This Standard defines XML encodings of the standard SGML character entity sets.

Non-normative Annex D of [SGML] defines 19 standard SGML character entity sets: Added Latin 1, Added Latin 2, Greek Letters, Monotniko Greek, Russian Cyrillic, Non-Russian Cyrillic, Numeric and Special Graphic, Diacritical Marks, Publishing, Box and Line Drawing, General Technical, Greek Symbols, Alternative Greek Symbols, Added Math Symbols: Ordinary, Added Math Symbols: Binary Operators, Added Math Symbols: Relations, Added Math Symbols: Negated Relations, Added Math Symbols: Arrow Relations, Added Math Symbols: Delimiters. The SGML declarations for these entities use the specific character data (SDATA) entity type that is not supported in XML, so alternative XML declarations are necessary.

In XML, the specific character data of most entities can be expressed as a [Unicode] character.

1. XML Character Entity Sets

The character entity sets defined by this Standard are summarized in Appendix A through Appendix S.

In order to use these entities in a document, they must be declared. Entities can be declared in the external subset or the internal subset, as described in [XML]. An example document, with the declaration in the internal subset, is shown in Example 1.

Example 1. Declaring and Using the ISO Latin 1 Character Entity Set

```
<!DOCTYPE doc [
  <!ENTITY % iso-lat1 PUBLIC "ISO 8879:1986//ENTITIES Added Latin 1//EN//XML"
    "http://www.oasis-open.org/docbook/xmlcharent/0.3/iso-lat1.ent">
  %iso-lat1;
]>
<doc>
  <p>This document declares the ISO Latin 1 Character Entity Set, providing
  access to the ISO Latin 1 entities, such as "&eacute;" and "&copy;".</p>
</doc>
```

Note

Non-validating XML Parsers may choose not to process externally declared entities. This Standard does not alter the semantics of XML processors. If a processor does not see the declaration for an entity, it will not be able to report the correct replacement text for that entity.

1.1. Multi-Character Replacements

The replacement text of some entities includes more than a single Unicode character. Some characters are composed with the "combining reverse solidus overlay" (20E5) and some are composed with a variation selector (FE00, FE01, ...).

1.2. Duplicate Entities

Historically, the `inodot` entity is multiply defined in `iso-lat2.ent` and `iso-amso.ent`. If both entity sets are included, some parsers will warn about redefinition of this entity. The warning can be ignored.

1.3. Entities with no Mapping

There are a small number of entities that have no [Unicode] representation. These entities are all mapped to the Unicode character "FFFD", the "replacement character".

Entity Name	Entity Set	Description
fjlig	iso-pub.ent	Small fj ligature
gnap	iso-amsn.ent	Greater, not approximate
jnodot	iso-amso.ent	Small j, no dot
lnap	iso-amsn.ent	Less, not approximate
lpargt	iso-amsc.ent	Greater than, left arc
nsmid	iso-amsn.ent	Negated short mid
prnE	iso-amsn.ent	Precedes, not double equals
rpargt	iso-amsc.ent	Right paren, greater than
scnE	iso-amsn.ent	Succeeds, not double equals
smid	iso-amsr.ent	shortmid r
vsubnE	iso-amsn.ent	Subset not double equals, variant

Users needing these characters will have to rely on the private use area or other non-portable mechanisms to access them.

1.4. Entities with Substituted Mappings

There are a few more for which there is no specific [Unicode] representation but where a reasonable substitution has been used:

Entity Name	Entity Set	Substitution	Description
bepsi	iso-amsr.ent	220D	Back epsilon: such that

Entity Name	Entity Set	Substitution	Description
ges	iso-amsr.ent	2265	Greater-or-equal, slanted
gvnE	iso-amsn.ent	2269	Gt, vert, not double equals
iff	iso-tech.ent	21D4	If and only if
les	iso-amsr.ent	2264	Less-than-or-equal, slanted
lozf	iso-pub.ent	2726	Lozenge, filled
lvnE	iso-amsn.ent	2268	Less, vert, not double equals
nge	iso-amsn.ent	2271	Neither greater-than nor equal to
nle	iso-amsn.ent	2270	Not less-than-or-equal
npre	iso-amsn.ent	22E0	Not precedes, equals
nsce	iso-amsn.ent	22E1	Not succeeds, equals
nspar	iso-amsn.ent	2226	Not short parallel
pre	iso-amsr.ent	227C	Precedes, equals
spar	iso-amsr.ent	2225	Short parallel
ssetmn	iso-amsb.ent	2216	Small set minus (reverse solidus)
star	iso-pub.ent	22C6	Star operator
starf	iso-pub.ent	2605	Black star
thkap	iso-amsr.ent	2248	Thick approximate
thksim	iso-amsr.ent	223C	Thick similar
vsubne	iso-amsn.ent	228A	Subset, not equals, variant
vsupnE	iso-amsn.ent	228B	Subset not double equals, variant
vsupne	iso-amsn.ent	228B	Superset, not equals, variant
xhArr	iso-amsa.ent	2194	Long left and right double arr
xharr	iso-amsa.ent	2194	Long left and right arr
xlArr	iso-amsa.ent	21D0	Long left double arrow
xrArr	iso-amsa.ent	21D2	Long right double arr
ssmile	iso-amsr.ent	2323	Small smile
sfrown	iso-amsr.ent	2322	Small frown

Users needing alternate glyphs for these characters will have to rely on redefining them to use the private use area or other non-portable mechanisms to access them.

2. XML Character Elements

Named XML entities (except for the five predefined entities [<http://www.w3.org/TR/REC-xml#sec-predefined-ent>]) cannot be used if they are not declared. Entity declaration requires either an external or an internal subset. Some classes of applications forbid the occurrence of markup declarations in documents. For these documents, named character entities are inaccessible.

In this section, we introduce an XML vocabulary with the semantics of character entity reference. This Standard defines the semantics of elements and attributes declared in the "<http://www.oasis-open.org/docbook/xmlchar-ent/namespaces>" namespace.

This namespace contains exactly one element, `char`. The `char` element has two attributes, `entity` and `name`. They are mutually exclusive.

The `entity` attribute identifies characters by their character entity names. (The set of valid names is the closed set of names associated with character entity sets defined by this Standard.) Case is significant in entity names.

The `name` attribute identifies characters by their Unicode character names. (The set of valid names is the set of character names published in the [Unicode] specification, or any later version of that specification.) Case is insignificant in character names.

The [RELAX NG] definition of this namespace is shown in figure Figure 1.

F i g u r e 1 . T h e R E L A X N G D e f i n i t i o n o f t h e http://www.oasis-open.org/docbook/xmlcharent/names Namespace

```
<?xml version="1.0"?>
<grammar xmlns="http://relaxng.org/ns/structure/0.9"
          ns="http://www.oasis-open.org/docbook/xmlcharent/names">

<start>
  <element name="char">
    <choice>
      <attribute name="entity">
        <ref name="EntityNames" />
      </attribute>
      <attribute name="name">
        <ref name="UnicodeNames" />
      </attribute>
    </choice>
  </element>
</start>

<define name="EntityNames">
  <!-- Logically, this is the list of ISO 9573 Character Entity Names -->
  <!-- For now, just text. -->
  <text/>
</define>

<define name="UnicodeNames">
  <!-- Logically, this is the list of Unicode Character Names -->
  <!-- For now, just text. -->
  <text/>
</define>

</grammar>
```

Example 2 shows a sample document using this mechanism.

Example 2. Declaring and Using the ISO Latin 1 Character Entity Set

```
<doc xmlns:e="http://www.oasis-open.org/docbook/xmlcharent/names">
  <p>This document uses the character names element to access
  character entities, such as "<e:char name='eacute' />" and
  "<e:char name='COPYRIGHT SIGN' />".</p>
</doc>
```

The character names element is limited to contexts where elements may occur. In particular, elements may not occur in XML attribute values. Note, however, that internationalization requirements such as bidirectional language support and Ruby already require structure in arbitrary contexts. It is probably an error to use attributes for human-readable content.

Unicode Glyphs

The Unicode reference glyphs in this document are examples only. Some characters have more than one Unicode representation and different Unicode characters may be appropriate in different contexts. The glyph images offer only one of many possible representations for the specified character.

Most of the glyphs this reference are from the TmsPF Roman font by Production First Software [<http://ourworld.compuserve.com/homepages/profirst/homepagx.htm>]. A few glyphs are from Everson Mono [<http://www.indigo.ie/egt/celtscript/>].

Unicode support requires much more than a simple character to glyph mapping; for more information on Unicode, consult *The Unicode Standard, Version 2.0* [<http://www.unicode.org/unicode/uni2book/u2.html>] and *Unicode Technical Report #8* [<http://www.unicode.org/unicode/reports/tr8.html>], which describes Unicode Version 2.1.
