**Abstract:**

[TODO]

**Status:**

This document specifies an ebXML Message Specification for the eBusiness community.  
Distribution of this document is unlimited.

Note: Implementers of this specification should consult the OASIS ebXML Messaging Services  
Technical Committee web site for current status and revisions to the specification  
(<http://www.oasis-open.org/committees/ebxml-msg/>).

***Previous version (2.0)***

## 223 1 Introduction

224 This specification is one of a series of specifications realizing the vision of creating a single global  
225 electronic marketplace where enterprises of any size and in any geographical location can meet and  
226 conduct business with each other through the exchange of XML based messages. The set of  
227 specifications enable a modular, yet complete electronic business framework.

228 This specification focuses on defining a communications-protocol neutral method for exchanging  
229 electronic business messages. It defines specific enveloping constructs supporting reliable, secure  
230 delivery of business information. Furthermore, the specification defines a flexible enveloping  
231 technique, permitting messages to contain payloads of any format type. This versatility ensures  
232 legacy electronic business systems employing traditional syntaxes (i.e. UN/EDIFACT, ASC X12, or  
233 HL7) can leverage the advantages of the ebXML infrastructure along with users of emerging  
234 technologies.

---

## 235 2 Summary of Contents of this Document

236 This specification defines the *ebXML Message Service Protocol* enabling the secure and reliable  
237 exchange of messages between two parties. It includes descriptions of:

- 238 • the ebXML Message structure used to package payload data for transport between parties,
- 239 • the behavior of the Message Service Handler sending and receiving those messages over a data  
240 communications protocol.

241 This specification is independent of both the payload and the communications protocol used.  
242 Appendices to this specification describe how to use this specification with HTTP [RFC2616] and  
243 SMTP [RFC2821].

244 This specification is organized around the following topics:

### 245 Core Functionality

- 246 • **Packaging Specification** – A description of how to package an ebXML Message and its associated  
247 parts into a form that can be sent using a communications protocol such as HTTP or SMTP (section  
248 3.1),
- 249 • **ebXML SOAP Envelope Extensions** – A specification of the structure and composition of the  
250 information necessary for an *ebXML Message Service* to generate or process an ebXML Message  
251 (section 3.3),
- 252 • **Error Handling** – A description of how one *ebXML Message Service* reports errors it detects to another  
253 ebXML Message Service Handler (section 5.2),
- 254 • **Security** – Provides a specification of the security semantics for ebXML Messages (section 5.1),
- 255 • **SyncReply** – Indicates to the Next MSH whether or not replies are to be returned synchronously  
256 (section 5.3).

### 257 Additional Features

- 258 • **Reliable Messaging** – The Reliable Messaging function defines an interoperable protocol where any  
259 two Message Service implementations can reliably exchange messages sent using once-and-only-once  
260 delivery semantics (section 7),
- 261 • **Message Status Service** – A description of services enabling one service to discover the status of  
262 another Message Service Handler (MSH) or an individual message (section 8 and 9),
- 263 • **Message Order** – The Order of message receipt by the *To Party MSH* can be guaranteed (section 10),
- 264 • **Multi-Hop** – Messages may be sent through intermediary MSH nodes (section 11).

### 265 Appendices to this specification cover the following:

- 266 • **Appendix A Schema** – This normative appendix contains XML schema definition [XMLSchema] for the  
267 ebXML SOAP *Header* and *Body* Extensions,
- 268 • **Appendix B Communications Protocol Envelope Mappings** – This normative appendix describes  
269 how to transport *ebXML Message Service* compliant messages over HTTP and SMTP,
- 270 • **Appendix C Security Profiles** – a discussion concerning Security Service Profiles.

### 271 2.1.1 Document Conventions

272 The keywords MUST, MUST NOT, REQUIRED, SHALL, SHALL NOT, SHOULD, SHOULD NOT,  
273 RECOMMENDED, MAY and OPTIONAL, when they appear in this document, are to be interpreted  
274 as described in [RFC2119] as quoted here:

- 275 • *MUST: This word, or the terms "REQUIRED" or "SHALL", means that the definition is an absolute*  
276 *requirement of the specification.*
- 277 • *MUST NOT: This phrase, or the phrase "SHALL NOT", means that the definition is an absolute*  
278 *prohibition of the specification.*

- 279           • *SHOULD: This word, or the adjective "RECOMMENDED", means that there may exist valid reasons in*  
280 *particular circumstances to ignore a particular item, but the full implications must be understood and*  
281 *carefully weighed before choosing a different course.*
- 282           • *SHOULD NOT: This phrase, or the phrase "NOT RECOMMENDED", means that there may exist valid*  
283 *reasons in particular circumstances when the particular behavior is acceptable or even useful, but the*  
284 *full implications should be understood and the case carefully weighed before implementing any*  
285 *behavior described with this label.*
- 286           • *MAY: This word, or the adjective "OPTIONAL", mean that an item is truly optional. One vendor may*  
287 *choose to include the item because a particular marketplace requires it or because the vendor feels*  
288 *that it enhances the product while another vendor may omit the same item. An implementation which*  
289 *does not include a particular option MUST be prepared to interoperate with another implementation*  
290 *which does include the option, though perhaps with reduced functionality. In the same vein an*  
291 *implementation which does include a particular option MUST be prepared to interoperate with another*  
292 *implementation which does not include the option (except, of course, for the feature the option*  
293 *provides).*

## 294           2.1.2 Audience

295           The target audience for this specification is the community of software developers who will  
296           implement the *ebXML Message Service*.

## 297           2.1.3 Caveats and Assumptions

298           It is assumed the reader has an understanding of communications protocols, MIME, XML, SOAP,  
299           SOAP Messages with Attachments and security technologies.

300           All examples are to be considered non-normative. If inconsistencies exist between the specification  
301           and the examples, the specification supersedes the examples.

302           It is strongly RECOMMENDED implementors read and understand the Collaboration Protocol Profile/  
303           Agreement [ebCPP] specification and its implications prior to implementation.

## 304           2.1.4 Related Documents

305           The following set of related specifications are developed independent of this specification as part of  
306           the ebXML initiative:

- 307           • **ebXML Technical Architecture Specification [ebTA]** – defines the overall technical architecture for  
308           ebXML
- 309           • **ebXML Technical Architecture Risk Assessment Technical Report [secRISK]** – defines the security  
310           mechanisms necessary to negate anticipated, selected threats
- 311           • **ebXML Collaboration Protocol Profile and Agreement Specification [ebCPP]** – defines how one  
312           party can discover and/or agree upon the information the party needs to know about another party prior  
313           to sending them a message that complies with this specification
- 314           • **ebXML Registry Services Specification [ebRS]** – defines a registry service for the ebXML  
315           environment

## 316           2.2 Concept of Operation

### 317           2.2.1 Scope

318           The ebXML Message Service (ebMS) defines the message enveloping and header document  
319           schema used to transfer ebXML messages over a communications protocol such as HTTP or SMTP  
320           and the behavior of software sending and receiving ebXML messages. The ebMS is defined as a  
321           set of layered extensions to the base Simple Object Access Protocol [SOAP] and SOAP Messages  
322           with Attachments [SOAPAttach] specifications. This document provides security and reliability  
323           features necessary to support international electronic business. These security and reliability  
324           features are not provided in the SOAP or SOAP with Attachments specifications.

325 The ebXML infrastructure is composed of several independent, but related, components.  
326 Specifications for the individual components are fashioned as stand-alone documents. The  
327 specifications are totally self-contained; nevertheless, design decisions within one document can and  
328 do impact the other documents. Considering this, the ebMS is a closely coordinated definition for an  
329 ebXML message service handler (MSH).

330 The ebMS provides the message packaging, routing and transport facilities for the ebXML  
331 infrastructure. The ebMS is not defined as a physical component, but rather as an abstraction of a  
332 process. An implementation of this specification could be delivered as a wholly independent  
333 software application or an integrated component of some larger business process.

## 334 2.2.2 Background and Objectives

335 Traditional business information exchanges have conformed to a variety of standards-based  
336 syntaxes. These exchanges were largely based on electronic data interchange (EDI) standards born  
337 out of mainframe and batch processing. Some of the standards defined bindings to specific  
338 communications protocols. These EDI techniques worked well; however, they were difficult and  
339 expensive to implement. Therefore, use of these systems was normally limited to large enterprises  
340 possessing mature information technology capabilities.

341 The proliferation of XML-based business interchanges served as the catalyst for defining a new  
342 global paradigm that ensured all business activities, regardless of size, could engage in electronic  
343 business activities. The prime objective of ebMS is to facilitate the exchange of electronic business  
344 messages within an XML framework. Business messages, identified as the 'payloads' of the ebXML  
345 messages, are not necessarily expressed in XML. XML-based messages, as well as traditional EDI  
346 formats, are transported by the ebMS. Actually, the ebMS payload can take any digital form—XML,  
347 ASC X12, HL7, AIAG E5, database tables, binary image files, etc.

348 The ebXML architecture requires that the ebXML Message Service protocol be capable of being  
349 carried over any available communications protocol. Therefore, this document does not mandate  
350 use of a specific communications protocol. This version of the specification provides bindings to  
351 HTTP and SMTP, but other protocols can, and reasonably will, be used.

352 The ebXML Requirements Specification [ebREQ] mandates the need for secure, reliable  
353 communications. The ebXML work focuses on leveraging existing and emerging  
354 technology—attempts to create new protocols are discouraged. Therefore, this document defines  
355 security within the context of existing security standards and protocols. Those requirements satisfied  
356 with existing standards are specified in the ebMS, others must be deferred until new technologies or  
357 standards are available, for example encryption of individual message header elements.

358 Reliability requirements defined in the ebREQ relate to delivery of ebXML messages over the  
359 communications channels. The ebMS provides mechanisms to satisfy the ebREQ requirements.  
360 The reliable messaging elements of the ebMS supply reliability to the communications layer; they are  
361 not intended as business-level acknowledgments to the applications supported by the ebMS. This is  
362 an important distinction. Business processes often anticipate responses to messages they generate.  
363 The responses may take the form of a simple acknowledgment of message receipt by the application  
364 receiving the message or a companion message reflecting action on the original message. Those  
365 messages are outside of the MSH scope. The acknowledgment defined in this specification does  
366 not indicate the payload of the ebXML message was syntactically correct. It does not acknowledge  
367 the accuracy of the payload information. It does not indicate business acceptance of the information  
368 or agreement with the content of the payload. The ebMS is designed to provide the sender with the  
369 confidence the receiving MSH has received the message securely and intact.

370 The underlying architecture of the MSH assumes messages are exchanged between two ebMS-  
371 compliant MSH nodes. This pair of MSH nodes provides a hop-to-hop model extended as required  
372 to support a multi-hop environment. The multi-hop environment allows the next destination of the  
373 message to be an intermediary MSH other than the 'receiving MSH' identified by the original sending  
374 MSH. The ebMS architecture assumes the sender of the message MAY be unaware of the specific

375 path used to deliver a message. However, it MUST be assumed the original sender has knowledge  
376 of the final recipient of the message and the first of one or more intermediary hops.

377 The MSH supports the concept of 'quality of service.' The degree of service quality is controlled by  
378 an agreement existing between the parties directly involved in the message exchange. In practice,  
379 multiple agreements may be required between the two parties. The agreements might be tailored to  
380 the particular needs of the business exchanges. For instance, business partners may have a  
381 contract defining the message exchanges related to buying products from a domestic facility and  
382 another defining the message exchanges for buying from an overseas facility. Alternatively, the  
383 partners might agree to follow the agreements developed by their trade association. Multiple  
384 agreements may also exist between the various parties handling the message from the original  
385 sender to the final recipient. These agreements could include:

- 386 • an agreement between the MSH at the message origination site and the MSH at the final destination;  
387 and
- 388 • agreement between the MSH at the message origination site and the MSH acting as an intermediary;  
389 and
- 390 • an agreement between the MSH at the final destination and the MSH acting as an intermediary. There  
391 would, of course, be agreements between any additional intermediaries; however, the originating site  
392 MSH and final destination MSH MAY have no knowledge of these agreements.

393 An ebMS-compliant MSH shall respect the in-force agreements between itself and any other ebMS-  
394 compliant MSH with which it communicates. In broad terms, these agreements are expressed as  
395 Collaboration Protocol Agreements (CPA). This specification identifies the information that must be  
396 agreed. It does not specify the method or form used to create and maintain these agreements. It is  
397 assumed, in practice, the actual content of the contracts may be contained in  
398 initialization/configuration files, databases, or XML documents complying with the ebXML  
399 Collaboration Protocol Profile and Agreement Specification [ebCPP].

## 400 2.2.3 Operational Policies and Constraints

401 The ebMS is a service logically positioned between one or more business applications and a  
402 communications service. This requires the definition of an abstract service interface between the  
403 business applications and the MSH. This document acknowledges the interface, but does not  
404 provide a definition for the interface. Future versions of the ebMS MAY define the service interface  
405 structure.

406 Bindings to two communications protocols are defined in this document; however, the MSH is  
407 specified independent of any communications protocols. While early work focuses on HTTP for  
408 transport, no preference is being provided to this protocol. Other protocols may be used and future  
409 versions of the specification may provide details related to those protocols.

410 The ebMS relies on external configuration information. This information is determined either through  
411 defined business processes or trading partner agreements. These data are captured for use within a  
412 Collaboration Protocol Profile (CPP) or Collaboration Protocol Agreement (CPA). The ebXML  
413 Collaboration Protocol Profile and Agreement Specification [ebCPP] provides definitions for the  
414 information constituting the agreements. The ebXML architecture defines the relationship between  
415 this component of the infrastructure and the ebMS. As regards the MSH, the information composing  
416 a CPP/CPA must be available to support normal operation. However, the method used by a specific  
417 implementation of the MSH does not mandate the existence of a discrete instance of a CPA. The  
418 CPA is expressed as an XML document. Some implementations may elect to populate a database  
419 with the information from the CPA and then use the database. This specification does not prescribe  
420 how the CPA information is derived, stored, or used: it only states specific information items must be  
421 available for the MSH to achieve successful operations.

## 422 2.2.4 Modes of Operation

423 This specification does not mandate how the MSH will be installed within the overall ebXML  
424 framework. It is assumed some MSH implementations will not implement all functionality defined in

425 this specification. For instance, a set of trading partners may not require reliable messaging  
 426 services; therefore, no reliable messaging capabilities exist within their MSH. But, all MSH  
 427 implementations shall comply with the specification with regard to the functions supported in the  
 428 specific implementation and provide error notifications for functionality requested but not supported.  
 429 Documentation for a MSH implementation SHALL identify all ebMS features not satisfied in the  
 430 implementation.

431 The *ebXML Message Service* may be conceptually broken down into the following three parts:  
 432 (1) an abstract *Service Interface*, (2) functions provided by the MSH and (3) the mapping to  
 433 underlying transport service(s).

434 *Figure 1* depicts a logical arrangement of the functional  
 435 modules existing within one possible implementation of  
 436 the *ebXML Message Services* architecture. These  
 437 modules are arranged in a manner to indicate their  
 438 inter-relationships and dependencies.

439 **Header Processing** – the creation of the ebXML  
 440 Header elements for the *ebXML Message* uses input  
 441 from the application, passed through the Message  
 442 Service Interface, information from the *Collaboration*  
 443 *Protocol Agreement* governing the message, and  
 444 generated information such as digital signature,  
 445 timestamps and unique identifiers.

446 **Header Parsing** – extracting or transforming  
 447 information from a received ebXML Header element  
 448 into a form suitable for processing by the MSH  
 449 implementation.

450 **Security Services** – digital signature creation and  
 451 verification, encryption, authentication and  
 452 authorization. These services MAY be used by other  
 453 components of the MSH including the Header  
 454 Processing and Header Parsing components.

455 **Reliable Messaging Services** – handles the delivery  
 456 and acknowledgment of ebXML Messages. The  
 457 service includes handling for persistence, retry, error  
 458 notification and acknowledgment of messages  
 459 requiring reliable delivery.

460 **Message Packaging** – the final enveloping of an  
 461 *ebXML Message* (ebXML header elements and  
 462 payload) into its SOAP Messages with Attachments  
 463 [SOAPAttach] container.

464 **Error Handling** – this component handles the  
 465 reporting of errors encountered during MSH or  
 466 Application processing of a message.

467 **Message Service Interface** – an abstract service  
 468 interface applications use to interact with the MSH to  
 469 send and receive messages and which the MSH uses  
 470 to interface with applications handling received messages (Delivery Module).

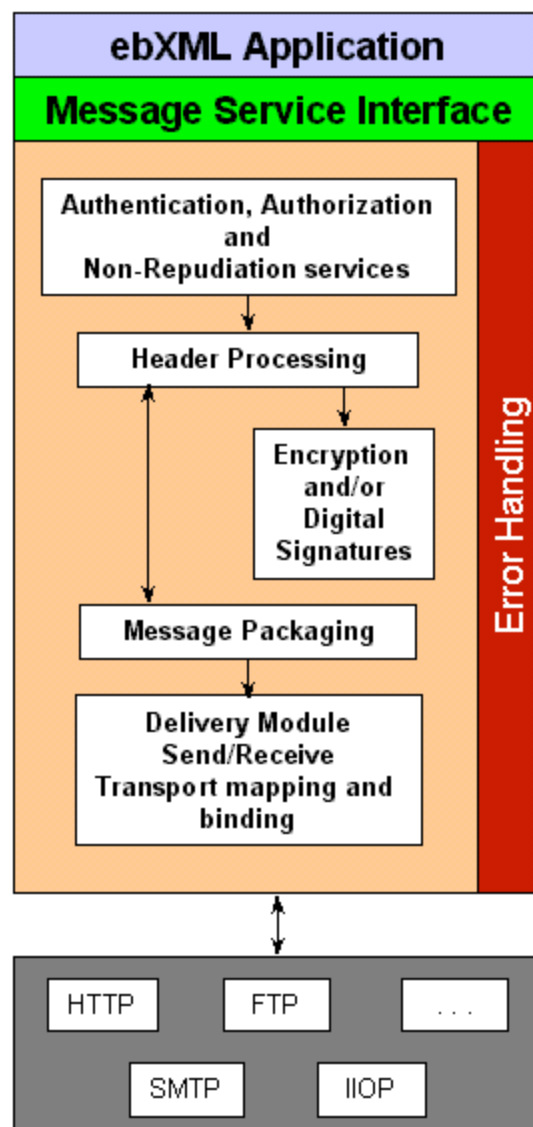

Figure 1.1 Typical Relationship between  
 ebXML Message Service Handler  
 Components

## 471 2.3 Minimal Requirements for Conformance

472 An implementation of this specification MUST satisfy ALL of the following conditions to be considered  
 473 a conforming implementation:

- 474 • It supports all the mandatory syntax, features and behavior (as identified by the [RFC2119] key words  
475 MUST, MUST NOT, REQUIRED, SHALL and SHALL NOT) defined in Part I – Core Functionality.
- 476 • It supports all the mandatory syntax, features and behavior defined for each of the additional module(s),  
477 defined in Part II – Additional Features, the implementation has chosen to implement.
- 478 • It complies with the following interpretation of the keywords OPTIONAL and MAY: When these  
479 keywords apply to the behavior of the implementation, the implementation is free to support these  
480 behaviors or not, as meant in [RFC2119]. When these keywords apply to message contents relevant to  
481 a module of features, a conforming implementation of such a module MUST be capable of processing  
482 these optional message contents according to the described ebXML semantics.
- 483 • If it has implemented optional syntax, features and/or behavior defined in this specification, it MUST be  
484 capable of interoperating with another implementation that has not implemented the optional syntax,  
485 features and/or behavior. It MUST be capable of processing the prescribed failure mechanism for those  
486 optional features it has chosen to implement.
- 487 • It is capable of interoperating with another implementation that has chosen to implement optional  
488 syntax, features and/or behavior, defined in this specification, it has chosen not to implement. Handling  
489 of unsupported features SHALL be implemented in accordance with the prescribed failure mechanism  
490 defined for the feature.
- 491 More details on Conformance to this specification – conformance levels or profiles and on their  
492 recommended implementation – are described in a companion document, "*Message Service*  
493 *Implementation Guidelines*" from the OASIS ebXML Implementation, Interoperability and  
494 Conformance (IIC) Technical Committee.

495

496

497

---

## Part I. Core Functionality

## 498 3 ebXML with SOAP

499 The ebXML Message Service Specification defines a set of namespace-qualified SOAP **Header** and  
 500 **Body** element extensions within the SOAP **Envelope**. These are packaged within a MIME multipart to  
 501 allow payloads or attachments to be included with the SOAP extension elements. In general, separate  
 502 ebXML SOAP extension elements are used where:

- 503 • different software components may be used to generate ebXML SOAP extension elements,
- 504 • an ebXML SOAP extension element is not always present or,
- 505 • the data contained in the ebXML SOAP extension element MAY be digitally signed separately from the other  
 506 ebXML SOAP extension elements.

### 507 3.1 Packaging Specification

508 An ebXML Message is a communications protocol independent MIME/Multipart message envelope,  
 509 structured in compliance with the SOAP Messages with Attachments [SOAPAttach] specification,  
 510 referred to as a *Message Package*.

511 There are two logical MIME parts within the *Message Package*:

- 512 • The first MIME part, referred to as the  
 513 *Header Container*, containing one SOAP  
 514 1.1 compliant message. This XML  
 515 document is referred to as a *SOAP*  
 516 *Message* for the remainder of this  
 517 specification,
- 518 • zero or more additional MIME parts,  
 519 referred to as *Payload Containers*,  
 520 containing application level payloads.

521 The general structure and composition of an  
 522 ebXML Message is described in the following  
 523 figure (2.1).

524

525 The *SOAP Message* is an XML document  
 526 consisting of a SOAP **Envelope** element. This  
 527 is the root element of the XML document  
 528 representing a *SOAP Message*. The SOAP  
 529 **Envelope** element consists of:

- 530 • One SOAP **Header** element. This is a  
 531 generic mechanism for adding features to a  
 532 *SOAP Message*, including ebXML specific  
 533 header elements.
- 534 • One SOAP **Body** element. This is a  
 535 container for message service handler  
 536 control data and information related to the  
 537 payload parts of the message.

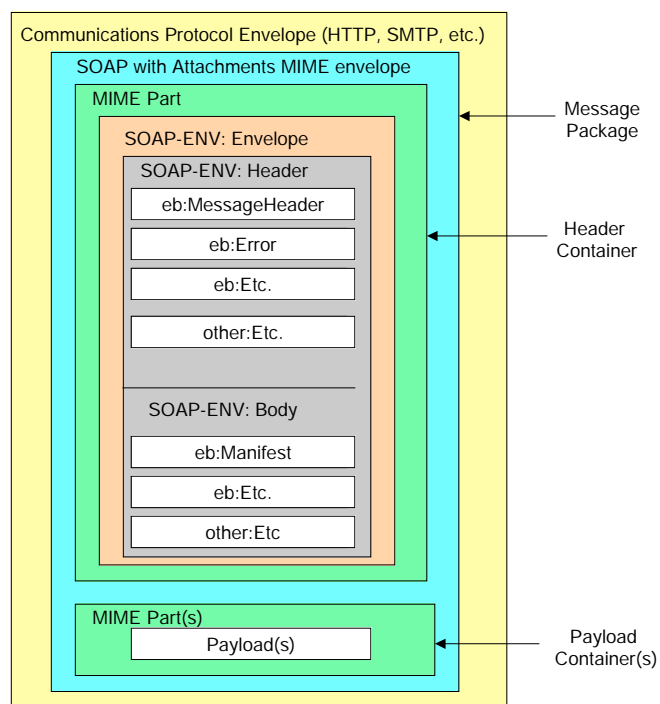

Figure 2.1 ebXML Message Structure

### 538 3.1.1 SOAP Structural Conformance

539 The *ebXML Message* packaging complies with the following specifications:

- 540 • Simple Object Access Protocol (SOAP) 1.1 [SOAP]
- 541 • SOAP Messages with Attachments [SOAPAttach]

542 Carrying ebXML headers in *SOAP Messages* does not mean ebXML overrides existing semantics of  
543 SOAP, but rather the semantics of ebXML over SOAP maps directly onto SOAP semantics.

### 544 3.1.2 Message Package

545 All MIME header elements of the *Message Package* are in conformance with the SOAP Messages  
546 with Attachments [SOAPAttach] specification. In addition, the Content-Type MIME header in the  
547 *Message Package* contain a type attribute matching the MIME media type of the MIME body part  
548 containing the *SOAP Message* document. In accordance with the [SOAP] specification, the MIME  
549 media type of the *SOAP Message* has the value "text/xml".

550 It is strongly RECOMMENDED the initial headers contain a Content-ID MIME header structured in  
551 accordance with MIME [RFC2045], and in addition to the required parameters for the  
552 Multipart/Related media type, the start parameter (OPTIONAL in MIME Multipart/Related [RFC2387])  
553 always be present. This permits more robust error detection. The following fragment is an example of  
554 the MIME headers for the multipart/related Message Package:

```
555 Content-Type: multipart/related; type="text/xml"; boundary="boundaryValue";  
556 start="<messagepackage-123@example.com>"  
557  
558 --boundaryValue  
559 Content-ID: <messagepackage-123@example.com>
```

560 Implementations MUST support non-multipart messages, which may occur when there are no  
561 ebXML payloads. An ebXML message with no payload may be sent either as a plain SOAP  
562 message or as a [SOAPAttach] multipart message with only one body part.

### 563 3.1.3 Header Container

564 The root body part of the *Message Package* is referred to in this specification as the *Header*  
565 *Container*. The *Header Container* is a MIME body part consisting of one *SOAP Message* as defined  
566 in the SOAP Messages with Attachments [SOAPAttach] specification.

#### 567 3.1.3.1 Content-Type

568 The MIME Content-Type header for the *Header Container* MUST have the value "text/xml" in  
569 accordance with the [SOAP] specification. The Content-Type header MAY contain a "charset"  
570 attribute. For example:

```
571 Content-Type: text/xml; charset="UTF-8"
```

#### 572 3.1.3.2 charset attribute

573 The MIME charset attribute identifies the character set used to create the *SOAP Message*. The  
574 semantics of this attribute are described in the "charset parameter / encoding considerations" of  
575 text/xml as specified in XML [XMLMedia]. The list of valid values can be found at  
576 <http://www.iana.org/>.

577 If both are present, the MIME charset attribute SHALL be equivalent to the encoding declaration of  
578 the *SOAP Message*. If provided, the MIME charset attribute MUST NOT contain a value conflicting  
579 with the encoding used when creating the *SOAP Message*.

580 For maximum interoperability it is RECOMMENDED UTF-8 [UTF-8] be used when encoding this  
581 document. Due to the processing rules defined for media types derived from text/xml [XMLMedia],  
582 this MIME attribute has no default.

### 583 3.1.3.3 Header Container Example

584 The following fragment represents an example of a *Header Container*.

585

```
586 Content-ID: <messagepackage-123@example.com>  
587 Content-Type: text/xml; charset="UTF-8"  
588  
589 <!--Start SOAP Envelope -->  
590 <SOAP:Envelope xmlns:SOAP="http://schema.xmlsoap.org/soap/envelope/">  
591   <SOAP:Header>  
592     <!-- ... -->  
593   </SOAP:Header>  
594   <SOAP:Body>  
595     <!-- ... -->  
596   </SOAP:Body>  
597 </SOAP:Envelope>  
598 <!--End SOAP Envelope -->  
599  
600 --boundaryValue
```

601

### 602 3.1.4 Payload Container

603 Zero or more *Payload Containers* MAY be present within a *Message Package* in conformance with  
604 the SOAP Messages with Attachments [SOAPAttach] specification.

605 If the *Message Package* contains an application payload, it SHOULD be enclosed within a *Payload*  
606 *Container*.

607 If there is no application payload within the *Message Package* then a *Payload Container* MUST NOT  
608 be present.

609 The contents of each *Payload Container* MUST be identified in the ebXML Message *Manifest*  
610 element within the SOAP *Body* (see section 4.2).

611 The ebXML Message Service Specification makes no provision, nor limits in any way, the structure  
612 or content of application payloads. Payloads MAY be simple-plain-text objects or complex nested  
613 multipart objects. The specification of the structure and composition of payload objects is the  
614 prerogative of the organization defining the business process or information exchange using the  
615 *ebXML Message Service*.

#### 616 3.1.4.1 Example of a Payload Container

617 The following fragment represents an example of a *Payload Container* and a payload:

```
618 Content-ID: <domainname.example.com>  
619 Content-Type: application/xml  
620  
621 <Invoice><LineItems>...</LineItems></Invoice>
```

622 Note: It might be noticed the content-type used in the preceding example (application/XML) is  
623 different than the content-type in the example SOAP envelope in section 3.1.2 above (text/XML).  
624 The SOAP 1.1 specification states the content-type used for the SOAP envelope MUST be 'text/xml'.  
625 However, many MIME experts disagree with the choice of the primary media type designation of  
626 'text/\*' for XML documents as most XML is not "human readable" in the sense the MIME designation  
627 of 'text' was meant to infer. They believe XML documents should be classified as 'application/XML'.

### 628 3.1.5 Additional MIME Parameters

629 Any MIME part described by this specification MAY contain additional MIME headers in conformance  
630 with the MIME [RFC2045] specification. Implementations MAY ignore any MIME header not defined  
631 in this specification. Implementations MUST ignore any MIME header they do not recognize.

632 For example, an implementation could include content-length in a message. However, a recipient of  
633 a message with content-length could ignore it.

### 634 3.1.6 Reporting MIME Errors

635 If a MIME error is detected in the *Message Package* then it MUST be reported as specified in SOAP  
636 with Attachments [SOAPAttach].

## 637 3.2 XML Prolog

638 The SOAP *Message's* XML Prolog, if present, MAY contain an XML declaration. This specification  
639 has defined no additional comments or processing instructions appearing in the XML prolog. For  
640 example:

```
641 Content-Type: text/xml; charset="UTF-8"  
642  
643 <?xml version="1.0" encoding="UTF-8"?>
```

### 644 3.2.1 XML Declaration

645 The XML declaration MAY be present in a SOAP *Message*. If present, it MUST contain the version  
646 specification required by the XML Recommendation [XML] and MAY contain an encoding  
647 declaration. The semantics described below MUST be implemented by a compliant *ebXML*  
648 *Message Service*.

### 649 3.2.2 Encoding Declaration

650 If both the encoding declaration and the *Header Container* MIME charset are present, the XML  
651 prolog for the SOAP *Message* SHALL contain the encoding declaration SHALL be equivalent to the  
652 charset attribute of the MIME Content-Type of the *Header Container* (see section 3.1.3).

653 If provided, the encoding declaration MUST NOT contain a value conflicting with the encoding used  
654 when creating the SOAP *Message*. It is RECOMMENDED UTF-8 be used when encoding the  
655 SOAP *Message*.

656 If the character encoding cannot be determined by an XML processor using the rules specified in  
657 section 4.3.3 of XML [XML], the XML declaration and its contained encoding declaration SHALL be  
658 provided in the ebXML SOAP *Header* Document.

659 Note: the encoding declaration is not required in an XML document according to XML v1.0  
660 specification [XML].

### 661 3.3 ebXML SOAP Envelope extensions

662 In conformance with the [SOAP] specification, all extension element content is namespace qualified.  
 663 All of the ebXML SOAP extension element content defined in this specification is namespace  
 664 qualified to the ebXML SOAP *Envelope* extensions namespace as defined in section 3.2.2.

665 Namespace declarations (xmlns pseudo attributes) for the ebXML SOAP extensions may be  
 666 included in the SOAP *Envelope*, *Header* or *Body* elements, or directly in each of the ebXML SOAP  
 667 extension elements.

#### 668 3.3.1 Namespace pseudo attribute

669 The namespace declaration for the ebXML SOAP *Envelope* extensions (*xmlns* pseudo attribute)  
 670 (see [XMLNS]) has a REQUIRED value of:

671 *[http://www.oasis-open.org/committees/ebxml-msg/schema/msg-header-2\\_0.xsd](http://www.oasis-open.org/committees/ebxml-msg/schema/msg-header-2_0.xsd)*

#### 672 3.3.2 xsi:schemaLocation attribute

673 The SOAP namespace:

674 *<http://schemas.xmlsoap.org/soap/envelope/>*

675 resolves to a W3C XML Schema specification. The ebXML OASIS ebXML Messaging TC has  
 676 provided an equivalent version of the SOAP schema conforming to the W3C Recommendation  
 677 version of the XML Schema specification [XMLSchema].

678 *<http://www.oasis-open.org/committees/ebxml-msg/schema/envelope.xsd>*

679 All ebXML MSH implementations are strongly RECOMMENDED to include the XMLSchema-  
 680 instance namespace qualified *schemaLocation* attribute in the SOAP *Envelope* element to indicate  
 681 to validating parsers a location of the schema document that should be used to validate the  
 682 document. Failure to include the *schemaLocation* attribute could prevent XML schema validation of  
 683 received messages.

684 For example:

```
685 <SOAP:Envelope xmlns:SOAP="http://schemas.xmlsoap.org/soap/envelope/"
686
687   xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
688     xsi:schemaLocation="http://schemas.xmlsoap.org/soap/envelope/
689 http://www.oasis-open.org/committees/ebxml-msg/schema/envelope.xsd">
```

691 In addition, ebXML SOAP *Header* and *Body* extension element content may be similarly qualified so  
 692 as to identify the location where validating parsers can find the schema document containing the  
 693 ebXML namespace qualified SOAP extension element definitions. The ebXML SOAP extension  
 694 element schema has been defined using the W3C Recommendation version of the XML Schema  
 695 specification [XMLSchema] (see Appendix A). The XMLSchema-instance namespace qualified  
 696 *schemaLocation* attribute should include a mapping of the ebXML SOAP *Envelope* extensions  
 697 namespace to its schema document in the same element that declares the ebXML SOAP *Envelope*  
 698 extensions namespace.

699 The *schemaLocation* for the namespace described above in section 3.3.1 is:

700 *[http://www.oasis-open.org/committees/ebxml-msg/schema/msg-header-2\\_0.xsd](http://www.oasis-open.org/committees/ebxml-msg/schema/msg-header-2_0.xsd)*

701 Separate *schemaLocation* attribute are RECOMMENDED so tools, which may not correctly use the  
 702 *schemaLocation* attribute to resolve schema for more than one namespace, will still be capable of  
 703 validating an ebXML SOAP *message*. For example:

```
704 <SOAP:Envelope xmlns:SOAP="http://schemas.xmlsoap.org/soap/envelope/"
```

```

705     xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
706
707     xsi:schemaLocation="http://schemas.xmlsoap.org/soap/envelope/
708     http://www.oasis-open.org/committees/ebxml-msg/schema/envelope.xsd">
709     <SOAP:Header
710
711         xmlns:eb="http://www.oasis-open.org/committees/ebxml-msg/schema/msg-header-2_0.xsd"
712         xsi:schemaLocation="http://www.oasis-
713     open.org/committees/ebxml-msg/schema/msg-header-2_0.xsd
714         http://www.oasis-
715     open.org/committees/ebxml-msg/schema/msg-header-2_0.xsd">
716         <eb:MessageHeader ...>
717             ...
718         </eb:MessageHeader>
719     </SOAP:Header>
720     <SOAP:Body
721
722         xmlns:eb="http://www.oasis-open.org/committees/ebxml-msg/schema/msg-header-2_0.xsd"
723         xsi:schemaLocation="http://www.oasis-
724     open.org/committees/ebxml-msg/schema/msg-header-2_0.xsd
725         http://www.oasis-
726     open.org/committees/ebxml-msg/schema/msg-header-2_0.xsd">
727         <eb:Manifest eb:version="2.0">
728             ...
729         </eb:Manifest>
730     </SOAP:Body>
731 </SOAP:Envelope>

```

### 734 3.3.3 SOAP Header Element

735 The SOAP *Header* element is the first child element of the SOAP *Envelope* element. It MUST have  
 736 a namespace qualifier that matches the SOAP *Envelope* namespace declaration for the namespace  
 737 "http://schemas.xmlsoap.org/soap/envelope/".

### 738 3.3.4 SOAP Body Element

739 The SOAP *Body* element is the second child element of the SOAP *Envelope* element. It MUST  
 740 have a namespace qualifier that matches the SOAP *Envelope* namespace declaration for the  
 741 namespace "http://schemas.xmlsoap.org/soap/envelope/".

### 742 3.3.5 ebXML SOAP Extensions

743 An ebXML Message extends the SOAP *Message* with the following principal extension elements:

#### 744 3.3.5.1 SOAP Header extensions:

- 745 • *MessageHeader* – a REQUIRED element containing routing information for the message  
 746 (To/From, etc.) as well as other context information about the message.
- 747 • *SyncReply* – an element indicating the required transport state to the next SOAP node.

#### 748 3.3.5.2 SOAP Body extension:

- 749 • *Manifest* – an element pointing to any data present either in the *Payload Container(s)* or  
 750 elsewhere, e.g. on the web. This element MAY be omitted.

#### 751 3.3.5.3 Core ebXML Modules:

- 752 • Error Handling Module
  - 753 - *ErrorList* – a SOAP Header element containing a list of the errors being reported against a previous  
 754 message. The *ErrorList* element is only used if reporting an error or warning on a previous message.  
 755 This element MAY be omitted.

- 756 • Security Module
- 757 - **Signature** – an element that contains a digital signature that conforms to [XMLDSIG] that signs
- 758 data associated with the message. This element MAY be omitted.

### 759 3.3.6 #wildcard Element Content

760 Some ebXML SOAP extension elements, as indicated in the schema, allow for foreign namespace-  
761 qualified element content to be added for extensibility. The extension element content MUST be  
762 namespace-qualified in accordance with XMLNS [XMLNS] and MUST belong to a foreign  
763 namespace. A foreign namespace is one that is NOT [http://www.oasis-open.org/committees/ebxml-  
765 msg/schema/msg-header-2\\_0.xsd](http://www.oasis-open.org/committees/ebxml-<br/>764 msg/schema/msg-header-2_0.xsd). The wildcard elements are provided wherever extensions might be  
required for private extensions or future expansions to the protocol.

766 An implementation of the MSH MAY ignore the namespace-qualified element and its content.

### 767 3.3.7 id attribute

768 Each of the ebXML SOAP extension elements defined in this specification has an *id* attribute which  
769 is an XML ID that MAY be added to provide for the ability to uniquely identify the element within the  
770 SOAP *Message*. This MAY be used when applying a digital signature to the ebXML SOAP *Message*  
771 as individual ebXML SOAP extension elements can be targeted for inclusion or exclusion by  
772 specifying a URI of "#<idvalue>" in the *Reference* element.

### 773 3.3.8 version attribute

774 The REQUIRED *version* attribute indicates the version of the ebXML Message Service Header  
775 Specification to which the ebXML *SOAP Header* extensions conform. Its purpose is to provide  
776 future versioning capabilities. For conformance to this specification, all of the version attributes on  
777 any SOAP extension elements defined in this specification MUST have a value of "2.1". An ebXML  
778 message MAY contain SOAP header extension elements that have a value other than "2.1". An  
779 implementation conforming to this specification that receives a message with ebXML SOAP  
780 extensions qualified with a version other than "2.1" MAY process the message if it recognizes the  
781 version identified and is capable of processing it. It MUST respond with an error, with the *errorCode*  
782 set to "NotUnderstood" if it does not recognize the identified version. The *version* attribute MUST be  
783 namespace qualified for the ebXML SOAP *Envelope* extensions namespace defined above.

784 Use of multiple versions of ebXML SOAP extensions elements within the same ebXML SOAP  
785 document, while supported, should only be used in extreme cases where it becomes necessary to  
786 semantically change an element, which cannot wait for the next ebXML Message Service  
787 Specification version release.

#### 788 Note: Backwards compatibility with 2.0

789 A 2.1 compliant MSH should be able to interoperate with 2.0 compliant MSHs. In the interest of  
790 compatibility with older 2.0 MSHs, implementers may choose to declare the value of the version  
791 attribute to be "2.0" on a case by case basis.

### 792 3.3.9 SOAP mustUnderstand attribute

793 The REQUIRED SOAP *mustUnderstand* attribute on SOAP *Header* extensions, namespace  
794 qualified to the SOAP namespace (<http://schemas.xmlsoap.org/soap/envelope/>), indicates whether  
795 the contents of the element MUST be understood by a receiving process or else the message MUST  
796 be rejected in accordance with SOAP [SOAP]. This attribute with a value of '1' (true) indicates the  
797 element MUST be understood or rejected. This attribute with a value of '0' (false), the default,  
798 indicates the element may be ignored if not understood.

### 799 **3.3.10 ebXML "Next MSH" actor URI**

800 The URI *urn:oasis:names:tc:ebxml-msg:actor:nextMSH* when used in the context of the SOAP  
801 *actor* attribute value SHALL be interpreted to mean an entity that acts in the role of an instance of  
802 the ebXML MSH conforming to this specification.

803 This *actor* URI has been established to allow for the possibility that SOAP nodes that are NOT  
804 ebXML MSH nodes MAY participate in the message path of an *ebXML Message*. An example might  
805 be a SOAP node that digitally signs or encrypts a message.

806 All ebXML MSH nodes MUST act in this role.

### 807 **3.3.11 ebXML "To Party MSH" actor URI**

808 The URI *urn:oasis:names:tc:ebxml-msg:actor:toPartyMSH* when used in the context of the  
809 SOAP *actor* attribute value SHALL be interpreted to mean an instance of an ebXML MSH node,  
810 conforming to this specification, acting in the role of the Party identified in the  
811 *MessageHeader/ToPartyId* element of the same message. An ebXML MSH MAY be configured to  
812 act in this role. How this is done is outside the scope of this specification.

813 The MSH that is the ultimate destination of ebXML messages MUST act in the role of the *To Party*  
814 *MSH* actor URI in addition to acting in the default actor as defined by SOAP.

---

## 815 4 Core Extension Elements

### 816 4.1 MessageHeader Element

817 The *MessageHeader* element is REQUIRED in all ebXML Messages. It MUST be present as a child  
818 element of the SOAP *Header* element.

819 The *MessageHeader* element is a composite element comprised of the following subordinate  
820 elements:

- 821 • an *id* attribute (see section 3.3.7 for details)
- 822 • a *version* attribute (see section 3.3.8 for details)
- 823 • a SOAP *mustUnderstand* attribute with a value of "1" (see section 3.3.9 for details)
- 824 • *From* element
- 825 • *To* element
- 826 • *CPAId* element
- 827 • *ConversationId* element
- 828 • *Service* element
- 829 • *Action* element
- 830 • *MessageData* element
- 831 • *DuplicateElimination* element
- 832 • *Description* element

#### 833 4.1.1 From and To Elements

834 The REQUIRED *From* element identifies the *Party* that originated the message. The REQUIRED *To*  
835 element identifies the *Party* that is the intended recipient of the message. Both *To* and *From* can  
836 contain logical identifiers, such as a DUNS number, or identifiers that also imply a physical location  
837 such as an eMail address.

838 The *From* and the *To* elements each contains:

- 839 • *PartyId* elements – occurs one or more times
- 840 • *Role* element – occurs zero or one times.

841 If either the *From* or *To* elements contains multiple *PartyId* elements, all members of the list MUST  
842 identify the same organization. Unless a single *type* value refers to multiple identification systems,  
843 the value of any given *type* attribute MUST be unique within the list of *PartyId* elements contained  
844 within either the *From* or *To* element.

845 Note: This mechanism is particularly useful when transport of a message between the parties may  
846 involve multiple intermediaries. More generally, the *From Party* should provide identification in all  
847 domains it knows in support of intermediaries and destinations that may give preference to particular  
848 identification systems.

849 The *From* and *To* elements contain zero or one *Role* child element that, if present, SHALL  
850 immediately follow the last *PartyId* child element.

##### 851 4.1.1.1 PartyId Element

852 The *PartyId* element has a single attribute, *type* and the content is a string value. The *type* attribute  
853 indicates the domain of names to which the string in the content of the *PartyId* element belongs. The  
854 value of the *type* attribute MUST be mutually agreed and understood by each of the *Parties*. It is

855 RECOMMENDED that the value of the *type* attribute be a URI. It is further recommended that these  
856 values be taken from the EDIRA (ISO 6523), EDIFACT ISO 9735 or ANSI ASC X12 I05 registries.

857 If the *PartyId type* attribute is not present, the content of the *PartyId* element MUST be a URI  
858 [RFC2396], otherwise the *Receiving MSH* SHOULD report an error (see section 5.1.5) with  
859 *errorCode* set to *Inconsistent* and *severity* set to *Error*. It is strongly RECOMMENDED that the  
860 content of the *PartyId* element be a URI.

#### 861 4.1.1.2 Role Element

862 The *Role* element, if present, identifies the authorized role (*fromAuthorizedRole* or  
863 *toAuthorizedRole*) of the *Party* sending (when present as a child of the *From* element) and/or  
864 receiving (when present as a child of the *To* element) the message. The value of the *Role* element is  
865 a non-empty string, which is specified in the *CPA*.

866 **Note:** Use of a URI for the value of the Role element is RECOMMENDED.

867 The following fragment demonstrates usage of the *From* and *To* elements.

```
868 <eb:From>
869   <eb:PartyId eb:type="urn:duns">123456789</eb:PartyId>
870   <eb:PartyId eb:type="SCAC">RDWY</eb:PartyId>
871   <eb:Role>http://rosettanet.org/roles/Buyer</eb:Role>
872 </eb:From>
873 <eb:To>
874   <eb:PartyId>mailto:joe@example.com</eb:PartyId>
875   <eb:Role>http://rosettanet.org/roles/Seller</eb:Role>
876 </eb:To>
```

#### 877 4.1.2 CPAId Element

878 The REQUIRED *CPAId* element is a string that identifies the parameters governing the exchange of  
879 messages between the parties. The recipient of a message MUST be able to resolve the *CPAId* to  
880 an individual set of parameters, taking into account the sender of the message.

881 The value of a *CPAId* element MUST be unique within a namespace mutually agreed by the two  
882 parties. This could be a concatenation of the *From* and *To PartyId* values, a URI prefixed with the  
883 Internet domain name of one of the parties, or a namespace offered and managed by some other  
884 naming or registry service. It is RECOMMENDED that the *CPAId* be a URI.

885 The *CPAId* MAY reference an instance of a *CPA* as defined in the ebXML Collaboration Protocol  
886 Profile and Agreement Specification [ebCPP]. An example of the *CPAId* element follows:

```
887 <eb:CPAId>http://example.com/cpas/ourcpawithyou.xml</eb:CPAId>
```

888 The messaging parameters are determined by the appropriate elements from the *CPA*, as identified  
889 by the *CPAId* element.

890 If a receiver determines that a message is in conflict with the *CPA*, the appropriate handling of this  
891 conflict is undefined by this specification. Therefore, senders SHOULD NOT generate such  
892 messages unless they have prior knowledge of the receiver's capability to deal with this conflict.

893 If a *Receiving MSH* detects an inconsistency, then it MUST report it with an *errorCode* of  
894 *Inconsistent* and a *severity* of *Error*. If the *CPAId* is not recognized, then it MUST report it with an  
895 *errorCode* of *NotRecognized* and a *severity* of *Error*.

#### 896 4.1.3 ConversationId Element

897 The REQUIRED *ConversationId* element is a string identifying the set of related messages that  
898 make up a conversation between two *Parties*. It MUST be unique within the context of the specified  
899 *CPAId*. The *Party* initiating a conversation determines the value of the *ConversationId* element that  
900 SHALL be reflected in all messages pertaining to that conversation.

901 The **ConversationId** enables the recipient of a message to identify the instance of an application or  
 902 process that generated or handled earlier messages within a conversation. It remains constant for all  
 903 messages within a conversation.

904 The value used for a **ConversationId** is implementation dependent. An example of the  
 905 **ConversationId** element follows:

```
<eb:ConversationId>20001209-133003-28572</eb:ConversationId>
```

907 Note: Implementations are free to choose how they will identify and store conversational state  
 908 related to a specific conversation. Implementations SHOULD provide a facility for mapping between  
 909 their identification scheme and a **ConversationId** generated by another implementation.

#### 910 4.1.4 Service Element

911 The REQUIRED **Service** element identifies the *service* that acts on the message and it is specified  
 912 by the designer of the *service*. The designer of the *service* may be:

- 913 • a standards organization, or
- 914 • an individual or enterprise

915 Note: In the context of an ebXML business process model, an action equates to the lowest possible  
 916 role based activity in the Business Process [ebBPSS] (requesting or responding role) and a service is  
 917 a set of related actions for an authorized role within a party.

918 An example of the **Service** element follows:

```
<eb:Service>urn:services:SupplierOrderProcessing</eb:Service>
```

920 Note: URIs in the **Service** element that start with the namespace *urn:oasis:names:tc:ebxml-*  
 921 *msg:service* are reserved for use by this specification.

922 The **Service** element has a single *type* attribute.

##### 923 4.1.4.1 type attribute

924 If the *type* attribute is present, it indicates the parties sending and receiving the message know, by  
 925 some other means, how to interpret the content of the **Service** element. The two parties MAY use  
 926 the value of the *type* attribute to assist in the interpretation.

927 If the *type* attribute is not present, the content of the **Service** element MUST be a URI [RFC2396]. If  
 928 it is not a URI then report an error with *errorCode* of *Inconsistent* and *severity* of *Error* (see  
 929 section 5.1.5).

#### 930 4.1.5 Action Element

931 The REQUIRED **Action** element identifies a process within a **Service** that processes the Message.  
 932 **Action** SHALL be unique within the **Service** in which it is defined. The value of the **Action** element  
 933 is specified by the designer of the *service*. An example of the **Action** element follows:

```
<eb>Action>NewOrder</eb>Action>
```

935 If the value of either the **Service** or **Action** element are unrecognized by the *Receiving MSH*, then it  
 936 MUST report the error with an *errorCode* of *NotRecognized* and a *severity* of *Error*.

#### 937 4.1.6 MessageData Element

938 The REQUIRED **MessageData** element provides a means of uniquely identifying an ebXML  
 939 Message. It contains the following:

- 940 • *MessageId* element
- 941 • *Timestamp* element

- 942 • *RefToMessageId* element
- 943 • *TimeToLive* element

944 The following fragment demonstrates the structure of the *MessageData* element:

```

945     <eb:MessageData>
946     <eb:MessageId>20001209-133003-28572@example.com</eb:MessageId>
947     <eb:Timestamp>2001-02-15T11:12:12</eb:Timestamp>
948     <eb:RefToMessageId>20001209-133003-28571@example.com</eb:RefToMessageId>
949     </eb:MessageData>

```

#### 950 4.1.6.1 MessageId Element

951 The REQUIRED element *MessageId* is a globally unique identifier for each message conforming to  
 952 MessageId [RFC2822].

953 Note: In the Message-Id and Content-Id MIME headers, values are always surrounded by angle  
 954 brackets. However references in mid: or cid: scheme URI's and the MessageId and  
 955 RefToMessageId elements MUST NOT include these delimiters.

#### 956 4.1.6.2 Timestamp Element

957 The REQUIRED *Timestamp* is a value representing the time that the message header was created  
 958 conforming to a dateTime [XMLSchema] and MUST be expressed as UTC. Indicating UTC in the  
 959 *Timestamp* element by including the 'Z' identifier is optional.

#### 960 4.1.6.3 RefToMessageId Element

961 The *RefToMessageId* element has a cardinality of zero or one. When present, it MUST contain the  
 962 *MessageId* value of an earlier ebXML Message to which this message relates. If there is no earlier  
 963 related message, the element MUST NOT be present.

964 For Error messages, the *RefToMessageId* element is REQUIRED and its value MUST be the  
 965 *MessageId* value of the message in error (as defined in section 5.2).

#### 966 4.1.6.4 TimeToLive Element

967 If the *TimeToLive* element is present, it MUST be used to indicate the time, expressed as UTC, by  
 968 which a message should be delivered to the *To Party MSH*. It MUST conform to an XML Schema  
 969 dateTime.

970 In this context, the *TimeToLive* has expired if the time of the internal clock, adjusted for UTC, of the  
 971 *Receiving MSH* is greater than the value of *TimeToLive* for the message.

972 If the *To Party's MSH* receives a message where *TimeToLive* has expired, it SHALL send a  
 973 message to the *From Party MSH*, reporting that the *TimeToLive* of the message has expired. This  
 974 message SHALL be comprised of an *ErrorList* containing an error with the *errorCode* attribute set  
 975 to *TimeToLiveExpired* and the *severity* attribute set to *Error*.

976 The *TimeToLive* element is discussed further under Reliable Messaging in section 7.4.5.

#### 977 4.1.7 DuplicateElimination Element

978 The *DuplicateElimination* element, if present, identifies a request by the sender for the receiving  
 979 MSH to check for duplicate messages (see section 7.4.1 for more details).

980 Valid values for *DuplicateElimination*:

- 981 • *DuplicateElimination* present – duplicate messages SHOULD be eliminated.
- 982 • *DuplicateElimination* not present – MAY result in either best-effort or at-least-once behaviour.

983 The **DuplicateElimination** element MUST NOT be present if the DeliveryChannel for the message  
 984 in the CPA identified by CPAId has a value of "never". The **DuplicateElimination** element MUST be  
 985 present if the DeliveryChannel for the message in the CPA identified by CPAId has a value of  
 986 "always". (see section 7.4.1 and section 7.6 for more details).

#### 987 4.1.8 Description Element

988 The **Description** element may be present zero or more times. Its purpose is to provide a human  
 989 readable description of the purpose or intent of the message. The language of the description is  
 990 defined by a required **xml:lang** attribute. The **xml:lang** attribute MUST comply with the rules for  
 991 identifying languages specified in XML [XML]. Each occurrence SHOULD have a different value for  
 992 **xml:lang**.

#### 993 4.1.9 MessageHeader Sample

994 The following fragment demonstrates the structure of the **MessageHeader** element within the SOAP  
 995 **Header**:

```

996 <eb:MessageHeader eb:id="..." eb:version="2.0" SOAP:mustUnderstand="1">
997   <eb:From>
998     <eb:PartyId>uri:example.com</eb:PartyId>
999     <eb:Role>http://rosettanet.org/roles/Buyer</eb:Role>
1000   </eb:From>
1001   <eb:To>
1002     <eb:PartyId eb:type="someType">QRS543</eb:PartyId>
1003     <eb:Role>http://rosettanet.org/roles/Seller</eb:Role>
1004   </eb:To>
1005   <eb:CPAId>http://www.oasis-open.org/cpa/123456</eb:CPAId>
1006   <eb:ConversationId>987654321</eb:ConversationId>
1007   <eb:Service eb:type="myservicetypes">QuoteToCollect</eb:Service>
1008   <eb:Action>NewPurchaseOrder</eb:Action>
1009   <eb:MessageData>
1010     <eb:MessageId>UUID-2@example.com</eb:MessageId>
1011     <eb:Timestamp>2000-07-25T12:19:05</eb:Timestamp>
1012     <eb:RefToMessageId>UUID-1@example.com</eb:RefToMessageId>
1013   </eb:MessageData>
1014   <eb:DuplicateElimination/>
1015 </eb:MessageHeader>

```

#### 1016 4.2 Manifest Element

1017 The **Manifest** element MAY be present as a child of the SOAP **Body** element. The **Manifest**  
 1018 element is a composite element consisting of one or more **Reference** elements. Each **Reference**  
 1019 element identifies payload data associated with the message, whether included as part of the  
 1020 message as payload document(s) contained in a **Payload Container**, or remote resources accessible  
 1021 via a URL. It is RECOMMENDED that no payload data be present in the SOAP **Body**. The purpose  
 1022 of the **Manifest** is:

- 1023 • to make it easier to directly extract a particular payload associated with this ebXML Message,
- 1024 • to allow an application to determine whether it can process the payload without having to parse it.

1025 The **Manifest** element is comprised of the following:

- 1026 • an **id** attribute (see section 3.3.7 for details)
- 1027 • a **version** attribute (see section 3.3.8 for details)
- 1028 • one or more **Reference** elements

## 1029 4.2.1 Reference Element

1030 The *Reference* element is a composite element consisting of the following subordinate elements:

- 1031 • zero or more *Schema* elements – information about the schema(s) that define the instance document
- 1032 identified in the parent *Reference* element
- 1033 • zero or more *Description* elements – a textual description of the payload object referenced by the
- 1034 parent *Reference* element

1035 The *Reference* element itself is a simple link [XLINK]. It should be noted that the use of XLINK in this  
 1036 context is chosen solely for the purpose of providing a concise vocabulary for describing an  
 1037 association. Use of an XLINK processor or engine is NOT REQUIRED, but may prove useful in  
 1038 certain implementations.

1039 The *Reference* element has the following attribute content in addition to the element content  
 1040 described above:

- 1041 • *id* – an XML ID for the *Reference* element,
- 1042 • *xlink:type* – this attribute defines the element as being an XLINK simple link. It has a fixed value of
- 1043 'simple',
- 1044 • *xlink:href* – this REQUIRED attribute has a value that is the URI of the payload object referenced. It
- 1045 SHALL conform to the XLINK [XLINK] specification criteria for a simple link.
- 1046 • *xlink:role* – this attribute identifies some resource that describes the payload object or its purpose. If
- 1047 present, then it SHALL have a value that is a valid URI in accordance with the [XLINK] specification,
- 1048 • Any other namespace-qualified attribute MAY be present. A *Receiving MSH* MAY choose to ignore any
- 1049 foreign namespace attributes other than those defined above.

1050 The designer of the business process or information exchange using ebXML Messaging decides what  
 1051 payload data is referenced by the *Manifest* and the values to be used for *xlink:role*.

### 1052 4.2.1.1 Schema Element

1053 If the item being referenced has schema(s) of some kind that describe it (e.g. an XML Schema, DTD  
 1054 and/or a database schema), then the *Schema* element SHOULD be present as a child of the  
 1055 *Reference* element. It provides a means of identifying the schema and its version defining the  
 1056 payload object identified by the parent *Reference* element. The *Schema* element contains the  
 1057 following attributes:

- 1058 • *location* – the REQUIRED URI of the schema
- 1059 • *version* – a version identifier of the schema

### 1060 4.2.1.2 Description Element

1061 See section 4.1.8 for more details. An example of a *Description* element follows.

```
1062 <eb:Description xml:lang="en-GB">Purchase Order for 100,000  
1063 widgets</eb:Description>
```

## 1064 4.2.2 Manifest Validation

1065 If an *xlink:href* attribute contains a URI that is a content id (URI scheme "cid") then a MIME part  
 1066 with that content-id MUST be present in the corresponding *Payload Container* of the message. If it is  
 1067 not, then the error SHALL be reported to the *From Party* with an *errorCode* of *MimeProblem* and a  
 1068 *severity* of *Error*.

1069 If an *xlink:href* attribute contains a URI, not a content id (URI scheme "cid"), and the URI cannot be  
 1070 resolved, it is an implementation decision whether to report the error. If the error is to be reported, it  
 1071 SHALL be reported to the *From Party* with an *errorCode* of *MimeProblem* and a *severity* of *Error*.

1072 Note: If a payload exists, which is not referenced by the *Manifest*, that payload SHOULD be  
1073 discarded.

### 1074 4.2.3 Manifest Sample

1075 The following fragment demonstrates a typical *Manifest* for a single payload MIME body part:

```
1076     <eb:Manifest eb:id="Manifest" eb:version="2.0">  
1077         <eb:Reference eb:id="pay01"  
1078             xlink:href="cid:payload-1"  
1079             xlink:role="http://regrep.org/gci/purchaseOrder">  
1080             <eb:Schema  
1081 eb:location="http://regrep.org/gci/purchaseOrder/po.xsd" eb:version="2.0"/>  
1082             <eb:Description xml:lang="en-US">Purchase Order for 100,000  
1083 widgets</eb:Description>  
1084             </eb:Reference>  
1085         </eb:Manifest>
```

---

## 5 Core Modules

### 5.1 Security Module

The *ebXML Message Service*, by its very nature, presents certain security risks. A Message Service may be at risk by means of:

- Unauthorized access
- Data integrity and/or confidentiality attacks (e.g. through man-in-the-middle attacks)
- Denial-of-Service and spoofing

Each security risk is described in detail in the ebXML Technical Architecture Risk Assessment Technical Report [secRISK].

Each of these security risks may be addressed in whole, or in part, by the application of one, or a combination, of the countermeasures described in this section. This specification describes a set of profiles, or combinations of selected countermeasures, selected to address key risks based upon commonly available technologies. Each of the specified profiles includes a description of the risks that are not addressed. See Appendix C for a table of security profiles.

Application of countermeasures SHOULD be balanced against an assessment of the inherent risks and the value of the asset(s) that might be placed at risk. For this specification, a *Signed Message* is any message containing a *Signature* element.

#### 5.1.1 Signature Element

An ebXML Message MAY be digitally signed to provide security countermeasures. Zero or more *Signature* elements, belonging to the XML Signature [XMLDSIG] defined namespace, MAY be present as a child of the SOAP *Header*. The *Signature* element MUST be namespace qualified in accordance with XML Signature [XMLDSIG]. The structure and content of the *Signature* element MUST conform to the XML Signature [XMLDSIG] specification. If there is more than one *Signature* element contained within the SOAP *Header*, the first MUST represent the digital signature of the ebXML Message as signed by the *From Party MSH* in conformance with section 5.1. Additional *Signature* elements MAY be present, but their purpose is undefined by this specification.

Refer to section 5.1.3 for a detailed discussion on how to construct the *Signature* element when digitally signing an ebXML Message.

#### 5.1.2 Security and Management

No technology, regardless of how advanced it might be, is an adequate substitute to the effective application of security management policies and practices.

It is strongly RECOMMENDED that the site manager of an *ebXML Message Service* apply due diligence to the support and maintenance of its security mechanisms, site (or physical) security procedures, cryptographic protocols, update implementations and apply fixes as appropriate. (See <http://www.cert.org/> and <http://ciac.llnl.gov/>)

##### 5.1.2.1 Collaboration Protocol Agreement

The configuration of Security for MSHs is specified in the *CPA*. Two areas of the *CPA* have security definitions as follows:

- The Document Exchange section addresses security to be applied to the payload of the message. The MSH is not responsible for any security specified at this level but may offer these services to the message sender.

1170 The result of this [XPath] statement excludes all elements within the SOAP *Envelope* which contain  
 1171 a SOAP:*actor* attribute targeting the *nextMSH*, and all their descendants. It also excludes all  
 1172 elements with *actor* attributes targeting the element at the next node (which may change en route).  
 1173 Any intermediate node or MSH MUST NOT change, format or in any way modify any element not  
 1174 targeted to the intermediary. Intermediate nodes MUST NOT add or delete white space. Any such  
 1175 change may invalidate the signature.

1176 The last *Transform* element SHOULD have an *Algorithm* attribute with a value of:

```
<Transform Algorithm="http://www.w3.org/TR/2001/REC-xml-c14n-20010315"/>
```

1178 The result of this algorithm is to canonicalize the SOAP *Envelope* XML and exclude comments.

1179 Note: These transforms are intended for the SOAP Envelope and its contents. These transforms  
 1180 are NOT intended for the payload objects. The determination of appropriate transforms for each  
 1181 payload is left to the implementation.

1182 Each payload object requiring signing SHALL be represented by a [XMLDSIG] *Reference* element  
 1183 that SHALL have a *URI* attribute resolving to the payload object. This can be either the Content-Id  
 1184 URI of the MIME body part of the payload object, or a URI matching the Content-Location of the  
 1185 MIME body part of the payload object, or a URI that resolves to a payload object external to the  
 1186 Message Package. It is strongly RECOMMENDED that the URI attribute value match the xlink:href  
 1187 URI value of the corresponding *Manifest/Reference* element for the payload object.

1188 Note: When a transfer encoding (e.g. base64) specified by a Content-Transfer-Encoding MIME  
 1189 header is used for the SOAP Envelope or payload objects, the signature generation MUST be  
 1190 executed before the encoding.

1191 Example of digitally signed ebXML SOAP *Message*:

```
1192 <?xml version="1.0" encoding="utf-8"?>
1193 <SOAP:Envelope xmlns:xlink="http://www.w3.org/1999/xlink"
1194     xmlns:SOAP="http://schemas.xmlsoap.org/soap/envelope/"
1195     xmlns:eb="http://www.oasis-open.org/committees/ebxml-
1196 msg/schema/msg-header-2_0.xsd"
1197     xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
1198     xsi:schemaLocation="http://schemas.xmlsoap.org/soap/envelope/
1199 http://www.oasis-open.org/committees/ebxml-msg/schema/envelope.xsd
1200 http://www.oasis-open.org/committees/ebxml-msg/schema/msg-header-2_0.xsd
1201 http://www.oasis-open.org/committees/ebxml-msg/schema/msg-header-2_0.xsd" >
1202 <SOAP:Header>
1203     <eb:MessageHeader eb:id="..." eb:version="2.0"
1204     SOAP:mustUnderstand="1">
1205         ...
1206     </eb:MessageHeader>
1207     <Signature xmlns="http://www.w3.org/2000/09/xmldsig#" >
1208         <SignedInfo>
1209             <CanonicalizationMethod
1210             Algorithm="http://www.w3.org/TR/2001/REC-xml-c14n-20010315"/>
1211             <SignatureMethod
1212             Algorithm="http://www.w3.org/2000/09/xmldsig#dsa-sha1"/>
1213             <Reference URI="" >
1214                 <Transforms>
1215                     <Transform
1216                     Algorithm="http://www.w3.org/2000/09/xmldsig#enveloped-signature"/>
1217                     <Transform
1218                     Algorithm="http://www.w3.org/TR/1999/REC-xpath-19991116">
1219                         <XPath> not(ancestor-or-
1220 self::())[@SOAP:actor=
```

```

1224     &quot;urn:oasis:names:tc:ebxml-msg:actor:nextMSH&quot; ]
1225
1226 ancestor-or-self::() [ @SOAP:actor=
1227
1228     &quot;http://schemas.xmlsoap.org/soap/actor/next&quot; ] )
1229
1230         </XPath>
1231     </Transform>
1232     <Transform
1233 Algorithm="http://www.w3.org/TR/2001/REC-xml-c14n-20010315"/>
1234     </Transforms>
1235     <DigestMethod
1236 Algorithm="http://www.w3.org/2000/09/xmlsig#sha1"/>
1237     <DigestValue>...</DigestValue>
1238     </Reference>
1239     <Reference URI="cid://blahblahblah/">
1240     <DigestMethod
1241 Algorithm="http://www.w3.org/2000/09/xmlsig#sha1"/>
1242     <DigestValue>...</DigestValue>
1243     </Reference>
1244     </SignedInfo>
1245     <SignatureValue>...</SignatureValue>
1246     <KeyInfo>...</KeyInfo>
1247     </Signature>
1248 </SOAP:Header>
1249 <SOAP:Body>
1250     <eb:Manifest eb:id="Mani01" eb:version="2.0">
1251     <eb:Reference xlink:href="cid://blahblahblah/"
1252 xlink:role="http://ebxml.org/gci/invoice">
1253     <eb:Schema eb:version="2.0"
1254 eb:location="http://ebxml.org/gci/busdocs/invoice.dtd"/>
1255     </eb:Reference>
1256     </eb:Manifest>
1257 </SOAP:Body>
1258 </SOAP:Envelope>

```

## 1259 5.1.4 Countermeasure Technologies

### 1260 5.1.4.1 Persistent Digital Signature

1261 The only available technology that can be applied to the purpose of digitally signing an ebXML  
1262 Message (the ebXML SOAP *Header* and *Body* and its associated payload objects) is provided by  
1263 technology that conforms to the W3C/IETF joint XML Signature specification [XMLDSIG]. An XML  
1264 Signature conforming to this specification can selectively sign portions of an XML document(s),  
1265 permitting the documents to be augmented (new element content added) while preserving the  
1266 validity of the signature(s).

1267 If signatures are being used to digitally sign an ebXML Message then XML Signature [DSIG] MUST  
1268 be used to bind the ebXML SOAP *Header* and *Body* to the ebXML Payload Container(s) or data  
1269 elsewhere on the web that relate to the message.

1270 An ebXML Message requiring a digital signature SHALL be signed following the process defined in  
1271 this section of the specification and SHALL be in full compliance with XML Signature [XMLDSIG].

### 1272 5.1.4.2 Persistent Signed Receipt

1273 An *ebXML Message* that has been digitally signed MAY be acknowledged with an *Acknowledgment*  
1274 *Message* that itself is digitally signed in the manner described in the previous section. The  
1275 *Acknowledgment Message* MUST contain a [XMLDSIG] *Reference* element list consistent with  
1276 those contained in the [XMLDSIG] *Signature* element of the original message.

### 1277 **5.1.4.3 Non-persistent Authentication**

1278 Non-persistent authentication is provided by the communications channel used to transport the  
1279 *ebXML Message*. This authentication MAY be either in one direction or bi-directional. The specific  
1280 method will be determined by the communications protocol used. For instance, the use of a secure  
1281 network protocol, such as TLS [RFC2246] or IPSEC [RFC2402] provides the sender of an *ebXML*  
1282 *Message* with a way to authenticate the destination for the TCP/IP environment.

### 1283 **5.1.4.4 Non-persistent Integrity**

1284 A secure network protocol such as TLS [RFC2246] or IPSEC [RFC2402] MAY be configured to  
1285 provide for digests and comparisons of the packets transmitted via the network connection.

### 1286 **5.1.4.5 Persistent Confidentiality**

1287 XML Encryption is a W3C/IETF joint activity actively engaged in the drafting of a specification for the  
1288 selective encryption of an XML document(s). It is anticipated that this specification will be completed  
1289 within the next year. The ebXML Transport, Routing and Packaging team for v1.0 of this  
1290 specification has identified this technology as the only viable means of providing persistent, selective  
1291 confidentiality of elements within an *ebXML Message* including the SOAP *Header*.

1292 Confidentiality for ebXML Payload Containers MAY be provided by functionality possessed by a  
1293 MSH. Payload confidentiality MAY be provided by using XML Encryption (when available) or some  
1294 other cryptographic process (such as S/MIME [S/MIME], [S/MIMEV3], or PGP MIME [PGP/MIME])  
1295 bilaterally agreed upon by the parties involved. The XML Encryption standard shall be the default  
1296 encryption method when XML Encryption has achieved W3C Recommendation status.

1297 Note: When both signature and encryption are required of the MSH, sign first and then encrypt.

### 1298 **5.1.4.6 Non-persistent Confidentiality**

1299 A secure network protocol, such as TLS [RFC2246] or IPSEC [RFC2402], provides transient  
1300 confidentiality of a message as it is transferred between two ebXML adjacent MSH nodes.

### 1301 **5.1.4.7 Persistent Authorization**

1302 The OASIS Security Services Technical Committee (TC) is actively engaged in the definition of a  
1303 specification that provides for the exchange of security credentials, including Name Assertion and  
1304 Entitlements, based on Security Assertion Markup Language [SAML]. Use of technology based on  
1305 this anticipated specification may provide persistent authorization for an *ebXML Message* once it  
1306 becomes available.

### 1307 **5.1.4.8 Non-persistent Authorization**

1308 A secure network protocol such as TLS [RFC2246] or IPSEC [RFC2402] MAY be configured to  
1309 provide for bilateral authentication of certificates prior to establishing a session. This provides for the  
1310 ability for an ebXML MSH to authenticate the source of a connection and to recognize the source as  
1311 an authorized source of *ebXML Messages*.

### 1312 **5.1.4.9 Trusted Timestamp**

1313 At the time of this specification, services offering trusted timestamp capabilities are becoming  
1314 available. Once these become more widely available, and a standard has been defined for their use  
1315 and expression, these standards, technologies and services will be evaluated and considered for use  
1316 in later versions of this specification.

## 1317 5.1.5 Security Considerations

1318 Implementers should take note, there is a vulnerability present even when an XML Digital Signature  
1319 is used to protect to protect the integrity and origin of ebXML messages. The significance of the  
1320 vulnerability necessarily depends on the deployed environment and the transport used to exchange  
1321 ebXML messages.

1322 The vulnerability is present because ebXML messaging is an integration of both XML and MIME  
1323 technologies. Whenever two or more technologies are conjoined there are always additional  
1324 (sometimes unique) security issues to be addressed. In this case, MIME is used as the framework  
1325 for the message package, containing the SOAP *Envelope* and any payload containers. Various  
1326 elements of the SOAP *Envelope* make reference to the payloads, identified via MIME mechanisms.  
1327 In addition, various labels are duplicated in both the SOAP *Envelope* and the MIME framework, for  
1328 example, the type of the content in the payload. The issue is how and when all of this information is  
1329 used.

1330 Specifically, the MIME Content-ID: header is used to specify a unique, identifying label for each  
1331 payload. The label is used in the SOAP *Envelope* to identify the payload whenever it is needed.  
1332 The MIME Content-Type: header is used to identify the type of content carried in the payload; some  
1333 content types may contain additional parameters serving to further qualify the actual type. This  
1334 information is available in the SOAP *Envelope*.

1335 The MIME headers are not protected, even when an XML-based digital signature is applied.  
1336 Although XML Encryption is not currently available and thus not currently used, its application is  
1337 developing similarly to XML digital signatures. Insofar as its application is the same as that of XML  
1338 digital signatures, its use will not protect the MIME headers. Thus, an ebXML message may be at  
1339 risk depending on how the information in the MIME headers is processed as compared to the  
1340 information in the SOAP *Envelope*.

1341 The Content-ID: MIME header is critical. An adversary could easily mount a denial-of-service attack  
1342 by mixing and matching payloads with the Content-ID: headers. As with most denial-of-service  
1343 attacks, no specific protection is offered for this vulnerability. However, it should be detected since  
1344 the digest calculated for the actual payload will not match the digest included in the SOAP *Envelope*  
1345 when the digital signature is validated.

1346 The presence of the content type in both the MIME headers and SOAP *Envelope* is a problem.  
1347 Ordinary security practices discourage duplicating information in two places. When information is  
1348 duplicated, ordinary security practices require the information in both places to be compared to  
1349 ensure they are equal. It would be considered a security violation if both sets of information fail to  
1350 match.

1351 An adversary could change the MIME headers while a message is en route from its origin to its  
1352 destination and this would not be detected when the security services are validated. This threat is  
1353 less significant in a peer-to-peer transport environment as compared to a multi-hop transport  
1354 environment. All implementations are at risk if the ebXML message is ever recorded in a long-term  
1355 storage area since a compromise of that area puts the message at risk for modification.

1356 The actual risk depends on how an implementation uses each of the duplicate sets of information. If  
1357 any processing beyond the MIME parsing for body part identification and separation is dependent on  
1358 the information in the MIME headers, then the implementation is at risk of being directed to take  
1359 unintended or undesirable actions. How this might be exploited is best compared to the common  
1360 programming mistake of permitting buffer overflows: it depends on the creativity and persistence of  
1361 the adversary.

1362 Thus, an implementation could reduce the risk by ensuring that the unprotected information in the  
1363 MIME headers is never used except by the MIME parser for the minimum purpose of identifying and  
1364 separating the body parts. This version of the specification makes no recommendation regarding  
1365 whether or not an implementation should compare the duplicate sets of information nor what action  
1366 to take based on the results of the comparison.

## 1367 5.2 Error Handling Module

1368 This section describes how one ebXML Message Service Handler (MSH) reports errors it detects in  
1369 an ebXML Message to another MSH. The *ebXML Message Service* error reporting and handling  
1370 module is to be considered as a layer of processing above the SOAP processor layer. This means  
1371 the ebXML MSH is essentially an application-level handler of a *SOAP Message* from the perspective  
1372 of the SOAP Processor. The SOAP processor MAY generate a SOAP **Fault** message if it is unable  
1373 to process the message. A *Sending MSH* MUST be prepared to accept and process these SOAP  
1374 **Fault** values.

1375 It is possible for the ebXML MSH software to cause a SOAP **Fault** to be generated and returned to  
1376 the sender of a *SOAP Message*. In this event, the returned message MUST conform to the [SOAP]  
1377 specification processing guidelines for SOAP **Fault** values.

1378 An ebXML *SOAP Message* reporting an error with a **highestSeverity** of **Warning** SHALL NOT be  
1379 reported or returned as a SOAP **Fault**.

### 1380 5.2.1.1 Definitions:

1381 For clarity, two phrases are defined for use in this section:

- 1382 • "message in error" – A *message* containing or causing an error or warning of some kind
- 1383 • "message reporting the error" – A *message* containing an ebXML **ErrorList** element that describes the  
1384 warning(s) and/or error(s) found in a message in error (also referred to as an *Error Message* elsewhere  
1385 in this document).

### 1386 5.2.2 Types of Errors

1387 One MSH needs to report errors to another MSH. For example, errors associated with:

- 1388 • ebXML namespace qualified content of the *SOAP Message* document (see section 3.3.1)
- 1389 • reliable messaging failures (see section 7.5.7)
- 1390 • security (see section 5.1)

1391 Unless specified to the contrary, all references to "an error" in the remainder of this specification imply  
1392 any or all of the types of errors listed above or defined elsewhere.

1393 Errors associated with data communications protocols are detected and reported using the standard  
1394 mechanisms supported by that data communications protocol and do not use the error reporting  
1395 mechanism described here.

### 1396 5.2.3 ErrorList Element

1397 The existence of an **ErrorList** extension element within the SOAP **Header** element indicates the  
1398 message identified by the **RefToMessageId** in the **MessageHeader** element has an error.

1399 The **ErrorList** element consists of:

- 1400 • **id** attribute (see section 3.3.7 for details)
- 1401 • a **version** attribute (see section 3.3.8 for details)
- 1402 • a SOAP **mustUnderstand** attribute with a value of "1" (see section 3.3.9 for details)
- 1403 • **highestSeverity** attribute
- 1404 • one or more **Error** elements

1405 If there are no errors to be reported then the **ErrorList** element MUST NOT be present.

### 1406 5.2.3.1 highestSeverity attribute

1407 The *highestSeverity* attribute contains the highest severity of any of the *Error* elements.  
1408 Specifically, if any of the *Error* elements have a *severity* of *Error*, *highestSeverity* MUST be set to  
1409 *Error*, otherwise, *highestSeverity* MUST be set to *Warning*.

### 1410 5.2.3.2 Error Element

1411 An *Error* element consists of:

- 1412 • *id* attribute (see section 3.3.7 for details)
- 1413 • *codeContext* attribute
- 1414 • *errorCode* attribute
- 1415 • *severity* attribute
- 1416 • *location* attribute
- 1417 • *Description* element

#### 1418 5.2.3.2.1 id attribute

1419 If the error is a part of an ebXML element, the *id* of the element MAY be provided for error tracking.

#### 1420 5.2.3.2.2 codeContext attribute

1421 The *codeContext* attribute identifies the namespace or scheme for the *errorCodes*. It MUST be a  
1422 URI. Its default value is *urn:oasis:names:tc:ebxml-msg:service:errors*. If it does not have the  
1423 default value, then it indicates an implementation of this specification has used its own *errorCode*  
1424 attribute values.

1425 Use of a *codeContext* attribute value other than the default is NOT RECOMMENDED. In addition,  
1426 an implementation of this specification should not use its own *errorCode* attribute values if an  
1427 existing *errorCode* as defined in this section has the same or very similar meaning.

#### 1428 5.2.3.2.3 errorCode attribute

1429 The REQUIRED *errorCode* attribute indicates the nature of the error in the message in error. Valid  
1430 values for the *errorCode* and a description of the code's meaning are given in the next section.

#### 1431 5.2.3.2.4 severity attribute

1432 The REQUIRED *severity* attribute indicates the severity of the error. Valid values are:

- 1433 • *Warning* – This indicates other messages in the conversation could be generated in the normal way in  
1434 spite of this problem.
- 1435 • *Error* – This indicates there is an unrecoverable error in the message and no further message  
1436 processing should occur. Appropriate failure conditions should be communicated to the Application.

#### 1437 5.2.3.2.5 location attribute

1438 The *location* attribute points to the part of the message containing the error.

1439 If an error exists in an ebXML element and the containing document is "well formed" (see XML  
1440 [XML]), then the content of the *location* attribute MUST be an XPointer [XPointer].

1441 If the error is associated with an ebXML Payload Container, then *location* contains the content-id of  
1442 the MIME part in error, using URI scheme "cid".

### 1443 5.2.3.2.6 Description Element

1444 The content of the *Description* element provides a narrative description of the error in the language  
 1445 defined by the *xml:lang* attribute. The XML parser or other software validating the message  
 1446 typically generates the message. The content is defined by the vendor/developer of the software  
 1447 that generated the *Error* element. (See section 4.1.8)

### 1448 5.2.3.3 ErrorList Sample

1449 An example of an *ErrorList* element is given below.

```

1450     <eb:ErrorList eb:id="3490sdo", eb:highestSeverity="error"
1451 eb:version="2.0" SOAP:mustUnderstand="1">
1452     <eb:Error eb:errorCode="SecurityFailure" eb:severity="Error"
1453 eb:location="URI_of_ds:Signature">
1454         <eb:Description xml:lang="en-US">Validation of
1455 signature failed<eb:Description>
1456     </eb:Error>
1457     <eb:Error ...> ... </eb:Error>
1458 </eb:ErrorList>
  
```

### 1459 5.2.3.4 errorCode values

1460 This section describes the values for the *errorCode* attribute used in a *message reporting an error*.  
 1461 They are described in a table with three headings:

- 1462 • the first column contains the value to be used as an *errorCode*, e.g. *SecurityFailure*
- 1463 • the second column contains a "Short Description" of the *errorCode*. This narrative MUST NOT be  
 1464 used in the content of the *Error* element.
- 1465 • the third column contains a "Long Description" that provides an explanation of the meaning of the error  
 1466 and provides guidance on when the particular *errorCode* should be used.

#### 1467 5.2.3.4.1 Reporting Errors in the ebXML Elements

1468 The following list contains error codes that can be associated with ebXML elements:

Error Code	Short Description	Long Description
<i>ValueNotRecognized</i>	Element content or attribute value not recognized.	Although the document is well formed and valid, the element/attribute contains a value that could not be recognized and therefore could not be used by the <i>ebXML Message Service</i> .
<i>NotSupported</i>	Element or attribute not supported	Although the document is well formed and valid, a module is present consistent with the rules and constraints contained in this specification, but is not supported by the <i>ebXML Message Service</i> processing the message.
<i>Inconsistent</i>	Element content or attribute value inconsistent with other elements or attributes.	Although the document is well formed and valid, according to the rules and constraints contained in this specification the content of an element or attribute is inconsistent with the content of other elements or their attributes.
<i>OtherXml</i>	Other error in an element content or attribute value.	Although the document is well formed and valid, the element content or attribute value contains values that do not conform to the rules and constraints contained in this specification and is not covered by other error codes. The content of the <i>Error</i> element should be used to indicate the nature of the problem.

#### 1469 5.2.3.4.2 Non-XML Document Errors

1470 The following are error codes that identify errors not associated with the ebXML elements:

Error Code	Short Description	Long Description
<i>DeliveryFailure</i>	Message Delivery Failure	A message has been received that either probably or definitely could not be sent to its next destination. Note: if <i>severity</i> is set to <i>Warning</i> then there is a small probability that the message was delivered.
<i>TimeToLiveExpired</i>	Message Time To Live Expired	A message has been received that arrived after the time specified in the <i>TimeToLive</i> element of the <i>MessageHeader</i> element.
<i>SecurityFailure</i>	Message Security Checks Failed	Validation of signatures or checks on the authenticity or authority of the sender of the message have failed.
<i>MimeProblem</i>	URI resolve error	If an xlink:href attribute contains a URI, not a content id (URI scheme "cid"), and the URI cannot be resolved, then it is an implementation decision whether to report the error.
<i>Unknown</i>	Unknown Error	Indicates that an error has occurred not covered explicitly by any of the other errors. The content of the <i>Error</i> element should be used to indicate the nature of the problem.

## 1471 5.2.4 Implementing Error Reporting and Handling

### 1472 5.2.4.1 When to Generate Error Messages

1473 When a MSH detects an error in a message it is strongly RECOMMENDED the error is reported to  
1474 the MSH that sent the message in error. This is possible when:

- 1475 • the Error Reporting Location (see section 5.2.4.2) to which the message reporting the error should be  
1476 sent can be determined
- 1477 • the message in error does not have an *ErrorList* element with *highestSeverity* set to *Error*.

1478 If the Error Reporting Location cannot be found or the message in error has an *ErrorList* element  
1479 with *highestSeverity* set to *Error*, it is RECOMMENDED:

- 1480 • the error is logged
- 1481 • the problem is resolved by other means
- 1482 • no further action is taken.

### 1483 5.2.4.2 Identifying the Error Reporting Location

1484 The Error Reporting Location is a URI specified by the sender of the message in error that indicates  
1485 where to send a *message reporting the error*.

1486 The *ErrorURI* implied by the *CPA*, identified by the *CPAId* on the message, SHOULD be used.  
1487 Otherwise, the recipient MAY resolve an *ErrorURI* using the *From* element of the message in error.  
1488 If neither is possible, no error will be reported to the sending *Party*.

1489 Even if the message in error cannot be successfully analyzed, MSH implementers MAY try to  
1490 determine the Error Reporting Location by other means. How this is done is an implementation  
1491 decision.

### 1492 5.2.4.3 Service and Action Element Values

1493 An *ErrorList* element can be included in a SOAP *Header* that is part of a *message* being sent as a  
1494 result of processing of an earlier message. In this case, the values for the *Service* and *Action*  
1495 elements are set by the designer of the Service. This method MUST NOT be used if the  
1496 *highestSeverity* is *Error*.

1497 An *ErrorList* element can also be included in an independent *message*. In this case the values of  
1498 the *Service* and *Action* elements MUST be set as follows:

- 1499           • The *Service* element **MUST** be set to: *urn:oasis:names:tc:ebxml-msg:service*  
 1500           • The *Action* element **MUST** be set to *MessageError*.

## 1501           5.3 SyncReply Module

1502           It may be necessary for the sender of a message, using a synchronous communications protocol,  
 1503           such as HTTP, to receive the associated response message over the same connection the request  
 1504           message was delivered. In the case of HTTP, the sender of the HTTP request message containing  
 1505           an ebXML message needs to have the response ebXML message delivered to it on the same HTTP  
 1506           connection.

1507           If there are intermediary nodes (either ebXML MSH nodes or possibly other SOAP nodes) involved  
 1508           in the message path, it is necessary to provide some means by which the sender of a message can  
 1509           indicate it is expecting a response so the intermediary nodes can keep the connection open.

1510           The *SyncReply* ebXML SOAP extension element is provided for this purpose.

### 1511           5.3.1 SyncReply Element

1512           The *SyncReply* element **MAY** be present as a direct child descendant of the SOAP *Header* element.  
 1513           It consists of:

- 1514           • an *id* attribute (see section 3.3.7 for details)  
 1515           • a *version* attribute (see section 3.3.8 for details)  
 1516           • a SOAP *actor* attribute with the REQUIRED value of "*http://schemas.xmlsoap.org/soap/actor/next*"  
 1517           • a SOAP *mustUnderstand* attribute with a value of "1" (see section 3.3.9 for details)

1518           If present, this element indicates to the receiving SOAP or ebXML MSH node the connection over  
 1519           which the message was received **SHOULD** be kept open in expectation of a response message to be  
 1520           returned via the same connection.

1521           This element **MUST NOT** be used to override the value of *syncReplyMode* in the CPA. If the value  
 1522           of *syncReplyMode* is *none* and a *SyncReply* element is present, the *Receiving MSH* should issue  
 1523           an error with *errorCode* of *Inconsistent* and a *severity* of *Error* (see section 5.1.5).

1524           The presence of a *SyncReply* element in synchronous responses is meaningless for the MSH,  
 1525           although its presence **MUST** not be interpreted as an error. An MSH **MUST** process such a response  
 1526           as if the element was absent. It is **RECOMMENDED** for an MSH to not include *SyncReply* when  
 1527           sending a synchronous response.

1528           An example of a *SyncReply* element:

```
1529           <eb:SyncReply eb:id="3833kkj9" eb:version="2.0" SOAP:mustUnderstand="1"  
1530           SOAP:actor="http://schemas.xmlsoap.org/soap/actor/next"/>  
1531
```

---

## 6 Combining ebXML SOAP Extension Elements

1532

1533 This section describes how the various ebXML SOAP extension elements may be used in combination.

1534

### 6.1.1 MessageHeader Element Interaction

1535

The *MessageHeader* element MUST be present in every message.

1536

### 6.1.2 Manifest Element Interaction

1537

1538

1539

The *Manifest* element MUST be present if there is any data associated with the message not present in the *Header Container*. This applies specifically to data in the *Payload Container(s)* or elsewhere, e.g. on the web.

1540

### 6.1.3 Signature Element Interaction

1541

One or more XML Signature [XMLDSIG] *Signature* elements MAY be present on any message.

1542

### 6.1.4 ErrorList Element Interaction

1543

1544

If the *highestSeverity* attribute on the *ErrorList* is set to *Warning*, then this element MAY be present with any element.

1545

1546

If the *highestSeverity* attribute on the *ErrorList* is set to *Error*, then this element MUST NOT be present with the *Manifest* element

1547

### 6.1.5 SyncReply Element Interaction

1548

1549

The *SyncReply* element MAY be present on any outbound message sent using synchronous communication protocol.

1550

1551

---

## Part II. Additional Features

---

## 1552 7 Reliable Messaging Module

1553 Reliable Messaging defines an interoperable protocol such that two Message Service Handlers (MSH)  
1554 can reliably exchange messages, using acknowledgment, retry and duplicate detection and elimination  
1555 mechanisms, resulting in the *To Party* receiving the message Once-And-Only-Once. The protocol is  
1556 flexible, allowing for both store-and-forward and end-to-end reliable messaging.

1557 Reliability is achieved by a *Receiving MSH* responding to a message with an *Acknowledgment Message*.  
1558 An *Acknowledgment Message* is any ebXML message containing an **Acknowledgment** element. Failure  
1559 to receive an *Acknowledgment Message* by a *Sending MSH* MAY trigger successive retries until such  
1560 time as an *Acknowledgment Message* is received or the predetermined number of retries has been  
1561 exceeded at which time the *From Party* MUST be notified of the probable delivery failure.

1562 Whenever an identical message may be received more than once, some method of duplicate detection  
1563 and elimination is indicated, usually with the assistance of a *persistent store*.

### 1564 7.1 Persistent Storage and System Failure

1565 A MSH that supports Reliable Messaging MUST keep messages sent or received reliably in  
1566 *persistent storage*. In this context *persistent storage* is a method of storing data that does not lose  
1567 information after a system failure or interruption.

1568 This specification recognizes different degrees of resilience may be realized depending upon the  
1569 technology used to store the data. However, at a minimum, persistent storage with the resilience  
1570 characteristics of a hard disk (or equivalent) SHOULD be used. It is strongly RECOMMENDED that  
1571 implementers of this specification use technology resilient to the failure of any single hardware or  
1572 software component.

1573 After a system interruption or failure, a MSH MUST ensure that messages in persistent storage are  
1574 processed as if the system failure or interruption had not occurred. How this is done is an  
1575 implementation decision.

1576 In order to support the filtering of duplicate messages, a *Receiving MSH* MUST save the *MessageId*  
1577 in *persistent storage*. It is also RECOMMENDED the following be kept in *persistent storage*:

- 1578 • the complete message, at least until the information in the message has been passed to the  
1579 application or other process needing to process it,
- 1580 • the time the message was received, so the information can be used to generate the response to a  
1581 *Message Status Request* (see section 8.1.1),
- 1582 • the complete response message.

### 1583 7.2 Methods of Implementing Reliable Messaging

1584 Support for Reliable Messaging is implemented in one of the following ways:

- 1585 • using the ebXML Reliable Messaging protocol,
- 1586 • using ebXML SOAP extension modules together with commercial software products that are designed  
1587 to provide reliable delivery of messages using alternative protocols,
- 1588 • user application support for some features, especially duplicate elimination, or
- 1589 • some mixture of the above options on a per-feature basis.

## 1590 7.3 Reliable Messaging SOAP Header Extensions

### 1591 7.3.1 AckRequested Element

1592 The **AckRequested** element is an OPTIONAL extension to the SOAP **Header** used by the *Sending*  
1593 *MSH* to request a *Receiving MSH*, acting in the role of the actor URI identified in the SOAP **actor**  
1594 attribute, returns an *Acknowledgment Message*.

1595 The **AckRequested** element contains the following:

- 1596 • a **id** attribute (see section 3.3.7 for details)
- 1597 • a **version** attribute (see section 3.3.8 for details)
- 1598 • a SOAP **mustUnderstand** attribute with a value of "1" (see section 3.3.9 for details)
- 1599 • a SOAP **actor** attribute
- 1600 • a **signed** attribute

1601 This element is used to indicate to a *Receiving MSH*, acting in the role identified by the SOAP **actor**  
1602 attribute, whether an *Acknowledgment Message* is expected, and if so, whether the message  
1603 should be signed by the *Receiving MSH*.

1604 An *ebXML Message* MAY have zero, one, or two instances of an **AckRequested** element. A single  
1605 MSH node SHOULD only insert one **AckRequested** element. If there are two **AckRequested**  
1606 elements present, they MUST have different values for their respective SOAP **actor** attributes. At  
1607 most one **AckRequested** element can be targeted at the **actor** URI meaning *Next MSH* (see  
1608 section 3.3.10) and at most one **AckRequested** element can be targeted at the **actor** URI meaning  
1609 *To Party MSH* (see section 3.3.11) for any given message.

#### 1610 7.3.1.1 SOAP actor attribute

1611 The **AckRequested** element MUST be targeted at either the *Next MSH* or the *To Party MSH* (these  
1612 are equivalent for single-hop routing). This is accomplished by including a SOAP **actor** with a URN  
1613 value with one of the two ebXML **actor** URNs defined in sections 3.3.10 and 3.3.11 or by leaving this  
1614 attribute out. The default **actor** targets the *To Party MSH*.

#### 1615 7.3.1.2 signed attribute

1616 The REQUIRED **signed** attribute is used by a *From Party* to indicate whether or not a message  
1617 received by the *To Party MSH* should result in the *To Party* returning a signed *Acknowledgment*  
1618 *Message* – containing a [XMLDSIG] **Signature** element as described in section 5.1. Valid values for  
1619 **signed** are:

- 1620 • **true** - a signed *Acknowledgment Message* is requested, or
- 1621 • **false** - an unsigned *Acknowledgment Message* is requested.

1622 Before setting the value of the **signed** attribute in **AckRequested**, the *Sending MSH* SHOULD check  
1623 if the *Receiving MSH* supports *Acknowledgment Messages* of the type requested (see also [ebCPP]).

1624 When a *Receiving MSH* receives a message with **signed** attribute set to **true** or **false** then it should  
1625 verify it is able to support the type of *Acknowledgment Message* requested.

- 1626 • If the *Receiving MSH* can produce the *Acknowledgment Message* of the type requested, then it MUST  
1627 return to the *Sending MSH* a message containing an **Acknowledgment** element.
- 1628 • If the *Receiving MSH* cannot return an *Acknowledgment Message* as requested it MUST report the  
1629 error to the *Sending MSH* using an **errorCode** of **Inconsistent** and a **severity** of either **Error** if  
1630 inconsistent with the CPA, or **Warning** if not supported.

### 1631 7.3.1.3 AckRequested Sample

1632 In the following example, an *Acknowledgment Message* is requested of a MSH node acting in the  
 1633 role of the *To Party* (see section 3.3.11). The **Acknowledgment** element generated MUST be  
 1634 targeted to the ebXML MSH node acting in the role of the *From Party* along the reverse message  
 1635 path (end-to-end acknowledgment).

```
1636 <eb:AckRequested SOAP:mustUnderstand="1" eb:version="2.0" eb:signed="false" />
```

### 1637 7.3.1.4 AckRequested Element Interaction

1638 An **AckRequested** element MUST NOT be included on a message with only an **Acknowledgment**  
 1639 element (no payload). This restriction is imposed to avoid endless loops of *Acknowledgment*  
 1640 *Messages*. An *Error Message* MUST NOT contain an **AckRequested** element.

## 1641 7.3.2 Acknowledgment Element

1642 The **Acknowledgment** element is an OPTIONAL extension to the SOAP *Header* used by one  
 1643 Message Service Handler to indicate to another Message Service Handler that it has received a  
 1644 message. The **RefToMessageld** element in an **Acknowledgment** element is used to identify the  
 1645 message being acknowledged by its *Messageld*.

1646 The **Acknowledgment** element consists of the following elements and attributes:

- 1647 • an *id* attribute (see section 3.3.7 for details)
- 1648 • a *version* attribute (see section 3.3.8 for details)
- 1649 • a SOAP *mustUnderstand* attribute with a value of "1" (see section 3.3.9 for details)
- 1650 • a SOAP *actor* attribute
- 1651 • a *Timestamp* element
- 1652 • a **RefToMessageld** element
- 1653 • a *From* element
- 1654 • zero or more [XMLDSIG] *Reference* element(s)

### 1655 7.3.2.1 SOAP actor attribute

1656 The SOAP *actor* attribute of the **Acknowledgment** element SHALL have a value corresponding to  
 1657 the **AckRequested** element of the message being acknowledged. If there is no SOAP *actor*  
 1658 attribute present on an **Acknowledgment** element, the default target is the *To Party MSH* (see  
 1659 section for 11.1.3).

### 1660 7.3.2.2 Timestamp Element

1661 The REQUIRED *Timestamp* element is a value representing the time that the message being  
 1662 acknowledged was received by the *MSH* generating the acknowledgment message. It must conform  
 1663 to a dateTime [XMLSchema] and is expressed as UTC (section 4.1.6.2).

### 1664 7.3.2.3 RefToMessageld Element

1665 The REQUIRED **RefToMessageld** element contains the *Messageld* of the message whose delivery  
 1666 is being reported.

1667 The value of this element MUST be identical to the value defined in the **RefToMessageld** element.  
 1668 This element will be removed in ebMS 3.0. See [APPENDIX\_ON\_MULTIHOP] for more details.

#### 1669 7.3.2.4 From Element

1670 This is the same element as the *From* element within *MessageHeader* element (see section 4.1.1).  
 1671 However, when used in the context of an *Acknowledgment* element, it contains the identifier of the  
 1672 *Party* generating the *Acknowledgment Message*.

1673 If the *From* element is omitted then the *Party* sending the element is identified by the *From* element  
 1674 in the *MessageHeader* element.

1675 This element will in all likelihood be removed in future versions of this specification. It is  
 1676 RECOMMENDED that this element not be used. See [APPENDIX\_ON\_MULTIHOP] for more  
 1677 details.

#### 1678 7.3.2.5 [XMLDSIG] Reference Element

1679 An *Acknowledgment Message* MAY be used to enable non-repudiation of receipt by a MSH by  
 1680 including one or more *Reference* elements, from the XML Signature [XMLDSIG] namespace,  
 1681 derived from the *message being acknowledged* (see section 5.1.3 for details). The *Reference*  
 1682 element(s) MUST be namespace qualified to the aforementioned namespace and MUST conform to  
 1683 the XML Signature [XMLDSIG] specification. If the *message being acknowledged* contains an  
 1684 *AckRequested* element with a *signea* attribute set to *true*, then the [XMLDSIG] *Reference* list is  
 1685 REQUIRED.

1686 Receipt of an *Acknowledgment Message*, indicates the original message reached its destination.  
 1687 Receipt of a signed *Acknowledgment Message* validates the sender of the *Acknowledgment*  
 1688 *Message*. However, a signed *Acknowledgment Message* does not indicate whether the message  
 1689 arrived intact. Including a digest (see [XMLDSIG] section 4.3.3) of the original message in the  
 1690 *Acknowledgment Message* indicates to the original sender what was received by the recipient of the  
 1691 message being acknowledged. The digest contained in the *Acknowledgment Message* may be  
 1692 compared to a digest of the original message. If the digests match, the message arrived intact.  
 1693 Such a digest already exists in the original message, if it is signed, contained within the [XMLDSIG]  
 1694 *Signature / Reference* element(s).

1695 If the original message is signed, the [XMLDSIG] *Signature / Reference* element(s) of the original  
 1696 message will be identical to the *Acknowledgment / [XMLDSIG] Reference* element(s) in the  
 1697 *Acknowledgment Message*. If the original message is not signed, the [XMLDSIG] *Reference*  
 1698 element must be derived from the original message (see section 5.1.3).

1699 Upon receipt of an end-to-end *Acknowledgment Message*, the *From Party MSH* MAY notify the  
 1700 application of successful delivery for the referenced message. This MSH SHOULD ignore  
 1701 subsequent *Error* or *Acknowledgment Messages* with the same *RefToMessageId* value.

#### 1702 7.3.2.6 Acknowledgment Sample

1703 An example *Acknowledgment* element targeted at the *To Party MSH*:

```
1704 <eb:Acknowledgment SOAP:mustUnderstand="1" eb:version="2.0">
1705   <eb:Timestamp>2001-03-09T12:22:30</eb:Timestamp>
1706   <eb:RefToMessageId>323210:e52151ec74:7ffc@xtacy</eb:RefToMessageId>
1707   <eb:From>
1708     <eb:PartyId>uri:www.example.com</eb:PartyId>
1709   </eb:From>
1710 </eb:Acknowledgment>
```

#### 1711 7.3.2.7 Sending an Acknowledgment Message by Itself

1712 If there are no errors in the message received and an *Acknowledgment Message* is being sent on its  
 1713 own, not as a message containing payload data, then the *Service* and *Action* MUST be set as  
 1714 follows:

- 1715 • the *Service* element MUST be set to *urn:oasis:names:tc:ebxml-msg:service*
- 1716 • the *Action* element MUST be set to *Acknowledgment*

### 1717 7.3.2.8 Acknowledgment Element Interaction

1718 An *Acknowledgment* element MAY be present on any message, except as noted in section 7.3.1.4.  
 1719 An *Acknowledgment Message* MUST NOT be returned for an *Error Message*.

## 1720 7.4 Reliable Messaging Parameters

1721 This section describes the parameters required to control reliable messaging. Many of these  
 1722 parameters can be obtained from a CPA.

### 1723 7.4.1 DuplicateElimination

1724 The *DuplicateElimination* element MUST be used by the *From Party MSH* to indicate whether the  
 1725 *Receiving MSH* MUST eliminate duplicates (see section 7.6 for Reliable Messaging behaviors). If the  
 1726 value of *duplicateElimination* in the CPA is *never*, *DuplicateElimination* MUST NOT be present.

- 1727 • If *DuplicateElimination* is present – The *To Party MSH* must persist messages in a persistent store so  
 1728 duplicate messages will be presented to the *To Party* Application At-Most-Once, or
- 1729 • If *DuplicateElimination* is not present – The *To Party MSH* is not required to maintain the message in  
 1730 persistent store and is not required to check for duplicates.

1731 If *DuplicateElimination* is present, the *To Party MSH* must adopt a reliable messaging behavior (see  
 1732 section 7.6) causing duplicate messages to be ignored.

1733 If *DuplicateElimination* is not present, a *Receiving MSH* is not required to check for duplicate  
 1734 message delivery. Duplicate messages might be delivered to an application and persistent storage of  
 1735 messages is not required – although elimination of duplicates is still allowed.

1736 If the *To Party* is unable to support the requested functionality, or if the value of *duplicateElimination*  
 1737 in the CPA does not match the implied value of the element, the *To Party* SHOULD report the error to  
 1738 the *From Party* using an *errorCode* of *Inconsistent* and a *Severity* of *Error*.

### 1739 7.4.2 AckRequested

1740 The *AckRequested* parameter is used by the *Sending MSH* to request a *Receiving MSH*, acting in  
 1741 the role of the actor URI identified in the SOAP *actor* attribute, return an *Acknowledgment Message*  
 1742 containing an *Acknowledgment* element (see section 7.3.1).

### 1743 7.4.3 Retries

1744 The *Retries* parameter, from a CPA, is an integer value specifying the maximum number of times a  
 1745 *Sending MSH* SHOULD attempt to redeliver an unacknowledged *message* using the same  
 1746 communications protocol.

### 1747 7.4.4 RetryInterval

1748 The *RetryInterval* parameter, from a CPA, is a time value, expressed as a duration in accordance  
 1749 with the *duration* [XMLSchema] data type. This value specifies the minimum time a *Sending MSH*  
 1750 SHOULD wait between *Retries*, if an *Acknowledgment Message* is not received or if a  
 1751 communications error was detected during an attempt to send the message. *RetryInterval* applies  
 1752 to the time between sending of the original message and the first retry as well as the time between  
 1753 retries.

### 1754 7.4.5 TimeToLive

1755 *TimeToLive* is defined in section 4.1.6.4.

1756 For a reliably delivered message, *TimeToLive* MUST conform to:

1757  $TimeToLive > Timestamp + ((Retries + 1) * RetryInterval)$ .

1758 where *TimeStamp* comes from *MessageData*.

#### 1759 7.4.6 PersistDuration

1760 The *PersistDuration* parameter, from a CPA, is the minimum length of time, expressed as a  
1761 *duration* [XMLSchema], data from a reliably sent *Message*, is kept in *Persistent Storage* by a  
1762 *Receiving MSH*.

1763 If the *PersistDuration* has passed since the message was first sent, a *Sending MSH* SHOULD NOT  
1764 resend a message with the same *MessageId*.

1765 If a message cannot be sent successfully before *PersistDuration* has passed, then the *Sending*  
1766 *MSH* should report a delivery failure (see section 7.5.7).

1767 *TimeStamp* for a reliably sent message (found in the message header), plus its *PersistDuration*  
1768 (found in the CPA), must be greater than its *TimeToLive* (found in the message header).

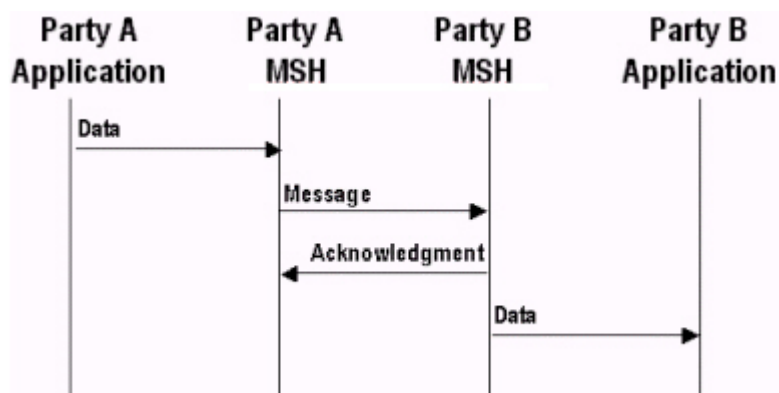

#### 1769 7.4.7 syncReplyMode

1770 The *syncReplyMode* parameter from the CPA is used only if the data communications protocol is  
1771 *synchronous* (e.g. HTTP). If the communications protocol is not *synchronous*, then the value of  
1772 *syncReplyMode* is ignored. If the *syncReplyMode* attribute is not present, it is semantically  
1773 equivalent to its presence with a value of *none*. If the *syncReplyMode* parameter is not *none*, a  
1774 *SyncReply* element MUST be present and the MSH must return any response from the application  
1775 or business process in the payload of the *synchronous* reply message, as specified in the CPA.  
1776 Valid values of *syncReplyMode* are *mshSignalsOnly*, *signalsOnly*, *signalsAndResponse*,  
1777 *responseOnly*, and *none*. See also the description of *syncReplyMode* in the CPPA [ebCPP]  
1778 specification.

1779 If the value of *syncReplyMode* is *none* and a *SyncReply* element is present, the *Receiving MSH*  
1780 should issue an error with *errorCode* of *Inconsistent* and a *severity* of *Error* (see section 5.1.5).

### 1781 7.5 ebXML Reliable Messaging Protocol

1782 The ebXML Reliable Messaging Protocol is illustrated by the following figure.

1783

1784

Figure 7-1 Indicating a message has been received

1785 The receipt of the *Acknowledgment Message* indicates the message being acknowledged has  
1786 been successfully received and either processed or persisted by the *Receiving MSH*.

1787 An *Acknowledgment Message* MUST contain an **Acknowledgment** element as described in  
 1788 section 7.3.1 with a **RefToMessaged** containing the same value as the **Messaged** element in  
 1789 the *message being acknowledged*.

## 1790 7.5.1 Sending Message Behavior

1791 If a MSH is given data by an application needing to be sent reliably, the MSH MUST do the following:

- 1792 1. Create a message from components received from the application.
- 1793 2. Insert an **AckRequested** element as defined in section 7.3.1.
- 1794 3. Save the message in *persistent storage* (see section 7.1).
- 1795 4. Send the message to the *Receiving MSH*.
- 1796 5. Wait for the return of an *Acknowledgment Message* acknowledging receipt of this specific  
 1797 message and, if it does not arrive before **RetryInterval** has elapsed, or if a communications  
 1798 protocol error is encountered, then take the appropriate action as described in section 7.5.4.

## 1799 7.5.2 Receiving Message Behavior

1800 If this is an *Acknowledgment Message* as defined in section 7 then:

- 1801 1 Look for a message in *persistent storage* with a **Messaged** the same as the value of  
 1802 **RefToMessaged** on the received Message.
- 1803 2 If a message is found in *persistent storage* then mark the persisted message as delivered.

1804 If the *Receiving MSH* is NOT the *To Party MSH* (as defined in section 3.3.10 and 3.3.11), then see  
 1805 section 11.1.3 for the behavior of the **AckRequested** element.

1806 If an **AckRequested** element is present (not an *Acknowledgment Message*) then:

- 1807 1 If the message is a duplicate (i.e. there is a **Messaged** held in persistent storage containing  
 1808 the same value as the **Messaged** in the received message), generate an *Acknowledgment*  
 1809 *Message* (see section 7.5.3). Follow the procedure in section 7.5.5 for resending lost  
 1810 *Acknowledgment Messages*. The *Receiving MSH* MUST NOT deliver the message to the  
 1811 application interface. Note: The check for duplicates is only performed when  
 1812 **DuplicateElimination** is present.
- 1813 2 If the message is not a duplicate or (there is no **Messaged** held in persistent storage  
 1814 corresponding to the **Messaged** in the received message) then:
  - 1815 a If there is a **DuplicateElimination** element, save the **Messaged** of the received  
 1816 message in persistent storage. As an implementation decision, the whole message  
 1817 MAY be stored.
  - 1818 b Generate an *Acknowledgment Message* in response (this may be as part of another  
 1819 message). The *Receiving MSH* MUST NOT send an *Acknowledgment Message*  
 1820 until the message has been safely stored in *persistent storage* or delivered to the  
 1821 application interface. Delivery of an *Acknowledgment Message* constitutes an  
 1822 obligation by the *Receiving MSH* to deliver the message to the application or forward  
 1823 to the next MSH in the message path as appropriate.

1824 If there is no **AckRequested** element then do the following:

- 1825 1 If there is a **DuplicateElimination** element, and the message is a  
 1826 duplicate, then do nothing.
- 1827 2 Otherwise, deliver the message to the application interface

1828 If the *Receiving MSH* node is operating as an intermediary along the message's message path, then  
 1829 it MAY use store-and-forward behavior. However, it MUST NOT filter out perceived duplicate  
 1830 messages from their normal processing at that node.

1831 If an *Acknowledgment Message* is received unexpectedly, it should be ignored. No error should be  
 1832 sent.

### 1833 7.5.3 Generating an Acknowledgment Message

1834 An *Acknowledgment Message* MUST be generated whenever a message is received with an  
 1835 **AckRequested** element having a SOAP *actor* URI targeting the *Receiving MSH* node.

1836 As a minimum, it MUST contain an **Acknowledgment** element with a **RefToMessageld** containing  
 1837 the same value as the **MessageId** element in the message being acknowledged. This message  
 1838 MUST be placed in persistent storage with the same **PersistDuration** as the original message.

1839 The *Acknowledgment Message* can be sent at the same time as the response to the received  
 1840 message. In this case, the values for the **MessageHeader** elements of the *Acknowledgment*  
 1841 *Message* are determined by the **Service** and **Action** associated with the business response.

1842 If an *Acknowledgment Message* is being sent on its own, then the value of the **MessageHeader**  
 1843 elements MUST be set as follows:

- 1844 • The **Service** element MUST be set to: *urn:oasis:names:tc:ebxml-msg:service*
- 1845 • The **Action** element MUST be set to *Acknowledgment*.
- 1846 • The **From** element MAY be populated with the **To** element extracted from the message received and  
 1847 all child elements from the **To** element received SHOULD be included in this **From** element.
- 1848 • The **To** element MAY be populated with the **From** element extracted from the message received and  
 1849 all child elements from the **From** element received SHOULD be included in this **To** element.
- 1850 • The **RefToMessageld** element MUST be set to the **MessageId** of the message received.

### 1851 7.5.4 Resending Lost Application Messages

1852 This section describes the behavior required by the sender and receiver of a message in order to  
 1853 handle lost messages. A message is "lost" when a *Sending MSH* does not receive a positive  
 1854 acknowledgment to a message. For example, it is possible a *message* was lost:

1855

1856 *Figure 7-2 Undelivered Message*

1857 It is also possible the *Acknowledgment Message* was lost, for example:

Figure 7-3 Lost Acknowledgment Message

Note: *Acknowledgment Messages* are never acknowledged.

The rules applying to the non-receipt of an anticipated *Acknowledgment Message* due to the loss of either the application message or the *Acknowledgment Message* are as follows:

- The *Sending MSH* MUST resend the original message if an *Acknowledgment Message* has been requested but has not been received and the following are true:
  - At least the time specified in the *RetryInterval* parameter has passed since the message was last sent,
  - The message has been resent less than the number of times specified in the *Retries* parameter.
- If the *Sending MSH* does not receive an *Acknowledgment Message* after the maximum number of retries, the *Sending MSH* SHALL notify the application and/or system administrator function of the failure to receive an *Acknowledgment Message* (see also section 5.2.3.2.4 concerning treatment of errors).
- If the *Sending MSH* detects a communications protocol error, the *Sending MSH* MUST resend the message using the same algorithm as if it has not received an *Acknowledgment Message*.

## 7.5.5 Resending Acknowledgments

If the *Receiving MSH* receives a message it discovers to be a duplicate, it should resend the original *Acknowledgment Message* if the message is stored in *persistent store*. In this case, do the following:

Look in persistent storage for the first response to the received message (i.e. it contains a *RefToMessageld* that matches the *MessageId* of the received message).

If a response message was found in *persistent storage* then resend the persisted message back to the MSH that sent the received message. If no response message was found in *persistent storage*, then:

- (1) If *syncReplyMode* is not set to *none* and if the CPA indicates an application response is included, then it must be the case that the application has not finished processing the earlier copy of the same message. Therefore, wait for the response from the application and then return that response synchronously over the same connection that was used for the retransmission.
- (2) Otherwise, generate an *Acknowledgment Message*.

## 7.5.6 Duplicate Message Handling

In the context of this specification:

- an "identical message" – a *message* containing the same ebXML SOAP *Header*, *Body* and ebXML Payload Container(s) as the earlier sent *message*.

- 1893 • a "duplicate message" – a *message* containing the same *MessageId* as a previously received
- 1894 message.
- 1895 • the "first response message" – the message with the earliest *Timestamp* in the *MessageData* element
- 1896 having the same *RefToMessageId* as the duplicate message.

1897

1898

Figure 7-4 Resending Unacknowledged Messages

1899 The diagram above shows the behavior to be followed by the *Sending* and *Receiving MSH* for  
 1900 messages sent with an *AckRequested* element and a *DuplicateElimination* element. Specifically:

- 1901 1) The sender of the *message* (e.g. Party A MSH) MUST resend the "identical message" if no
- 1902 *Acknowledgment Message* is received.
- 1903 2) When the recipient (Party B MSH) of the *message* receives a "duplicate message", it MUST
- 1904 resend to the sender (Party A MSH) an *Acknowledgment Message* identical to the *first response*
- 1905 *message* sent to the sender Party A MSH).
- 1906 3) The recipient of the *message* (Party B MSH) MUST NOT forward the message a second time to
- 1907 the application/process.

### 1908 7.5.7 Failed Message Delivery

1909 If a message sent with an *AckRequested* element cannot be delivered, the MSH or process handling  
 1910 the message (as in the case of a routing intermediary) SHALL send a delivery failure notification to  
 1911 the *From Party*. The delivery failure notification message is an *Error Message* with *errorCode* of  
 1912 *DeliveryFailure* and a *severity* of:

- 1913 • **Error** if the party who detected the problem could not transmit the message (e.g. the communications
- 1914 transport was not available)
- 1915 • **Warning** if the message was transmitted, but an *Acknowledgment Message* was not received. This
- 1916 means the message probably was not delivered.

1917 It is possible an error message with an *Error* element having an *errorCode* set to *DeliveryFailure*  
 1918 cannot be delivered successfully for some reason. If this occurs, then the *From Party*, the ultimate  
 1919 destination for the *Error Message*, MUST be informed of the problem by other means. How this is  
 1920 done is outside the scope of this specification

1921 Note: If the *From Party MSH* receives an *Acknowledgment Message* from the *To Party MSH*, it  
 1922 should ignore all other *DeliveryFailure* or *Acknowledgment Messages*.

1923

### 1924 7.6 Reliable Messaging Combinations

	<i>Duplicate- Elimination</i> <sup>s</sup>	<i>AckRequested ToPartyMSH</i>	<i>AckRequested NextMSH</i>	<i>Comment</i>
1	Y	Y	Y	<b>Once-And-Only-Once</b> Reliable Messaging at the End-To-End and At-Least-Once to the Intermediate. Intermediate and To Party can issue Delivery Failure Notifications if they cannot deliver.
2	Y	Y	N	<b>Once-And-Only-Once</b> Reliable Message at the End-To-End level only based upon end-to-end retransmission
3	Y	N	Y	<b>At-Least-Once Reliable</b> Messaging at the Intermediate Level – Once-And-Only-Once end-to-end if all Intermediates are Reliable. No End-to-End notification.
4	Y	N	N	<b>At-Most-Once</b> Duplicate Elimination only at the To Party No retries at the Intermediate or the End.
5	N	Y	Y	<b>At-Least-Once</b> Reliable Messaging with

				duplicates possible at the Intermediate and the To Party.
6	N	Y	N	<b>At-Least-Once</b> Reliable Messaging duplicates possible at the Intermediate and the To Party.
7	N	N	Y	<b>At-Least-Once</b> Reliable Messaging to the Intermediate and at the End. No End-to-End notification.
8	N	N	N	<b>Best Effort</b>

1925

<sup>s</sup>*Duplicate Elimination is only performed at the To Party MSH, not at the Intermediate Level.*

## 1926 8 Message Status Service

1927 The Message Status Request Service consists of the following:

- 1928 • A Message Status Request message containing details regarding a message previously sent is sent to a
- 1929 Message Service Handler (MSH)
- 1930 • The Message Service Handler receiving the request responds with a Message Status Response message.

1931 A Message Service Handler SHOULD respond to Message Status Requests for messages that have

1932 been sent reliably and the *MessageId* in the *RefToMessageId* is present in *persistent storage* (see

1933 section 7.1).

1934 A Message Service Handler MAY respond to Message Status Requests for messages that have not been

1935 sent reliably.

1936 A Message Service SHOULD NOT use the Message Status Request Service to implement Reliable

1937 Messaging.

1938 If a *Receiving MSH* does not support the service requested, it SHOULD return an *Error Message* with an

1939 *errorCode* of *NotSupported* and a *highestSeverity* attribute set to *Error*. Each service is described

1940 below.

### 1941 8.1 Message Status Messages

#### 1942 8.1.1 Message Status Request Message

1943 A Message Status Request message consists of an *ebXML Message* with no ebXML Payload

1944 Container and the following:

- 1945 • a *MessageHeader* element containing:
  - 1946 • a *From* element identifying the *Party* that created the Message Status Request message
  - 1947 • a *To* element identifying a *Party* who should receive the message.
  - 1948 • a *Service* element that contains: *urn:oasis:names:tc:ebxml-msg:service*
  - 1949 • an *Action* element that contains *StatusRequest*
  - 1950 • a *MessageData* element
- 1951 • a *StatusRequest* element containing:
  - 1952 • a *RefToMessageId* element in *StatusRequest* element containing the *MessageId* of the message
  - 1953 whose status is being queried.
- 1954 • an [XMLDSIG] *Signature* element (see section 5.1 for more details)

1955 The message is then sent to the *To Party*.

#### 1956 8.1.2 Message Status Response Message

1957 Once the *To Party* receives the Message Status Request message, they SHOULD generate a

1958 Message Status Response message with no ebXML Payload Container consisting of the following:

- 1959 • a *MessageHeader* element containing:
  - 1960 • a *From* element that identifies the sender of the Message Status Response message
  - 1961 • a *To* element set to the value of the *From* element in the Message Status Request message
  - 1962 • a *Service* element that contains *urn:oasis:names:tc:ebxml-msg:service*
  - 1963 • an *Action* element that contains *StatusResponse*
  - 1964 • a *MessageData* element containing:
    - 1965 • a *RefToMessageId* that identifies the Message Status Request message.

- 1966 • **StatusResponse** element (see section 8.2.3)
- 1967 • an [XMLDSIG] **Signature** element (see section 5.1 for more details)

1968 The message is then sent to the *To Party*.

### 1969 8.1.3 Security Considerations

1970 Parties who receive a Message Status Request message SHOULD always respond to the message.  
 1971 However, they MAY ignore the message instead of responding with **messageStatus** set to  
 1972 **Unauthorized** if they consider the sender of the message to be unauthorized. The decision process  
 1973 resulting in this course of action is implementation dependent.

## 1974 8.2 StatusRequest Element

1975 The OPTIONAL **StatusRequest** element is an immediate child of a SOAP **Body** and is used to  
 1976 identify an earlier message whose status is being requested (see section 8.3.5).

1977 The **StatusRequest** element consists of the following:

- 1978 • an **id** attribute (see section 3.3.7 for details)
- 1979 • a **version** attribute (see section 3.3.8 for details)
- 1980 • a **RefToMessageId** element

### 1981 8.2.1 RefToMessageId Element

1982 A REQUIRED **RefToMessageId** element contains the **MessageId** of the message whose status is  
 1983 being requested.

### 1984 8.2.2 StatusRequest Sample

1985 An example of the **StatusRequest** element is given below:

```
1986 <eb:StatusRequest eb:version="2.0" >
1987   <eb:RefToMessageId>323210:e52151ec74:-7ffc@xtacy</eb:RefToMessageId>
1988 </eb:StatusRequest>
```

### 1989 8.2.3 StatusRequest Element Interaction

1990 A **StatusRequest** element MUST NOT be present with the following elements:

- 1991 • a **Manifest** element
- 1992 • a **StatusResponse** element
- 1993 • an **ErrorList** element

## 1994 8.3 StatusResponse Element

1995 The OPTIONAL **StatusResponse** element is an immediate child of a SOAP **Body** and is used by  
 1996 one MSH to describe the status of processing of a message.

1997 The **StatusResponse** element consists of the following elements and attributes:

- 1998 • an **id** attribute (see section 3.3.7 for details)
- 1999 • a **version** attribute (see section 3.3.8 for details)
- 2000 • a **RefToMessageId** element
- 2001 • a **Timestamp** element
- 2002 • a **messageStatus** attribute

### 2003 **8.3.1 RefToMessageld Element**

2004 A REQUIRED *RefToMessageld* element contains the *MessageId* of the message whose status is  
 2005 being reported. *RefToMessageld* element child of the *MessageData* element of a message  
 2006 containing a *StatusResponse* element SHALL have the *MessageId* of the message containing the  
 2007 *StatusRequest* element to which the *StatusResponse* element applies. The *RefToMessageld*  
 2008 child element of the *StatusRequest* or *StatusResponse* element SHALL contain the *MessageId* of  
 2009 the message whose status is being queried.

### 2010 **8.3.2 Timestamp Element**

2011 The *Timestamp* element contains the time the message, whose status is being reported, was  
 2012 received (section 4.1.6.2.). This MUST be omitted if the message, whose status is being reported, is  
 2013 *NotRecognized* or the request was *Unauthorized*.

### 2014 **8.3.3 messageStatus attribute**

2015 The REQUIRED *messageStatus* attribute identifies the status of the message identified by the  
 2016 *RefToMessageld* element. It SHALL be set to one of the following values:

- 2017 • *Unauthorized* – the Message Status Request is not authorized or accepted
- 2018 • *NotRecognized* – the message identified by the *RefToMessageld* element in the *StatusResponse*  
 2019 element is not recognized
- 2020 • *Received* – the message identified by the *RefToMessageld* element in the *StatusResponse* element  
 2021 has been received by the MSH
- 2022 • *Processed* – the message identified by the *RefToMessageld* element in the *StatusResponse* element  
 2023 has been processed by the MSH
- 2024 • *Forwarded* – the message identified by the *RefToMessageld* element in the *StatusResponse* element  
 2025 has been forwarded by the MSH to another MSH

2026 Note: if a Message Status Request is sent after the elapsed time indicated by *PersistDuration* has  
 2027 passed since the message being queried was sent, the Message Status Response may indicate the  
 2028 *MessageId* was *NotRecognized* – the *MessageId* is no longer in persistent storage.

### 2029 **8.3.4 StatusResponse Sample**

2030 An example of the *StatusResponse* element is given below:

```

2031 <eb:StatusResponse eb:version="2.0" eb:messageStatus="Received">
2032 <eb:RefToMessageId>323210:e52151ec74:-
2033 7ffc@xtacy</eb:RefToMessageId>
2034 <eb:Timestamp>2001-03-09T12:22:30</eb:Timestamp>
2035 </eb:StatusResponse>
  
```

### 2036 **8.3.5 StatusResponse Element Interaction**

2037 This element MUST NOT be present with the following elements:

- 2038 • a *Manifest* element
- 2039 • a *StatusRequest* element
- 2040 • an *ErrorList* element with a *highestSeverity* attribute set to *Error*

## 9 Message Service Handler Ping Service

2041  
2042 The OPTIONAL Message Service Handler Ping Service enables one MSH to determine if another MSH is  
2043 operating. It consists of:

- 2044 • one MSH sending a Message Service Handler Ping message to a MSH, and
- 2045 • another MSH, receiving the Ping, responding with a Message Service Handler Pong message.

2046 If a *Receiving MSH* does not support the service requested, it SHOULD return an *Error Message* with an  
2047 *errorCode* of **NotSupported** and a *highestSeverity* attribute set to **Error**.

### 9.1 Message Service Handler Ping Message

2048  
2049 A Message Service Handler Ping (MSH Ping) message consists of an *ebXML Message* containing no  
2050 ebXML Payload Container and the following:

- 2051 • a *MessageHeader* element containing the following:
  - 2052 • a *From* element identifying the *Party* creating the MSH Ping message
  - 2053 • a *To* element identifying the *Party* being sent the MSH Ping message
  - 2054 • a *CPAId* element
  - 2055 • a *ConversationId* element
  - 2056 • a *Service* element containing: *urn:oasis:names:tc:ebxml-msg:service*
  - 2057 • an *Action* element containing *Ping*
  - 2058 • a *MessageData* element
- 2059 • an [XMLDSIG] *Signature* element (see section 5.1 for details).

2060 The message is then sent to the *To Party*.

2061 An example Ping:

```

2062 . . .Transport Headers
2063 SOAPAction: "ebXML"
2064 Content-type: multipart/related; boundary="ebXMLBoundary"
2065
2066 --ebXMLBoundary
2067 Content-Type: text/xml
2068
2069 <?xml version="1.0" encoding="UTF-8"?>
2070 <SOAP:Envelope xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
2071     xmlns:SOAP="http://schemas.xmlsoap.org/soap/envelope/"
2072     xsi:schemaLocation="http://schemas.xmlsoap.org/soap/envelope/
2073
2074 http://www.oasis-open.org/committees/ebxml-msg/schema/envelope.xsd">
2075 <SOAP:Header xmlns:eb="http://www.oasis-open.org/committees/ebxml-msg/schema/msg-
2076 header-2_0.xsd"
2077     xsi:schemaLocation="http://www.oasis-
2078 open.org/committees/ebxml-msg/schema/msg-header-2_0.xsd
2079     http://www.oasis-
2080 open.org/committees/ebxml-msg/schema/msg-header-2_0.xsd">
2081   <eb:MessageHeader version="2.0" SOAP:mustUnderstand="1"
2082     xmlns:eb="http://www.oasis-open.org/committees/ebxml-
2083 msg/schema/msg-header-2_0.xsd"
2084     xsi:schemaLocation="http://www.oasis-
2085 open.org/committees/ebxml-msg/schema/msg-header-2_0.xsd
2086     http://www.oasis-
2087 open.org/committees/ebxml-msg/schema/msg-header-2_0.xsd">
2088     <eb:From> <eb:PartyId>urn:duns:123456789</eb:PartyId> </eb:From>
2089     <eb:To> <eb:PartyId>urn:duns:912345678</eb:PartyId> </eb:To>
2090     <eb:CPAId>20001209-133003-28572</eb:CPAId>
2091     <eb:ConversationId>20010215-111213-28572</eb:ConversationId>
     <eb:Service>urn:oasis:names:tc:ebxml-msg:service</eb:Service>

```

```

2092         <eb:Action>Ping</eb:Action>
2093         <eb:MessageData>
2094             <eb:MessageId>20010215-111212-
2095 28572@example.com</eb:MessageId>
2096             <eb:Timestamp>2001-02-15T11:12:12</eb:Timestamp>
2097         </eb:MessageData>
2098     </eb:MessageHeader>
2099 </SOAP:Header>
2100 <SOAP:Body/>
2101 </SOAP:Envelope>
2102
2103 --ebXMLBoundary--

```

2104 Note: The above example shows a Multipart/Related MIME structure with only one bodypart.

## 2105 9.2 Message Service Handler Pong Message

2106 Once the *To Party* receives the MSH Ping message, they MAY generate a Message Service Handler  
2107 Pong (MSH Pong) message consisting of an ebXML Message containing no ebXML Payload  
2108 Container and the following:

- 2109 • a *MessageHeader* element containing the following:
  - 2110 • a *From* element identifying the creator of the MSH Pong message
  - 2111 • a *To* element identifying a *Party* that generated the MSH Ping message
  - 2112 • a *CPAId* element
  - 2113 • a *ConversationId* element
  - 2114 • a *Service* element containing the value: *urn:oasis:names:tc:ebxml-msg:service*
  - 2115 • an *Action* element containing the value *Pong*
  - 2116 • a *MessageData* element containing:
    - 2117 ▪ a *RefToMessageId* identifying the MSH Ping message.
  - 2118 • an [XMLDSIG] *Signature* element (see section 5.1.1 for details).

2119 An example Pong:

```

2120 . . .Transport Headers
2121 SOAPAction: "ebXML"
2122 Content-Type: text/xml
2123
2124 <?xml version="1.0" encoding="UTF-8"?>
2125 <SOAP:Envelope xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
2126
2127     xmlns:SOAP="http://schemas.xmlsoap.org/soap/envelope/"
2128     xsi:schemaLocation="http://schemas.xmlsoap.org/soap/envelope/
2129 http://www.oasis-open.org/committees/ebxml-msg/schema/envelope.xsd">
2130 <SOAP:Header xmlns:eb="http://www.oasis-open.org/committees/ebxml-msg/schema/msg-
2131 header-2_0.xsd"
2132     xsi:schemaLocation="http://www.oasis-
2133 open.org/committees/ebxml-msg/schema/msg-header-2_0.xsd
2134     http://www.oasis-
2135 open.org/committees/ebxml-msg/schema/msg-header-2_0.xsd">
2136     <eb:MessageHeader eb:version="2.0" SOAP:mustUnderstand="1">
2137         <eb:From> <eb:PartyId>urn:duns:912345678</eb:PartyId> </eb:From>
2138     <eb:To> <eb:PartyId>urn:duns:123456789</eb:PartyId> </eb:To>
2139     <eb:CPAId>20001209-133003-28572</eb:CPAId>
2140     <eb:ConversationId>20010215-111213-28572</eb:ConversationId>
2141     <eb:Service>urn:oasis:names:tc:ebxml-msg:service</eb:Service>
2142     <eb:Action>Pong</eb:Action>
2143     <eb:MessageData>
2144         <eb:MessageId>20010215-111213-
2145 395884@example2.com</eb:MessageId>
2146         <eb:Timestamp>2001-02-15T11:12:13</eb:Timestamp>
2147         <eb:RefToMessageId>20010215-111212-
2148 28572@example.com</eb:RefToMessageId>
2149

```

```
2150         </eb:MessageData>
2151     </eb:MessageHeader>
2152 </SOAP:Header>
2153 <SOAP:Body/>
2154 </SOAP:Envelope>
```

2155 Note: This example shows a non-multipart MIME structure.

## 2156 9.3 Security Considerations

2157 Parties who receive a MSH Ping message SHOULD always respond to the message. However,  
2158 there is a risk some parties might use the MSH Ping message to determine the existence of a  
2159 Message Service Handler as part of a security attack on that MSH. Therefore, recipients of a MSH  
2160 Ping MAY ignore the message if they consider that the sender of the message received is  
2161 unauthorized or part of some attack. The decision process that results in this course of action is  
2162 implementation dependent.

---

## 2163 10 MessageOrder Module

2164 The *MessageOrder* module allows messages to be presented to the *To Party* in a particular order. This  
2165 is accomplished through the use of the *MessageOrder* element. Reliable Messaging MUST be used  
2166 when a *MessageOrder* element is present.

2167 *MessageOrder* module MUST only be used in conjunction with the ebXML Reliable Messaging Module  
2168 (section 7) with a scheme of Once-And-Only-Once (sections 7.6). If a sequence is sent and one  
2169 message fails to arrive at the *To Party MSH*, all subsequent messages will also fail to be presented to the  
2170 *To Party Application* (see *status* attribute section 10.1.1).

### 2171 10.1 MessageOrder Element

2172 The *MessageOrder* element is an OPTIONAL extension to the SOAP *Header* requesting the  
2173 preservation of message order in this conversation.

2174 The *MessageOrder* element contains the following:

- 2175 • a *id* attribute (see section 3.3.7)
- 2176 • a *version* attribute (see section 3.3.8 for details)
- 2177 • a SOAP *mustUnderstand* attribute with a value of "1" (see section 3.3.9 for details)
- 2178 • a *SequenceNumber* element

2179 When the *MessageOrder* element is present, *DuplicateElimination* MUST also be present and  
2180 *SyncReply* MUST NOT be present.

#### 2181 10.1.1 SequenceNumber Element

2182 The REQUIRED *SequenceNumber* element indicates the sequence a *Receiving MSH* MUST  
2183 process messages. The *SequenceNumber* is unique within the *ConversationId* and MSH. The  
2184 *From Party MSH* and the *To Party MSH* each set an independent *SequenceNumber* as the *Sending*  
2185 *MSH* within the *ConversationId*. It is set to zero on the first message from that MSH within a  
2186 conversation and then incremented by one for each subsequent message sent.

2187 A MSH that receives a message with a *SequenceNumber* element MUST NOT pass the message  
2188 to an application until all the messages with a lower *SequenceNumber* have been passed to the  
2189 application.

2190 If the implementation defined limit for saved out-of-sequence messages is reached, then the  
2191 *Receiving MSH* MUST indicate a delivery failure to the *Sending MSH* with *errorCode* set to  
2192 *DeliveryFailure* and *severity* set to *Error* (see section 5.1.5).

2193 The *SequenceNumber* element is an integer value incremented by the *Sending MSH* (e.g. 0, 1, 2,  
2194 3, 4...) for each application-prepared message sent by that MSH within the *ConversationId*. The  
2195 next value after 99999999 in the increment is "0". The value of *SequenceNumber* consists of ASCII  
2196 numerals in the range 0-99999999. In following cases, *SequenceNumber* takes the value "0":

- 2197 1. First message from the *Sending MSH* within the conversation
- 2198 2. First message after resetting *SequenceNumber* information by the *Sending MSH*
- 2199 3. First message after wraparound (next value after 99999999)

2200 The *SequenceNumber* element has a single attribute, *status*. This attribute is an enumeration,  
2201 which SHALL have one of the following values:

- 2202 • *Reset* – the *SequenceNumber* is reset as shown in 1 or 2 above
- 2203 • *Continue* – the *SequenceNumber* continues sequentially (including 3 above)

2204 When the *SequenceNumber* is set to "0" because of 1 or 2 above, the *Sending MSH* MUST set the  
2205 *status* attribute of the message to *Reset*. In all other cases, including 3 above, the *status* attribute  
2206 MUST be set to *Continue*. The default value of the *status* attribute is *Continue*.

2207 A *Sending MSH* MUST wait before resetting the *SequenceNumber* of a conversation until it has  
2208 received confirmation of all the messages previously sent for the conversation. Only when all the  
2209 sent Messages are accounted for, can the *Sending MSH* reset the *SequenceNumber*.

### 2210 10.1.2 MessageOrder Sample

2211 An example of the *MessageOrder* element is given below:

```
2212 <eb:MessageOrder eb:version="2.0" SOAP:mustUnderstand="1">  
2213   <eb:SequenceNumber>00000010</eb:SequenceNumber>  
2214 </eb:MessageOrder>
```

### 2215 10.2 MessageOrder Element Interaction

2216 For this version of the ebXML Messaging Specification, the *MessageOrder* element MUST NOT be  
2217 present with the *SyncReply* element. If these two elements are received in the same message, the  
2218 *Receiving MSH* SHOULD report an error (see section 5.1.5) with *errorCode* set to *Inconsistent* and  
2219 *severity* set to *Error*.

## 2220 11 Multi-Hop Module

2221 Multi-hop is the process of passing the message through one or more intermediary nodes or MSH's. An  
2222 Intermediary is any node or MSH where the message is received, but is not the *Sending* or *Receiving*  
2223 *MSH*. This node is called an Intermediary.

2224 Intermediaries may be for the purpose of Store-and-Forward or may be involved in some processing  
2225 activity such as a trusted third-party timestamp service. For the purposes of this version of this  
2226 specification, Intermediaries are considered only as Store-and-Forward entities.

2227 Intermediaries MAY be involved in removing and adding SOAP extension elements or modules targeted  
2228 either to the *Next* SOAP node or the *NextMSH*. SOAP rules specify, the receiving node must remove  
2229 any element or module targeted to the *Next* SOAP node. If the element or module needs to continue to  
2230 appear on the SOAP message destined to the *Next* SOAP node, or in this specification the *NextMSH*, it  
2231 must be reapplied. This deleting and adding of elements or modules poses potential difficulties for signed  
2232 ebXML messages. Any Intermediary node or MSH MUST NOT change, format or in any way modify any  
2233 element not targeted to the Intermediary. Any such change may invalidate the signature.

### 2234 11.1 Multi-hop Reliable Messaging

2235 Multi-hop (hop-to-hop) Reliable Messaging is accomplished using the *AckRequested* element  
2236 (section 7.3.1) and an *Acknowledgment Message* containing an *Acknowledgment* element (section  
2237 7.3.1.4) each with a SOAP *actor* of *Next MSH* (section 3.3.10) between the *Sending MSH* and the  
2238 *Receiving MSH*. This MAY be used in store-and-forward multi-hop situations.

2239 The use of the duplicate elimination is not required for Intermediate nodes. Since duplicate  
2240 elimination by an intermediate MSH can interfere with End-to-End Reliable Messaging Retries, the  
2241 intermediate MSH MUST know it is an intermediate and MUST NOT perform duplicate elimination  
2242 tasks.

2243 At this time, the values of *Retry* and *RetryInterval* between Intermediate MSHs remains  
2244 implementation specific. See section 7.4 for more detail on Reliable Messaging.

#### 2245 11.1.1 AckRequested Sample

2246 An example of the *AckRequested* element targeted at the *NextMSH* is given below:

```
2247 <eb:AckRequested SOAP:mustUnderstand="1" eb:version="2.0" eb:signed="false"
2248 SOAP:actor="urn:oasis:names:tc:ebxml-msg:actor:nextMSH" />
```

2249 In the preceding example, an *Acknowledgment Message* is requested of the next ebXML MSH node  
2250 (see section 3.3.10) in the message. The *Acknowledgment* element generated MUST be targeted  
2251 at the next ebXML MSH node along the reverse message path (the *Sending MSH*) using the SOAP  
2252 *actor* with a value of *NextMSH* (section 3.3.10).

2253 Any Intermediary receiving an *AckRequested* with SOAP *actor* of *NextMSH* MUST remove the  
2254 *AckRequested* element before forwarding to the next MSH. Any Intermediary MAY insert a single  
2255 *AckRequested* element into the SOAP *Header* with a SOAP *actor* of *NextMSH*. There SHALL  
2256 NOT be two *AckRequested* elements targeted at the next MSH.

2257 When the *SyncReply* element is present, an *AckRequested* element with SOAP *actor* of *NextMSH*  
2258 MUST NOT be present. If the *SyncReply* element is not present, the Intermediary MAY return the  
2259 Intermediate *Acknowledgment Message* synchronously with a synchronous transport protocol. If  
2260 these two elements are received in the same message, the *Receiving MSH* SHOULD report an error  
2261 (see section 5.1.5) with *errorCode* set to *Inconsistent* and *severity* set to *Error*.

## 2262 11.1.2 Acknowledgment Sample

2263 An example of the *Acknowledgment* element targeted at the *NextMSH* is given below:

```

2264     <eb:Acknowledgment SOAP:mustUnderstand="1" eb:version="2.0"
2265                             SOAP:actor="urn:oasis:names:tc:ebxml-
2266 msg:actor:nextMSH">
2267         <eb:Timestamp>2001-03-09T12:22:30</eb:Timestamp>
2268         <eb:RefToMessageId>323210:e52151ec74:-
2269 7ffc@xtacy</eb:RefToMessageId>
2270         <eb:From> <eb:PartyId>uri:www.example.com</eb:PartyId>
2271 </eb:From>
2272     </eb:Acknowledgment>

```

## 2273 11.1.3 Multi-Hop Acknowledgments

2274 There MAY be two *AckRequested* elements on the same message. An *Acknowledgement* MUST  
 2275 be sent for each *AckRequested* using an identical SOAP *actor* attribute as the *AckRequested*  
 2276 element.

2277 If the *Receiving MSH* is the *To Party MSH*, then see section 7.5.2. If the *Receiving MSH* is the *To*  
 2278 *Party MSH* and there is an *AckRequested* element targeting the Next MSH (the *To Party MSH* is  
 2279 acting in both roles), then perform both procedures (this section and section 7.5.2) for generating  
 2280 *Acknowledgment Messages*. This MAY require sending two *Acknowledgment* elements, possibly  
 2281 on the same message, one targeted for the *Next MSH* and one targeted for the *To Party MSH*.

2282 There MAY be multiple *Acknowledgements* elements, on the same message or on different  
 2283 messages, returning from either the Next MSH or from the *To Party MSH*. A MSH supporting Multi-  
 2284 hop MUST differentiate, based upon the *actor*, which *Acknowledgment* is being returned and act  
 2285 accordingly.

2286 If this is an *Acknowledgment Message* as defined in section 7 then:

- 2287 1 Look for a message in *persistent storage* with a *MessageId* the same as the value of  
 2288 *RefToMessageId* on the received Message.
- 2289 2 If a message is found in *persistent storage* then mark the persisted message as delivered.

2290 If an *AckRequested* element is present (not an *Acknowledgment Message*) then generate an  
 2291 *Acknowledgment Message* in response (this may be as part of another message). The *Receiving*  
 2292 *MSH* MUST NOT send an *Acknowledgment Message* until the message has been persisted or  
 2293 delivered to the *Next MSH*.

## 2294 11.1.4 Signing Multi-Hop Acknowledgments

2295 When a signed Intermediate *Acknowledgment Message* is requested (i.e. a signed *Acknowledgment*  
 2296 *Message* with a SOAP *actor* of *NextMSH*), it MUST be sent by itself and not bundled with any other  
 2297 message. The XML Signature [XMLDSIG] *Signature* element with *Transforms*, as described in  
 2298 section 5.1.3, will exclude this *Acknowledgment* element. To send a signed *Acknowledgment*  
 2299 *Message* with SOAP *actor* of *NextMSH*, create a message with no payloads, including a single  
 2300 *Acknowledgment* element (see section 7.3.2.6), and a [XMLDSIG] *Signature* element with the  
 2301 following *Transforms*:

```

2302 <Transforms>
2303   <Transform Algorithm="http://www.w3.org/2000/09/xmlsig#enveloped-
2304 signature"/>
2305   <Transform Algorithm="http://www.w3.org/TR/2001/REC-xml-c14n-20010315"/>
2306 </Transforms>

```

### 2307 **11.1.5 Multi-Hop Security Considerations**

2308 SOAP messaging allows intermediaries to add or remove elements targeted to the intermediary  
2309 node. This has potential conflicts with end-to-end signatures since the slightest change in any  
2310 character of the SOAP *Envelope* or to a payload will invalidate the *ds:Signature* by changing the  
2311 calculated digest. Intermediaries MUST NOT add or remove elements unless they contain a SOAP  
2312 *actor* of *next* or *nextMSH*. Intermediaries MUST NOT disturb white space – line terminators  
2313 (CR/LF), tabs, spaces, etc. – outside those elements being added or removed.

### 2314 **11.2 Message Ordering and Multi-Hop**

2315 Intermediary MSH nodes MUST NOT participate in Message Order processing as specified in  
2316 section 10.

2317

## 2318 Appendix A. The ebXML SOAP Extension Elements 2319 Schema

2320

2321 The OASIS ebXML Messaging Technical Committee has provided a version of the SOAP 1.1 envelope  
2322 schema specified using the schema vocabulary that conforms to the W3C XML Schema  
2323 Recommendation specification [XMLSchema].

2324 SOAP1.1- <http://www.oasis-open.org/committees/ebxml-msg/schema/envelope.xsd>

2325 It was necessary to craft a schema for the XLINK [XLINK] attribute vocabulary to conform to the W3C  
2326 XML Schema Recommendation [XMLSchema]. This schema is referenced from the ebXML SOAP  
2327 extension elements schema and is available from the following URL:

2328 Xlink - <http://www.oasis-open.org/committees/ebxml-msg/schema/xlink.xsd>

```

2329 <?xml version="1.0" encoding="UTF-8"?>
2330 <!-- Some parsers may require explicit declaration of
2331 xmlns:xml="http://www.w3.org/XML/1998/namespace" .
2332     In that case, a copy of this schema augmented with the above declaration should be
2333     cached and used
2334     for the purpose of schema validation on ebXML messages.-->
2335 <schema targetNamespace="http://www.oasis-open.org/committees/ebxml-msg/schema/msg-
2336 header-2_0.xsd"
2337     xmlns:tns="http://www.oasis-open.org/committees/ebxml-msg/schema/msg-header-2_0.xsd"
2338     xmlns:ds="http://www.w3.org/2000/09/xmldsig#"
2339     xmlns:xlink="http://www.w3.org/1999/xlink"
2340     xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"

## Appendix B. Communications Protocol Bindings

2633

## Introduction

2634

2635 One of the goals of this specification is to design a message handling service usable over a variety of  
2636 network and application level transport protocols. These protocols serve as the "carrier" of ebXML  
2637 Messages and provide the underlying services necessary to carry out a complete ebXML Message  
2638 exchange between two parties. HTTP, FTP, Java Message Service (JMS) and SMTP are examples of  
2639 application level transport protocols. TCP and SNA/LU6.2 are examples of network transport protocols.  
2640 Transport protocols vary in their support for data content, processing behavior and error handling and  
2641 reporting. For example, it is customary to send binary data in raw form over HTTP. However, in the case  
2642 of SMTP it is customary to "encode" binary data into a 7-bit representation. HTTP is equally capable of  
2643 carrying out *synchronous* or *asynchronous* message exchanges whereas it is likely that message  
2644 exchanges occurring over SMTP will be *asynchronous*. This section describes the technical details  
2645 needed to implement this abstract ebXML Message Handling Service over particular transport protocols.

2646 This section specifies communications protocol bindings and technical details for carrying *ebXML*  
2647 *Message Service* messages for the following communications protocols:

- 2648 • Hypertext Transfer Protocol [RFC2616], in both *asynchronous* and *synchronous* forms of transfer.
- 2649 • Simple Mail Transfer Protocol [RFC2821], in *asynchronous* form of transfer only.
- 2650 •

2651 

## HTTP

2652 

### Minimum level of HTTP protocol

2653 Hypertext Transfer Protocol Version 1.1 [RFC2616] is the minimum level of protocol that **MUST** be used.

2654 

### Sending ebXML Service messages over HTTP

2655 Even though several HTTP request methods are available, this specification only defines the use of HTTP  
 2656 POST requests for sending *ebXML Message Service* messages over HTTP. The identity of the ebXML  
 2657 MSH (e.g. ebxmlhandler) may be part of the HTTP POST request:

```
2658 POST /ebxmlhandler HTTP/1.1
```

2659 Prior to sending over HTTP, an ebXML Message **MUST** be formatted according to ebXML Message  
 2660 Service Specification. Additionally, the messages **MUST** conform to the HTTP specific MIME canonical  
 2661 form constraints specified in section 19.4 of RFC 2616 [RFC2616] specification.

2662 HTTP protocol natively supports 8-bit and Binary data. Hence, transfer encoding is **OPTIONAL** for such  
 2663 parts in an ebXML Service Message prior to sending over HTTP. However, content-transfer-encoding of  
 2664 such parts (e.g. using base64 encoding scheme) is not precluded by this specification.

2665 The rules for forming an HTTP message containing an ebXML Service Message are as follows:

- 2666 • The **Content-Type** MIME header with the associated parameters, from the ebXML Service Message  
 2667 Envelope **MUST** appear as an HTTP header.
- 2668 • All other MIME headers that constitute the ebXML Message Envelope **MUST** also become part of the HTTP  
 2669 header.
- 2670 • The mandatory SOAPAction HTTP header field must also be included in the HTTP header and **MAY** have a  
 2671 value of "ebXML". This value should always be surrounded with quotes, even if it is an empty string.

2672 SOAPAction: "ebXML"

2673 Synchronous responses over HTTP may contain a SOAPAction header field. The receiving MSH  
 2674 **MUST** process such a response as if the header field was absent.

- 2675
- 2676 • Other headers with semantics defined by MIME specifications, such as Content-Transfer-Encoding, **SHALL**  
 2677 **NOT** appear as HTTP headers. Specifically, the "MIME-Version: 1.0" header **MUST NOT** appear as an  
 2678 HTTP header. However, HTTP-specific MIME-like headers defined by HTTP 1.1 **MAY** be used with the  
 2679 semantic defined in the HTTP specification.
- 2680 • All ebXML Service Message parts that follow the ebXML Message Envelope, including the MIME boundary  
 2681 string, constitute the HTTP entity body. This encompasses the SOAP *Envelope* and the constituent ebXML  
 2682 parts and attachments including the trailing MIME boundary strings.

2683

2684 The example below shows an example instance of an HTTP POST ebXML Service Message:

```
2685 POST /servlet/ebXMLhandler HTTP/1.1
2686 Host: www.example2.com
2687 SOAPAction: "ebXML"
2688 Content-type: multipart/related; boundary="Boundary"; type="text/xml";
2689 start="<ebxhmheader111@example.com>"
2690
2691 --Boundary
2692 Content-ID: <ebxhmheader111@example.com>
2693 Content-Type: text/xml
2694
```

```

2695 <?xml version="1.0" encoding="UTF-8"?>
2696 <SOAP:Envelope xmlns:xlink="http://www.w3.org/1999/xlink"
2697     xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"

2743 </purchase_order>
2744
2745 --Boundary--

```

## 2749 HTTP Response Codes

2750 In general, semantics of communicating over HTTP as specified in the [RFC2616] MUST be followed, for  
2751 returning the HTTP level response codes. A 2xx code MUST be returned when the HTTP Posted  
2752 message is successfully received by the receiving HTTP entity. However, see exception for SOAP error  
2753 conditions below. Similarly, other HTTP codes in the 3xx, 4xx, 5xx range MAY be returned for conditions

2754 corresponding to them. However, error conditions encountered while processing an ebXML Service  
2755 Message MUST be reported using the error mechanism defined by the ebXML Message Service  
2756 Specification (see section 5.1.5).

## 2757 SOAP Error conditions and Synchronous Exchanges

2758 The SOAP 1.1 specification states:

2759 "*In case of a SOAP error while processing the request, the SOAP HTTP server MUST issue an HTTP*  
2760 *500 "Internal Server Error" response and include a SOAP message in the response containing a SOAP*  
2761 *Fault element indicating the SOAP processing error.*"

2762 However, the scope of the SOAP 1.1 specification is limited to *synchronous* mode of message exchange  
2763 over HTTP, whereas the ebXML Message Service Specification specifies both *synchronous* and  
2764 *asynchronous* modes of message exchange over HTTP. Hence, the SOAP 1.1 specification MUST be  
2765 followed for *synchronous* mode of message exchange, where the SOAP *Message* containing a SOAP  
2766 **Fault** element indicating the SOAP processing error MUST be returned in the HTTP response with a  
2767 response code of "HTTP 500 Internal Server Error". When *asynchronous* mode of message exchange is  
2768 being used, a HTTP response code in the range 2xx MUST be returned when the message is received  
2769 successfully and any error conditions (including SOAP errors) must be returned via separate HTTP Post.

## 2770 Synchronous vs. Asynchronous

2771 When a synchronous transport is in use, the MSH response message(s) SHOULD be returned on the  
2772 same HTTP connection as the inbound request, with an appropriate HTTP response code, as described  
2773 above. When the *syncReplyMode* parameter is set to values other than *none*, the application response  
2774 messages, if any, are also returned on the same HTTP connection as the inbound request, rather than  
2775 using an independent HTTP Post request. If the *syncReplyMode* has a value of *none*, an HTTP  
2776 response with a response code as defined in section 0 above and with an empty HTTP body MUST be  
2777 returned in response to the HTTP Post.

## 2778 Access Control

2779 Implementers MAY protect their ebXML Message Service Handlers from unauthorized access through the  
2780 use of an access control mechanism. The HTTP access authentication process described in "HTTP  
2781 Authentication: Basic and Digest Access Authentication" [RFC2617] defines the access control  
2782 mechanisms allowed to protect an ebXML Message Service Handler from unauthorized access.

2783 Implementers MAY support all of the access control schemes defined in [RFC2617] including support of  
2784 the Basic Authentication mechanism, as described in [RFC2617] section 2, when Access Control is used.

2785 Implementers that use basic authentication for access control SHOULD also use communications  
2786 protocol level security, as specified in the section titled "Confidentiality and Transport Protocol Level  
2787 Security" in this document.

## 2788 Confidentiality and Transport Protocol Level Security

2789 An ebXML Message Service Handler MAY use transport layer encryption to protect the confidentiality of  
2790 ebXML Messages and HTTP transport headers. The IETF Transport Layer Security specification TLS  
2791 [RFC2246] provides the specific technical details and list of allowable options, which may be used by  
2792 ebXML Message Service Handlers. ebXML Message Service Handlers MUST be capable of operating in  
2793 backwards compatibility mode with SSL [SSL3], as defined in Appendix E of TLS [RFC2246].

2794 ebXML Message Service Handlers MAY use any of the allowable encryption algorithms and key sizes  
2795 specified within TLS [RFC2246]. At a minimum ebXML Message Service Handlers MUST support the key  
2796 sizes and algorithms necessary for backward compatibility with [SSL3].

2797 The use of 40-bit encryption keys/algorithms is permitted, however it is RECOMMENDED that stronger  
2798 encryption keys/algorithms SHOULD be used.

2799 Both TLS [RFC2246] and SSL [SSL3] require the use of server side digital certificates. Client side  
2800 certificate based authentication is also permitted. All ebXML Message Service handlers MUST support  
2801 hierarchical and peer-to-peer or direct-trust trust models.

---

## 2802 SMTP

2803 The Simple Mail Transfer Protocol (SMTP) [RFC2821] specification is commonly referred to as Internet  
2804 Electronic Mail. This specifications has been augmented over the years by other specifications, which  
2805 define additional functionality "layered on top" of this baseline specifications. These include:

2806 Multipurpose Internet Mail Extensions (MIME) [RFC2045], [RFC2046], [RFC2387]

2807 SMTP Service Extension for Authentication [RFC2554]

2808 SMTP Service Extension for Secure SMTP over TLS [RFC2487]

2809 Typically, Internet Electronic Mail Implementations consist of two "agent" types:

2810 Message Transfer Agent (MTA): Programs that send and receive mail messages with other MTA's on  
2811 behalf of MUA's. Microsoft Exchange Server is an example of a MTA

2812 Mail User Agent (MUA): Electronic Mail programs are used to construct electronic mail messages and  
2813 communicate with an MTA to send/retrieve mail messages. Microsoft Outlook is an example of a MUA.

2814 MTA's often serve as "mail hubs" and can typically service hundreds or more MUA's.

2815 MUA's are responsible for constructing electronic mail messages in accordance with the Internet  
2816 Electronic Mail Specifications identified above. This section describes the "binding" of an ebXML  
2817 compliant message for transport via eMail from the perspective of a MUA. No attempt is made to define  
2818 the binding of an ebXML Message exchange over SMTP from the standpoint of a MTA.

## 2819 Minimum Level of Supported Protocols

2820 Simple Mail Transfer Protocol [RFC2821]

2821 MIME [RFC2045] and [RFC2046]

2822 Multipart/Related MIME [RFC2387]

## 2823 Sending ebXML Messages over SMTP

2824 Prior to sending messages over SMTP an ebXML Message MUST be formatted according to the ebXML  
2825 Message Service Specification. Additionally the messages must also conform to the syntax, format and  
2826 encoding rules specified by MIME [RFC2045], [RFC2046] and [RFC2387].

2827 Many types of data that a party might desire to transport via email are represented as 8bit characters or  
2828 binary data. Such data cannot be transmitted over SMTP [RFC2821], which restricts mail messages to  
2829 7bit US-ASCII data with lines no longer than 1000 characters including any trailing CRLF line separator. If  
2830 a sending Message Service Handler knows that a receiving MTA, or ANY intermediary MTA's, are  
2831 restricted to handling 7-bit data then any document part that uses 8 bit (or binary) representation must be  
2832 "transformed" according to the encoding rules specified in section 6 of MIME [RFC2045]. In cases where  
2833 a Message Service Handler knows that a receiving MTA and ALL intermediary MTA's are capable of  
2834 handling 8-bit data then no transformation is needed on any part of the ebXML Message.

2835 The rules for forming an ebXML Message for transport via SMTP are as follows:

- 2836 • If using SMTP [RFC2821] restricted transport paths, apply transfer encoding to all 8-bit data that will be  
2837 transported in an ebXML message, according to the encoding rules defined in section 6 of MIME  
2838 [RFC2045]. The Content-Transfer-Encoding MIME header MUST be included in the MIME envelope portion  
2839 of any body part that has been transformed (encoded).
- 2840 • The Content-Type MIME header with the associated parameters, from the ebXML Message Envelope  
2841 MUST appear as an eMail MIME header.
- 2842 • All other MIME headers that constitute the ebXML Message Envelope MUST also become part of the eMail  
2843 MIME header.

- 2844 • The SOAPAction MIME header field must also be included in the eMail MIME header and MAY have the  
2845 value of ebXML:

2846 SOAPAction: "ebXML"

- 2847 • The "MIME-Version: 1.0" header must appear as an eMail MIME header.
- 2848 • The eMail header "To:" MUST contain the SMTP [RFC2821] compliant eMail address of the ebXML  
2849 Message Service Handler.
- 2850 • The eMail header "From:" MUST contain the SMTP [RFC2821] compliant eMail address of the senders  
2851 ebXML Message Service Handler.
- 2852 • Construct a "Date:" eMail header in accordance with SMTP [RFC2821]
- 2853 • Other headers MAY occur within the eMail message header in accordance with SMTP [RFC2821] and  
2854 MIME [RFC2045], however ebXML Message Service Handlers MAY choose to ignore them.

2855 The example below shows a minimal example of an eMail message containing an ebXML Message:

```

2856 From: ebXMLhandler@example.com
2857 To: ebXMLhandler@example2.com
2858 Date: Thu, 08 Feb 2001 19:32:11 CST
2859 MIME-Version: 1.0
2860 SOAPAction: "ebXML"
2861 Content-type: multipart/related; boundary="Boundary"; type="text/xml";
2862 start="<ebxhmheader111@example.com>"
2863

2930

## 2931 Response Messages

2932 All ebXML response messages, including errors and acknowledgments, are delivered *asynchronously*  
 2933 between ebXML Message Service Handlers. Each response message MUST be constructed in  
 2934 accordance with the rules specified in the section 0.

2935 All ebXML Message Service Handlers MUST be capable of receiving a delivery failure notification  
 2936 message sent by an MTA. A MSH that receives a delivery failure notification message SHOULD examine  
 2937 the message to determine which ebXML message, sent by the MSH, resulted in a message delivery  
 2938 failure. The MSH SHOULD attempt to identify the application responsible for sending the offending  
 2939 message causing the failure. The MSH SHOULD attempt to notify the application that a message  
 2940 delivery failure has occurred. If the MSH is unable to determine the source of the offending message the  
 2941 MSH administrator should be notified.

2942 MSH's which cannot identify a received message as a valid ebXML message or a message delivery  
 2943 failure SHOULD retain the unidentified message in a "dead letter" folder.

2944 A MSH SHOULD place an entry in an audit log indicating the disposition of each received message.

## 2945 Access Control

2946 Implementers MAY protect their ebXML Message Service Handlers from unauthorized access through the  
 2947 use of an access control mechanism. The SMTP access authentication process described in "SMTP  
 2948 Service Extension for Authentication" [RFC2554] defines the ebXML recommended access control  
 2949 mechanism to protect a SMTP based ebXML Message Service Handler from unauthorized access.

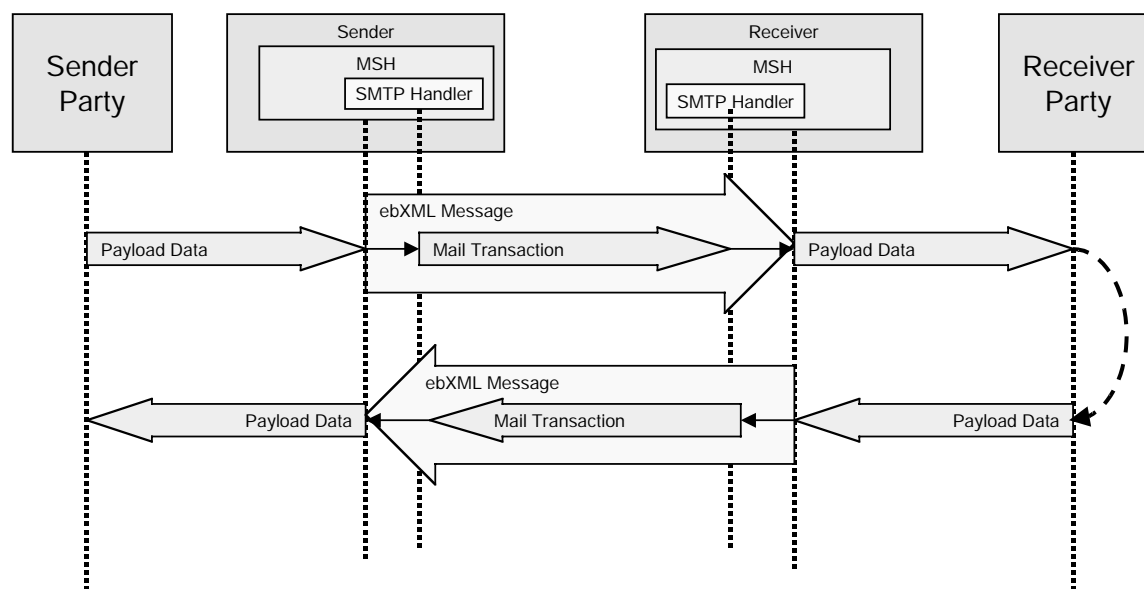

## 2950 Confidentiality and Transport Protocol Level Security

2951 An ebXML Message Service Handler MAY use transport layer encryption to protect the confidentiality of  
 2952 ebXML messages. The IETF "SMTP Service Extension for Secure SMTP over TLS" specification  
 2953 [RFC2487] provides the specific technical details and list of allowable options, which may be used.

## 2954 SMTP Model

2955 All *ebXML Message Service* messages carried as mail in an SMTP [RFC2821] Mail Transaction as  
 2956 shown in Figure B1.

2957  
 2958 *Figure B-1 SMTP Mail Depiction*

## 2959 Communication Errors during Reliable Messaging

2960 When the Sender or the Receiver detects a communications protocol level error (such as an HTTP,  
 2961 SMTP or FTP error) and Reliable Messaging is being used then the appropriate transport recovery  
 2962 handler will execute a recovery sequence. Only if the error is unrecoverable, does Reliable Messaging  
 2963 recovery take place (see section 7).

2964

## Appendix C. Supported Security Services

2965

The general architecture of the ebXML Message Service Specification is intended to support all the security services required for electronic business. The following table combines the security services of the *Message Service Handler* into a set of security profiles. These profiles, or combinations of these profiles, support the specific security policy of the ebXML user community. Due to the immature state of XML security specifications, this version of the specification requires support for profiles 0 and 1 only.

2968

2969

This does not preclude users from employing additional security features to protect ebXML exchanges; however, interoperability between parties using any profiles other than 0 and 1 cannot be guaranteed.

2970

2971

2972

Present in baseline MSH		Persistent digital signature	Non-persistent authentication	Persistent signed receipt	Non-persistent integrity	Persistent confidentiality	Non-persistent confidentiality	Persistent authorization	Non-persistent authorization	Trusted timestamp	Description of Profile
✓	Profile 0										no security services are applied to data
✓	Profile 1	✓									<i>Sending MSH</i> applies XML/DSIG structures to message
	Profile 2		✓						✓		<i>Sending MSH</i> authenticates and <i>Receiving MSH</i> authorizes sender based on communication channel credentials.
	Profile 3		✓				✓				<i>Sending MSH</i> authenticates and both MSHs negotiate a secure channel to transmit data
	Profile 4		✓		✓						<i>Sending MSH</i> authenticates, the <i>Receiving MSH</i> performs integrity checks using communications protocol
	Profile 5		✓								<i>Sending MSH</i> authenticates the communication channel only (e.g., SSL 3.0 over TCP/IP)
	Profile 6	✓					✓				<i>Sending MSH</i> applies XML/DSIG structures to message and passes in secure communications channel
	Profile 7	✓		✓							<i>Sending MSH</i> applies XML/DSIG structures to message and <i>Receiving MSH</i> returns a signed receipt
	Profile 8	✓		✓			✓				combination of profile 6 and 7
	Profile 9	✓								✓	Profile 5 with a trusted timestamp applied
	Profile 10	✓		✓						✓	Profile 9 with <i>Receiving MSH</i> returning a signed receipt

Present in baseline MSH		Persistent digital signature	Non-persistent authentication	Persistent signed receipt	Non-persistent integrity	Persistent confidentiality	Non-persistent confidentiality	Persistent authorization	Non-persistent authorization	Trusted timestamp	Description of Profile
	Profile 11	✓					✓			✓	Profile 6 with the <i>Receiving MSH</i> applying a trusted timestamp
	Profile 12	✓		✓			✓			✓	Profile 8 with the <i>Receiving MSH</i> applying a trusted timestamp
	Profile 13	✓				✓					<i>Sending MSH</i> applies XML/DSIG structures to message and applies confidentiality structures (XML-Encryption)
	Profile 14	✓		✓		✓					Profile 13 with a signed receipt
	Profile 15	✓		✓						✓	<i>Sending MSH</i> applies XML/DSIG structures to message, a trusted timestamp is added to message, <i>Receiving MSH</i> returns a signed receipt
	Profile 16	✓				✓				✓	Profile 13 with a trusted timestamp applied
	Profile 17	✓		✓		✓				✓	Profile 14 with a trusted timestamp applied
	Profile 18	✓						✓			<i>Sending MSH</i> applies XML/DSIG structures to message and forwards authorization credentials [SAML]
	Profile 19	✓		✓				✓			Profile 18 with <i>Receiving MSH</i> returning a signed receipt
	Profile 20	✓		✓				✓		✓	Profile 19 with the a trusted timestamp being applied to the <i>Sending MSH</i> message
	Profile 21	✓		✓		✓		✓		✓	Profile 19 with the <i>Sending MSH</i> applying confidentiality structures (XML-Encryption)
	Profile 22					✓					<i>Sending MSH</i> encapsulates the message within confidentiality structures (XML-Encryption)

## 3052 Appendix E. Notices

3053

3054 Copyright © 2002 OASIS Open, Inc. All Rights Reserved.

3055

3056 OASIS takes no position regarding the validity or scope of any intellectual property or other rights that  
3057 might be claimed to pertain to the implementation or use of the technology described in this document or  
3058 the extent to which any license under such rights might or might not be available; neither does it  
3059 represent that it has made any effort to identify any such rights. Information on OASIS's procedures with  
3060 respect to rights in OASIS specifications can be found at the OASIS website. Copies of claims of rights  
3061 made available for publication and any assurances of licenses to be made available, or the result of an  
3062 attempt made to obtain a general license or permission for the use of such proprietary rights by  
3063 implementers or users of this specification, can be obtained from the OASIS Executive Director.

3064

3065 OASIS invites any interested party to bring to its attention any copyrights, patents or patent applications,  
3066 or other proprietary rights which may cover technology that may be required to implement this  
3067 specification. Please address the information to the OASIS Executive Director.

3068

3069 This document and translations of it may be copied and furnished to others, and derivative works that  
3070 comment on or otherwise explain it or assist in its implementation may be prepared, copied, published  
3071 and distributed, in whole or in part, without restriction of any kind, provided that the above copyright notice  
3072 and this paragraph are included on all such copies and derivative works. However, this document itself  
3073 may not be modified in any way, such as by removing the copyright notice or references to OASIS,  
3074 except as needed for the purpose of developing OASIS specifications, in which case the procedures for  
3075 copyrights defined in the OASIS Intellectual Property Rights document must be followed, or as required to  
3076 translate it into languages other than English.
