the error codes defined in WSS: SOAP Message Security are as defined in the following table:

Assertion Processing Error (faultString)	RECOMMENDED Error(Faultcode)
A referenced SAML assertion could not be retrieved.	`wsse:SecurityTokenUnavailable`
An assertion contains a `<saml:Condition>` element that the receiver does not understand.	`wsse:UnsupportedSecurityToken`
A signature within an assertion or referencing an assertion is invalid.	`wsse:FailedCheck`
The issuer of an assertion is not acceptable to the receiver.	`wsse:InvalidSecurityToken`

The receiver does not understand the extension schema used in an assertion.	`wsse:UnsupportedSecurityToken`

831 The preceding table defines the mapping to SOAP 1.1 fault strings and codes. The
832 WSS: SOAP Message Security specification defines the mapping to SOAP 1.2 fault
833 constructs.

4 Threat Model and Countermeasures (Non-Normative)

This document defines the mechanisms and procedures for securely attaching SAML assertions to SOAP messages. SOAP messages are used in multiple contexts, specifically including cases where the message is transported without an active session, the message is persisted, or the message is routed through a number of intermediaries. Such a general context of use suggests that users of this profile must be concerned with a variety of threats.

In general, the use of SAML assertions with WSS: SOAP Message Security introduces no new threats beyond those identified for SAML or by the WSS: SOAP Message Security specification. The following sections provide an overview of the characteristics of the threat model, and the countermeasures that SHOULD be adopted for each perceived threat.

4.1 Eavesdropping

Eavesdropping is a threat to the SAML token profile of WSS: SOAP Message Security in the same manner as it is a threat to any network protocol. The routing of SOAP messages through intermediaries increases the potential incidences of eavesdropping. Additional opportunities for eavesdropping exist when SOAP messages are persisted.

To provide maximum protection from eavesdropping, assertions, assertion references, and sensitive message content SHOULD be encrypted such that only the intended audiences can view their content. This removes threats of eavesdropping in transit, but MAY not remove risks associated with storage or poor handling by the receiver.

Transport-layer security MAY be used to protect the message and contained SAML assertions and/or references from eavesdropping while in transport, but message content MUST be encrypted above the transport if it is to be protected from eavesdropping by intermediaries.

4.2 Replay

Reliance on authority protected (e.g. signed) assertions with a holder-of-key subject confirmation mechanism precludes all but a holder of the key from binding the assertions to a SOAP message. Although this mechanism affectively restricts data origin to a holder of the confirmation key, it does not, by itself, provide the means to detect the capture and resubmission of the message by other parties.

Assertions that contain a sender-vouches confirmation mechanism introduce another dimension to replay vulnerability if the assertions impose no restriction on the entities that may use or reuse the assertions.

Replay attacks can be detected by receivers if message senders include additional message identifying information (e.g. timestamps, nonces, and or recipient

identifiers) within origin protected message content and receivers check this information against previously received values.

4.3 Message Insertion

The SAML token profile of WSS: SOAP Message Security is not vulnerable to message insertion attacks.

4.4 Message Deletion

The SAML token profile of WSS: SOAP Message Security is not vulnerable to message deletion attacks.

4.5 Message Modification

Messages constructed according to this specification are protected from message modification if receivers can detect unauthorized modification of relevant message content. Therefore, it is strongly RECOMMENDED that all relevant and immutable message content be signed by an attesting entity. Receivers SHOULD only consider the correspondence between the subject of the SAML assertions and the SOAP message content to have been established for those portions of the message that are protected by the attesting entity against modification by another entity.

To ensure that message receivers can have confidence that received assertions have not been forged or altered since their issuance, SAML assertions and assertion references appearing in `<wsse:Security>` header elements MUST be protected against unauthorized modification (e.g. signed) by their issuing authority or the attesting entity (as the case warrants). It is strongly RECOMMENDED that an attesting entity sign any `<saml:Assertion>` elements that it is attesting for and that are not signed by their issuing authority.

Transport-layer security MAY be used to protect the message and contained SAML assertions and/or assertion references from modification while in transport, but signatures are required to extend such protection through intermediaries.

4.6 Man-in-the-Middle

Assertions with a holder-of-key subject confirmation method are not vulnerable to a MITM attack. Assertions with a sender-vouches subject confirmation method are vulnerable to MITM attacks to the degree that the receiver does not have a trusted binding of key to the attesting entity’s identity.

949 # Appendix A: Revision History

Rev	Date	What
01	19-Sep-02	Initial draft produced by extracting SAML related content from [XML token]
02	23-Sep-02	Merged in content from SS TC submission
03	18-Nov-02	Resolved issues raised by TC
04	09-Dec-02	Refined confirmation mechanisms, and added signing example
05	15-Dec-02	Results of Baltimore F2F
06	21-Feb-03	Changed name to profile
07	05-May-03	Acknowledged contributors
07	05-May-03	Throughout document, Refined terminology to distinguish attesting entity from subject and sender, and to distinguish assertions from statements within assertions. Also modified sender-vouches to support traced vouching (by allowing for the use of a confirmation key)
08	09-Jun-03	Indicated reliance on conventions of core in "Notational Conventions"
08	09-Jun-03	In "Terminology", added definitions of new terms (attesting entity and confirmation method identifier), edited definition of Subject Confirmation, and replaced definition of sender with subject.
08	09-Jun-03	In "Subject Confirmation of SAML Assertions", added requirement that an attesting entity must protect unsigned sender-vouches confirmed assertions.
08	25-Nov-03	Added SAM v1.1 version distinction to "Abstract"
08	25-Nov-03	Editorial changes to "Introduction"
08	25-Nov-03	Reorganized non-normative text of requirements and goals sections
08	25-Nov-03	Removed Identification, Contact Information, Description, and Updates from "Usage".
	25-Nov-03	Updated schema URIs and corrected namespace prefixes in "Namespaces"
08	25-Nov-03	Updated SAML document references in "References" to point to v1.1. specs.
08	25-Nov-03	In Error codes, changed error processing such that it is optional and consistent with the recommendations in core.
08	25-Nov-03	Qualified "Threat Model and Counter-measures" as non-normative.
08	30-Nov-03	In "Identifying and Referencing Security Tokens", removed keyname references and added embedded references. Also removed editorial comment regarding using artifacts to

Rev	Date	What
		reference assertions.
08	30-Nov-03	Made editorial changes to "Processing Model", including clarification (by footnote) of "semantic labeling"
08	30-Nov-03	Removed "Acknowledgments" as it duplicated preceding sections of the document
08	12-15-03	Added high level goals and non-goals
08	12-15-03	Added support for the use of (fragment) URI references to section 3.3
08	12-15-03	Specified default encoding type for SAML and fragment UR references to be xsi:string
08	12-15-03	Added two more contexts in which SAML assertions may be referenced; from within SubjectConfirmation elements and as encrypted data.
08	12-15-03	Made it a requirement of conformant implementations that they support the various methods of referencing SAML assertions
08	12-15-03	Added new sections to describe SAML assertion referenced from SubjectConfirmation and SAML assertion referenced from Encrypted Data reference.
09	01-27-04	Changed document identifier and location
09	01-27-04	Modified namespace table of section 2.2 to differentiate SOAP 1.1 and SOAP 1.2 and to reflect stable WSS schema locations
09	01-27-04	Rewrote section 3.3 Identifying and Referencing Security Tokens to use AuthorityBinding element to supplement remote keyidentifier references. Also clarified use of wsse:Embedded.
09	01-27-04	Added Table 2 to define URI values for wsse:Reference/@ValueType and wsse:KeyIdentifier/@ValueType. Also changed all uses of these attributes to use the appropriate URI (was QNAME).
09	01-27-04	Added example to Section 3.3.4 to demonstrate assertion reference from SubjectConfirmation.
09	01-27-04	Completed section 3.3.5 SAML Assertion Referenced from Encrypted Data reference
09	01-27-04	Added text to end of Error Codes section to account for SOAP 1.2 fault processing.
09	01-27-04	Updated all examples to be consistent with STR and @ValueType changes.
09	01-27-04	Changed Sender-Vouches example to sign STR1 by using STR Dereference Transform
