TC Administration announcements

OASIS is pleased to announce the publication of SAML V2.0 Protocol Extension for Requesting Attributes per Request Version 1.0 Committee Specification 01 by the members of the OASIS Security Services (SAML) TC:

SAML V2.0 Protocol Extension for Requesting Attributes per Request Version 1.0  
Committee Specification 01  
23 August 2017

This specification, related to Security Assertion Markup Language (SAML) v2.0, defines an extension to the core protocol that allows Service Providers to specify ad-hoc sets of attributes per request. This brings more flexibility than existing mechanisms, which are based on signaling pre-defined sets of requested attributes.

The OASIS Security Services (SAML) TC is responsible for the standard XML-based framework for creating and exchanging authentication and information. Interoperable exchange of security information between domains, including the ability to federate identities across domains, is crucial to developing solutions for business problems such as performing Web Single Sign-On, utilizing distributed authorization services, and securing e-business transactions.

This is an OASIS deliverable, completed and approved by the TC and fully ready for testing and implementation.

The prose specification and related files are available here:

SAML V2.0 Protocol Extension for Requesting Attributes per Request Version 1.0

Members of the SAML TC [1] approved this specification by Special Majority Vote. The specification had been released for public review as required by the TC Process [2]. The vote to approve as a Committee Specification passed [3], and the document is now available online in the OASIS Library as referenced above.

Our congratulations to the TC on achieving this milestone and our thanks to the reviewers who provided feedback on the specification drafts to help improve the quality of the work.
